

GENERAL DESCRIPTION

The 86004 is a high performance 1:4 LVCMOS/LVTTL Clock Buffer. The 86004 has a fully integrated PLL and can be configured as zero delay buffer and has an input and output frequency range of 15.625MHz to 62.5MHz. The VCO operates at a frequency range of 250MHz to 500MHz. The external feedback allows the device to achieve “zero delay” between the input clock and the output clocks. The PLL_SEL pin can be used to bypass the PLL for system test and debug purposes. In bypass mode, the reference clock is routed around the PLL and into the internal output divider.

POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. The 86004 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL. V_{DD} , V_{DDA} , and V_{DDO} should be individually connected to the power supply plane through vias, and bypass capacitors should be used for each pin. To achieve optimum jitter performance, power supply isolation is required. *Figure 1* illustrates how a 10Ω resistor along with a $10\mu F$ and a $.01\mu F$ bypass capacitor should be connected to each V_{DDA} .

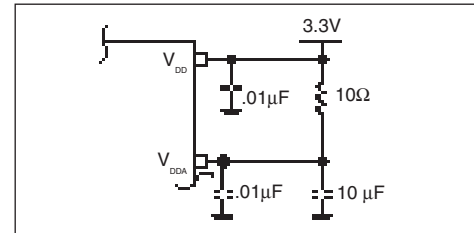

FIGURE 1. POWER SUPPLY FILTERING

RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

INPUTS:

LVCNOS CONTROL PINS:

All control pins have internal pull-ups or pull-downs; additional resistance is not required but can be added for additional protection. A $1k\Omega$ resistor can be used.

OUTPUTS:

LVCNOS OUTPUT:

All unused LVCNOS output can be left floating. We recommend that there is no trace attached.

SCHEMATIC EXAMPLE

Figure 2 shows a schematic example of using an 86004. It is recommended to have one decouple capacitor per power pin. Each decoupling capacitor should be located as close as possible to the

power pin. The low pass filter R7, C11 and C16 for clean analog supply should also be located as close to the V_{DDA} pin as possible.
