

High Voltage Power Operational Amplifiers

FEATURES

- High Voltage — 400V ($\pm 200V$)
- Low Quiescent Current — 10mA
- High Output Current — 4A
- Programmable Current Limit

APPLICATIONS

- Piezoelectric Positioning
- High Voltage Instrumentation
- Electrostatic Transducers
- Programmable Power Supplies up to 390V

DESCRIPTION

The PA92 is a high voltage, low quiescent current MOSFET operational amplifier designed as a low cost solution for driving continuous output currents up to 4A and pulse currents up to 7A. The safe operating area (SOA) has no second breakdown limitations and can be observed for all type loads by choosing an appropriate current limiting resistor. The MOSFET output stage is biased AB for linear operation. External compensation provides flexibility in choosing bandwidth and slew rate for the application. Apex Microtechnology's Power SIP uses a minimum of board space allowing for high density circuit boards. The Power SIP is electrically isolated.

TYPICAL CONNECTION

Figure 2: Typical Connection

PINOUT AND DESCRIPTION TABLE

Figure 3: External Connections

Pin Number	Name	Description
1	-IN	The inverting input.
2	+IN	The non-inverting input.
3	I_Q	Quiescent current reduction pin. Connect to pin 5 to disable the AB bias. See applicable section.
4	R_C	Compensation resistor connection. Select value based on Phase Compensation. See applicable section.
5	C_C	Compensation capacitor connection. Select value based on Phase Compensation. See applicable section.
6	OUT	The output. Connect this pin to load and to the feedback resistors.
7, 8	$-V_S$	The negative supply rail. Pins 7 and 8 are internally connected.
9, 10	CL	Connect to the current limit resistor. Output current flows into/out of these pins through R_{CL} . The output pin and the load are connected to the other side of R_{CL} . Pins 9 and 10 are internally connected.
11, 12	$+V_S$	The positive supply rail. Pins 11 and 12 are internally connected.

SPECIFICATIONS

All Min/Max characteristics and specifications are guaranteed over the Specified Operating Conditions. Typical performance characteristics and specifications are derived from measurements taken at typical supply voltages and $T_C = 25^\circ\text{C}$.

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Min	Max	Units
Supply Voltage, total	$+V_S$ to $-V_S$		400	V
Output Current, source, sink, peak, within SOA	I_{OUT}		7	A
Power Dissipation, continuous @ $T_C = 25^\circ\text{C}$	P_D		80	W
Input Voltage, differential	$V_{IN(Diff)}$	-20	20	V
Input Voltage, common mode	V_{CM}	$-V_S$	$+V_S$	V
Temperature, pin solder, 10s max.			260	$^\circ\text{C}$
Temperature, junction ¹	T_J		150	$^\circ\text{C}$
Temperature Range, storage		-55	+125	$^\circ\text{C}$
Operating Temperature Range, case	T_C	-40	+85	$^\circ\text{C}$

- Long term operation at the maximum junction temperature will result in reduced product life. Derate power dissipation to achieve high MTTF.

CAUTION

The PA92 is constructed from MOSFET transistors. ESD handling procedures must be observed. The substrate contains beryllia (BeO). Do not crush, machine, or subject to temperatures in excess of 850°C to avoid generating toxic fumes.

INPUT

Parameter	Test Conditions	Min	Typ	Max	Units
Offset Voltage, initial			2	10	mV
Offset Voltage vs. Temperature	Full temp range		15	50	$\mu\text{V}/^\circ\text{C}$
Offset Voltage vs. Supply			10	25	$\mu\text{V}/\text{V}$
Offset Voltage vs. Time			75		$\mu\text{V}/\text{kh}$
Bias Current, initial			200	2000	pA
Bias Current vs. Supply			4		pA/V
Offset Current, initial			50	500	pA
Input Impedance, DC			10^{11}		Ω
Input Capacitance			4		pF
Common Mode Voltage Range ¹		$\pm V_S \mp 15$			V
Common Mode Rejection, DC	$V_{CM} = \pm 90\text{V}$	80	98		dB
Noise	100 kHz BW, $R_S = 1\text{ k}\Omega$, $C_C = 10\text{pF}$		1		$\mu\text{V RMS}$

- $+V_S$ and $-V_S$ denote the positive and negative power supply rail respectively.

GAIN

Parameter	Test Conditions	Min	Typ	Max	Units
Open Loop @ 15 Hz	$R_L = 2\text{ k}\Omega$, $C_C = 10\text{pF}$	94	111		dB
Gain Bandwidth Product @ 1 MHz	$R_L = 2\text{ k}\Omega$, $C_C = 10\text{pF}$		18		MHz
Power Bandwidth	$R_L = 2\text{ k}\Omega$, $C_C = 10\text{pF}$		30		kHz
Phase Margin	Full temp range		60		°

OUTPUT

Parameter	Test Conditions	Min	Typ	Max	Units
Voltage Swing ¹	$I_{OUT} = 4\text{A}$	$\pm V_S \mp 12$	$\pm V_S \mp 10$		V
Current, continuous		4			A
Slew Rate, $A_V = 100$	$C_C = 10\text{pF}$		50		V/ μs
Capacitive Load, $A_V = +1$	Full temp range	1			nF
Settling Time to 0.1%	$C_C = 10\text{pF}$, 2V step		1		μs
Resistance, no load			10		Ω

1. $+V_S$ and $-V_S$ denote the positive and negative power supply rail respectively.

POWER SUPPLY

Parameter	Test Conditions	Min	Typ	Max	Units
Voltage ¹		± 50	± 150	± 200	V
Current, quiescent			10	14	mA

1. Derate max supply rating 0.625 V/°C below 25°C case. No derating needed above 25°C case.

THERMAL

Parameter	Test Conditions	Min	Typ	Max	Units
Resistance, AC, junction to case ¹	Full temp range, $F > 60\text{ Hz}$			1	°C/W
Resistance, DC, junction to case	Full temp range, $F < 60\text{ Hz}$			1.5	°C/W
Resistance, junction to air	Full temp range		30		°C/W
temperature range, case	Meets full range specs	-25		+85	°C

1. Rating applies if the output current alternates between both output transistors at a rate faster than 60 Hz.

SAFE OPERATING AREA (SOA)

The safe operating area curves define the maximum additional internal power dissipation the amplifier can tolerate when it produces the necessary output to drive an external load.

The MOSFET output stage of this power operational amplifier has two distinct limitations:

1. The current handling capability of the MOSFET geometry and the wire bonds.
2. The junction temperature of the output MOSFETs.

Note: The output stage is protected against transient flyback. However, for protection against sustained, high energy flyback, external fast-recovery diodes should be used.

Figure 14: SOA

GENERAL

Please read Application Note 1 “General Operating Considerations” which covers stability, supplies, heat sinking, mounting, current limit, SOA interpretation, and specification interpretation. Visit www.apexanalog.com for Apex Microtechnology’s complete Application Notes library, Technical Seminar Workbook, and Evaluation Kits.

PHASE COMPENSATION

Gain	C _C *	R _C
≥1	150pF	100 Ω
≥2	100pF	100 Ω
≥3	47pF	0 Ω
≥12	10pF	0 Ω

*C_C Never to be <10pF. C_C to be rated for the full supply voltage +V_S to -V_S. Use ceramic NPO (COG) type.

CURRENT LIMIT

For proper operation, the current limit resistor (R_{CL}) must be connected as shown in the typical connection diagram. For optimum reliability the resistor value should be set as high as possible. The value is calculated as follows; with the maximum practical value of 16 Ω.

$$R_{CL}(\Omega) = \frac{0.65V}{I_{CL}(A)}$$

INPUT PROTECTION

Although the PA92 can withstand differential voltages up to ±20V, additional external protection is recommended. Low leakage, low capacitance JFETs connected as diodes are recommended (e.g. 2N4416, Q1-Q4 in Figure 15). The differential input voltage will be clamped to ±1.4V. This is sufficient overdrive to produce maximum power bandwidth.

Figure 15: Overvoltage Protection

POWER SUPPLY PROTECTION

Unidirectional zener diode transient suppressors are recommended as protection on the supply pins. See Figure 315. The zeners clamp transients to voltages within the power supply rating and also clamp power supply reversals to ground. Whether the zeners are used or not, the system power supply should be evaluated for transient performance including power-on overshoot and power-off polarity reversals as well as line regulation.

Conditions which can cause open circuits or polarity reversals on either power supply rail should be avoided or protected against. Reversals or opens on the negative supply rail are known to induce input stage failure. Unidirectional transzors prevent this, and it is desirable that they be both electrically and physically as close to the amplifier as possible.

STABILITY

The PA92 is externally compensated and performance can be tailored to the application. Use the graphs of small signal response and power response as a guide. The compensation capacitor C_C must be rated at 500V working voltage. An NPO capacitor is recommended. The compensation network $C_C R_C$ must be mounted closely to the amplifier pins 4 and 5 to avoid spurious oscillation.

QUIESCENT CURRENT REDUCTION

When pin 3 (I_Q) is shorted to pin 5 (CC2) the AB biasing of the output stage is disabled. This lowers quiescent power but also raises distortion since the output stage is then class C biased. The output stage bias current is nominally set at 1mA. Pin 3 may be left open if not used.

PACKAGE DESIGN

Part Number	Apex Package Style	Description
PA92	DP	12-Pin SIP
PA92EE	EE	12-Pin SIP w/ formed leads

PACKAGE STYLE DP

NOTES:

1. Dimensions are inches & [mm].
2. Triangle on lid denotes pin 1.
3. Pins: Alloy 510 phosphor bronze plated with matte tin (150 – 300μ") over nickel (50 μ" max.) underplate.
4. Package: Vectra liquid crystal polymer, black
5. Epoxy-sealed & ultrasonically welded non-hermetic package.
6. Package weight: .367 oz. [11.41 g]

PACKAGE STYLE EE

NOTES:

1. Dimensions are inches & [mm].
2. For other dimensions and information on this package with unformed leads, see package DP.
