

FEATURES

256K x 16 MRAM Memory

- Fast 35 ns Read/Write Cycle
- SRAM Compatible Timing, Uses Existing SRAM Controllers Without Redesign
- Unlimited Read & Write Endurance
- Data Non-volatile for >20-years at Temperature
- One Memory Replaces Flash, SRAM, EEPROM and BBSRAM in System for Simpler, More Efficient Design
- Replace battery-backed SRAM solutions with MRAM to improve reliability
- 3.3 Volt Power Supply
- Automatic Data Protection on Power Loss
- Commercial, Industrial, Extended Temperatures
- RoHS-Compliant SRAM TSOP2 and BGA Packages - MSL Level 3
- AEC-Q100 Grade 1 option

INTRODUCTION

The **MR2A16A** is a 4,194,304-bit magnetoresistive random access memory (MRAM) device organized as 262,144 words of 16 bits. The **MR2A16A** offers SRAM compatible 35 ns read/write timing with unlimited endurance. Data is always non-volatile for greater than 20-years. Data is automatically protected on power loss by low-voltage inhibit circuitry to prevent writes with voltage out of specification. The **MR2A16A** is the ideal memory solution for applications that must permanently store and retrieve critical data and programs quickly.

The **MR2A16A** is available in small footprint 400-mil, 44-lead plastic small-outline TSOP type-II package or 8 mm x 8 mm, 48-pin ball grid array (BGA) package with 0.75 mm ball centers. These packages are compatible with similar low-power SRAM products and other non-volatile RAM products.

The **MR2A16A** provides highly reliable data storage over a wide range of temperatures. The product is offered with commercial (0 to +70 °C), industrial (-40 to +85 °C), extended (-40 to +105 °C) and AEC-Q100 Grade 1 (-40 to +125 °C) operating temperature range options.

2. ELECTRICAL SPECIFICATIONS

Absolute Maximum Ratings

This device contains circuitry to protect the inputs against damage caused by high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage greater than maximum rated voltages to these high-impedance (Hi-Z) circuits.

The device also contains protection against external magnetic fields. Precautions should be taken to avoid application of any magnetic field more intense than the maximum field intensity specified in the maximum ratings.

Table 2.1 Absolute Maximum Ratings¹

Parameter	Symbol	Value	Unit
Supply voltage ²	V_{DD}	-0.5 to 4.0	V
Voltage on any pin ²	V_{IN}	-0.5 to $V_{DD} + 0.5$	V
Output current per pin	I_{OUT}	±20	mA
Package power dissipation ³	P_D	0.600	W

Storage Temperature	T_{stg}	-55 to 150	°C
Lead temperature during solder (3 minute max)	T_{Lead}	260	°C
Maximum magnetic field during write MR2A16A (All Temperatures)	H_{max_write}	2000	A/m
Maximum magnetic field during read or standby	H_{max_read}	8000	A/m

¹ Permanent device damage may occur if absolute maximum ratings are exceeded. Functional operation should be restricted to recommended operating conditions. Exposure to excessive voltages or magnetic fields could affect device reliability.

² All voltages are referenced to V_{SS} .

³ Power dissipation capability depends on package characteristics and use environment.

¹ There is a 2 ms startup time once V_{DD} exceeds $V_{DD}(max)$. See **Power Up and Power Down Sequencing** below.

² $V_{IH}(max) = V_{DD} + 0.3 V_{DC}$; $V_{IH}(max) = V_{DD} + 2.0 V_{AC}$ (pulse width ≤ 10 ns) for $I \leq 20.0$ mA.

³ $V_{IL}(min) = -0.5 V_{DC}$; $V_{IL}(min) = -2.0 V_{AC}$ (pulse width ≤ 10 ns) for $I \leq 20.0$ mA.

⁴ AEC-Q100 Grade 1 temperature profile assumes 10% duty cycle at maximum temperature (2 years out of 20 years life.)

Power Up and Power Down Sequencing

The MRAM is protected from write operations whenever V_{DD} is less than V_{WI} . As soon as V_{DD} exceeds $V_{DD}(min)$, there is a startup time of 2 ms before read or write operations can start. This time allows memory power supplies to stabilize.

The $\overline{E}$ and $\overline{W}$ control signals should track V_{DD} on power up to $V_{DD} - 0.2$ V or V_{IH} (whichever is lower) and remain high for the startup time. In most systems, this means that these signals should be pulled up with a resistor so that signal remains high if the driving signal is Hi-Z during power up. Any logic that drives $\overline{E}$ and $\overline{W}$ should hold the signals high with a power-on reset signal for longer than the startup time.

During power loss or brownout where V_{DD} goes below V_{WI} , writes are protected and a startup time must be observed when power returns above $V_{DD}(min)$.

¹ All write occurs during the overlap of $\overline{E}$ low and $\overline{W}$ low. Power supplies must be properly grounded and decoupled and bus contention conditions must be minimized or eliminated during read and write cycles. If $\overline{G}$ goes low at the same time or after $\overline{W}$ goes low, the output will remain in a high impedance state. After $\overline{W}$, $\overline{E}$ or $\overline{UB/LB}$ has been brought high, the signal must remain in steady-state high for a minimum of 2 ns. The minimum time between $\overline{E}$ being asserted low in one cycle to $\overline{E}$ being asserted low in a subsequent cycle is the same as the minimum cycle time allowed for the device.

² All write cycle timings are referenced from the last valid address to the first transition address.

³ This parameter is sampled and not 100% tested. Transition is measured ± 200 mV from the steady-state voltage. At any given voltage or temperature, $t_{WLQZ}(\text{max}) < t_{WHQX}(\text{min})$

6. REVISION HISTORY

Revision	Date	Description of Change
5	Sept 21, 2007	Changed MR2A16ATS35C product description to Legacy Commercial. Added the New Commercial temperature product (MR2A16AYS35) information. Table 3: MR2A16AYS35 Hmax-write=25 Oe. Table 4: MR2A16AYS35 has a 2 ms power up waiting period. Table 6: Applied values to TBD's in IDD specifications.
6	Nov 12, 2007	Table 2: Changed IDDA to IDDR or IDDW. Table 13: Added note indicating that TS and YS are both valid package codes. Current Part Numbering System: Added commercial (missing letter) temperature range.
7	Sep 12, 2008	Reformat Datasheet for EverSpin, Add BGA Packaging Information, Add Tape & Reel Part Numbers, Add Power Sequencing Info, Correct IOH spec of VOH to -100 uA, Correct ac Test Conditions.
8	July 22, 2009	Add TSOP2 Lead Cross-Section, Add Production Note. Converted to new document format.
9	Dec 16, 2011	Added AEC-Q100 Grade 1 product option for TSOP2 package to Table 4.1. Revised Tables 2.1, 2.2 and 4.1 to include AEC-Q100 Grade 1 specifications. New logo design.
