

NCP6922C

4 Channels PMIC with 2 DC-to-DC Converters and 2 LDOs

The NCP6922C integrated circuit is part of the ON Semiconductor mini power management IC family (PMIC). It is optimized to supply battery powered portable application sub-systems such as camera function, microprocessors. This device integrates 2 high efficiency 800 mA Step-down DC-to-DC converters with DVS (Dynamic Voltage Scale) and 2 low dropout (LDO) voltage regulators in a 4x4 mm WQFN package.

Features

- 2 DC-to-DC Converters (3 MHz, 1 μ H / 10 μ F, 800 mA)
 - ◆ Peak Efficiency 95%
 - ◆ Programmable Output Voltage from 0.6 V to 3.3 V by 12.5 mV Steps
- 2 Low Noise – Low Drop Out Regulators (2.2 μ F, 150 mA)
 - ◆ Programmable Output Voltage from 1.0 V to 3.3 V by 50 mV Steps
 - ◆ 50 μ Vrms Typical Low Output Noise
- Control
 - ◆ 400 kHz / 3.4 MHz I²C Compatible
 - ◆ Independent Enable Pins, I²C Enable Control Bits
 - ◆ Power Good Output Pin
 - ◆ Customizable Power Up Sequence
- Extended Input Voltage Range from 2.3 V to 5.5 V
- 82 μ A Low Quiescent Current at No Load
- Less than 7 μ A Sleep Mode Current
- Footprint: 4.0 x 4.0 mm WQFN 0.5 mm Pitch
- These Devices are Pb-Free, Halogen Free/BFR Free and are RoHS Compliant

Typical Applications

- Cellular Phones, Tablets
- Digital Cameras

Figure 3. Pin Out (Top View)

Table 1. PIN FUNCTION DESCRIPTION

Pin	Name	Type	Description
SUPPLY			
10	AVIN	Analog Input	Analog Supply. This pin is the device analog and digital supply. A 1.0 μ F ceramic capacitor or larger must bypass this input to ground. This capacitor should be placed as close as possible to this pin.
21	AGND	Analog Ground	Analog Ground. Analog and digital modules ground. Must be connected to the system ground.
I/O			
9	ENDCDC1	Digital Input	DCDC1 Enable, high level will enable DCDC1; there is internal pull down resistor on this pin.
3	ENDCDC2	Digital Input	DCDC2 Enable, high level will enable DCDC2; there is internal pull down resistor on this pin.
12	ENLDO3	Digital Input	LDO3 Enable, high level will enable LDO 3; there is internal pull down resistor on this pin.
11	ENLDO4	Digital Input	LDO4 Enable, high level will enable LDO 4; there is internal pull down resistor on this pin.
18	SCL	Digital Input	I ² C interface Clock
17	SDA	Digital Input	I ² C interface Data
7	PG	Digital Output	Power Good open drain output.
DC-DC CONVERTERS			
4	PVIN1	Power Input	DCDC1 Power Supply. This pin must be decoupled to ground by a 4.7 μ F ceramic capacitor. This capacitor should be placed as close as possible to this pin.
6	SW1	Power Output	DCDC1 Switch Power. This pin connects the power transistors to one end of the inductor. Typical application uses 1.0 μ H inductor; refer to application section for more information.
8	FB1	Analog Input	DCDC1 Feedback Voltage. This pin is the input to the error amplifier and must be connected to the output capacitor.
5	PGND1	Power Ground	DCDC1 Power Ground. This pin is the power ground and carries the high switching current. A high quality ground must be provided to prevent noise spikes. A local ground plane is recommended to avoid high-density current flow in a limited PCB track.
2	PVIN2	Power Input	DCDC2 Power Supply. This pin must be decoupled to ground by a 4.7 μ F ceramic capacitor. This capacitor should be placed as close as possible to this pin.
20	SW2	Power Output	DCDC2 Switch Power. This pin connects the power transistors to one end of the inductor. Typical application uses 1.0 μ H inductor; refer to application section for more information.
19	FB2	Analog Input	DCDC2 Feedback Voltage. This pin is the input to the error amplifier and must be connected to the output capacitor.
1	PGND2	Power Ground	DCDC2 Power Ground. This pin is the power ground and carries the high switching current. A high quality ground must be provided to prevent noise spikes. A local ground plane is recommended to avoid high-density current flow in a limited PCB track.
LDO REGULATORS			
15	VIN3	Power Input	LDO3 Power Supply
16	VOUT3	Power Output	LDO3 Output Power. This pin requires a 2.2 μ F decoupling capacitor.

NCP6922C

Table 1. PIN FUNCTION DESCRIPTION

Pin	Name	Type	Description
LDO REGULATORS			
14	VIN4	Power Input	LDO4 Power Supply
13	VOUT4	Power Output	LDO4 Output Power. This pin requires a 2.2 μ F decoupling capacitor.

Table 2. MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Analog and power pins: AVIN, PVIN1, SW1, PVIN2, SW2, VIN3, VIN4, VOUT3, VOUT4, PG, FB1, FB2	V_A	–0.3 to + 6.0	V
Digital pins: SCL, SDA, ENDCDC1, ENDCDC2, ENLDO3, ENLDO4: Input Voltage Input Current	VDG IDG	–0.3 to $V_A + 0.3 \leq 6.0$ 10	V mA
Human Body Model (HBM) ESD Rating are (Note 1)	ESD HBM	2000	V
Charged Device Model (CDM) ESD Rating are (Note 1)	ESD CDM	750	V
Latch up Current: (Note 2) Digital pins All other pins	ILU	± 10 ± 100	mA
Storage Temperature Range	TSTG	–65 to + 150	°C
Maximum Junction Temperature	TJMAX	–40 to +150	°C
Moisture Sensitivity (Note 3)	MSL	Level 1	

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

Table 3. RECOMMENDED OPERATING CONDITIONS

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
AV_{IN} PV_{IN}	Analog and Power Supply	(Note 12)	2.3	–	5.5	V
LDO_{VIN}	LDO Input Voltage range		1.7	–	5.5	V
T_A	Ambient Temperature Range		–40	25	+85	°C
T_J	Junction Temperature Range (Note 5)		–40	25	+125	°C
$R_{\theta JA}$	Thermal Resistance Junction to Ambient (Note 6)	WQFN–20 on Demo–board	–	40	–	°C/W
P_D	Power Dissipation Rating (Note 7)	$T_A \leq 85^\circ\text{C}$	–	1000	–	mW
P_D	Power Dissipation Rating (Note 7)	$T_A = 40^\circ\text{C}$	–	2125	–	mW
L	Inductor for DC–to–DC converters (Note 4)		0.47	1	2.2	μ H
Co	Output Capacitor for DC–to–DC Converters (Note 4)		–	10	–	μ F
	Output Capacitors for LDO (Note 4)		1.2	2.2	–	μ F
Cin	Input Capacitor for DC–to–DC Converters (Note 4)		–	4.7	–	μ F

Functional operation above the stresses listed in the Recommended Operating Ranges is not implied. Extended exposure to stresses beyond the Recommended Operating Ranges limits may affect device reliability.

- This device series contains ESD protection and passes the following tests:
Human Body Model (HBM) ± 2.0 kV per JEDEC standard: JESD22–A114,
Charged Device Model (CDM) ± 750 V per JEDEC standard: JESD22–C101.
- Latch up Current per JEDEC standard: JESD78 class II.
- Moisture Sensitivity Level (MSL): 1 per IPC/JEDEC standard: J–STD–020A.
- Refer to the Application Information section of this data sheet for more details.
- The thermal shutdown set to 150°C (typical) avoids potential irreversible damage on the device due to power dissipation.
- The $R_{\theta JA}$ is dependent of the PCB heat dissipation. Board used to drive this data was a 2" x 2" NCP6922CEVB board. It is a multilayer board with 1–once internal power and ground planes and 2–once copper traces on top and bottom of the board.
- The maximum power dissipation (P_D) is dependent by input voltage, maximum output current and external components selected.

$$R_{\theta JA} = \frac{125 - T_A}{P_D}$$

NCP6922C

Table 4. ELECTRICAL CHARACTERISTICS (Min and Max limits apply for $T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$, $AV_{IN} = PV_{IN1} = PV_{IN2} = V_{IN3} = V_{IN4} = 5.0\text{ V}$ and default configuration, unless otherwise specified. Typical values are referenced to $T_A = +25^{\circ}\text{C}$, $AV_{IN} = PV_{IN1} = PV_{IN2} = V_{IN3} = V_{IN4} = 5.0\text{ V}$ and default configuration) (Note 9).

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
--------	-----------	------------	-----	-----	-----	------

SUPPLY CURRENT: PINS AVIN – PVIN1 – PVIN2

I_Q	Operating Quiescent Current	DCDCs & LDO4 Off LDO3 on – no load	–	17	30	μA
		DCDC1 on – no load – PFM DCDC2 & LDOs off	–	36	70	
		DCDCs on – no load – PFM LDOs on – no load	–	82	150	
I_{SLEEP}	Sleep Mode Current	All DCDC and LDOs off	–	7	15	μA

DCDC1&2 STEP DOWN CONVERTERS

$PV_{IN1,2}$	Input Voltage Range	$V_{OUT} \leq 2.1\text{ V}$ (Note 11)	2.3	5.0	5.5	V
		$V_{OUT} > 2.1\text{ V}$	$V_{OUT}+0.2\text{V}$	5.0	5.5	
I_{OUTMAX}	Maximum Output Current		0.8	–	–	A
ΔV_{OUT}	Output Voltage DC Error	Forced PWM mode, V_{IN} range, I_{OUT} from 0 mA and 100 mA	–1	–	1	%
		Forced PWM mode, V_{IN} range, I_{OUT} up to I_{OUTMAX} (Note 10)	–1	–	1	
		Auto mode, V_{IN} range, I_{OUT} up to I_{OUTMAX} (Note 10)	–1	–	2	
F_{SW}	Switching Frequency	Forced PWM	2.7	3	3.3	MHz
R_{ONHS}	P–Channel MOSFET On Resistance	From PV_{IN1} / PV_{IN2} pins to SW1 / SW2 pins	–	270	400	$\text{m}\Omega$
R_{ONLS}	N–Channel MOSFET On Resistance	From SW1 / SW2 pins to PGND1 / PGND2 pins	–	190	300	$\text{m}\Omega$
I_{PK}	Peak Inductor Current	Open loop	1.0	1.3	1.6	A
DC_{LOAD}	Load Regulation	I_{OUT} from 100 mA to I_{OUTMAX}	–	5	–	mV/A
DC_{LINE}	Line Regulation	$PV_{IN} = PV_{INMIN}$ to 5.0 V, $I_{OUT} = 100\text{ mA}$	–	0.5	–	%
D	Maximum Duty Cycle		–	100	–	%
t_{START}	Soft–Start Time	Time from I ² C command ACK to 90% of Output Voltage	–	–	0.6	ms
$R_{DISDCDC}$	DCDC Active Output Discharge		–	7	–	Ω

LDO3 and LDO4

V_{IN3}, V_{IN4}	LDO3 and LDO4 Input Voltage	$V_{OUT} \leq 1.5\text{ V}$, $I_{OUT} = 150\text{ mA}$	1.7	–	5.5	V
		$V_{OUT} > 1.5\text{ V}$, $I_{OUT} = 150\text{ mA}$	$V_{OUT}+V_{DROP}$	–	5.5	V
I_{OUT}	Maximum Output Current		150	–	–	mA
I_{SC}	Short Circuit Protection (foldback)	$V_{IN} = 3.6\text{ V}$	–	70	–	mA
I_{LIMIT}	Current Limit	$V_{IN} = 3.6\text{ V}$	200	–	500	
ΔV_{OUT}	Output Voltage Accuracy	$I_{OUT} = 75\text{ mA}$	–1	V_{NOM}	+1	%
		V_{IN} range, $I_{OUT} = 0\text{ mA}$ and 150 mA (Note 10)	–2	V_{NOM}	+2	
DC_{LOAD}	Load Regulation	$I_{OUT} = 0\text{ mA}$ to 150 mA	–	0.5	–	%
DC_{LINE}	Line Regulation	$V_{IN} = V_{INMIN}$ to 5.5 V, $I_{OUT} = 150\text{ mA}$	–	0.5	–	%

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

8. Devices that use non–standard supply voltages which do not conform to the intent I²C bus system levels must relate their input levels to the V_{DD} voltage to which the pull–up resistors R_P are connected.

9. Refer to the Application Information section of this data sheet for more details.

10. Guaranteed by design and characterized.

11. Operation above 5.5 V input voltage for extended periods may affect device reliability.

GENERAL DESCRIPTION

The NCP6922C mini power management integrated circuit is optimized to supply different sub systems of battery powered portable applications. The IC can be supplied directly from the latest technology single cell batteries such as Lithium-Polymer as well as from triple alkaline cells. Alternatively, the IC can be supplied from a pre-regulated supply rail in case of multi-cell or mains powered applications.

It integrates two switched mode DC-to-DC converters and two low dropout linear regulators. The IC is widely programmable through an I²C interface and includes low level IO signaling. An analog core provides the necessary references for the IC while a digital core ensures proper control.

The output voltage range, current capabilities and performance of the switched mode DC-to-DC converters are well suited to supply the different peripherals in the system as well as to supply processor cores. To reduce overall power consumption of the application, Dynamic Voltage Scaling (DVS) is supported on the DC-to-DC converters. For PWM operation, the converters run on a local 3 MHz clock. A low power PFM mode ensures that, even at low loads, high efficiency can be achieved. All the switching components are integrated including the compensation networks and synchronous rectifier. Only a small size 1 μ H inductor and 10 μ F bypass capacitor are required for typical applications.

The general purpose low dropout regulators can be used to supply the lower power rails in the application. To improve the overall application standby current, regulators bias current is very low. The regulators have their own input supply pin to be able to connect them independently to either the system supply rail or to the DC-to-DC converter output, in the application. The regulators are bypassed with a small size 2.2 μ F capacitor.

All IC feature can be controlled by I²C interface. In addition to this bus, digital control pins including individual enable (ENx) and power good (PG) are provided.

UNDER VOLTAGE LOCKOUT

The core does not operate for voltages below the Under Voltage lock Out (UVLO) level. Below UVLO threshold, all internal circuitry (both analog and digital) is held in reset.

NCP6922C operation is guaranteed down to VUVLO when battery voltage is dropping down. To avoid erratic on / off behaviour, a maximum 200 mV hysteresis is implemented. Restart is guaranteed at 2.5 V when VBAT voltage is recovering or rising up.

THERMAL SHUTDOWN

The thermal capabilities of the device can be exceeded due to the output power capabilities of the on chip step down converters and low drop out regulators. A thermal protection

circuit is therefore implemented to prevent the part from being damaged. This protection circuit is only activated when the core is in active mode (at least one output channel is enabled). During thermal shutdown, all outputs of the NCP6922C are off. When the NCP6922C returns from thermal shutdown mode, it can re-start in three different configurations depending on REARM[1:0] bits:

1. If REARM[1:0] = 00 then NCP6922C re-starts with default register values,
2. If REARM[1:0] = 01 it re-starts with register values set prior to thermal shutdown,
3. Finally if REARM[1:0] = 10, NCP6922C does not re-start automatically, a toggle of HWEN or ENx pins is needed.

In addition, a thermal warning is implemented which can inform the processor through an interrupt (if not masked) that NCP6922C is close to its thermal shutdown so that preventive measurement can be taken by software.

ACTIVE OUTPUT DISCHARGE

Active output discharge can be independently enabled / disabled by the appropriate settings in the DIS register (refer to the register definition section). However to prevent any disturbances on the power-up sequence, a quick active output discharge is done during the start-up sequence for all output channels. When the IC is turned off through HWEN pin (or ENx pins) or AVIN drops down below UVLO threshold, no shut down sequence is expected, all supplies are disabled and outputs discharged simultaneously if discharge enabled.

ENABLING

By default when applying a valid AVIN with all Enable pins (ENx) low, all supply rails will remain off. Each power rail can be independently enabled by making the ENx pins high or by setting the related enable bit in the ENABLE register, see Table 2. The voltage of the supply rails can be programmed through I²C before enabling. A built-in pull-down resistor disables supply rail if the corresponding EN pin is left unconnected.

Power Up Sequence and ENx

When applying a valid AVIN with all ENx pins high, the part will start up in the default configuration that is factory programmed. This default configuration determines the order of enabling and the output voltage.

During the power-up sequence, the state of a LDO/DC-to-DC is defined by its corresponding EN pin, its I²C EN bit and its TAP position in the sequence. The LDO/DC-to-DC will be enabled as soon as the sequencer passes its TAP, AND the corresponding EN pin OR I²C EN bit is high.

Any order and output voltage setting can be factory programmed upon request.

NCP6922C

Two different power-up sequences are pre-defined:

Table 5. NCP6922CB POWER UP SEQUENCE

Rail	Sequencer	Default Vprog	Default Mode – ON/OFF
DCDC1	T2	1.20 V	Forced PWM – OFF
DCDC2	T1	1.20 V	Forced PWM – OFF
LDO3	T2	2.50 V	OFF
LDO4	T1	2.50 V	OFF

Table 6. NCP6922CC POWER UP SEQUENCE

Rail	Sequencer	Default Vprog	Default Mode – ON/OFF
DCDC1	T3	1.35 V	Forced PWM – OFF
DCDC2	T0	3.30 V	Auto mode – OFF
LDO3	T0	1.15 V	OFF
LDO4	T0	2.50 V	OFF

Table 7. NCP6922CD POWER UP SEQUENCE

Rail	Sequencer	Default Vprog	Default Mode – ON/OFF
DCDC1	T2	1.50 V	Auto Mode – ON
DCDC2	T4	1.10 V	Auto Mode – ON
LDO3	T1	1.80 V	ON
LDO4	T3	3.30 V	ON

NCP6922CB power-up diagrams are depicted in Figures 57, 58, 59:

Figure 57. NCP6922CB Power Up Sequence with All ENx Pins High

NCP6922C

Figure 58. NCP6922CB Power-up Sequence with Only ENLDO4 High First then Others Enable

Figure 59. NCP6922CB Power-up Sequence with All ENx After the Power Up Sequence

I²C registers can be read and written while ENx pins are low. By programming the appropriate registers (see registers description section), the power up sequence can be modified.

Reset to the factory default configuration can be achieved either by hardware reset (all power supplies removed) or by writing through the I²C in the RESET register.

Enable Control

Table 8. TRUTH TABLE OF ENABLE/DISABLE CONTROL

Enable Pin	Enable bit	Output
L	0	Disabled
L	1	Enabled
H	0	Enabled
H	1	Enabled

Note that each enable pin has a corresponding sense bit reflecting the state of the pin: sense bit is 1 when pin is high (filtered) and 0 when the pin is low (filtered).

Shutdown

When shutting down the device (AVIN falls below the Under Voltage threshold VUVLO), no shut down sequence is applied. All supplies are disabled and outputs are discharged simultaneously, and PG open drain output is low.

DYNAMIC VOLTAGE SCALING (DVS)

The step down converters support dynamic voltage scaling (DVS). This means output voltage can be individually reprogrammed by I²C commands to provide the different voltages required by the processor. Change between two different voltages is managed in a smooth manner without disturbing the operation of the processor.

When programming a higher voltage, the reference of the switcher and therefore the output is raised in equidistant steps per defined time period such that the dV/dt is controlled (by default $12.5 \text{ mV} / 1.33 \mu\text{s}$). When programming a lower voltage the output voltage will decrease accordingly. The DVS step is fixed and the speed is programmable.

Figure 60. Default Dynamic Voltage Scaling Effect Timing Diagram

Programmability

DC-to-DC converter output voltage can be controlled by GOx bit (TIME register) with VPROGDCDCx[7:0] and VDVSDCDCx[7:0] registers. Available output levels are listed in table VPROGDCDCx[7:0] and VDVSDCDCx[7:0] in register description.

GOx bit determines whether DC-to-DC output voltage value is set in VPROGDCDCx[7:0] register or in VDVSDCDCx[7:0] register.

Table 9. GO BIT DESCRIPTION

GOx	Bit Description
0	Output voltage is set to VPROGDCDCx
1	Output voltage is set to VDVSDCDCx

The two DVS bits in the TIME register determine the ramp up time per each voltage step.

Table 10. DVS BITS DESCRIPTION

DVS [1:0]	Bit Description
00	$1.33 \mu\text{s}$ per step (default)
01	$2.67 \mu\text{s}$ per step
10	$5.33 \mu\text{s}$ per step
11	$10.67 \mu\text{s}$ per step

There are two ways of I²C registers programming to switch the DC-to-DC converters output voltages between different levels:

1. Preset VPROGDCDCx[7:0] and VDVSDCDCx[7:0] registers, and start DVS sequence by changing GOx bit state.
2. GOx bit remains unchanged, change output voltage value in either VPROGDCDCx[7:0] or VDVSDCDCx[7:0] register.

For example, the device needs to supply either 1.2 V or 0.9 V depending on working conditions. If using method 1, VPROGDCDCx[7:0] and VDVSDCDCx[7:0] should be set as shown in Table 11. GOx bit should be programmed to 1

to change DCDCx Output Voltage from 1.2 V to 0.9 V, and be programmed to 0 to move back from 0.9 V to 1.2 V.

Table 11. VPROGDCDCx / VDVSDCDCx SETTINGS FOR VDCDCx SWITCHING BETWEEN 1.2 V AND 0.9 V

Register Name	Values	Target VDCDC (V)
VPROGDCDCx	0\$30	1.2
VDVSDCDCx	0\$18	0.9

DC-to-DC CONVERTERS AND LDOs POWER GOOD

To indicate the output of a converter is established, a power good signal is available for each output channel (routed in the INT_SEN1 register). The power good signal is high when the channel is off and goes low when enabling the channel. Once the output voltage reaches the expected output level, the power good signal becomes high again.

When during operation the output gets below 90% of the expected level, the power good signal goes low which indicates a power failure. When the voltage rises again above 95% the power good signal goes high again.

Note that these PG Sense bits are independent of PGASSIGN_x and PGGATE_x bits.

Figure 61. DCDCx Channel Internal Power Good Signal

Figure 62. DCDCx Channel Internal Power Good Signal

Power Good Assignment and Gating

Each power good sense signal can be individually assigned to the PG pin through PGASSIGN_x bits of PGOOD1 register. In addition, 3 other signals can be assigned to the PG pin: the internal reset signal and the DCDC DVS signals through the PGOOD1 register. By assigning the internal reset signal, the PG pin is held low throughout the power up sequence and the reset period (by default). By assigning the DVS signal of a converter, the PG pin is made low during the period the output voltage is being

raised to the new setting as shown in Figure 63. The PG pin state is an AND combination of assigned signals.

Figure 63. PG Operation in DVS Sequence

Moreover PPGATE_x bits of the PGOOD2 register force the PG pin low when the channel is off.

POWER GOOD PIN

The PG pin is an open drain output. By default, the power good signal of DCDC2 converter and reset signal are assigned to the PG pin and DCDC2 gates PG pin.

Figure 64. PG Pin Description Behavior

Figure 65. Power Good Behavior in Case of DCDC2 Monitoring and DCDC2 Gating

Power Good Delay

A delay can be programmed between the moment the AND result of the assigned internal power good signals becomes high and the moment the PG pin is released. The delay is set from 0 ms to 512 ms through the TOR[2:0] bits

in the TIME register. The default delay is 0 ms could be change upon request

Figure 66. PG Delay

Interrupt

The interrupt controller continuously monitors internal interrupt sources, generating an interrupt signal when a system status change is detected (dual/rising edge monitoring). The interrupt sources include:

Table 12. INTERRUPT SOURCES

Interrupt	Description
PG_DCDC1	DCDC1 Converter Power Good (dual edge)
PG_DCDC2	DCDC2 Converter Power Good (dual edge)
PG_LDO3	LDO3 Power Good (dual edge)
PG_LDO4	LDO4 Power Good (dual edge)
UVLO	UVLO state (dual edge)
IDCDC1	DCDC1 Converter Output Over Current (rising edge)
IDCDC2	DCDC2 Converter Output Over Current (rising edge)
ILDO3	LDO3 Output Over Current (dual edge)
ILDO4	LDO4 Output Over Current (dual edge)
WNRG	Thermal Warning (dual edge)
TSD	Thermal Shutdown (dual edge)

Individual bits generating interrupts will be set to 1 in the INT_ACK1/INT_ACK2 registers (I²C read only registers), indicating the interrupt source. INT_ACK1/INT_ACK2 registers are reset by an I²C read. INT_SEN1/INT_SEN2 registers (read only registers) are real time indicators of interrupt sources.

When the host reads the INT_ACK1/INT_ACK2 registers the interrupt registers INT_ACK1/INT_ACK2 are cleared.

Figure 67 shows how DCDC1 converter power good produces interrupt with INT_SEN1/INT_ACK1 and I²C read access (assuming no other interrupt happens during this read period).

Figure 67. Interrupt Timing Chart Example of PG_DCDC1

Note that each enable pin has a corresponding sense bit reflecting the state of the pin, without interrupt associated.

LOW DROP OUT REGULATOR

The LDOs (low drop out regulator) are based on an embedded PMOS and requires no external stability components or feedback networks.

The low drop out regulators can be supplied from the systems supply rail such as a battery or from a step down converter as available on the IC itself. The latter case provides a power efficient line up when the voltage drop allows such. When the output of the LDO gets out of regulation, due to for instance a short at the output, an interrupt is generated and optionally the LDO is automatically disabled.

Current Limitation

Both LDOs have foldback current limiter: the goal of the foldback current limit is to reduce the output voltage and the current in order to limit the power dissipation (see Figure 68). Under a short circuit, where the output voltage has reduced below ~30% nominal value, the current (I_{SC}) is typically limited to a small fraction of the maximum current (I_{LIMIT}).

Foldback also reduces power dissipation in the load in fault conditions, which can reduce the risks of fire and heat damage.

Figure 68. 1.0 V LDO Foldback Current Limit Principle

DC-to-DC STEP DOWN CONVERTERS

The DC-to-DC converters are synchronous rectifier type with both high side and low side integrated switches. Neither external transistor nor diodes are required for proper operation. Feedback and compensation network are also fully integrated.

The DC-to-DC converters can operate in two different modes: PWM and PFM. The transition between PWM/PFM modes can occur automatically or the switcher can be placed in forced PWM mode by I²C programming. (MODECDC1 & MODECDC2 bits of ENABLE register)

PWM (Pulse Width Modulation) Operating Mode

In medium and high load conditions, DC-to-DCs operate in PWM mode from a fixed clock and adapts its duty cycle to regulate the desired output voltage. In this mode, the inductor current is in CCM and the voltage is regulated by PWM. The internal N-MOSFET switch operates as synchronous rectifier and is driven complementary to the P-MOSFET switch. In CCM, the lower switch (N-MOSFET) in a synchronous converter provides a lower voltage drop than the diode in an asynchronous converter, which provides less loss and higher efficiency.

PFM (Pulse Frequency Modulation) Operating Mode

In order to save power and improve efficiency at low loads the DC-to-DC converters operate in PFM mode as the inductor drops into DCM (Discontinuous Current Mode). The upper FET on time is kept constant and the switching frequency is variable. Output voltage is regulated by varying the switching frequency which becomes proportional to loading current. As it does in PWM mode, the internal N-MOSFET operates as synchronous rectifier after each

P-MOSFET on-pulse with very small negative current limit. When load increases and current in inductor becomes continuous again, the controller automatically turns back to PWM fixed frequency mode.

Forced PWM

The DC-to-DC converters can be programmed to only use PWM and disable the transition to PFM.

Table 13. MODECDC1&2 BIT DESCRIPTION

MODECDC1&2	Bit Description
0	Auto switching PFM / PWM
1	Forced PWM

Inductor Peak Current Limitation

During normal operation, peak current limitation will monitor and limit the current through the inductor. This current limitation is particularly useful when size and/or height constrains inductor power

Soft Start

A soft start is provided to limit inrush currents when enabling the converter. After enabling and internal delays elapsed, the DC to DC converter output will gradually ramp up to the programmed voltage.

I²C COMPATIBLE INTERFACE

NCP6922C can support a subset of I²C protocol, below are detailed introduction for I²C programming.

I²C Communication Description

ON Semiconductor communication protocol is a subset of I²C protocol.

Figure 69. General Protocol Description

The first byte transmitted is the Chip address (with LSB bit sets to 1 for a read operation, or sets to 0 for a Write operation). Then the following data will be:

- In case of a Write operation, the register address (@REG) we want to write in followed by the data we will write in the chip. The writing process is incremental. So the first data will be written in @REG, the second one in @REG + 1... The data are optional.

- In case of read operation, the NCP6922C will output the data out from the last register that has been accessed by the last write operation. Like writing process, reading process is an incremental process.

Read Out from Part

The Master will first make a “Pseudo Write” transaction with no data to set the internal address register. Then, a stop then start or a Repeated Start will initiate the read transaction from the register address the initial write transaction has set:

Figure 70. Read Out from Part

The first WRITE sequence will set the internal pointer on the register we want access to. Then the read transaction will start at the address the write transaction has initiated.

Transaction with Real Write then Read:

With Stop Then Start

Figure 71. Write Followed by Read Transaction

Write In Part

Write operation will be achieved by only one transaction. After chip address, the MCU first data will be the internal register we want access to, then following data will be the data we want to write in Reg, Reg + 1, Reg + 2, ..., Reg + n.

Write n Registers:

Figure 72. Write In n Registers

I²C Address

NCP6922C has fixed I²C (7 bit address, see below table A7~A1):

Table 14. NCP6922C I²C ADDRESS

Register Map

Following register map describes I²C registers.

Registers can be:

R	Read only register
RC	Read then Clear
RW	Read and Write register
RWM	Read, Write and can be modified by the IC
Reserved	Address is reserved and register is not physically designed
Spare	Address is reserved and register is physically designed

Table 15. I²C REGISTER MAP NCP6922CB CONFIGURATION

Address	Register Name	Type	Default	Function
0x00	INT_ACK1	RC	0x00	Interrupt 1 Register, dual edge

APPLICATION INFORMATION

Figure 73. Typical Application Schematic

Inductor Selection

NCP6922C DC-to-DC converters typically use 1 µH inductor. Use of different values can be considered to optimize operation in specific conditions. The inductor parameters directly related to device performances are saturation current, DC resistance and inductance value. The inductor ripple current (ΔI_L) decreases with higher inductance.

$$\Delta I_L = V_O \times \frac{1 - \frac{V_O}{V_{IN}}}{L \times F_{SW}} \quad (\text{eq. 1})$$

$$I_{LMAX} = I_{OMAX} + \frac{\Delta I_L}{2} \quad (\text{eq. 2})$$

With:

- F_{sw} = Switching Frequency (Typical 3 MHz)
- L = Inductor value
- ΔI_L = Peak-To-Peak inductor ripple current
- I_{LMAX} = Maximum Inductor Current

To achieve better efficiency, ultra low DC resistance inductor should be selected.

The saturation current of the inductor should be higher than the I_{LMAX} calculated with the Equations 1 and 2.

Table 52. INDUCTOR L = 1.0 µH

Supplier	Part #	Size (mm) (L x l x T)	DC Rated Current (A)	DCR Max at 25°C (mΩ)

Output Capacitor Selection for DC-to-DC Converters

Selecting the proper output capacitor is based on the desired output ripple voltage. Ceramic capacitors with low ESR values will have the lowest output ripple voltage and are strongly recommended. The output capacitor requires either an X7R or X5R dielectric.

The output ripple voltage in PWM mode can be estimated by:

$$\Delta V_O = V_O \times \frac{1 - \frac{V_O}{V_{IN}}}{L \times F_{SW}} \times \left(\frac{1}{2 \times \pi \times C_O \times F_{SW}} + ESR \right) \quad (\text{eq. 3})$$

Table 54. RECOMMENDED OUTPUT CAPACITOR FOR DC-to-DC CONVERTERS

Manufacturer	Part Number	Case Size	Height Typ. [mm]	C [μF]
MURATA	GRM188R60J106ME47	0603	0.8	10
MURATA	GRM219R60J106KE19	0805	1.25	10

TDK	C2012X5R0C106K/M	0805	1.25	10
TDK	C2012X5R0C226K/M	0805	1.25	22

Input Capacitor Selection for DCDC Converters

In PWM operating mode, the input current is pulsating with large switching noise. Using an input bypass capacitor can reduce the peak current transients drawn from the input supply source, thereby reducing switching noise significantly.

The maximum RMS current occurs at 50% duty cycle with maximum output current, which is 1/2 of maximum output current. A low profile ceramic capacitor of 4.7 μF should be used for most of the cases. For effective bypass results, the input capacitor should be placed as close as possible to PVIN1 and PVIN2 pins.

Table 55. RECOMMENDED INPUT CAPACITOR FOR DC-to-DC CONVERTERS

Supplier	Part Number	CaseSize	Height Typ. [mm]	C [μF]
MURATA	GRM188R60J475KE	0603	0.8	4.7
MURATA	GRM188R60J106ME	0603	0.8	10
TDK	C1608X5R0C475K/M	0603	0.8	4.7
TDK	C1608X5R0C106K/M	0603	0.8	10

Output Capacitor for LDOs

For stability reason, a typical 2.2 μF ceramic output capacitor is suitable for LDOs. The LDO output capacitor should be placed as close as possible to the NCP6922C output pin.

Input Capacitor for LDOs

NCP6922C LDOs do not require specific input capacitor. However, a typical 1 μF ceramic capacitor placed close to LDOs' input is helpful for load transient.

Power input of LDO can be connected to main power supply. However, for optimum efficiency and lower NCP6922C thermal dissipation, lowest voltage available in

the system is preferred. Input voltage of LDO, should always be higher than VOUT + VLDODROP (VDROP, LDO dropout voltage at maximum current).

Capacitor DC Bias Characteristics

Real capacitance of ceramic capacitor changes versus DC voltage. Special care should be taken to DC bias effect in order to make sure that the real capacitor value is always higher than the minimum allowable capacitor value specified.

PCB layout Recommendation

The high speed operation of the NCP6922C demands careful attention to board layout and component placement. To prevent electromagnetic interference (EMI) problems and reduce voltage ripple of the device, any high current copper trace which see high frequency switching should be optimized. Therefore, use short and wide traces for power current paths and for power ground tracks, power plane and ground plane are recommended if possible.

Both the inductor and input/output capacitor of DC-to-DC converters are in the high frequency switching path where current flow may be discontinuous. These components should be placed as close to NCP6922C as possible to reduce parasitic inductance connection. Also it is important to minimize the area of the switching nodes and use the ground plane under them to minimize cross-talk to sensitive signals and ICs. It's suggested to keep as complete ground plane under NCP6922C as possible.

PGND and AGND pin connection must be be connected to the ground plane. Care should be taken to avoid noise interference between PGND and AGND.

It is always good practice to keep the sensitive tracks such as feedback connection (FB1 / FB2) away from switching signal connections (SW1 / SW2) by laying the tracks on the other side or inner layers of PCB.

Figure 74. Recommended PCB Layout

Thermal Considerations

Careful attention must be paid to the power dissipation of the NCP6922C. The power dissipation is a function of efficiency and output power. Hence, increasing the output power requires better components selection. Care should be taken of LDO VDROPP, the larger it is, the higher dissipation it will bring to NCP6922C. Keep large copper plane under and close to NCP6922C is helpful for thermal dissipation.

PACKAGE DIMENSIONS

WQFN20, 4x4, 0.5P
CASE 510AV
ISSUE O

NOTES:

1. DIMENSIONING AND TOLERANCING PER ASME Y14.5M, 1994.
2. CONTROLLING DIMENSION: MILLIMETERS.
3. DIMENSION b APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN 0.15 AND 0.30 MM FROM THE TERMINAL TIP.
4. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

DIM	MIN	MAX
A	0.70	0.80
A1	0.00	0.05
A3	0.20	REF
b	0.20	0.30
D	4.00	BSC
D2	2.60	2.80
E	4.00	BSC
E2	2.60	2.80
e	0.50	BSC
K	0.20	REF
L	0.30	0.50
L1	0.00	0.15
