4-output 1.8V PCIe Gen1-2-3 Zero-delay/Fanout Buffer (ZDB/FOB)

DATASHEET

Description

The 9DBV0431 is a member of IDT's SOC-Friendly 1.8V Very-Low-Power (VLP) PCIe family. It can also be used for 50M or 125M Ethernet Applications via software frequency selection. The device has 4 output enables for clock management, and 3 selectable SMBus addresses.

Recommended Application

1.8V PCIe Gen1-2-3 Zero-Delay/Fan-out Buffer (ZDB/FOB)

Output Features

• 4 - 1-200Hz Low-Power (LP) HCSL DIF pairs w/Zo=100ohms

Key Specifications

- DIF cycle-to-cycle jitter <50ps
- DIF output-to-output skew <50ps
- DIF additive phase jitter is <100fs rms for PCle Gen3
- DIF additive phase jitter <300fs rms for 12k-20MHz

Features/Benefits

- LP-HCSL outputs save 8 resistors; minimal board space and BOM cost
- 53mW typical power consumption in PLL mode; minimal power consumption
- OE# pins; support DIF power management
- HCSL compatible differential input; can be driven by common clock sources
- Programmable Slew rate for each output; allows tuning for various line lengths
- Programmable output amplitude; allows tuning for various application environments
- Pin/software selectable PLL bandwidth and PLL Bypass; minimize phase jitter for each application
- Outputs blocked until PLL is locked; clean system start-up
- Software selectable 50MHz or 125MHz PLL operation; useful for Ethernet applications
- Configuration can be accomplished with strapping pins; SMBus interface not required for device control
- 3.3V tolerant SMBus interface works with legacy controllers
- Space saving 32-pin 5x5mm VFQFPN; minimal board space
- Selectable SMBus addresses; multiple devices can easily share an SMBus segment

Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 9DBV0431. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

² Measured from differential waveform

³ Slew rate is measured through the Vswing voltage range centered around differential 0V. This results in a +/-150mV window around differential 0V.

⁴ Matching applies to rising edge rate for Clock and falling edge rate for Clock#. It is measured using a +/-75mV window centered on the average cross point where Clock rising meets Clock# falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations.

⁵ Vcross is defined as voltage where Clock = Clock# measured on a component test board and only applies to the differential rising edge (i.e. Clock rising and Clock# falling).

⁶ The total variation of all Vcross measurements in any particular system. Note that this is a subset of Vcross_min/max (Vcross absolute) allowed. The intent is to limit Vcross induced modulation by setting Δ -Vcross to be smaller than Vcross absolute.

⁷ At default SMBus settings.

² Input clock stopped, and CKPWRGD_PD# pin low.

² Measured from differential waveform

³ Duty cycle distortion is the difference in duty cycle between the output and the input clock when the device is operated in bypass mode.

⁴ All outputs at default slew rate

⁵ The MIN/TYP/MAX values of each BW setting track each other, i.e., Low BW MAX will never occur with Hi BW MIN.

² See http://www.pcisig.com for complete specs

³ Sample size of at least 100K cycles. This figures extrapolates to 108ps pk-pk @ 1M cycles for a BER of 1-12.

⁴ For RMS figures, additive jitter is calculated by solving the following equation: Additive jitter = SQRT[(total jitter)^2 - (input jitter)^2]

⁵ Driven by 9FGV0831 or equivalent

⁶ Driven by Rohde&Schwarz SMA100

- IDT clock will send the data byte count = X
- IDT clock sends Byte N+X-1
- IDT clock sends Byte 0 through Byte X (if X_(H) was written to Byte 8)
- Controller (host) will need to acknowledge each byte
- Controller (host) will send a not acknowledge bit
- Controller (host) will send a stop bit

Marking Diagrams

Notes:

- 1. "LOT" is the lot sequence number.
- 2. "COO" denotes country of origin.
- 3. YYWW is the last two digits of the year and week that the part was assembled.
- 4. Line 2: truncated part number
- 5. "L" denotes RoHS compliant package.
- 6. "I" denotes industrial temperature range device.

Revision History

| Rev. | Initiator | Issue Date | Description | Page # |
|------|-----------|------------|---|--------------------------|
| A | RDW | 8/13/2012 | Removed "Differential" from DS title and Recommended Application, corrected typo's in Description. Corrected spelling error in pullup/pulldown text under pinout Updated all electrical tables and added "Industry Limit" column to "Phase Jitter Parameters". Updated Byte3[0] to be consistent with Byte 2. Updated Byte6[7:6] definition. Added thermal data to page 12. Added NLG32 to "Package Outline and Package Dimensions" on page 13. Move to final | 1,2,5- 8,10, 12,13 |
| В | RDW | 2/28/2013 | 1. "Input/Supply/Common Parameters" table modified as follows: a. Updated Single-ended input logic thresholds to include missing mid-level on tri-level inputs. Adjusted logic thresholds as follows: i. Changed VIH min. from 0.65*VDD to 0.75*VDD ii. Changed VIL max. from 0.35*VDD to 0.25*VDD iii. Added missing mid-level input voltage spec (VIM) of 0.4*VDD to 0.6*VDD. iv. Clarified conditions for these specifications, accordingly. b. Clarified the operating conditions and voltages of the SMBus to make it clear that the SMBus operates at <3.3V by addition of footnotes 4 and 5 to "Input/Supply/Common Parameters" table. 2. Slight modifications of Slew Rates and typical values in the "DIF 0.7V Low Power Differential Outputs" table. 3. "Current Consumption" table modifed as follows: a. Overall current consumption values lowered b. VDDA is now grouped with VDD1.8 instead of VDDR c. Added separate current specs for PLL bypass mode. d. Clarified that CKPWRDG_PD# is low for power down current. 4. "Output Duty Cycle, Jitter, Skew and PLL Characterisitics" table modifed as follows: a. Bypass mode Input-to-Output skew changed from 3000 to 4500ps to 2550 to 4200ps. Typical value reduced from 3500ps to 3370ps. b. Separate Output-to-Output skew spec added for Industrial temp. c. Additive cycle-to-cycle jitter spec reduced to 1ps max. 5. "Phase Jitter Parameters" modifed as follows: a. Corrected typo in PLL Mode conditions for tjPHSGMII. Frequency integration range is 1.5MHz to 10MHz. Bypass mode conditions were correct. | 5-8 |
| С | RDW | 11/26/2014 | 1. Updated front page text for consistency and updated block diagram resistor colors to highlight internal resistors. 2. Updated max frequency of 100MHz PLL mode from 110MHz to 140MHz 3. Updated max frequency of 125MHz PLL mode from 137.5MHz to 175MHz 4. Updated max frequency of 50MHz PLL mode from 55MHz to 65MHz 5. Updated Key Specifications with additive phase jitter. 6. Added additive phase jitter plot to specifications. | Various |
| D | RDW | 4/3/2015 | Updated block diagram with new format showing individual outputs instead of bussed outputs. Updated pin out and pin descriptions to show ePad on package connected to ground. | 1-4 |
| Е | RDW | 4/22/2016 | Updated max frequency of 100MHz PLL mode to 140MHz Updated max frequency of 125MHz PLL mode to 175MHz Updated max frequency of 50MHz PLL mode to 65MHz | 6 |
