DESCRIPTION:

The IDT5V9910A is a high fanout phase locked-loop clock driver intended for high performance computing and data-communications applications. It has eight zero delay LVTTTL outputs.

When the GND/sOE pin is held low, all the outputs are synchronously enabled. However, if GND/sOE is held high, all the outputs except Q2 and Q3 are synchronously disabled.

Furthermore, when the VCCQ/PE is held high, all the outputs are synchronized with the positive edge of the REF clock input. When VCCQ/PE is held low, all the outputs are synchronized with the negative edge of REF.

The FB signal is compared with the input REF signal at the phase detector in order to drive the VCO. Phase differences cause the VCO of the PLL to adjust upwards or downwards accordingly.

An internal loop filter moderates the response of the VCO to the phase detector. The loop filter transfer function has been chosen to provide minimal jitter (or frequency variation) while still providing accurate responses to input frequency changes.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Symbol	Description	Max	Unit
	Supply Voltage to Ground	-0.5 to +7	V
V _I	DC Input Voltage	-0.5 to V _{CC} +0.5	V
	REF Input Voltage	-0.5 to +5.5	V
	Maximum Power Dissipation (T _A = 85°C)	530	mW
T _{STG}	Storage Temperature	-65 to +150	°C

NOTE:

- Stresses beyond those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

CAPACITANCE (T_A = +25°C, f = 1MHz, V_{IN} = 0V)

Parameter	Description	Typ.	Max.	Unit
C _{IN}	Input Capacitance	5	7	pF

NOTE:

- Capacitance applies to all inputs except TEST and FS. It is characterized but not production tested.

PIN DESCRIPTION

Pin Name	Type	Description
REF	IN	Reference Clock Input
FB	IN	Feedback Input
TEST ⁽¹⁾	IN	When MID or HIGH, disables PLL (except for conditions of Note 1). REF goes to all outputs. Set LOW for normal operation.
GND/ $\overline{sOE}$ ⁽¹⁾	IN	Synchronous Output Enable. When HIGH, it stops clock outputs (except Q2 and Q3) in a LOW state - Q2 and Q3 may be used as the feedback signal to maintain phase lock. Set GND/ $\overline{sOE}$ LOW for normal operation.
VccQ/PE	IN	Selectable positive or negative edge control. When LOW/HIGH the outputs are synchronized with the negative/positive edge of the reference clock.
FS ⁽²⁾	IN	Frequency range select: FS = GND: 15 to 35MHz FS = MID (or open): 25 to 60MHz FS = Vcc: 40 to 85MHz
Q0 - Q7	OUT	Eight clock output
VccN	PWR	Power supply for output buffers
VccQ	PWR	Power supply for phase locked loop and other internal circuitry
GND	PWR	Ground

NOTES:

- When TEST = MID and GND/ $\overline{sOE}$ = HIGH, PLL remains active.
- This input is wired to Vcc, GND, or unconnected. Default is MID level. If it is switched in the real time mode, the outputs may glitch, and the PLL may require an additional lock time before all data sheet limits are achieved.

NOTES:

- All timing and jitter tolerances apply for F_{NOM} ≥ 25MHz.
- Skew is the time between the earliest and the latest output transition among all outputs with the specified load.
- t_{SKEW} is the skew between all outlets. See AC TEST LOADS.
- For IDT5V9910A-2 t_{SKEW0} is measured with C_L = 0pF; for C_L = 20pF, t_{SKEW0} = 0.35ns Max.
- t_{DEV} is the output-to-output skew between any two devices operating under the same conditions (V_{CC}, ambient temperature, air flow, etc.)
- t_{LOCK} is the time that is required before synchronization is achieved. This specification is valid only after V_{CC} is stable and within normal operating limits. This parameter is measured from the application of a new signal or frequency at REF or FB until t_{PD} is within specified limits.
- t_{PD} is measured with REF input rise and fall times (from 0.8V to 2V) of 1ns.
