

# HIGH-SPEED 3.3V 16/8K X 9 SYNCHRONOUS PIPELINED DUAL-PORT STATIC RAM

**IDT70V9169/59L**

## Features:

- ♦ True Dual-Ported memory cells which allow simultaneous access of the same memory location
- ♦ High-speed clock to data access
  - Commercial: 6.5/7.5/9ns (max.)
  - Industrial: 7.5ns (max.)
- ♦ Low-power operation
  - IDT70V916/59L/59L
  - Active: 450mW (typ.)
  - Standby: 1.5mW (typ.)
- ♦ Flow-Through or Pipelined output mode on either port via the  $\overline{\text{FT}}/\text{PIPE}$  pins
- ♦ Counter enable and reset features
- ♦ Dual chip enables allow for depth expansion without additional logic

- ♦ Full synchronous operation on both ports
  - 3.5ns setup to clock and 0ns hold on all control, data, and address inputs
  - Data input, address, and control registers
  - Fast 6.5ns clock to data out in the Pipelined output mode
  - Self-timed write allows fast cycle time
  - 10ns cycle time, 100MHz operation in Pipelined output mode
- ♦ Separate upper-byte and lower-byte controls for multiplexed bus and bus matching compatibility
- ♦ LVTTTL-compatible, single 3.3V ( $\pm 0.3\text{V}$ ) power supply
- ♦ Industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ) is available for 83 MHz
- ♦ Available in a 100-pin Thin Quad Flatpack (TQFP) and 100-pin fine pitch Ball Grid Array (fpBGA) packages.

## Functional Block Diagram

## NOTE:

1.  $\text{A}_{13}$  is a NC for IDT70V9159.

**JUNE 2015**

## Description:

The IDT70V9169/59 is a high-speed 16/8K x 9 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times.

With an input data register, the IDT70V9169/59 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by  $\overline{CE}0$  and  $CE1$ , permits the on-chip circuitry of each port to enter a very low standby power mode. Fabricated using CMOS high-performance technology, these devices typically operate on only 450mW of power.

## Pin Configurations<sup>(1,2,3,4)</sup>

### NOTES:

1. A13 is a NC for IDT70V9159.
2. All VDD pins must be connected to power supply.
3. All VSS pins must be connected to ground supply.
4. Package body is approximately 14mm x 14mm x 1.4mm.
5. This package code is used to reference the package diagram.
6. This text does not indicate orientation of the actual part-marking.

| X                | An                        | An + 1                | ↑   | H                       | L <sup>(5)</sup>          | H                         | D <sub>IO</sub> (n+1) | Counter Enabled—Internal Address generation               |
| X                | An + 1                    | An + 1                | ↑   | H                       | H                         | H                         | D <sub>IO</sub> (n+1) | External Address Blocked—Counter disabled (An + 1 reused) |
| X                | X                         | A0                    | ↑   | X                       | X                         | L <sup>(4)</sup>          | D <sub>IO</sub> (0)   | Counter Reset to Address 0                                |

5655 tbl 03

**NOTES:**

- "H" = V<sub>IH</sub>, "L" = V<sub>IL</sub>, "X" = Don't Care.
- $\overline{\text{CE0}}$ ,  $\overline{\text{LB}}$ ,  $\overline{\text{UB}}$ , and  $\overline{\text{OE}}$  = V<sub>IL</sub>;  $\overline{\text{CE1}}$  and  $\overline{\text{RW}}$  = V<sub>IH</sub>.
- Outputs configured in Flow-Through Output mode: if outputs are in Pipelined mode the data out will be delayed by one cycle.
- $\overline{\text{ADS}}$  and  $\overline{\text{CNRST}}$  are independent of all other signals including  $\overline{\text{CE0}}$ ,  $\overline{\text{CE1}}$ ,  $\overline{\text{UB}}$  and  $\overline{\text{LB}}$ .
- The address counter advances if  $\overline{\text{CNTEN}}$  = V<sub>IL</sub> on the rising edge of CLK, regardless of all other signals including  $\overline{\text{CE0}}$ ,  $\overline{\text{CE1}}$ ,  $\overline{\text{UB}}$  and  $\overline{\text{LB}}$ .

**Recommended Operating Temperature and Supply Voltage**

| Grade      | Ambient Temperature <sup>(1)</sup> | GND | V <sub>DD</sub> |
|------------|------------------------------------|-----|-----------------|
| Commercial | 0°C to +70°C                       | 0V  | 3.3V ± 0.3V     |
| Industrial | -40°C to +85°C                     | 0V  | 3.3V ± 0.3V     |

5655 tbl 04

**NOTES:**

- This is the parameter T<sub>A</sub>. This is the "instant on" case temperature.

**Recommended DC Operating Conditions**

| Symbol          | Parameter          | Min.                | Typ. | Max.                                 | Unit |
|-----------------|--------------------|---------------------|------|--------------------------------------|------|
| V <sub>DD</sub> | Supply Voltage     | 3.0                 | 3.3  | 3.6                                  | V    |
| V <sub>SS</sub> | Ground             | 0                   | 0    | 0                                    | V    |
| V <sub>IH</sub> | Input High Voltage | 2.0                 | —    | V <sub>DD</sub> +0.3V <sup>(2)</sup> | V    |
| V <sub>IL</sub> | Input Low Voltage  | -0.3 <sup>(1)</sup> | —    | 0.8                                  | V    |

5655 tbl 05

**NOTES:**

- V<sub>IL</sub> ≥ -1.5V for pulse width less than 10 ns.
- V<sub>TERM</sub> must not exceed V<sub>DD</sub>+0.3V.

**Absolute Maximum Ratings<sup>(1)</sup>**

| Symbol                           | Rating                               | Commercial & Industrial | Unit |
|----------------------------------|--------------------------------------|-------------------------|------|
| V <sub>TERM</sub> <sup>(2)</sup> | Terminal Voltage with Respect to GND | -0.5 to +4.6            | V    |
| T <sub>BIAS</sub>                | Temperature Under Bias               | -55 to +125             | °C   |
| T <sub>STG</sub>                 | Storage Temperature                  | -65 to +150             | °C   |

5655 tbl 06

**NOTES:**

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>TERM</sub> must not exceed V<sub>DD</sub> +0.3V for more than 25% of the cycle time or 10ns maximum, and is limited to ≤ 20mA for the period of V<sub>TERM</sub> ≥ V<sub>DD</sub> + 0.3V.

**Capacitance<sup>(1)</sup>**(T<sub>A</sub> = +25°C, f = 1.0MHz)

| Symbol                          | Parameter          | Conditions <sup>(2)</sup> | Max. | Unit |
|---------------------------------|--------------------|---------------------------|------|------|
| C <sub>IN</sub>                 | Input Capacitance  | V <sub>IN</sub> = 3dV     | 9    | pF   |
| C <sub>OUT</sub> <sup>(3)</sup> | Output Capacitance | V <sub>OUT</sub> = 3dV    | 10   | pF   |

5655 tbl 07

**NOTES:**

- These parameters are determined by device characterization, but are not production tested.
- 3dV references the interpolated capacitance when the input and output switch from 0V to 3V or from 3V to 0V.
- C<sub>OUT</sub> also references C<sub>I/O</sub>.

5655 tbl 09

### NOTES:

- At  $f = f_{MAX}$ , address and control lines (except Output Enable) are cycling at the maximum frequency clock cycle of  $1/t_{CYC}$ , using "AC TEST CONDITIONS" at input levels of GND to 3V.
- $f = 0$  means no address, clock, or control lines change. Applies only to input at CMOS level standby.
- Port "A" may be either left or right port. Port "B" is the opposite from port "A".
- $V_{DD} = 3.3V, T_A = 25^\circ C$  for Typ, and are not production tested.  $I_{CCDC}(f=0) = 90mA$  (Typ).
- $\overline{CE}_X = V_{IL}$  means  $\overline{CE}_{0X} = V_{IL}$  and  $CE_{1X} = V_{IH}$   
 $\overline{CE}_X = V_{IH}$  means  $\overline{CE}_{0X} = V_{IH}$  or  $CE_{1X} = V_{IL}$   
 $\overline{CE}_X \leq 0.2V$  means  $\overline{CE}_{0X} \leq 0.2V$  and  $CE_{1X} \geq V_{DD} - 0.2V$   
 $\overline{CE}_X \geq V_{DD} - 0.2V$  means  $\overline{CE}_{0X} \geq V_{DD} - 0.2V$  or  $CE_{1X} \leq 0.2V$   
 "X" represents "L" for left port or "R" for right port.

## AC Test Conditions

**NOTES:**

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2). This parameter is guaranteed by device characterization, but is not production tested.
2. The Pipelined output parameters (t<sub>CYC2</sub>, t<sub>CD2</sub>) apply to either or both the Left and Right ports when  $\overline{FT}/PIPE = V_{IH}$ . Flow-through parameters (t<sub>CYC1</sub>, t<sub>CD1</sub>) apply when  $\overline{FT}/PIPE = V_{IL}$  for that port.
3. All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ( $\overline{OE}$ ),  $\overline{FT}/PIPE_R$ , and  $\overline{FT}/PIPE_L$ .

## Timing Waveform of Read Cycle for Flow-Through Output ( $\overline{\text{FT}}/\text{PIPE}^{\text{X}} = \text{V}_{\text{IL}}$ )<sup>(3,6)</sup>

## Timing Waveform of Read Cycle for Pipelined Operation ( $\overline{\text{FT}}/\text{PIPE}^{\text{X}} = \text{V}_{\text{IH}}$ )<sup>(3,6)</sup>

5655 drw 08

### NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2.  $\overline{\text{OE}}$  is asynchronously controlled; all other inputs are synchronous to the rising clock edge.
3.  $\overline{\text{ADS}} = \text{V}_{\text{IL}}$ ,  $\overline{\text{CNTEN}} = \text{V}_{\text{IL}}$  and  $\overline{\text{CNTRST}} = \text{V}_{\text{IH}}$ .
4. The output is disabled (High-Impedance state) by  $\overline{\text{CE0}} = \text{V}_{\text{IH}}$ ,  $\text{CE1} = \text{V}_{\text{IL}}$  following the next rising edge of the clock. Refer to Truth Table 1.
5. Addresses do not have to be accessed sequentially since  $\overline{\text{ADS}} = \text{V}_{\text{IL}}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
6. 'X' here denotes Left or Right port. The diagram is with respect to that port.

## Timing Waveform of a Bank Select Pipelined Read<sup>(1,2)</sup>

5655 drw 09

## Timing Waveform with Port-to-Port Flow-Through Read<sup>(4,5,7)</sup>

5655 drw 10

### NOTES:

1. B1 Represents Bank #1; B2 Represents Bank #2. Each Bank consists of one IDT70V9169/59L for this waveform, and are setup for depth expansion in this example. ADDRESS(B1) = ADDRESS(B2) in this situation.
2.  $\overline{OE}$  and  $\overline{ADS} = V_{IL}$ ;  $CE_1(B1)$ ,  $CE_1(B2)$ ,  $R/\overline{W}$ ,  $\overline{CNTEN}$ , and  $\overline{CNTRST} = V_{IH}$ .
3. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
4.  $CE_0$  and  $\overline{ADS} = V_{IL}$ ;  $CE_1$ ,  $\overline{CNTEN}$ , and  $\overline{CNTRST} = V_{IH}$ .
5.  $\overline{OE} = V_{IL}$  for the Right Port, which is being read from.  $\overline{OE} = V_{IH}$  for the Left Port, which is being written to.
6. If  $t_{CCS} \leq$  maximum specified, then data from right port READ is not valid until the maximum specified for  $t_{CWD}$ . If  $t_{CCS} >$  maximum specified, then data from right port READ is not valid until  $t_{CCS} + t_{CD1}$ .  $t_{CWD}$  does not apply in this case.
7. All timing is the same for both Left and Right ports. Port "A" may be either Left or Right port. Port "B" is the opposite from Port "A".

## Timing Waveform of Pipelined Read-to-Write-to-Read ( $\overline{OE} = V_{IL}$ )<sup>(3)</sup>

5655 drw 11

## Timing Waveform of Pipelined Read-to-Write-to-Read ( $\overline{OE}$ Controlled)<sup>(3)</sup>

5655 drw 12

### NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
3.  $\overline{CE0}$  and  $\overline{ADS} = V_{IL}$ ;  $\overline{CE1}$ ,  $\overline{CNTEN}$ , and  $\overline{CNTRST} = V_{IH}$ . "NOP" is "No Operation".
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

### Timing Waveform of Flow-Through Read-to-Write-to-Read ( $\overline{OE} = V_{IL}$ )<sup>(3)</sup>

### Timing Waveform of Flow-Through Read-to-Write-to-Read ( $\overline{\text{OE}}$ Controlled)<sup>(3)</sup>

**NOTES:**

1. Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2).
2. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
3.  $\overline{CE0}$  and  $\overline{ADS} = V_{IL}$ ;  $\overline{CE1}$ ,  $\overline{CNTEN}$ , and  $\overline{CNRST} = V_{IH}$ . "NOP" is "No Operation".
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. "NOP" is "No Operation." Data in memory at the selected address may be corrupted and should be re-written to guarantee data integrity.

## Timing Waveform of Pipelined Read with Address Counter Advance<sup>(1)</sup>

## Timing Waveform of Flow-Through Read with Address Counter Advance<sup>(1)</sup>

### NOTES:

1.  $\overline{CE_0}$  and  $\overline{OE} = V_{IL}$ ;  $\overline{CE_1}$ ,  $R/\overline{W}$ , and  $\overline{CNTRST} = V_{IH}$ .
2. If there is no address change via  $\overline{ADS} = V_{IL}$  (loading a new address) or  $\overline{CNTEN} = V_{IL}$  (advancing the address), i.e.  $\overline{ADS} = V_{IH}$  and  $\overline{CNTEN} = V_{IH}$ , then the data output remains constant for subsequent clocks.

## Timing Waveform of Write with Address Counter Advance (Flow-Through or Pipelined Outputs)<sup>(1)</sup>

## Timing Waveform of Counter Reset (Pipelined Outputs)<sup>(2)</sup>

### NOTES:

1.  $\overline{CE_0}$  and  $R/\overline{W} = V_{IL}$ ;  $\overline{CE_1}$  and  $\overline{CNTRST} = V_{IH}$ .
2.  $\overline{CE_0} = V_{IL}$ ;  $\overline{CE_1} = V_{IH}$ .
3. The "Internal Address" is equal to the "External Address" when  $\overline{ADS} = V_{IL}$  and equals the counter output when  $\overline{ADS} = V_{IH}$ .
4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.
5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.
6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle. ADDR<sub>0</sub> will be accessed. Extra cycles are shown here simply for clarification.
7.  $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An + 1'. The transition shown indicates the time required for the counter to advance. The 'An + 1' Address is written to during this cycle.

## Functional Description

The IDT70V9169/59 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

$\overline{CE}_0 = V_{IL}$  and  $CE_1 = V_{IH}$  for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70V9169/59's for depth expansion configurations. When the Pipelined output mode is enabled, two cycles are required with  $\overline{CE}_0 = V_{IL}$  and  $CE_1 = V_{IH}$  to re-activate the outputs.

## Depth and Width Expansion

The IDT70V9169/59 features dual chip enables (refer to Truth Table I) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70V9169/59 can also be used in applications requiring expanded width, as indicated in Figure 4. Since the banks are allocated at the discretion of the user, the external controller can be set up to drive the input signals for the various devices as required to allow for 36-bit or wider applications.

Figure 4. Depth and Width Expansion with IDT70V9169/59L

**NOTE:**

1.  $A_{14}$  is for IDT70V9169,  $A_{13}$  is for IDT70V9159.
