ZSPM4141

Ultra-Low-Power Linear Regulator w/ Minimal Quiescent Current Technology

ZMDI[®]
The Analog Mixed Signal Company

Brief Description

The ZSPM4141 is an ultra-low-power linear regulator optimized for minimal quiescent current losses via advanced, proprietary technology. It can improve energy efficiency and reduce heat due to power dissipation because it draws low nA-level quiescent current for light loads, yet it can regulate current loads as high as 200mA. The linear regulated output voltage is factory-configured to an option from 1.2V to 4.2V in 100mV steps. The ZSPM4141 also provides over-current protection.

Features

- Low operating voltage range: 2.5V to 5.5V
- Power-Down Mode for 100pA quiescent current
- Over-current protection 250mA
- Output voltage options of 1.2V to 4.2V in 100mV steps (programmed at manufacturing)

Benefits

- Ultra-low nA operating current with light loads
- Best-in-class quiescent current of 20nA at $I_{LOAD}=0$
- Accurate output regulation

1 ZSPM4141 Characteristics

Important: Stresses beyond those listed under “Absolute Maximum Ratings” (section 1.1) may cause permanent damage to the device. These are stress ratings only. Functional operation of the device at these or any other conditions beyond those indicated under “Recommended Operating Conditions” (section 1.3) is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

1.1. Absolute Maximum Ratings

Over operating free–air temperature range unless otherwise noted. All voltage values are with respect to network ground terminal.

Table 1.1 Absolute Maximum Ratings

Parameter	Symbol	Value	Unit
Maximum input/output on VCC, VOUT, EN, and FB pins		-0.3 to 6.0	V
Electrostatic Discharge – Human Body Model, according to the respective JESD22 JEDEC standard		2	kV
Operating Junction Temperature Range	T _J	-20 to 85	°C
Storage Temperature Range	T _{stg}	-65 to 150	°C
Lead Temperature (soldering, 10 seconds)		260	°C

1.2. Thermal Characteristics

Table 1.2 Thermal Characteristics for 8-pin DFN (2x2) Package

θ_{JA} (°C/W) ¹⁾	θ_{JC} (°C/W) ²⁾
73.1	10.7
1) This assumes a FR4 board only.	
2) This assumes a 1oz. copper JEDEC standard board with thermal vias. See section 6.1 for more information.	

1.3. Recommended Operating Conditions

Table 1.3 Recommended Operating Conditions

Parameter	Symbol	Min	Typ	Max	Unit
Unregulated Supply Input at VCC pin	V _{CC}	2.5		5.5	V
Enable Input (EN pin)	V _{EN}	0		5.0	V
Typical Regulated Supply Output Voltage	V _{OUT}	1.2		4.2	V
Operating Ambient Temperature ¹⁾	T _A	-20		55	°C
Operating Junction Temperature	T _J	-20		85	°C
1) Operating ambient temperature is only intended as a guideline. The operating junction temperature requirements must not be exceeded.

3 Description of Circuit

The ZSPM4141 is an ultra-low-power linear regulator optimized for minimal quiescent current losses via advanced, proprietary technology. It draws low nA-level quiescent current for light loads, yet it can regulate current loads as high as 200mA. The linear regulated output voltage is factory-configured to an option from 1.2V to 4.2V in 100mV steps. The ZSPM4141 also provides over-current protection (see Table 1.4).

4 Application Circuits

4.1. Selection of External Components

4.1.1. Output Bypass Capacitor C_{OUT}

Connect a bypass capacitor (C_{OUT}) from the VOUT pin to ground. The typical value for C_{OUT} is 2.2 μ F. See Table 1.4 for further specifications.

4.1.2. Input Bypass Capacitor C_{BYP}

Connect a bypass capacitor (C_{BYP}) from the VCC pin to ground. The typical value for C_{OUT} is 0.1 μ F.

6 Layout and Soldering Requirements

To maximize the efficiency of this package for applications on a single layer or multi-layer printed circuit board (PCB), certain guidelines must be followed when laying out this part on the PCB.

6.1. Recommended Landing Pattern for PCBs

Figure 6.1 Recommended Landing Pattern for 8-Pin DFN

6.2. Multi-Layer PCB Layout

The following are guidelines for mounting the exposed pad ZSPM4141 on a multi-layer PCB with ground a plane. In a multi-layer board application, the thermal vias are the primary method of heat transfer from the package thermal pad to the internal ground plane. The efficiency of this method depends on several factors, including die area, number of thermal vias, and thickness of copper, etc.

ZSPM4141

ZMDI[®]

The Analog Mixed Signal Company

Figure 6.2 Package and PCB Land Configuration for Multi-Layer PCB

Figure 6.3 JEDEC Standard FR4 Multi-Layer Board – Cross-Sectional View

Figure 6.4 is a representation of how the heat can be conducted away from the die using an exposed pad package. Each application will have different requirements and limitations, and therefore the user should use sufficient copper to dissipate the power in the system. The output current rating for the linear regulators might need to be de-rated for ambient temperatures above 85°C. The de-rated value will depend on calculated worst case power dissipation and the thermal management implementation in the application.

ZSPM4141

Ultra-Low-Power Linear Regulator w/ Minimal Quiescent Current Technology

ZMDI

The Analog Mixed Signal Company

Figure 6.4 Conducting Heat Away from the Die using an Exposed Pad Package

6.3. Single-Layer PCB Layout

Layout recommendation for a single-layer PCB: utilize as much copper area for power management as possible. In a single-layer board application, the thermal pad is attached to a heat spreader (copper areas) by using a low thermal impedance attachment method (solder paste or thermal conductive epoxy).

In both of the methods mentioned above, it is advisable to use as much copper trace as possible to dissipate the heat.

Figure 6.5 Application Using a Single-Layer PCB

Important: If the attachment method is NOT implemented correctly, the functionality of the product is not guaranteed. Power dissipation capability will be adversely affected if the device is incorrectly mounted onto the circuit board.
