MAX22500E/MAX22501E

100Mbps Half-Duplex RS-485/RS-422 Transceivers for Long Cables

General Description

The MAX22500E/MAX22501E half-duplex ESD-protected RS-485/RS-422 transceivers are optimized for high-speed (up to 100Mbps) communication over long cables. These transceivers feature integrated hot-swap protection and a fail-safe receiver, ensuring a logic-high on the receiver output when input signals are shorted or open for longer than 10 μ s (typ).

The MAX22500E features integrated preemphasis circuitry that extends the distance and increases the data rate of reliable communication by reducing inter-symbol interference (ISI) caused by long cables. The MAX22500E features a flexible logic interface down to 1.6V.

The MAX22501E operates without preemphasis and is powered from a 3V to 5.5V supply.

The MAX22500E is available in a 10-pin TDFN-EP package. The MAX22501E is available in a 8-pin TDFN-EP package.

Both transceivers operate over the -40°C to +125°C ambient temperature range.

Applications

- Motion Control
- Encoder Interfaces
- Field Bus Networks
- Industrial Control Systems
- Backplane Busses

Benefits and Features

- High-Speed Operation Over Long Distances
 - Up to 100Mbps Data Rate
 - Integrated Preemphasis Extends Cable Length (MAX22500E)
 - High Receiver Sensitivity
 - Wide Receiver Bandwidth
 - Symmetrical Receiver Thresholds
- Integrated Protection Increases Robustness
 - -15V to +15V Common Mode Range
 - ± 15 kV ESD Protection (Human Body Model)
 - ± 7 kV IEC 61000-4-2 Air-Gap ESD Protection
 - ± 6 kV IEC 61000-4-2 Contact Discharge ESD Protection
 - Driver Outputs are Short-Circuit Protected
- Flexibility for Many Different Applications
 - 3V to 5.5V Supply Range
 - Low Voltage Logic Supply Down to 1.6V (MAX22500E)
 - Low 5 μ A (max) Shutdown Current
 - Available in 8-pin or 10-pin TDFN Package
 - -40°C to +125°C Operating Temperature Range

Ordering Information appears at end of data sheet.

Simplified Block Diagram

Absolute Maximum Ratings

V_{CC}	-0.3 V to +6 V
$\overline{RE}$, DE, DI, VL	-0.3 V to +6 V
RO (MAX22500E only).....	-0.3 V to ($V_L + 0.3$) V
RO (MAX22501E only).....	-0.3V to ($V_{CC} + 0.3$)V
PSET	-0.3 V to ($V_{CC}+0.3$) V
A, B.....	-15V to +15V
Short-Circuit Duration (RO, A, B) to GND	Continuous
Continuous Power Dissipation ($T_A = +70^\circ\text{C}$) (8-Pin TDFN (derate 24.4mW/°C above +70°C))	1951mW

Continuous Power Dissipation ($T_A = +70^\circ\text{C}$) (10-Pin TDFN (derate 24.4mW/°C above +70°C))	1951mW
Operating Temperature Range	-40°C to +125°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (Soldering 10sec)	+300°C
Reflow Temperature	+270°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Information

TDFN8

PACKAGE CODE	T833-2
Outline Number	21-0137
Land Pattern Number	90-0059
Thermal Resistance, Single-Layer Board:	
Junction to Ambient (θ_{JA})	54°C/W
Junction to Case (θ_{JC})	8°C/W
Thermal Resistance, Four-Layer Board:	
Junction to Ambient (θ_{JA})	41°C/W
Junction to Case (θ_{JC})	8°C/W

TDFN10

PACKAGE CODE	T1033-2
Outline Number	21-0137
Land Pattern Number	90-0061
Thermal Resistance, Single-Layer Board:	
Junction to Ambient (θ_{JA})	54°C/W
Junction to Case (θ_{JC})	9°C/W
Thermal Resistance, Four-Layer Board:	
Junction to Ambient (θ_{JA})	41°C/W
Junction to Case (θ_{JC})	9°C/W

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Electrical Characteristics

Note 1: All devices are 100% production tested at $T_A = +25^{\circ}\text{C}$. Specifications for all temperature limits are guaranteed by design.

Note 2: All currents into the device are positive; all currents out of the device are negative. All voltages are referenced to device ground, unless otherwise noted.

Note 3: V_{ODP} is the differential voltage between A and B during the preemphasis interval on the MAX22500E, and is the differential voltage when preemphasis is disabled. $V_{ODP} = D_{PRE} \times V_{OD}$.

Note 4: ΔV_{ON} and ΔV_{OC} are the changes in V_{ON} and V_{OC} , respectively, when the DI input changes state.

Note 5: Capacitive load includes test probe and fixture capacitance.

Note 6: Not production tested. Guaranteed by design.

Note 7: Shutdown is enabled by driving RE high and DE low. The device is guaranteed to have entered shutdown after t_{SHDN} has elapsed.

Note 8: The timing parameter refers to the driver or receiver enable delay, when the device has exited the initial hot-swap protect state and is in normal operating mode.

Pin Configuration

Pin Description

PIN		NAME	FUNCTION
MAX22500E	MAX22501E		
1	-	V_L	Logic Supply Input. V_L defines the interface logic levels on DE, DI and RO. Apply a voltage between 1.6V to 5.5V to V_L . Bypass V_L to ground with a 0.1 μ F capacitor as close to the device as possible.
2	1	RO	Receiver Output. See the Receiving Function Table for more information.
3	3	DE	Driver Output Enable. Force DE high to enable driver. Pull DE low to three-state the driver output.
4	2	$\overline{RE}$	Receiver Enable. Pull $\overline{RE}$ high to disable and the receiver and tri-state RO. The device is in low-power shutdown when $\overline{RE}$ = high and DE = low.
5	4	DI	Driver Input. See the Transmitting Function Table for more information.
6	-	PSET	Preemphasis Select Control Input. Connect a resistor from PSET to GND to select the preemphasis duration. See the Layout Recommendations in the Applications Information section for more information. To disable preemphasis, connect PSET to GND or V_{CC} .
7	5	GND	Ground
8	6	A	Noninverting Receiver Input/Driver Output
9	7	B	Inverting Receiver Input/Driver Output
10	8	V_{CC}	Supply Input. Bypass V_{CC} to ground with a 0.1 μ F ceramic capacitor as close to the device as possible.

MAX22500E/MAX22501E
100Mbps Half-Duplex RS-485/RS-422 Transceivers for Long Cables

Functional Tables

Transmitting Function Table

INPUTS			OUTPUTS	
$\overline{\text{RE}}$	DE	DI	A	B
X	1	1	1	0
X	1	0	0	1
0	0	X	High Impedance	High Impedance
1	0	X	Shutdown. A and B are high impedance	

X = Don't care

Receiving Function Table

INPUTS				OUTPUTS
$\overline{\text{RE}}$	DE	$(V_A - V_B)$	Time from Last A-B Transition	RO
0	X	$\geq +200\text{mV}$	Always	1
0	X	$-200\text{mV} < (V_A - V_B) < +200\text{mV}$	$< t_{D_FS}$	Indeterminate RO is latched to previous value
0	X	$-50\text{mV} < (V_A - V_B) < +50\text{mV}$	$> t_{D_FS}$	1
0	X	$\leq -200\text{mV}$	Always	0
0	X	Open/Shorted	$> t_{D_FS}$	1
1	1	X	X	High Impedance
1	0	X	X	Shutdown. RO is high impedance

Functional Diagrams

Half-Duplex Application Circuit

Detailed Description

The MAX22500E/MAX22501E ESD-protected RS-485/RS-422 transceivers are optimized for high-speed, half-duplex communications over long cables. Both transceivers feature integrated hot-swap functionality to eliminate false transitions on the driver during power-up or during a hot-plug event. These transceivers also feature fail-safe receiver inputs, guaranteeing a logic-high on the receiver output when inputs are shorted or open for longer than 10 μ s (typ).

Receiver Threshold Voltages

The MAX22500E and MAX22501E receivers feature large threshold hysteresis of 250mV (typ) for increased differential noise rejection.

Additionally, the receivers feature symmetrical threshold voltages. Symmetric thresholds have the advantage that recovered data at the RO output does not have duty cycle distortion. Typically, fail-safe receivers, which have unipolar (non-symmetric) thresholds, show some duty cycle distortion at high signal attenuation due to long cable lengths.

Preemphasis (MAX22500E only)

The MAX22500E features integrated driver preemphasis circuitry, which strongly improves signal integrity at high data rates over long distances by reducing inter-symbol interference (ISI) caused by long cables. Preemphasis is set by connecting a resistor (R_{PSET}) between PSET and ground.

Long cables attenuate the high-frequency content of transmitted signals due to the cable's limited bandwidth. This causes signal/pulse distortion at the receiving end, resulting in ISI. ISI causes jitter in data and clock recovery circuits. ISI can be visualized by considering the following cases: If a series of ones (1's) is transmitted, followed by a zero (0), the transmission-line voltage has risen to a high value by the end of the string of ones. It takes longer for the signal to move toward the '0' state because the starting voltage on the line is so far from the zero crossing. Similarly, if a data pattern has a string of zeros followed by a one and then another zero, the one-to-zero transition starts from a voltage that is much closer to the zero-crossing ($V_A - V_B = 0$) and it takes much less time for the signal to reach the zero crossing.

Preemphasis reduces ISI by boosting the differential signal amplitude at every transition edge, counteracting the high frequency attenuation of the cable. When the DI input changes from a logic-low to a logic-high, the differential output ($V_A - V_B$) is driven high to V_{ODP} . At the end of the preemphasis interval, the differential voltage returns to a lower level (V_{OD}). The preemphasis differential high voltage (V_{ODP}) is typically 1.37 the V_{OD} voltage.

If DI switches back to a logic-low state before the preemphasis interval ends, the differential output switches directly from the 'strong' V_{ODP} high to a 'strong' low ($-V_{ODP}$).

Driver behavior is similar when the DI input changes from a logic-high to a logic-low. When this occurs, the differential output is pulled low to $-V_{ODP}$ until the end of the preemphasis interval, at which point $V_A - V_B = -V_{ODP}$.

Setting the Preemphasis Interval

Connect a resistor (R_{PSET}) between PSET and GND to set the preemphasis time interval on the MAX22500E. An optimum preemphasis interval ranges from 1 to 1.5 unit intervals (bit time). Use the following equation to calculate the resistance needed on PSET to achieve a 1.2 preemphasis interval:

$$R_{PSET} = 400 \times 10^9 / DR$$

where DR is the data rate and 1Mbps $\leq$ DR $\leq$ 100Mbps.

Preemphasis only minimally degrades the jitter on the eye diagram when using short cables, making it reasonable to permanently enable preemphasis on systems where cable lengths may vary or change. [Figure 10](#) and [Figure 11](#) are eye diagrams taken at 100Mbps over a 10m Cat-5e cable. Note that the eye varies only slightly as preemphasis is enabled or disabled.

[Figure 12](#) and [Figure 13](#) show the driver eye diagrams over a long cable length. The MAX22500E was used as the driver and the eye diagrams were taken at the receiver input after a length of 100m Cat-5e cable. [Figure 12](#) shows the signal at the receiver when the driver preemphasis is disabled. [Figure 13](#) shows the receiver signal when preemphasis is enabled.

Fail-Safe Functionality

The MAX22500E/MAX22501E feature fail-safe receiver inputs, guaranteeing a logic-high on the receiver output (RO) when the receiver inputs are shorted or open for longer than 10 μ s (typ). When the differential receiver input voltage is greater than -50mV [$(V_A - V_B) \geq -50\text{mV}$] for more than 10 μ s (typ), RO is logic-high. For example, in the case of a terminated bus with all transmitters disabled, the receiver's differential input voltage is pulled to 0V by the termination resistor, so $(V_A - V_B = 0\text{V}) > -50\text{mV}$ and RO is guaranteed to be a logic-high after 10 μ s (typ).

Driver Single-Ended Operation

The A and B outputs on the MAX22500E/MAX22501E can be used in the standard differential operating mode or as single-ended outputs. Because the driver outputs swing rail-to-rail, they can also be used as individual standard TTL logic outputs.

Figure 10: Eye Diagram, 100Mbps Over 10m Cat-5e Cable, Preemphasis Disabled

Figure 11: Eye Diagram, 100Mbps Over 10m Cat-5e Cable, Preemphasis Enabled

Figure 12: Eye Diagram, 50Mbps Over 100m Cat-5e Cable, Preemphasis Disabled

Figure 13: Eye Diagram, 50Mbps Over 100m Cat-5e Cable, Preemphasis Enabled

Hot-Swap Capability

The DE and $\overline{\text{RE}}$ enable inputs feature hot-swap functionality. At each input there are two NMOS devices, M1 and M2 (Figure 14). When V_{CC} ramps from zero, an internal 10ms timer turns on M2 and sets the SR latch, which also turns on M1. Transistors M2 (a 500 μA current sink) and M1 (a 100 μA current sink) pull DE to GND through a 5k Ω resistor. M2 is designed to pull DE to the disabled state against an external parasitic capacitance up to 100pF that can drive DE high. After 10 μs , the timer deactivates M2 while M1 remains on, holding DE low against three-state leakages that can drive DE high. M1 remains on until an external source overcomes the required input current. At this time, the SR latch resets and M1 turns off. When M1 turns off, DE reverts to a standard, high-impedance CMOS input. Whenever V_{CC} drops below 1V, the hot-swap input is reset. There is a complimentary circuit for $\overline{\text{RE}}$ that uses two PMOS devices to pull $\overline{\text{RE}}$ to V_{CC} .

Driver Output Protection

Two mechanisms prevent excessive output current and power dissipation caused by faults or by bus contention. The first, a current limit on the output stage provides immediate protection against short circuits over the whole common-mode voltage range. The second, a thermal-shutdown circuit, forces the driver outputs into a high-impedance state if the die temperature exceeds +160°C (typ).

Low-Power Shutdown Mode

The MAX22500E/MAX22501E feature a low-power shutdown mode to reduce supply current when the transceiver

is not needed. Pull the $\overline{\text{RE}}$ input high and the DE input low to put the device in low-power shutdown mode. If the inputs are in this state for at least 800ns, the parts are guaranteed to enter shutdown. The MAX22500E/MAX22501E draw 5 μA (max) of supply current when the device is in shutdown.

The $\overline{\text{RE}}$ and DE inputs can be driven simultaneously. The MAX22500E/MAX22501E are guaranteed not to enter shutdown if $\overline{\text{RE}}$ is high and DE is low for less than 50ns.

Applications Information

Layout Recommendations

Ensure that the preemphasis set resistor (R_{PSET}) is located close to the PSET and GND pins in order to minimize interference by other signals. Minimize the trace length to the PSET resistor. Additionally, place a ground plane under R_{PSET} and surround it with ground connections/traces to minimize interference from the A and B switching signals. See Figure 15.

Network Topology

The MAX22500E/MAX22501E transceivers are designed for high-speed bidirectional RS-485/RS-422 data communications. Multidrop networks can cause impedance discontinuities which affect signal integrity. Maxim recommends using a point-to-point network topology (Figure 16), instead of a multidrop topology, when communicating with high data rates. Terminate the transmission line at both ends with the cable's characteristic impedance to reduce reflections.
