Jameco Part Number 1848273

CAT93C46

1-Kb Microwire Serial EEPROM

FEATURES

- High speed operation: 2MHz
- 1.8V to 5.5V supply voltage range
- Selectable x8 or x16 memory organization
- Self-timed write cycle with auto-clear
- Software write protection
- Power-up inadvertant write protection
- Low power CMOS technology
- 1,000,000 Program/erase cycles
- 100 year data retention
- Industrial temperature ranges
- RoHS-compliant 8-pin PDIP, SOIC, TSSOP and 8-pad TDFN packages

DESCRIPTION

The CAT93C46 is a 1K-bit Serial EEPROM memory device which is configured as either 64 registers of 16 bits (ORG pin at V_{CC}) or 128 registers of 8 bits (ORG pin at GND). Each register can be written (or read) serially by using the DI (or DO) pin. The CAT93C46 features a self-timed internal write with auto-clear. On-chip Power-On Reset circuit protects the internal logic against powering up in the wrong state.

For Ordering Information details, see page 13.

PIN CONFIGURATION

PDIP (L) SOIC (V, X) TSSOP (Y) TDFN (VP2)				SOIC (W)			
CS	1	8	V _{CC}	NC	1	8	ORG
SK	2	7	NC	V _{CC}	2	7	GND
DI	3	6	ORG	CS	3	6	DO
DO	4	5	GND	SK	4	5	DI

FUNCTIONAL SYMBOL

PIN FUNCTIONS

Pin Name	Function
CS	Chip Select
SK	Clock Input
DI	Serial Data Input
DO	Serial Data Output
V _{CC}	Power Supply
GND	Ground
ORG	Memory Organization
NC	No Connection

Note: When the ORG pin is connected to V_{CC}, the x16 organization is selected. When it is connected to ground, the x8 organization is selected. If the ORG pin is left unconnected, then an internal pullup device will select the x16 organization.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Storage Temperature	-65°C to +150°C
Voltage on Any Pin with Respect to Ground ⁽²⁾	-0.5 V to +6.5 V

RELIABILITY CHARACTERISTICS⁽³⁾

Symbol	Parameter	Min	Units
N _{END} ⁽⁴⁾	Endurance	1,000,000	Program/ Erase Cycles
T _{DR}	Data Retention	100	Years

D.C. OPERATING CHARACTERISTICS

V_{CC} = +1.8V to +5.5V, T_A = -40°C to +85°C, unless otherwise specified.

Symbol	Parameter	Test Conditions	Min	Max	Units
I _{CC1}	Power Supply Current (Write)	f _{SK} = 1MHz V _{CC} = 5.0V		1	mA
I _{CC2}	Power Supply Current (Read)	f _{SK} = 1MHz V _{CC} = 5.0V		500	μA
I _{SB1}	Power Supply Current (Standby) (x8 Mode)	V _{IN} =GND or V _{CC} , CS =GND ORG=GND		2	μA
I _{SB2}	Power Supply Current (Standby) (x16Mode)	V _{IN} =GND or V _{CC} , CS =GND ORG=Float or V _{CC}		1	μA
I _{LI}	Input Leakage Current	V _{IN} = GND to V _{CC}		1	μA
I _{LO}	Output Leakage Current	V _{OUT} = GND to V _{CC} , CS = GND		1	μA
V _{IL1}	Input Low Voltage	4.5V ≤ V _{CC} < 5.5V	-0.1	0.8	V
V _{IH1}	Input High Voltage	4.5V ≤ V _{CC} < 5.5V	2	V _{CC} + 1	V
V _{IL2}	Input Low Voltage	1.8V ≤ V _{CC} < 4.5V	0	V _{CC} × 0.2	V
V _{IH2}	Input High Voltage	1.8V ≤ V _{CC} < 4.5V	V _{CC} × 0.7	V _{CC} +1	V
V _{OL1}	Output Low Voltage	4.5V ≤ V _{CC} < 5.5V I _{OL} = 2.1mA		0.4	V
V _{OH1}	Output High Voltage	4.5V ≤ V _{CC} < 5.5V I _{OH} = -400μA	2.4		V
V _{OL2}	Output Low Voltage	1.8V ≤ V _{CC} < 4.5V I _{OL} = 1mA		0.2	V
V _{OH2}	Output High Voltage	1.8V ≤ V _{CC} < 4.5V I _{OH} = -100μA	V _{CC} - 0.2		V

Notes:

- (1) Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions outside of those listed in the operational sections of this specification is not implied. Exposure to any absolute maximum rating for extended periods may affect device performance and reliability.
- (2) The DC input voltage on any pin should not be lower than -0.5V or higher than V_{CC} +0.5V. During transitions, the voltage on any pin may undershoot to no less than -1.5V or overshoot to no more than V_{CC} +1.5V, for periods of less than 20 ns.
- (3) These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.
- (4) Block Mode, V_{CC} = 5V, 25°C

PIN CAPACITANCE
 $T_A = 25^\circ\text{C}$, $f = 1\text{MHz}$, $V_{CC} = 5\text{V}$

Symbol	Test	Conditions	Min	Typ	Max	Units
$C_{OUT}^{(1)}$	Output Capacitance (DO)	$V_{OUT} = 0\text{V}$			5	pF
$C_{IN}^{(1)}$	Input Capacitance (CS, SK, DI, ORG)	$V_{IN} = 0\text{V}$			5	pF

A.C. CHARACTERISTICS⁽²⁾
 $V_{CC} = +1.8\text{V}$ to $+5.5\text{V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$, unless otherwise specified.

Symbol	Parameter	Limits		Units
		Min	Max	
t_{CSS}	CS Setup Time	50		ns
t_{CSH}	CS Hold Time	0		ns
t_{DIS}	DI Setup Time	100		ns
t_{DIH}	DI Hold Time	100		ns
t_{PD1}	Output Delay to 1		0.25	μs
t_{PD0}	Output Delay to 0		0.25	μs
$t_{HZ}^{(1)}$	Output Delay to High-Z		100	ns
t_{EW}	Program/Erase Pulse Width		5	ms
t_{CSMIN}	Minimum CS Low Time	0.25		μs
t_{SKHI}	Minimum SK High Time	0.25		μs
t_{SKLOW}	Minimum SK Low Time	0.25		μs
t_{SV}	Output Delay to Status Valid		0.25	μs
SK_{MAX}	Maximum Clock Frequency	DC	2000	kHz

POWER-UP TIMING ⁽¹⁾⁽³⁾

Symbol	Parameter	Max	Units
t_{PUR}	Power-up to Read Operation	1	ms
t_{PUW}	Power-up to Write Operation	1	ms

NOTES:

- (1) These parameters are tested initially and after a design or process change that affects the parameter according to appropriate AEC-Q100 and JEDEC test methods.
- (2) Test conditions according to "AC Test Conditions" table.
- (3) t_{PUR} and t_{PUW} are the delays required from the time V_{CC} is stable until the specified operation can be initiated.

A.C. TEST CONDITIONS

Input Rise and Fall Times	≤ 50ns	
Input Pulse Voltages	0.4V to 2.4V	4.5V ≤ V _{CC} ≤ 5.5V
Timing Reference Voltages	0.8V, 2.0V	4.5V ≤ V _{CC} ≤ 5.5V
Input Pulse Voltages	0.2V _{CC} to 0.7V _{CC}	1.8V ≤ V _{CC} ≤ 4.5V
Timing Reference Voltages	0.5V _{CC}	1.8V ≤ V _{CC} ≤ 4.5V
Output Load	Current Source I _{OLmax} /I _{OHmax} ; C _L =100pF	

DEVICE OPERATION

The CAT93C46 is a 1024-bit nonvolatile memory intended for use with industry standard microprocessors. The CAT93C46 can be organized as either registers of 16 bits or 8 bits. When organized as X16, seven 9-bit instructions control the reading, writing and erase operations of the device. When organized as X8, seven 10-bit instructions control the reading, writing and erase operations of the device. The CAT93C46 operates on a single power supply and will generate on chip the high voltage required during any write operation.

Instructions, addresses, and write data are clocked into the DI pin on the rising edge of the clock (SK). The DO pin is normally in a high impedance state except when reading data from the device, or when checking the ready/busy status during a write operation. The serial communication protocol follows the timing shown in Figure 1.

The ready/busy status can be determined after the start of internal write cycle by selecting the device (CS high) and polling the DO pin; DO low indicates that the write operation is not completed, while DO high indicates that the device is ready for the next instruction. If necessary, the DO pin may be placed back into a high impedance state during chip select by shifting a dummy "1" into the DI pin. The DO pin will enter the high impedance state on the rising edge of the clock (SK). Placing the DO pin into the high impedance state is recommended in applications where the DI pin and the DO pin are to be tied together to form a common DI/O pin. The Ready/Busy

flag can be disabled only in Ready state; no change is allowed in Busy state.

The format for all instructions sent to the device is a logical "1" start bit, a 2-bit (or 4-bit) opcode, 6-bit address (an additional bit when organized X8) and for write operations a 16-bit data field (8-bit for X8 organization).

Read

Upon receiving a READ command (Figure 2) and an address (clocked into the DI pin), the DO pin of the CAT93C46 will come out of the high impedance state and, after sending an initial dummy zero bit, will begin shifting out the data addressed (MSB first). The output data bits will toggle on the rising edge of the SK clock and are stable after the specified time delay (t_{PD0} or t_{PD1}).

Erase/Write Enable and Disable

The CAT93C46 powers up in the write disable state. Any writing after power-up or after an EWDS (write disable) instruction must first be preceded by the EWEN (write enable) instruction. Once the write instruction is enabled, it will remain enabled until power to the device is removed, or the EWDS instruction is sent. The EWDS instruction can be used to disable all CAT93C46 write and erase instructions, and will prevent any accidental writing or clearing of the device. Data can be read normally from the device regardless of the write enable/disable status. The EWEN and EWDS instructions timing is shown in Figure 3.

INSTRUCTION SET

Instruction	Start Bit	Opcode	Address		Data		Comments
			x8	x16	x8	x16	
READ	1	10	A6-A0	A5-A0			Read Address AN– A0
ERASE	1	11	A6-A0	A5-A0			Clear Address AN– A0
WRITE	1	01	A6-A0	A5-A0	D7-D0	D15-D0	Write Address AN– A0
EWEN	1	00	11XXXXX	11XXXX			Write Enable
EWDS	1	00	00XXXXX	00XXXX			Write Disable
ERAL	1	00	10XXXXX	10XXXX			Clear All Addresses
WRAL	1	00	01XXXXX	01XXXX	D7-D0	D15-D0	Write All Addresses

Figure 1. Synchronous Data Timing

Figure 2. Read Instruction Timing

Figure 3. EWEN/EWDS Instruction Timing

Write

After receiving a WRITE command (Figure 4), address and the data, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking for auto-clear and data store cycles on the memory location specified in the instruction. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C46 can be determined by selecting the device and polling the DO pin. Since this device features Auto-Clear before write, it is NOT necessary to erase a memory location before it is written into.

Erase

Upon receiving an ERASE command and address, the CS (Chip Select) pin must be deasserted for a minimum of t_{CSMIN} (Figure 5). The falling edge of CS will start the self clocking clear cycle of the selected memory location. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C46 can be determined by selecting the device and polling the DO pin. Once cleared, the content of a cleared location returns to a logical "1" state.

Erase All

Upon receiving an ERAL command (Figure 6), the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} . The falling edge of CS will start the self clocking clear cycle of all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C46 can be determined by selecting the device and polling the DO pin. Once cleared, the contents of all memory bits return to a logical "1" state.

Write All

Upon receiving a WRAL command and data, the CS (Chip Select) pin must be deselected for a minimum of t_{CSMIN} (Figure 7). The falling edge of CS will start the self clocking data write to all memory locations in the device. The clocking of the SK pin is not necessary after the device has entered the self clocking mode. The ready/busy status of the CAT93C46 can be determined by selecting the device and polling the DO pin. It is not necessary for all memory locations to be cleared before the WRAL command is executed.

Notes:

1. All dimensions are in millimeters.
2. Complies with JEDEC specification MO-229.

EXAMPLE OF ORDERING INFORMATION

Notes:

- (1) All packages are RoHS-compliant (Lead-free, Halogen-free).
- (2) The standard lead finish for the SOIC, EIAJ (X) package is Matte-Tin; the standard lead finish for all other packages is NiPdAu.
- (3) The device used in the above example is a CAT93C46VI-GT3 (SOIC, JEDEC, Industrial Temperature, NiPdAu, Tape & Reel).
- (4) The SOIC, EIAJ (X) package is available in reels of 2000 pcs/reel (i.e. CAT93C46XI-T2). All other packages are offered in reels of 3000 pcs/reel.
- (5) For additional package and temperature options, please contact your nearest Catalyst Semiconductor Sales office.
