

PROTECTION PRODUCTS

Description

The RClamp®3346PQ provides ESD protection for high-speed data interfaces. It features a high maximum ESD withstand voltage of $\pm 17\text{kV}$ contact and $\pm 20\text{kV}$ air discharge per IEC 61000-4-2. RClamp3346PQ is designed to minimize both the ESD peak clamping and the TLP clamping. Package inductance is reduced at each pin resulting in lower peak ESD clamping voltage. The dynamic resistance is among the industry's lowest at 0.15 Ohms (typical). Maximum capacitance on each line to ground is 0.65pF allowing the RClamp3346PQ to be used in applications operating in excess of 5GHz without signal attenuation. Each device will protect up to six lines (three high-speed pairs).

The RClamp3346PQ is in a 7-pin SGP2708N7 package measuring 2.7 x 0.8mm with a nominal height of 0.50mm. The leads have a nominal pin-to-pin pitch of 0.40mm. Flow-through package design simplifies PCB layout and maintains signal integrity on high-speed lines.

The combination of low peak ESD clamping, low dynamic resistance, and innovative package design enables this device to provide the highest level of ESD protection for applications such as USB 3.0, eSATA, and DisplayPort.

Application Information

Protecting USB 3.0 Ports

RClamp3346PQ is designed to protect all six USB 3.0 SuperSpeed and high speed differential lines. PCB traces enter and exit each I/O pin and ground is connected at pin 2. For best results, it is recommended that the ground connection be made using a filled via-in-pad. The via should be filled with a conductive paste. This technique saves board space and reduces parasitic inductance in the ground path. Figures 2 and 3 are examples of how to route high speed differential traces through the RClamp3346PQ. Differential impedance of each pair can easily be controlled for USB 3.0 (85 Ohms +/-15%).

The RClamp3346PQ should be placed as close to the connector as possible for optimum ESD performance. Internal construction of the RClamp3346PQ has been optimized to minimize series inductance within the package. This helps to reduce the ESD peak clamping voltage. Dynamic resistance is extremely low (typically 0.15 Ohms) further reducing the ESD clamping voltage.
