| 31:1      | reserved | RO    | 0x0000.000 | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 0         | RESUME   | R/W1C | 0          | RESUME Interrupt Status and Clear                                                                                                                                                             |

| Value | Description                                                                                                                       |
|-------|-----------------------------------------------------------------------------------------------------------------------------------|
| 1     | The RESUME bits in the <b>USBDRRIS</b> and <b>USBDRCIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0     | No interrupt has occurred or the interrupt is masked.                                                                             |

This bit is cleared by writing a 1. Clearing this bit also clears the RESUME bit in the **USBDRCRIS** register.

## Register 324: USB General-Purpose Control and Status (USBGPCS), offset 0x41C

OTG A /  
Host

OTG B /  
Device

**USBGPCS** provides the state of the internal ID signal.

**Note:** When used in OTG mode, USB0VBUS and USB0ID do not require any configuration as they are dedicated pins for the USB controller and directly connect to the USB connector's VBUS and ID signals. If the USB controller is used as either a dedicated Host or Device, the DEVMOD0TG and DEVMOD bits in the **USB General-Purpose Control and Status (USBGPCS)** register can be used to connect the USB0VBUS and USB0ID inputs to fixed levels internally, freeing the PB0 and PB1 pins for GPIO use. For proper self-powered Device operation, the VBUS value must still be monitored to assure that if the Host removes VBUS, the self-powered Device disables the D+/D- pull-up resistors. This function can be accomplished by connecting a standard GPIO to VBUS.

Register 325: USB VBUS Droop Control (USBVDC), offset 0x430

OTG A /  
Host

This 32-bit register enables a controlled masking of VBUS to compensate for any in-rush current by a Device that is connected to the Host controller. The in-rush current can cause VBUS to droop, causing the USB controller's behavior to be unexpected. The USB Host controller allows VBUS to fall lower than the VBUS Valid level (4.5 V) but not below AValid (2.0 V) for 65 microseconds without signaling a VBUSERR interrupt in the controller. Without this, any glitch on VBUS would force the USB Host controller to remove power from VBUS and then re-enumerate the Device.

USB VBUS Droop Control (USBVDC)

Value Description

1 A VBUS droop lasting for 65 microseconds has been detected.

0 An interrupt has not occurred.

This bit is cleared by writing a 1 to the VD bit in the **USBVDCISC** register.

Register 327: USB VBUS Droop Control Interrupt Mask (USBVDCIM), offset 0x438

OTG A /  
Host

This 32-bit register specifies the interrupt mask of the VBUS droop.

### Value Description

- |   |                                                                                                                                |
|---|--------------------------------------------------------------------------------------------------------------------------------|
| 1 | The VD bits in the <b>USBVDCRIS</b> and <b>USBVDCIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0 | No interrupt has occurred or the interrupt is masked.                                                                          |

This bit is cleared by writing a 1. Clearing this bit also clears the VD bit in the **USBVDCRIS** register.

## Register 329: USB ID Valid Detect Raw Interrupt Status (USBIDVRIS), offset 0x444

OTG

This 32-bit register specifies whether the unmasked interrupt status of the ID value is valid.

**Value Description**

- |   |                                                                                        |
|---|----------------------------------------------------------------------------------------|
| 1 | The raw interrupt signal from a detected ID valid is sent to the interrupt controller. |
| 0 | A detected ID valid does not affect the interrupt status.                              |

Register 331: USB ID Valid Detect Interrupt Status and Clear (USBIDVISC), offset 0x44C

OTG

This 32-bit register specifies the masked interrupt status of the ID valid detect. It also provides a method to clear the interrupt state.

USB ID Valid Detect Interrupt Status and Clear (USBIDVISC)

Base 0x4005.0000  
Offset 0x44C  
Type R/W1C, reset 0x0000.0000

| Value | Description                                                                                                                    |
|-------|--------------------------------------------------------------------------------------------------------------------------------|
| 1     | The ID bits in the <b>USBIDVRIS</b> and <b>USBIDVIM</b> registers are set, providing an interrupt to the interrupt controller. |
| 0     | No interrupt has occurred or the interrupt is masked.                                                                          |

This bit is cleared by writing a 1. Clearing this bit also clears the ID bit in the **USBIDVRIS** register.

**Register 332: USB DMA Select (USBDMASEL), offset 0x450****OTG A /  
Host**

This 32-bit register specifies which endpoints are mapped to the 6 allocated  $\mu$ DMA channels, see Table 8-1 on page 243 for more information on channel assignments.

**OTG B /  
Device**

## 20 Analog Comparators

An analog comparator is a peripheral that compares two analog voltages and provides a logical output that signals the comparison result.

**Note:** Not all comparators have the option to drive an output pin.

The comparator can provide its output to a device pin, acting as a replacement for an analog comparator on the board. In addition, the comparator can signal the application via interrupts or trigger the start of a sample sequence in the ADC. The interrupt generation and ADC triggering logic is separate and independent. This flexibility means, for example, that an interrupt can be generated on a rising edge and the ADC triggered on a falling edge.

The Stellaris® LM3S5791 microcontroller provides three independent integrated analog comparators with the following functions:

- Compare external pin input to external pin input or to internal programmable voltage reference
- Compare a test voltage against any one of the following voltages:
  - An individual external reference voltage
  - A shared single external reference voltage
  - A shared internal reference voltage

## 20.1 Block Diagram

Figure 20-1. Analog Comparator Module Block Diagram

## 20.2 Signal Description

Table 20-1 on page 950 and Table 20-2 on page 951 list the external signals of the Analog Comparators and describe the function of each. The Analog Comparator output signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for the Analog Comparator signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 324) should be set to choose the Analog Comparator function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 342) to assign the Analog Comparator signal to the specified GPIO port pin. The positive and negative input signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 299.

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 20.3 Functional Description

The comparator compares the VIN- and VIN+ inputs to produce an output, VOUT.

$$\begin{aligned} V_{IN-} < V_{IN+}, & V_{OUT} = 1 \\ V_{IN-} > V_{IN+}, & V_{OUT} = 0 \end{aligned}$$

As shown in Figure 20-2 on page 952, the input source for  $V_{IN-}$  is an external input,  $Cn-$ . In addition to an external input,  $Cn+$ , input sources for  $V_{IN+}$  can be the  $C0+$  or an internal reference,  $V_{IREF}$ .

**Figure 20-2. Structure of Comparator Unit**

A comparator is configured through two status/control registers, **Analog Comparator Control (ACCTL)** and **Analog Comparator Status (ACSTAT)**. The internal reference is configured through one control register, **Analog Comparator Reference Voltage Control (ACREFCTL)**. Interrupt status and control are configured through three registers, **Analog Comparator Masked Interrupt Status (ACMIS)**, **Analog Comparator Raw Interrupt Status (ACRIS)**, and **Analog Comparator Interrupt Enable (ACINTEN)**.

Typically, the comparator output is used internally to generate an interrupt as controlled by the ISEN bit in the **ACCTL** register. The output may also be used to drive an external pin,  $C_o$  or generate an analog-to-digital converter (ADC) trigger.

**Important:** The ASRCP bits in the **ACCTL** register must be set before using the analog comparators.

### 20.3.1 Internal Reference Programming

The structure of the internal reference is shown in Figure 20-3 on page 953. The internal reference is controlled by a single configuration register (**ACREFCTL**). Table 20-3 on page 953 shows the programming options to develop specific internal reference values, to compare an external voltage against a particular voltage generated internally ( $V_{IREF}$ ).

Figure 20-3. Comparator Internal Reference Structure

Table 20-3. Internal Reference Voltage and ACREFCTL Field Values

| ACREFCTL Register |               | Output Reference Voltage Based on VREF Field Value                                                                                                                                                                                                       |
|-------------------|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EN Bit Value      | RNG Bit Value |                                                                                                                                                                                                                                                          |
| EN=0              | RNG=X         | 0 V (GND) for any value of VREF; however, it is recommended that RNG=1 and VREF=0 for the least noisy ground reference.                                                                                                                                  |
| EN=1              | RNG=0         | <p>Total resistance in ladder is 31 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{(VREF + 8)}{31}$ $V_{IREF} = 0.85 + 0.106 \times VREF$ <p>The range of internal reference in this mode is 0.85-2.448 V.</p> |
|                   | RNG=1         | <p>Total resistance in ladder is 23 R.</p> $V_{IREF} = V_{DDA} \times \frac{R_{VREF}}{R_T}$ $V_{IREF} = V_{DDA} \times \frac{VREF}{23}$ $V_{IREF} = 0.143 \times VREF$ <p>The range of internal reference for this mode is 0-2.152 V.</p>                |

## 20.4 Initialization and Configuration

The following example shows how to configure an analog comparator to read back its output value from an internal register.

1. Enable the analog comparator 0 clock by writing a value of 0x0010.0000 to the **RCGC1** register in the System Control module (see page 179).
2. In the GPIO module, enable the GPIO port/pin associated with the input signals as GPIO inputs. To determine which GPIO to configure, see Table 24-4 on page 1090.
3. Configure the PMCN fields in the **GPIOPCTL** register to assign the analog comparator output signals to the appropriate pins (see page 342 and Table 24-5 on page 1099).
4. Configure the internal voltage reference to 1.65 V by writing the **ACREFCTL** register with the value 0x0000.030C.
5. Configure the comparator to use the internal voltage reference and to *not* invert the output by writing the **ACCTLn** register with the value of 0x0000.040C.
6. Delay for 10  $\mu$ s.
7. Read the comparator output value by reading the **ACSTATn** register's OVAL value.

Change the level of the comparator negative input signal C- to see the OVAL value change.

## 20.5 Register Map

Table 20-4 on page 954 lists the comparator registers. The offset listed is a hexadecimal increment to the register's address, relative to the Analog Comparator base address of 0x4003.C000. Note that the analog comparator clock must be enabled before the registers can be programmed (see page 179).

**Table 20-4. Analog Comparators Register Map**

| Offset | Name     | Type  | Reset       | Description                                 | See page |
|--------|----------|-------|-------------|---------------------------------------------|----------|
| 0x000  | ACMIS    | R/W1C | 0x0000.0000 | Analog Comparator Masked Interrupt Status   | 956      |
| 0x004  | ACRIS    | RO    | 0x0000.0000 | Analog Comparator Raw Interrupt Status      | 957      |
| 0x008  | ACINTEN  | R/W   | 0x0000.0000 | Analog Comparator Interrupt Enable          | 958      |
| 0x010  | ACREFCTL | R/W   | 0x0000.0000 | Analog Comparator Reference Voltage Control | 959      |
| 0x020  | ACSTAT0  | RO    | 0x0000.0000 | Analog Comparator Status 0                  | 960      |
| 0x024  | ACCTL0   | R/W   | 0x0000.0000 | Analog Comparator Control 0                 | 961      |
| 0x040  | ACSTAT1  | RO    | 0x0000.0000 | Analog Comparator Status 1                  | 960      |
| 0x044  | ACCTL1   | R/W   | 0x0000.0000 | Analog Comparator Control 1                 | 961      |
| 0x060  | ACSTAT2  | RO    | 0x0000.0000 | Analog Comparator Status 2                  | 960      |
| 0x064  | ACCTL2   | R/W   | 0x0000.0000 | Analog Comparator Control 2                 | 961      |

## 20.6 Register Descriptions

The remainder of this section lists and describes the Analog Comparator registers, in numerical order by address offset.

## Register 1: Analog Comparator Masked Interrupt Status (ACMIS), offset 0x000

This register provides a summary of the interrupt status (masked) of the comparators.

### Analog Comparator Masked Interrupt Status (ACMIS)

Base 0x4003.C000

Offset 0x000

Type R/W1C, reset 0x0000.0000

|       | 31       | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18    | 17    | 16    |
|-------|----------|----|----|----|----|----|----|----|----|----|----|----|----|-------|-------|-------|
|       | reserved |    |    |    |    |    |    |    |    |    |    |    |    |       |       |       |

Clearing this bit also clears the IN1 bit in the <b>ACRIS</b> register.</p> |
| 0         | IN0      | R/W1C | 0          | <p>Comparator 0 Masked Interrupt Status</p> <p>Value Description</p> <p>1 The IN0 bits in the <b>ACRIS</b> register and the <b>ACINTEN</b> registers are set, providing an interrupt to the interrupt controller.</p> <p>0 No interrupt has occurred or the interrupt is masked.</p> <p>This bit is cleared by writing a 1. Clearing this bit also clears the IN0 bit in the <b>ACRIS</b> register.</p> |

## Register 2: Analog Comparator Raw Interrupt Status (ACRIS), offset 0x004

This register provides a summary of the interrupt status (raw) of the comparators. The bits in this register must be enabled to generate interrupts using the **ACINTEN** register.

### Analog Comparator Raw Interrupt Status (ACRIS)

| 1         | The output of the comparator is inverted prior to being processed by hardware. |      |       |                                                                                                                                                                                                                                                                                                                                                                                                          |       |             |     |                                                            |     |                                                                                |     |             |     |             |
| 0         | reserved                                                                       | RO   | 0     | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation.                                                                                                                                                                                                            |       |             |     |                                                            |     |                                                                                |     |             |     |             |

## 21 Pulse Width Modulator (PWM)

Pulse width modulation (PWM) is a powerful technique for digitally encoding analog signal levels. High-resolution counters are used to generate a square wave, and the duty cycle of the square wave is modulated to encode an analog signal. Typical applications include switching power supplies and motor control.

The Stellaris® PWM module consists of four PWM generator blocks and a control block. The control block determines the polarity of the PWM signals, and which signals are passed through to the pins.

Each PWM generator block produces two PWM signals that share the same timer and frequency and can either be programmed with independent actions or as a single pair of complementary signals with dead-band delays inserted. The output signals, `pwmA'` and `pwmB'`, of the PWM generation blocks are managed by the output control block before being passed to the device pins as `PWM0` and `PWM1` or `PWM2` and `PWM3`, and so on.

The Stellaris® PWM module provides a great deal of flexibility and can generate simple PWM signals, such as those required by a simple charge pump as well as paired PWM signals with dead-band delays, such as those required by a half-H bridge driver. Three generator blocks can also generate the full six channels of gate controls required by a 3-phase inverter bridge.

The Stellaris LM3S5791 PWM module consists of four PWM generator blocks and a control block. Each PWM generator block has the following features:

- Four fault-condition handling input to quickly provide low-latency shutdown and prevent damage to the motor being controlled
- One 16-bit counter
  - Runs in Down or Up/Down mode
  - Output frequency controlled by a 16-bit load value
  - Load value updates can be synchronized
  - Produces output signals at zero and load value
- Two PWM comparators
  - Comparator value updates can be synchronized
  - Produces output signals on match
- PWM signal generator
  - Output PWM signal is constructed based on actions taken as a result of the counter and PWM comparator output signals
  - Produces two independent PWM signals
- Dead-band generator
  - Produces two PWM signals with programmable dead-band delays suitable for driving a half-H bridge
  - Can be bypassed, leaving input PWM signals unmodified

- Can initiate an ADC sample sequence

The control block determines the polarity of the PWM signals and which signals are passed through to the pins. The output of the PWM generation blocks are managed by the output control block before being passed to the device pins. The PWM control block has the following options:

- PWM output enable of each PWM signal
- Optional output inversion of each PWM signal (polarity control)
- Optional fault handling for each PWM signal
- Synchronization of timers in the PWM generator blocks
- Synchronization of timer/comparator updates across the PWM generator blocks
- Synchronization of PWM output enables across the PWM generator blocks
- Interrupt status summary of the PWM generator blocks
- Extended fault capabilities with multiple fault signals, programmable polarities, and filtering
- PWM generators can be operated independently or synchronized with other generators

## **21.1 Block Diagram**

Figure 21-1 on page 965 provides the Stellaris<sup>®</sup> PWM module unit diagram and Figure 21-2 on page 965 provides a more detailed diagram of a Stellaris<sup>®</sup> PWM generator. The LM3S5791 controller contains four generator blocks (PWM0, PWM1, PWM2, and PWM3) and generates eight independent PWM signals or four paired PWM signals with dead-band delays inserted.

## 21.2 Signal Description

Table 21-1 on page 966 and Table 21-2 on page 967 list the external signals of the PWM module and describe the function of each. The PWM controller signals are alternate functions for some GPIO

signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these PWM signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 324) should be set to choose the PWM function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOCTL)** register (page 342) to assign the PWM signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 299.

Table 21-1. Signals for PWM (100LQFP)

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                                          |
|----------|------------|--------------------------|----------|--------------------------|------------------------------------------------------|
| Fault0   | 6          | PE4 (4)                  | I        | TTL                      | PWM Fault 0.                                         |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 21.3 Functional Description

### 21.3.1 PWM Timer

The timer in each PWM generator runs in one of two modes: Count-Down mode or Count-Up/Down mode. In Count-Down mode, the timer counts from the load value to zero, goes back to the load value, and continues counting down. In Count-Up/Down mode, the timer counts from zero up to the load value, back down to zero, back up to the load value, and so on. Generally, Count-Down mode

is used for generating left- or right-aligned PWM signals, while the Count-Up/Down mode is used for generating center-aligned PWM signals.

The timers output three signals that are used in the PWM generation process: the direction signal (this is always Low in Count-Down mode, but alternates between Low and High in Count-Up/Down mode), a single-clock-cycle-width High pulse when the counter is zero, and a single-clock-cycle-width High pulse when the counter is equal to the load value. Note that in Count-Down mode, the zero pulse is immediately followed by the load pulse. In the figures in this chapter, these signals are labelled "dir," "zero," and "load."

### 21.3.2 PWM Comparators

Each PWM generator has two comparators that monitor the value of the counter; when either comparator matches the counter, they output a single-clock-cycle-width High pulse, labelled "cmpA" and "cmpB" in the figures in this chapter. When in Count-Up/Down mode, these comparators match both when counting up and when counting down, and thus are qualified by the counter direction signal. These qualified pulses are used in the PWM generation process. If either comparator match value is greater than the counter load value, then that comparator never outputs a High pulse.

Figure 21-3 on page 970 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Down mode. Figure 21-4 on page 970 shows the behavior of the counter and the relationship of these pulses when the counter is in Count-Up/Down mode. In these figures, the following definitions apply:

- LOAD is the value in the **PWMnLOAD** register
- COMPA is the value in the **PWMnCMPA** register
- COMPB is the value in the **PWMnCMPB** register
- 0 is the value zero
- load is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to the load value
- zero is the internal signal that has a single-clock-cycle-width High pulse when the counter is zero
- cmpA is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPA
- cmpB is the internal signal that has a single-clock-cycle-width High pulse when the counter is equal to COMPB
- dir is the internal signal that indicates the count direction

**Figure 21-3. PWM Count-Down Mode****Figure 21-4. PWM Count-Up/Down Mode**

### 21.3.3 PWM Signal Generator

The PWM generator takes the load, zero, cmpA, and cmpB pulses (qualified by the dir signal) and generates two internal PWM signals, pwmA and pwmB. In Count-Down mode, there are four events that can affect these signals: zero, load, match A down, and match B down. In Count-Up/Down mode, there are six events that can affect these signals: zero, load, match A down, match A up, match B down, and match B up. The match A or match B events are ignored when they coincide with the zero or load events. If the match A and match B events coincide, the first signal, pwmA, is generated based only on the match A event, and the second signal, pwmB, is generated based only on the match B event.

For each event, the effect on each output PWM signal is programmable: it can be left alone (ignoring the event), it can be toggled, it can be driven Low, or it can be driven High. These actions can be used to generate a pair of PWM signals of various positions and duty cycles, which do or do not overlap. Figure 21-5 on page 971 shows the use of Count-Up/Down mode to generate a pair of

center-aligned, overlapped PWM signals that have different duty cycles. This figure shows the pwmA and pwmB signals before they have passed through the dead-band generator.

**Figure 21-5. PWM Generation Example In Count-Up/Down Mode**

In this example, the first generator is set to drive High on match A up, drive Low on match A down, and ignore the other four events. The second generator is set to drive High on match B up, drive Low on match B down, and ignore the other four events. Changing the value of comparator A changes the duty cycle of the pwmA signal, and changing the value of comparator B changes the duty cycle of the pwmB signal.

### 21.3.4 Dead-Band Generator

The pwmA and pwmB signals produced by the PWM generator are passed to the dead-band generator. If the dead-band generator is disabled, the PWM signals simply pass through to the pwmA' and pwmB' signals unmodified. If the dead-band generator is enabled, the pwmB signal is lost and two PWM signals are generated based on the pwmA signal. The first output PWM signal, pwmA' is the pwmA signal with the rising edge delayed by a programmable amount. The second output PWM signal, pwmB', is the inversion of the pwmA signal with a programmable delay added between the falling edge of the pwmA signal and the rising edge of the pwmB' signal.

The resulting signals are a pair of active High signals where one is always High, except for a programmable amount of time at transitions where both are Low. These signals are therefore suitable for driving a half-H bridge, with the dead-band delays preventing shoot-through current from damaging the power electronics. Figure 21-6 on page 971 shows the effect of the dead-band generator on the pwmA signal and the resulting pwmA' and pwmB' signals that are transmitted to the output control block.

**Figure 21-6. PWM Dead-Band Generator**

### 21.3.5 Interrupt/ADC-Trigger Selector

The PWM generator also takes the same four (or six) counter events and uses them to generate an interrupt or an ADC trigger. Any of these events or a set of these events can be selected as a source for an interrupt; when any of the selected events occur, an interrupt is generated. Additionally, the same event, a different event, the same set of events, or a different set of events can be selected as a source for an ADC trigger; when any of these selected events occur, an ADC trigger pulse is generated. The selection of events allows the interrupt or ADC trigger to occur at a specific position

within the pwmA or pwmB signal. Note that interrupts and ADC triggers are based on the raw events; delays in the PWM signal edges caused by the dead-band generator are not taken into account.

### 21.3.6 Synchronization Methods

The PWM unit provides four PWM generators providing eight PWM outputs that may be used in a wide variety of applications. Generally speaking, the PWM is used in one of two categories of operation:

- **Unsynchronized.** The PWM generator and its two output signals are used alone, independent of other PWM generators.
- **Synchronized.** The PWM generator and its two outputs signals are used in conjunction with other PWM generators using a common, unified time base. If multiple PWM generators are configured with the same counter load value, synchronization can be used to guarantee that they also have the same count value (the PWM generators must be configured before they are synchronized). With this feature, more than two PWMn signals can be produced with a known relationship between the edges of those signals because the counters always have the same values. Other states in the unit provide mechanisms to maintain the common time base and mutual synchronization.

The counter in a PWM unit generator can be reset to zero by writing the **PWM Time Base Sync (PWMSYNC)** register and setting the SYNCn bit associated with the generator. Multiple PWM generators can be synchronized together by setting all necessary SYNCn bits in one access. For example, setting the SYNC0 and SYNC1 bits in the **PWMSYNC** register causes the counters in PWM generators 0 and 1 to reset together.

Additional synchronization can occur between multiple PWM generators by updating register contents in one of the following three ways:

- **Immediately.** The write value has immediate effect, and the hardware reacts immediately.
- **Locally Synchronized.** The write value does not affect the logic until the counter reaches the value zero at the end of the PWM cycle. In this case, the effect of the write is deferred, providing a guaranteed defined behavior and preventing overly short or overly long output PWM pulses.
- **Globally Synchronized.** The write value does not affect the logic until two sequential events have occurred: (1) the Update mode for the generator function is programmed for global synchronization in the **PWMnCTL** register, and (2) the counter reaches zero at the end of the PWM cycle. In this case, the effect of the write is deferred until the end of the PWM cycle following the end of all updates. This mode allows multiple items in multiple PWM generators to be updated simultaneously without odd effects during the update; everything runs from the old values until a point at which they all run from the new values. The Update mode of the load and comparator match values can be individually configured in each PWM generator block. It typically makes sense to use the synchronous update mechanism across PWM generator blocks when the timers in those blocks are synchronized, although this is not required in order for this mechanism to function properly.

The following registers provide either local or global synchronization based on the state of various Update mode bits and fields in the **PWMnCTL** register (LOADUPD; CMPAUPD; CMPBUPD):

- Generator Registers: **PWMnLOAD**, **PWMnCMPA**, and **PWMnCMPB**

The following registers default to immediate update, but are provided with the optional functionality of synchronously updating rather than having all updates take immediate effect:

- Module-Level Register: **PWMENABLE** (based on the state of the ENUPDn bits in the PWMENUPD register).
- Generator Register: **PWMnGENA**, **PWMnGENB**, **PWMnDBCTL**, **PWMnDBRISE**, and **PWMnDBFALL** (based on the state of various Update mode bits and fields in the **PWMnCTL** register (GENAUPD; GENBUPD; DBCTLUPD; DBRISEUPD; DBFALLUPD)).

All other registers are considered statically provisioned for the execution of an application or are used dynamically for purposes unrelated to maintaining synchronization and therefore do not need synchronous update functionality.

### 21.3.7 Fault Conditions

A fault condition is one in which the controller must be signaled to stop normal PWM function and then set the PWMn signals to a safe state. Two basic situations cause fault conditions:

- The microcontroller is stalled and cannot perform the necessary computation in the time required for motion control
- An external error or event is detected

The PWM unit can use the following inputs to generate a fault condition, including:

- FAULTn pin assertion
- A stall of the controller generated by the debugger
- The trigger of an ADC digital comparator

Fault conditions are calculated on a per-PWM generator basis. Each PWM generator configures the necessary conditions to indicate a fault condition exists. This method allows the development of applications with dependent and independent control.

Four fault input pins (FAULT0-FAULT3). These inputs may be used with circuits that generate an active High or active Low signal to indicate an error condition. A FAULTn pins may be individually programmed for the appropriate logic sense using the **PWMnFLTSEN** register.

The PWM generator's mode control, including fault condition handling, is provided in the **PWMnCTL** register. This register determines whether the FAULT0 input or a combination of FAULTn input signals and/or digital comparator triggers (as configured by the **PWMnFLTSRC0** and **PWMnFLTSRC1** registers) is used to generate a fault condition. The **PWMnCTL** register also selects whether the fault condition is maintained as long as the external condition lasts or if it is latched until the fault condition until cleared by software. Finally, this register also enables a counter that may be used to extend the period of a fault condition for external events to assure that the duration is a minimum length. The minimum fault period count is specified in the **PWMnMINFLTPER** register.

Status regarding the specific fault cause is provided in the **PWMnFLTSTAT0** and **PWMnFLTSTAT1** registers.

PWM generator fault conditions may be promoted to a controller interrupt using the **PWMINTEN** register.

### 21.3.8 Output Control Block

The output control block takes care of the final conditioning of the pwmA' and pwmB' signals before they go to the pins as the PWMn signals. Via a single register, the **PWM Output Enable** (**PWENABLE**) register, the set of PWM signals that are actually enabled to the pins can be modified.

This function can be used, for example, to perform commutation of a brushless DC motor with a single register write (and without modifying the individual PWM generators, which are modified by the feedback control loop). In addition, the updating of the bits in the **PWMENABLE** register can be configured to be immediate or locally or globally synchronized to the next synchronous update using the **PWM Enable Update (PWMENUPD)** register.

During fault conditions, the PWM output signals, PWMn, usually must be driven to safe values so that external equipment may be safely controlled. The **PWMFAULT** register specifies whether during a fault condition, the generated signal continues to be passed driven or to an encoding specified in the **PWMFAULTVAL** register.

A final inversion can be applied to any of the PWMn signals, making them active Low instead of the default active High using the **PWM Output Inversion (PWMINVERT)**. The inversion is applied even if a value has been enabled in the **PWMFAULT** register and specified in the **PWMFAULTVAL** register. In other words, if a bit is set in the **PWMFAULT**, **PWMFAULTVAL**, and **PWMINVERT** registers, the output on the PWMn signal is 0, not 1 as specified in the **PWMFAULTVAL** register.

## 21.4 Initialization and Configuration

The following example shows how to initialize PWM Generator 0 with a 25-kHz frequency, a 25% duty cycle on the PWM0 pin, and a 75% duty cycle on the PWM1 pin. This example assumes the system clock is 20 MHz.

1. Enable the PWM clock by writing a value of 0x0010.0000 to the **RCGC0** register in the System Control module (see page 171).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 191).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 24-4 on page 1090.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the PWM signals to the appropriate pins (see page 342 and Table 24-5 on page 1099).
5. Configure the **Run-Mode Clock Configuration (RCC)** register in the System Control module to use the PWM divide (USEPWMDIV) and set the divider (PWMDIV) to divide by 2 (000).
6. Configure the PWM generator for countdown mode with immediate updates to the parameters.
  - Write the **PWM0CTL** register with a value of 0x0000.0000.
  - Write the **PWM0GENA** register with a value of 0x0000.008C.
  - Write the **PWM0GENB** register with a value of 0x0000.080C.
7. Set the period. For a 25-KHz frequency, the period = 1/25,000, or 40 microseconds. The PWM clock source is 10 MHz; the system clock divided by 2. Thus there are 400 clock ticks per period. Use this value to set the **PWM0LOAD** register. In Count-Down mode, set the LOAD field in the **PWM0LOAD** register to the requested period minus one.
  - Write the **PWM0LOAD** register with a value of 0x0000.018F.
8. Set the pulse width of the PWM0 pin for a 25% duty cycle.
  - Write the **PWM0CMPA** register with a value of 0x0000.012B.

9. Set the pulse width of the PWM1 pin for a 75% duty cycle.
  - Write the **PWM0CMPB** register with a value of 0x0000.0063.
10. Start the timers in PWM generator 0.
  - Write the **PWM0CTL** register with a value of 0x0000.0001.
11. Enable PWM outputs.
  - Write the **PWMENABLE** register with a value of 0x0000.0003.

## 21.5 Register Map

Table 21-3 on page 975 lists the PWM registers. The offset listed is a hexadecimal increment to the register's address, relative to the PWM base address of 0x4002.8000. Note that the PWM module clock must be enabled before the registers can be programmed (see page 171).

**Table 21-3. PWM Register Map**

| Offset | Name        | Type  | Reset       | Description                       | See page |
|--------|-------------|-------|-------------|-----------------------------------|----------|

**Table 21-3. PWM Register Map (continued)**

| Offset | Name         | Type | Reset       | Description         | See page |
|--------|--------------|------|-------------|---------------------|----------|
| 0x984  | PWM3FLTSTAT0 | -    | 0x0000.0000 | PWM3 Fault Status 0 | 1036     |
| 0x988  | PWM3FLTSTAT1 | -    | 0x0000.0000 | PWM3 Fault Status 1 | 1038     |

## 21.6 Register Descriptions

The remainder of this section lists and describes the PWM registers, in numerical order by address offset.

## Register 1: PWM Master Control (PWMCTL), offset 0x000

This register provides master control over the PWM generation blocks.

### PWM Master Control (PWMCTL)

Base 0x4002.8000

Offset 0x000

Type R/W, reset 0x0000.0000

## Register 2: PWM Time Base Sync (PWMSYNC), offset 0x004

This register provides a method to perform synchronization of the counters in the PWM generation blocks. Setting a bit in this register causes the specified counter to reset back to 0; setting multiple bits resets multiple counters simultaneously. The bits auto-clear after the reset has occurred; reading them back as zero indicates that the synchronization has completed.

**Register 3: PWM Output Enable (PWMENABLE), offset 0x008**

This register provides a master control of which generated pwmA' and pwmB' signals are output to the PWMn pins. By disabling a PWM output, the generation process can continue (for example, when the time bases are synchronized) without driving PWM signals to the pins. When bits in this register are set, the corresponding pwmA' or pwmB' signal is passed through to the output stage. When bits are clear, the pwmA' or pwmB' signal is replaced by a zero value which is also passed to the output stage. The **PWMINVERT** register controls the output stage, so if the corresponding bit is set in that register, the value seen on the PWMn signal is inverted from what is configured by the bits in this register. Updates to the bits in this register can be immediate or locally or globally synchronized to the next synchronous update as controlled by the ENUPDn fields in the **PWMENUPD** register.

**PWM Output Enable (PWMENABLE)**

**Register 4: PWM Output Inversion (PWMINVERT), offset 0x00C**

This register provides a master control of the polarity of the PWMn signals on the device pins. The pwmA' and pwmB' signals generated by the PWM generator are active High; but can be made active Low via this register. Disabled PWM channels are also passed through the output inverter (if so configured) so that inactive signals can be High. In addition, if the **PWMFAULT** register enables a specific value to be placed on the PWMn signals during a fault condition, that value is inverted if the corresponding bit in this register is set.

**PWM Output Inversion (PWMINVERT)**

**Register 5: PWM Output Fault (PWMFAULT), offset 0x010**

This register controls the behavior of the PWMn outputs in the presence of fault conditions. Both the fault inputs (FAULTn pins and digital comparator outputs) and debug events are considered fault conditions. On a fault condition, each pwmA' or pwmB' signal can be passed through unmodified or driven to the value specified by the corresponding bit in the **PWMFAULTVAL** register. For outputs that are configured for pass-through, the debug event handling on the corresponding PWM generator also determines if the pwmA' or pwmB' signal continues to be generated.

Fault condition control occurs before the output inverter, so PWM signals driven to a specified value on fault are inverted if the channel is configured for inversion (therefore, the pin is driven to the logical complement of the specified value on a fault condition).

**Register 6: PWM Interrupt Enable (PWMINTEN), offset 0x014**

This register controls the global interrupt generation capabilities of the PWM module. The events that can cause an interrupt are the fault input and the individual interrupts from the PWM generators.

**PWM Interrupt Enable (PWMINTEN)**

Base 0x4002.8000

Offset 0x014

Type R/W, reset 0x0000.0000

**Register 7: PWM Raw Interrupt Status (PWMRIS), offset 0x018**

This register provides the current set of interrupt sources that are asserted, regardless of whether they are enabled to cause an interrupt to be asserted to the interrupt controller. The fault interrupt is asserted based on the fault condition source that is specified by the **PWMnCTL**, **PWMnFLTSRC0** and **PWMnFLTSRC1** registers. The fault interrupt is latched on detection and must be cleared through the **PWM Interrupt Status and Clear (PWMISC)** register. The actual value of the FAULTn signals can be observed using the **PWMSTATUS** register.

The PWM generator interrupts simply reflect the status of the PWM generators and are cleared via the interrupt status register in the PWM generator blocks. If a bit is set, the event is active; if a bit is clear the event is not active.

**PWM Raw Interrupt Status (PWMRIS)**

## Register 8: PWM Interrupt Status and Clear (PWMISC), offset 0x01C

This register provides a summary of the interrupt status of the individual PWM generator blocks. If a fault interrupt is set, the corresponding FAULTn input has caused an interrupt. For the fault interrupt, a write of 1 to that bit position clears the latched interrupt status. If an block interrupt bit is set, the corresponding generator block is asserting an interrupt. The individual interrupt status registers, **PWMnISC**, in each block must be consulted to determine the reason for the interrupt and used to clear the interrupt.

**Register 9: PWM Status (PWMSTATUS), offset 0x020**

This register provides the unlatched status of the PWM generator fault condition.

**PWM Status (PWMSTATUS)**

Base 0x4002.8000

Offset 0x020

Type RO, reset 0x0000.0000

|           |        |      |       | 1 The fault condition for PWM generator 0 is asserted.                                                                                        |
|           |        |      |       | If the FLT SRC bit in the <b>PWM0CTL</b> register is clear, the FAULT0 input is the source of the fault condition, and is therefore asserted. |
|           |        |      |       | 0 The fault condition for PWM generator 0 is not asserted.                                                                                    |

**Register 10: PWM Fault Condition Value (PWMFAULTVAL), offset 0x024**

This register specifies the output value driven on the PWMn signals during a fault condition if enabled by the corresponding bit in the **PWMFAULT** register. Note that if the corresponding bit in the **PWMINVERT** register is set, the output value is driven to the logical NOT of the bit value in this register.

**PWM Fault Condition Value (PWMFAULTVAL)**

**Register 11: PWM Enable Update (PWMENUPD), offset 0x028**

This register specifies when updates to the PWMnEn bit in the **PWMENABLE** register are performed. The PWMnEn bit enables the pwmA' or pwmB' output to be passed to the microcontroller's pin. Updates can be immediate or locally or globally synchronized to the next synchronous update.

**PWM Enable Update (PWMENUPD)**

|           |        |      |       | Writes to the PWM0En bit in the <b>PWMENABLE</b> register are used by the PWM generator module the next time the counter is 0 after a synchronous update has been requested through the PWM Master Control ( <b>PWMCTL</b> ) register. |

**Register 12: PWM0 Control (PWM0CTL), offset 0x040****Register 13: PWM1 Control (PWM1CTL), offset 0x080****Register 14: PWM2 Control (PWM2CTL), offset 0x0C0****Register 15: PWM3 Control (PWM3CTL), offset 0x100**

These registers configure the PWM signal generation blocks (PWM0CTL controls the PWM generator 0 block, and so on). The Register Update mode, Debug mode, Counting mode, and Block Enable mode are all controlled via these registers. The blocks produce the PWM signals, which can be either two independent PWM signals (from the same counter), or a paired set of PWM signals with dead-band delays added.

The PWM0 block produces the PWM0 and PWM1 outputs, the PWM1 block produces the PWM2 and PWM3 outputs, the PWM2 block produces the PWM4 and PWM5 outputs, and the PWM3 block produces the PWM6 and PWM7 outputs.

**PWM0 Control (PWM0CTL)**

| 17        | MINFLTPER | R/W  | 0     | <p>Minimum Fault Period</p> <p>This bit specifies that the PWM generator enables a one-shot counter to provide a minimum fault condition period.</p> <p>The timer begins counting on the rising edge of the fault condition to extend the condition for a minimum duration of the count value. The timer ignores the state of the fault condition while counting.</p> <p>The minimum fault delay is in effect only when the MINFLTPER bit is set. If a detected fault is in the process of being extended when the MINFLTPER bit is cleared, the fault condition extension is aborted.</p> <p>The delay time is specified by the <b>PWMnMINFLTPER</b> register MFP field value. The effect of this is to pulse stretch the fault condition input.</p> <p>The delay value is defined by the PWM clock period. Because the fault input is not synchronized to the PWM clock, the period of the time is <math>PWMClock * (MFP \text{ value} + 1)</math> or <math>PWMClock * (MFP \text{ value} + 2)</math>.</p> <p>The delay function makes sense only if the fault source is unlatched. A latched fault source makes the fault condition appear asserted until cleared by software and negates the utility of the extend feature. It applies to all fault condition sources as specified in the FLTSRC field.</p> <p>Value Description</p> <p>0 The FAULT input deassertion is unaffected.</p> <p>1 The <b>PWMnMINFLTPER</b> one-shot counter is active and extends the period of the fault condition to a minimum period.</p> |

**Register 16: PWM0 Interrupt and Trigger Enable (PWM0INTEN), offset 0x044**

**Register 17: PWM1 Interrupt and Trigger Enable (PWM1INTEN), offset 0x084**

**Register 18: PWM2 Interrupt and Trigger Enable (PWM2INTEN), offset 0x0C4**

**Register 19: PWM3 Interrupt and Trigger Enable (PWM3INTEN), offset 0x104**

These registers control the interrupt and ADC trigger generation capabilities of the PWM generators (**PWM0INTEN** controls the PWM generator 0 block, and so on). The events that can cause an interrupt or an ADC trigger are:

- The counter being equal to the load register
- The counter being equal to zero
- The counter being equal to the **PWMnCMPA** register while counting up
- The counter being equal to the **PWMnCMPA** register while counting down
- The counter being equal to the **PWMnCMB** register while counting up
- The counter being equal to the **PWMnCMB** register while counting down

Any combination of these events can generate either an interrupt or an ADC trigger, though no determination can be made as to the actual event that caused an ADC trigger if more than one is specified. The **PWMnRIS** register provides information about which events have caused raw interrupts.

#### PWM0 Interrupt and Trigger Enable (PWM0INTEN)

Base 0x4002.8000  
Offset 0x044  
Type R/W, reset 0x0000.0000

**Register 20: PWM0 Raw Interrupt Status (PWM0RIS), offset 0x048****Register 21: PWM1 Raw Interrupt Status (PWM1RIS), offset 0x088****Register 22: PWM2 Raw Interrupt Status (PWM2RIS), offset 0x0C8****Register 23: PWM3 Raw Interrupt Status (PWM3RIS), offset 0x108**

These registers provide the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (**PWM0RIS** controls the PWM generator 0 block, and so on). If a bit is set, the event has occurred; if a bit is clear, the event has not occurred. Bits in this register are cleared by writing a 1 to the corresponding bit in the **PWMnISC** register.

**PWM0 Raw Interrupt Status (PWM0RIS)**

**Register 24: PWM0 Interrupt Status and Clear (PWM0ISC), offset 0x04C****Register 25: PWM1 Interrupt Status and Clear (PWM1ISC), offset 0x08C****Register 26: PWM2 Interrupt Status and Clear (PWM2ISC), offset 0x0CC****Register 27: PWM3 Interrupt Status and Clear (PWM3ISC), offset 0x10C**

These registers provide the current set of interrupt sources that are asserted to the interrupt controller (**PWM0ISC** controls the PWM generator 0 block, and so on). A bit is set if the event has occurred and is enabled in the **PWMnINTEN** register; if a bit is clear, the event has not occurred or is not enabled. These are R/W1C registers; writing a 1 to a bit position clears the corresponding interrupt reason.

**Register 28: PWM0 Load (PWM0LOAD), offset 0x050****Register 29: PWM1 Load (PWM1LOAD), offset 0x090****Register 30: PWM2 Load (PWM2LOAD), offset 0x0D0****Register 31: PWM3 Load (PWM3LOAD), offset 0x110**

These registers contain the load value for the PWM counter (**PWM0LOAD** controls the PWM generator 0 block, and so on). Based on the counter mode configured by the **MODE** bit in the **PWMnCTL** register, this value is either loaded into the counter after it reaches zero or is the limit of up-counting after which the counter decrements back to zero. When this value matches the counter, a pulse is output which can be configured to drive the generation of the pwmA and/or pwmB signal (via the **PWMnGENA/PWMnGENB** register) or drive an interruptor ADC trigger (via the **PWMnINTEN** register).

If the Load Value Update mode is locally synchronized (based on the **LOADUPD** field encoding in the **PWMnCTL** register), the 16-bit **LOAD** value is used the next time the counter reaches zero. If the update mode is globally synchronized, it is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 979). If this register is re-written before the actual update occurs, the previous value is never used and is lost.

**PWM0 Load (PWM0LOAD)**

**Register 44: PWM0 Generator A Control (PWM0GENA), offset 0x060****Register 45: PWM1 Generator A Control (PWM1GENA), offset 0x0A0****Register 46: PWM2 Generator A Control (PWM2GENA), offset 0x0E0****Register 47: PWM3 Generator A Control (PWM3GENA), offset 0x120**

These registers control the generation of the pwmA signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENA** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENA** register controls generation of the pwm0A signal; **PWM1GENA**, the pwm1A signal; **PWM2GENA**, the pwm2A signal; and **PWM3GENA**, the pwm3A signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare A action is taken and the compare B action is ignored.

If the Generator A update mode is immediate (based on the GENAUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 979). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 48: PWM0 Generator B Control (PWM0GENB), offset 0x064****Register 49: PWM1 Generator B Control (PWM1GENB), offset 0x0A4****Register 50: PWM2 Generator B Control (PWM2GENB), offset 0x0E4****Register 51: PWM3 Generator B Control (PWM3GENB), offset 0x124**

These registers control the generation of the pwmB signal based on the load and zero output pulses from the counter, as well as the compare A and compare B pulses from the comparators (**PWM0GENB** controls the PWM generator 0 block, and so on). When the counter is running in Count-Down mode, only four of these events occur; when running in Count-Up/Down mode, all six occur. These events provide great flexibility in the positioning and duty cycle of the resulting PWM signal.

The **PWM0GENB** register controls generation of the pwm0B signal; **PWM1GENB**, the pwm1B signal; **PWM2GENB**, the pwm2B signal; and **PWM3GENB**, the pwm3B signal.

If a zero or load event coincides with a compare A or compare B event, the zero or load action is taken and the compare A or compare B action is ignored. If a compare A event coincides with a compare B event, the compare B action is taken and the compare A action is ignored.

If the Generator B update mode is immediate (based on the GENBUPD field encoding in the **PWMnCTL** register), the ACTCMPBD, ACTCMPBU, ACTCMPAD, ACTCMPAU, ACTLOAD, and ACTZERO values are used immediately. If the update mode is locally synchronized, these values are used the next time the counter reaches zero. If the update mode is globally synchronized, these values are used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 979). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**PWM0 Generator B Control (PWM0GENB)**

**Register 52: PWM0 Dead-Band Control (PWM0DBCTL), offset 0x068****Register 53: PWM1 Dead-Band Control (PWM1DBCTL), offset 0x0A8****Register 54: PWM2 Dead-Band Control (PWM2DBCTL), offset 0x0E8****Register 55: PWM3 Dead-Band Control (PWM3DBCTL), offset 0x128**

The **PWMnDBCTL** register controls the dead-band generator, which produces the PWMn signals based on the pwmA and pwmB signals. When disabled, the pwmA signal passes through to the pwmA' signal and the pwmB signal passes through to the pwmB' signal. When dead-band control is enabled, the pwmB signal is ignored, the pwmA' signal is generated by delaying the rising edge(s) of the pwmA signal by the value in the **PWMnDBRISE** register (see page 1027), and the pwmB' signal is generated by inverting the pwmA signal and delaying the falling edge(s) of the pwmA signal by the value in the **PWMnDBFALL** register (see page 1028). The Output Control block outputs the pwm0A' signal on the PWM0 signal and the pwm0B' signal on the PWM1 signal. In a similar manner, PWM2 and PWM3 are produced from the pwm1A' and pwm1B' signals, PWM4 and PWM5 are produced from the pwm2A' and pwm2B' signals, and PWM6 and PWM7 are produced from the pwm3A' and pwm3B' signals.

If the Dead-Band Control mode is immediate (based on the DBCTLUPD field encoding in the **PWMnCTL** register), the ENABLE bit value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 979). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

**Register 56: PWM0 Dead-Band Rising-Edge Delay (PWM0DBRISE), offset 0x06C**

**Register 57: PWM1 Dead-Band Rising-Edge Delay (PWM1DBRISE), offset 0x0AC**

**Register 58: PWM2 Dead-Band Rising-Edge Delay (PWM2DBRISE), offset 0x0EC**

**Register 59: PWM3 Dead-Band Rising-Edge Delay (PWM3DBRISE), offset 0x12C**

The **PWMnDBRISE** register contains the number of clock cycles to delay the rising edge of the pwmA signal when generating the pwmA' signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a High pulse on the pwmA signal, the rising-edge delay consumes the entire High time of the signal, resulting in no High time on the output. Care must be taken to ensure that the pwmA High time always exceeds the rising-edge delay.

If the Dead-Band Rising-Edge Delay mode is immediate (based on the DBRISEUPD field encoding in the **PWMnCTL** register), the 12-bit RISEDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 979). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 31:12     | reserved  | RO   | 0x0000.0 | Software should not rely on the value of a reserved bit. To provide compatibility with future products, the value of a reserved bit should be preserved across a read-modify-write operation. |
| 11:0      | RISEDELAY | R/W  | 0x000    | Dead-Band Rise Delay<br><br>The number of clock cycles to delay the rising edge of pwmA' after the rising edge of pwmA.                                                                       |

**Register 60: PWM0 Dead-Band Falling-Edge-Delay (PWM0DBFALL), offset 0x070**

**Register 61: PWM1 Dead-Band Falling-Edge-Delay (PWM1DBFALL), offset 0x0B0**

**Register 62: PWM2 Dead-Band Falling-Edge-Delay (PWM2DBFALL), offset 0x0F0**

**Register 63: PWM3 Dead-Band Falling-Edge-Delay (PWM3DBFALL), offset 0x130**

The **PWMnDBFALL** register contains the number of clock cycles to delay the rising edge of the pwmB' signal from the falling edge of the pwmA signal. If the dead-band generator is disabled through the **PWMnDBCTL** register, this register is ignored. If the value of this register is larger than the width of a Low pulse on the pwmA signal, the falling-edge delay consumes the entire Low time of the signal, resulting in no Low time on the output. Care must be taken to ensure that the pwmA Low time always exceeds the falling-edge delay.

If the Dead-Band Falling-Edge-Delay mode is immediate (based on the DBFALLUP field encoding in the **PWMnCTL** register), the 12-bit FALLDELAY value is used immediately. If the update mode is locally synchronized, this value is used the next time the counter reaches zero. If the update mode is globally synchronized, this value is used the next time the counter reaches zero after a synchronous update has been requested through the **PWM Master Control (PWMCTL)** register (see page 979). If this register is rewritten before the actual update occurs, the previous value is never used and is lost.

| 11:0      | FALLDELAY | R/W  | 0x000    | Dead-Band Fall Delay<br><br>The number of clock cycles to delay the falling edge of pwmB' from the rising edge of pwmA.                                                                       |

**Register 64: PWM0 Fault Source 0 (PWM0FLTSRC0), offset 0x074****Register 65: PWM1 Fault Source 0 (PWM1FLTSRC0), offset 0x0B4****Register 66: PWM2 Fault Source 0 (PWM2FLTSRC0), offset 0x0F4****Register 67: PWM3 Fault Source 0 (PWM3FLTSRC0), offset 0x134**

This register specifies which fault pin inputs are used to generate a fault condition. Each bit in the following register indicates whether the corresponding fault pin is included in the fault condition. All enabled fault pins are ORed together to form the **PWMnFLTSRC0** portion of the fault condition. The **PWMnFLTSRC0** fault condition is then ORed with the **PWMnFLTSRC1** fault condition to generate the final fault condition for the PWM generator.

If the FLTSRC bit in the **PWMnCTL** register (see page 1004) is clear, only the **Fault0** signal affects the fault condition generated. Otherwise, sources defined in **PWMnFLTSRC0** and **PWMnFLTSRC1** affect the fault condition generated.

**Register 72: PWM0 Minimum Fault Period (PWM0MINFLTPER), offset 0x07C**

**Register 73: PWM1 Minimum Fault Period (PWM1MINFLTPER), offset 0x0BC**

**Register 74: PWM2 Minimum Fault Period (PWM2MINFLTPER), offset 0x0FC**

**Register 75: PWM3 Minimum Fault Period (PWM3MINFLTPER), offset 0x13C**

If the MINFLTPER bit in the **PWMnCTL** register is set, this register specifies the 16-bit time-extension value to be used in extending the fault condition. The value is loaded into a 16-bit down counter, and the counter value is used to extend the fault condition. The fault condition is released in the clock immediately after the counter value reaches 0. The fault condition is asynchronous to the PWM clock; and the delay value is the product of the PWM clock period and the (MFP field value + 1) or (MFP field value + 2) depending on when the fault condition asserts with respect to the PWM clock. The counter decrements at the PWM clock rate, without pause or condition.

**Register 80: PWM0 Fault Status 0 (PWM0FLTSTAT0), offset 0x804****Register 81: PWM1 Fault Status 0 (PWM1FLTSTAT0), offset 0x884****Register 82: PWM2 Fault Status 0 (PWM2FLTSTAT0), offset 0x904****Register 83: PWM3 Fault Status 0 (PWM3FLTSTAT0), offset 0x984**

Along with the **PWMnFLTSTAT1** register, this register provides status regarding the fault condition inputs.

If the LATCH bit in the **PWMnCTL** register is clear, the contents of the **PWMnFLTSTAT0** register are read-only (RO) and provide the current state of the FAULTn inputs.

If the LATCH bit in the **PWMnCTL** register is set, the contents of the **PWMnFLTSTAT0** register are read / write 1 to clear (R/W1C) and provide a latched version of the FAULTn inputs. In this mode, the register bits are cleared by writing a 1 to a set bit. The FAULTn inputs are recorded after their sense is adjusted in the generator.

The contents of this register can only be written if the fault source extensions are enabled (the FLTSRC bit in the **PWMnCTL** register is set).

## 22 Quadrature Encoder Interface (QEI)

A quadrature encoder, also known as a 2-channel incremental encoder, converts linear displacement into a pulse signal. By monitoring both the number of pulses and the relative phase of the two signals, you can track the position, direction of rotation, and speed. In addition, a third channel, or index signal, can be used to reset the position counter.

The LM3S5791 microcontroller includes two quadrature encoder interface (QEI) modules. Each QEI module interprets the code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The Stellaris® LM3S5791 microcontroller includes two QEI modules providing control of two motors at the same time with the following features:

- Position integrator that tracks the encoder position
- Programmable noise filter on the inputs
- Velocity capture using built-in timer
- The input frequency of the QEI inputs may be as high as 1/4 of the processor frequency (for example, 12.5 MHz for a 50-MHz system)
- Interrupt generation on:
  - Index pulse
  - Velocity-timer expiration
  - Direction change
  - Quadrature error detection

### 22.1 Block Diagram

Figure 22-1 on page 1042 provides a block diagram of a Stellaris® QEI module.

Figure 22-1. QEI Block Diagram

## 22.2 Signal Description

Table 22-1 on page 1042 and Table 22-2 on page 1043 list the external signals of the QEI module and describe the function of each. The QEI signals are alternate functions for some GPIO signals and default to be GPIO signals at reset. The column in the table below titled "Pin Mux/Pin Assignment" lists the possible GPIO pin placements for these QEI signals. The AFSEL bit in the **GPIO Alternate Function Select (GPIOAFSEL)** register (page 324) should be set to choose the QEI function. The number in parentheses is the encoding that must be programmed into the PMCN field in the **GPIO Port Control (GPIOPCTL)** register (page 342) to assign the QEI signal to the specified GPIO port pin. For more information on configuring GPIOs, see "General-Purpose Input/Outputs (GPIOs)" on page 299.

Table 22-1. Signals for QEI (100LQFP)

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 22.3 Functional Description

The QEI module interprets the two-bit gray code produced by a quadrature encoder wheel to integrate position over time and determine direction of rotation. In addition, it can capture a running estimate of the velocity of the encoder wheel.

The position integrator and velocity capture can be independently enabled, though the position integrator must be enabled before the velocity capture can be enabled. The two phase signals, PhA and PhB, can be swapped before being interpreted by the QEI module to change the meaning of

forward and backward and to correct for miswiring of the system. Alternatively, the phase signals can be interpreted as a clock and direction signal as output by some encoders.

The QEI module input signals have a digital noise filter on them that can be enabled to prevent spurious operation. The noise filter requires that the inputs be stable for a specified number of consecutive clock cycles before updating the edge detector. The filter is enabled by the **FILTEN** bit in the **QEI Control (QEICTL)** register. The frequency of the input update is programmable using the **FILTCNT** bit field in the **QEICTL** register.

The QEI module supports two modes of signal operation: quadrature phase mode and clock/direction mode. In quadrature phase mode, the encoder produces two clocks that are 90 degrees out of phase; the edge relationship is used to determine the direction of rotation. In clock/direction mode, the encoder produces a clock signal to indicate steps and a direction signal to indicate the direction of rotation. This mode is determined by the **SIGMODE** bit of the **QEICTL** register (see page 1048).

When the QEI module is set to use the quadrature phase mode (**SIGMODE** bit is clear), the capture mode for the position integrator can be set to update the position counter on every edge of the PhA signal or to update on every edge of both PhA and PhB. Updating the position counter on every PhA and PhB edge provides more positional resolution at the cost of less range in the positional counter.

When edges on PhA lead edges on PhB, the position counter is incremented. When edges on PhB lead edges on PhA, the position counter is decremented. When a rising and falling edge pair is seen on one of the phases without any edges on the other, the direction of rotation has changed.

The positional counter is automatically reset on one of two conditions: sensing the index pulse or reaching the maximum position value. The reset mode is determined by the **RESMODE** bit of the **QEICTL** register.

When **RESMODE** is set, the positional counter is reset when the index pulse is sensed. This mode limits the positional counter to the values [0:N-1], where N is the number of phase edges in a full revolution of the encoder wheel. The **QEI Maximum Position (QEIMAXPOS)** register must be programmed with N-1 so that the reverse direction from position 0 can move the position counter to N-1. In this mode, the position register contains the absolute position of the encoder relative to the index (or home) position once an index pulse has been seen.

When **RESMODE** is clear, the positional counter is constrained to the range [0:M], where M is the programmable maximum value. The index pulse is ignored by the positional counter in this mode.

Velocity capture uses a configurable timer and a count register. The timer counts the number of phase edges (using the same configuration as for the position integrator) in a given time period. The edge count from the previous time period is available to the controller via the **QEI Velocity (QEISPEED)** register, while the edge count for the current time period is being accumulated in the **QEI Velocity Counter (QEICOUNT)** register. As soon as the current time period is complete, the total number of edges counted in that time period is made available in the **QEISPEED** register (overwriting the previous value), the **QEICOUNT** register is cleared, and counting commences on a new time period. The number of edges counted in a given time period is directly proportional to the velocity of the encoder.

Figure 22-2 on page 1045 shows how the Stellaris® quadrature encoder converts the phase input signals into clock pulses, the direction signal, and how the velocity predivider operates (in Divide by 4 mode).

**Figure 22-2. Quadrature Encoder and Velocity Predivider Operation**

The period of the timer is configurable by specifying the load value for the timer in the **QEI Timer Load (QEILOAD)** register. When the timer reaches zero, an interrupt can be triggered, and the hardware reloads the timer with the **QEILOAD** value and continues to count down. At lower encoder speeds, a longer timer period is required to be able to capture enough edges to have a meaningful result. At higher encoder speeds, both a shorter timer period and/or the velocity predivider can be used.

The following equation converts the velocity counter value into an rpm value:

$$\text{rpm} = (\text{clock} * (2 ^ \text{VELDIV}) * \text{SPEED} * 60) \div (\text{LOAD} * \text{ppr} * \text{edges})$$

where:

clock is the controller clock rate

ppr is the number of pulses per revolution of the physical encoder

edges is 2 or 4, based on the capture mode set in the **QEICTL** register (2 for CAPMODE clear and 4 for CAPMODE set)

For example, consider a motor running at 600 rpm. A 2048 pulse per revolution quadrature encoder is attached to the motor, producing 8192 phase edges per revolution. With a velocity predivider of ÷1 (VELDIV is clear) and clocking on both PhA and PhB edges, this results in 81,920 pulses per second (the motor turns 10 times per second). If the timer were clocked at 10,000 Hz, and the load value was 2,500 (¼ of a second), it would count 20,480 pulses per update. Using the above equation:

$$\text{rpm} = (10000 * 1 * 20480 * 60) \div (2500 * 2048 * 4) = 600 \text{ rpm}$$

Now, consider that the motor is sped up to 3000 rpm. This results in 409,600 pulses per second, or 102,400 every ¼ of a second. Again, the above equation gives:

$$\text{rpm} = (10000 * 1 * 102400 * 60) \div (2500 * 2048 * 4) = 3000 \text{ rpm}$$

Care must be taken when evaluating this equation because intermediate values may exceed the capacity of a 32-bit integer. In the above examples, the clock is 10,000 and the divisor is 2,500; both could be predivided by 100 (at compile time if they are constants) and therefore be 100 and 25. In fact, if they were compile-time constants, they could also be reduced to a simple multiply by 4, cancelled by the ÷4 for the edge-count factor.

**Important:** Reducing constant factors at compile time is the best way to control the intermediate values of this equation and reduce the processing requirement of computing this equation.

The division can be avoided by selecting a timer load value such that the divisor is a power of 2; a simple shift can therefore be done in place of the division. For encoders with a power of 2 pulses per revolution, the load value can be a power of 2. For other encoders, a load value must be selected such that the product is very close to a power of 2. For example, a 100 pulse-per-revolution encoder

could use a load value of 82, resulting in 32,800 as the divisor, which is 0.09% above  $2^{14}$ . In this case a shift by 15 would be an adequate approximation of the divide in most cases. If absolute accuracy were required, the microcontroller's divide instruction could be used.

The QEI module can produce a controller interrupt on several events: phase error, direction change, reception of the index pulse, and expiration of the velocity timer. Standard masking, raw interrupt status, interrupt status, and interrupt clear capabilities are provided.

## 22.4 Initialization and Configuration

The following example shows how to configure the Quadrature Encoder module to read back an absolute position:

1. Enable the QEI clock by writing a value of 0x0000.0100 to the **RCGC1** register in the System Control module (see page 179).
2. Enable the clock to the appropriate GPIO module via the **RCGC2** register in the System Control module (see page 191).
3. In the GPIO module, enable the appropriate pins for their alternate function using the **GPIOAFSEL** register. To determine which GPIOs to configure, see Table 24-4 on page 1090.
4. Configure the PMCN fields in the **GPIOPCTL** register to assign the QEI signals to the appropriate pins (see page 342 and Table 24-5 on page 1099).
5. Configure the quadrature encoder to capture edges on both signals and maintain an absolute position by resetting on index pulses. A 1000-line encoder with four edges per line, results in 4000 pulses per revolution; therefore, set the maximum position to 3999 (0xF9F) as the count is zero-based.
  - Write the **QEICTL** register with the value of 0x0000.0018.
  - Write the **QEIMAXPOS** register with the value of 0x0000.0F9F.
6. Enable the quadrature encoder by setting bit 0 of the **QEICTL** register.
7. Delay until the encoder position is required.
8. Read the encoder position by reading the **QEI Position (QEIPOS)** register value.

## 22.5 Register Map

Table 22-3 on page 1047 lists the QEI registers. The offset listed is a hexadecimal increment to the register's address, relative to the module's base address:

- QEIO: 0x4002.C000
- QEI1: 0x4002.D000

Note that the QEI module clock must be enabled before the registers can be programmed (see page 179).

Table 22-3. QEI Register Map

| Offset | Name      | Type  | Reset       | Description                    | See page |
|--------|-----------|-------|-------------|--------------------------------|----------|
| 0x000  | QEICTL    | R/W   | 0x0000.0000 | QEI Control                    | 1048     |

## 22.6 Register Descriptions

The remainder of this section lists and describes the QEI registers, in numerical order by address offset.

## Register 1: QEI Control (QEICTL), offset 0x000

This register contains the configuration of the QEI module. Separate enables are provided for the quadrature encoder and the velocity capture blocks; the quadrature encoder must be enabled in order to capture the velocity, but the velocity does not need to be captured in applications that do not need it. The phase signal interpretation, phase swap, Position Update mode, Position Reset mode, and velocity predivider are all set via this register.

### QEI Control (QEICTL)

Register 3: QEI Position (QEIPOS), offset 0x008

This register contains the current value of the position integrator. The value is updated by the status of the QEI phase inputs and can be set to a specific value by writing to it.

QEI Position (QEIPOS)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x008  
Type R/W, reset 0x0000.0000

| 31:0      | MAXPOS | R/W  | 0x0000.0000 | Maximum Position Integrator Value<br>The maximum value of the position integrator. |

Register 5: QEI Timer Load (QEILOAD), offset 0x010

This register contains the load value for the velocity timer. Because this value is loaded into the timer on the clock cycle after the timer is zero, this value should be one less than the number of clocks in the desired period. So, for example, to have 2000 decimal clocks per timer period, this register should contain 1999 decimal.

QEI Timer Load (QEILOAD)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x010  
Type R/W, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                            |
|-----------|------|------|-------------|----------------------------------------|
| 31:0      | LOAD | R/W  | 0x0000.0000 | Velocity Timer Load Value              |
|           |      |      |             | The load value for the velocity timer. |

Register 6: QEI Timer (QEITIME), offset 0x014

This register contains the current value of the velocity timer. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

QEI Timer (QEITIME)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x014  
Type RO, reset 0x0000.0000

| Bit/Field | Name | Type | Reset       | Description                                                              |
|-----------|------|------|-------------|--------------------------------------------------------------------------|
| 31:0      | TIME | RO   | 0x0000.0000 | Velocity Timer Current Value<br>The current value of the velocity timer. |

Register 7: QEI Velocity Counter (QEICOUNT), offset 0x018

This register contains the running count of velocity pulses for the current time period. Because this count is a running total, the time period to which it applies cannot be known with precision (that is, a read of this register does not necessarily correspond to the time returned by the **QEITIME** register because there is a small window of time between the two reads, during which either value may have changed). The **QEISPEED** register should be used to determine the actual encoder velocity; this register is provided for information purposes only. This counter does not increment when the VELEN bit in the **QEICTL** register is clear.

QEI Velocity Counter (QEICOUNT)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x018  
Type RO, reset 0x0000.0000

| Bit/Field | Name  | Type | Reset       | Description          |
|-----------|-------|------|-------------|----------------------|
| 31:0      | COUNT | RO   | 0x0000.0000 | Velocity Pulse Count |

The running total of encoder pulses during this velocity timer period.

Register 8: QEI Velocity (QEISPEED), offset 0x01C

This register contains the most recently measured velocity of the quadrature encoder. This value corresponds to the number of velocity pulses counted in the previous velocity timer period. This register does not update when the VELEN bit in the **QEICTL** register is clear.

QEI Velocity (QEISPEED)

QEIO base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x01C  
Type RO, reset 0x0000.0000

| Bit/Field | Name  | Type | Reset       | Description |
|-----------|-------|------|-------------|-------------|
| 31:0      | SPEED | RO   | 0x0000.0000 | Velocity    |

The measured speed of the quadrature encoder in pulses per period.

## Register 9: QEI Interrupt Enable (QEIINTEN), offset 0x020

This register contains enables for each of the QEI module interrupts. An interrupt is asserted to the interrupt controller if the corresponding bit in this register is set.

### QEI Interrupt Enable (QEIINTEN)

QEI0 base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x020  
Type R/W, reset 0x0000.0000

|       |          |    |    |    |    |    |    |    |    |    |    |    |          |        |          |          |

|           |          |      |       | 0 The INTINDEX interrupt is suppressed and not sent to the interrupt controller.                               |

## Register 10: QEI Raw Interrupt Status (QEIRIS), offset 0x024

This register provides the current set of interrupt sources that are asserted, regardless of whether they cause an interrupt to be asserted to the controller (configured through the **QEINTEN** register). If a bit is set, the latched event has occurred; if a bit is clear, the event in question has not occurred.

### QEI Raw Interrupt Status (QEIRIS)

QEIO base: 0x4002.C000  
QEI1 base: 0x4002.D000  
Offset 0x024  
Type RO, reset 0x0000.0000

## Register 11: QEI Interrupt Status and Clear (QEIISC), offset 0x028

This register provides the current set of interrupt sources that are asserted to the controller. If a bit is set, the latched event has occurred and is enabled to generate an interrupt; if a bit is clear the event in question has not occurred or is not enabled to generate an interrupt. This register is R/W1C; writing a 1 to a bit position clears the bit and the corresponding interrupt reason.

### QEI Interrupt Status and Clear (QEIISC)

QEIO base: 0x4002.C000

QEI1 base: 0x4002.D000

Offset 0x028

Type R/W1C, reset 0x0000.0000

|           |          |       |       | 0 No interrupt has occurred or the interrupt is masked.                                                                                         |
|           |          |       |       | This bit is cleared by writing a 1. Clearing this bit also clears the INTINDEX bit in the <b>QEIRIS</b> register.                               |

## 23 Pin Diagram

The LM3S5791 microcontroller pin diagrams are shown below.

Each GPIO signal is identified by its GPIO port unless it defaults to an alternate function on reset. In this case, the GPIO port name is followed by the default alternate function. To see a complete list of possible functions for each pin, see Table 24-5 on page 1099.

**Figure 23-1. 100-Pin LQFP Package Pin Diagram**

Figure 23-2. 108-Ball BGA Package Pin Diagram (Top View)

## 24 Signal Tables

The following tables list the signals available for each pin. Signals are configured as GPIOs on reset, except for those noted below. Use the **GPIOAMSEL** register (see page 340) to select analog mode. For a GPIO pin to be used for an alternate digital function, the corresponding bit in the **GPIOAFSEL** register (see page 324) must be set. Further pin muxing options are provided through the PMCx bit field in the **GPIOPCTL** register (see page 342), which selects one of several available peripheral functions for that GPIO.

**Important:** All GPIO pins are configured as GPIOs by default with the exception of the pins shown in the table below. A Power-On-Reset (POR) or asserting RST puts the pins back to their default state.

**Table 24-1. GPIO Pins With Default Alternate Functions**

| GPIO Pin | Default State     | GPIOAFSEL Bit | GPIOPCTL PMCx Bit Field |
|----------|-------------------|---------------|-------------------------|
| PA[1:0]  | UART0             | 1             | 0x1                     |
| PA[5:2]  | SSI0              | 1             | 0x1                     |
| PB[3:2]  | I <sup>2</sup> C0 | 1             | 0x1                     |
| PC[3:0]  | JTAG/SWD          | 1             | 0x3                     |

Table 24-2 on page 1067 shows the pin-to-signal-name mapping, including functional characteristics of the signals. Each possible alternate analog and digital function is listed for each pin.

Table 24-3 on page 1079 lists the signals in alphabetical order by signal name. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed. The "Pin Mux" column indicates the GPIO and the encoding needed in the PMCx bit field in the **GPIOPCTL** register.

Table 24-4 on page 1090 groups the signals by functionality, except for GPIOs. If it is possible for a signal to be on multiple pins, each possible pin assignment is listed.

Table 24-5 on page 1099 lists the GPIO pins and their analog and digital alternate functions. The AINx and VREFA analog signals are not 5-V tolerant and go through an isolation circuit before reaching their circuitry. These signals are configured by clearing the corresponding DEN bit in the **GPIO Digital Enable (GPIODEN)** register and setting the corresponding AMSEL bit in the **GPIO Analog Mode Select (GPIOAMSEL)** register. Other analog signals are 5-V tolerant and are connected directly to their circuitry (C0-, C0+, C1-, C1+, C2-, C2+, USB0VBUS, USB0ID). These signals are configured by clearing the DEN bit in the **GPIO Digital Enable (GPIODEN)** register. The digital signals are enabled by setting the appropriate bit in the **GPIO Alternate Function Select (GPIOAFSEL)** and **GPIODEN** registers and configuring the PMCx bit field in the **GPIO Port Control (GPIOPCTL)** register to the numeric encoding shown in the table below. Table entries that are shaded gray are the default values for the corresponding GPIO pin.

Table 24-6 on page 1102 lists the signals based on number of possible pin assignments. This table can be used to plan how to configure the pins for a particular functionality. Application Note AN01274 Configuring Stellaris® Microcontrollers with Pin Multiplexing provides an overview of the pin muxing implementation, an explanation of how a system designer defines a pin configuration, and examples of the pin configuration process.

|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                                                                                                                                                                                                                                           |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                                                                                                                                                                                                                         |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                   |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                                                                                                                                                                                                                                |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
| 7          | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| 8          | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |
| 9          | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                                                                                                                                                                                                                       |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 10         | PD0       | I/O      | TTL                      | GPIO port D bit 0.                                                          |
|            | AIN15     | I        | Analog                   | Analog-to-digital converter input 15.                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                       |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                    |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                         |
|            | PWM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                        |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                      |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 11         | PD1       | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14     | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 12         | PD2       | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13     | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20   | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 13         | PD3       | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12     | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7      | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21   | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3      | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 14         | EPI0S16    | I/O      | TTL                      | EPI module 0 signal 16.                                                                          |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PJ0        | I/O      | TTL                      | GPIO port J bit 0.                                                                               |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
| 15         | PH7        | I/O      | TTL                      | GPIO port H bit 7.                                                                               |
|            | EPI0S27    | I/O      | TTL                      | EPI module 0 signal 27.                                                                          |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Tx     | O        | TTL                      | SSI module 1 transmit.                                                                           |
| 16         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                                               |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                                     |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
| 17         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                                               |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                                              |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
| 18         | PG1        | I/O      | TTL                      | GPIO port G bit 1.                                                                               |
|            | EPI0S14    | I/O      | TTL                      | EPI module 0 signal 14.                                                                          |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | U2Tx       | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| 19         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                                               |
|            | EPI0S13    | I/O      | TTL                      | EPI module 0 signal 13.                                                                          |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| 20         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| 21         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 22         | PC7      | I/O      | TTL                      | GPIO port C bit 7.                                                                                        |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | C2-      | I        | Analog                   | Analog comparator 2 negative input.                                                                       |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | EPI0S5   | I/O      | TTL                      | EPI module 0 signal 5.                                                                                    |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 23         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                        |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                       |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                    |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 24         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                                        |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                                       |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                                    |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                              |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 25         | PC4      | I/O      | TTL                      | GPIO port C bit 4.                                                                                        |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S2   | I/O      | TTL                      | EPI module 0 signal 2.                                                                                    |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                                                     |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| 26         | PA0        | I/O      | TTL                      | GPIO port A bit 0.                                                                               |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | U0Rx       | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | U1Rx       | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                       |
| 27         | PA1        | I/O      | TTL                      | GPIO port A bit 1.                                                                               |
|            | I2C1SDA    | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                  |
|            | U0Tx       | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
|            | U1Tx       | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| 28         | PA2        | I/O      | TTL                      | GPIO port A bit 2.                                                                               |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | SSI0C1k    | I/O      | TTL                      | SSI module 0 clock.                                                                              |
| 29         | PA3        | I/O      | TTL                      | GPIO port A bit 3.                                                                               |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI0Fss    | I/O      | TTL                      | SSI module 0 frame.                                                                              |
| 30         | PA4        | I/O      | TTL                      | GPIO port A bit 4.                                                                               |
|            | CAN0Rx     | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | I2S0TXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                        |
|            | PWM6       | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                             |
|            | SSI0Rx     | I        | TTL                      | SSI module 0 receive.                                                                            |
| 31         | PA5        | I/O      | TTL                      | GPIO port A bit 5.                                                                               |
|            | CAN0Tx     | O        | TTL                      | CAN module 0 transmit.                                                                           |
|            | I2S0TXWS   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                  |
|            | PWM7       | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                             |
|            | SSI0Tx     | O        | TTL                      | SSI module 0 transmit.                                                                           |
| 32         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                          |
| 33         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| 34         | PA6        | I/O      | TTL                      | GPIO port A bit 6.                                                                               |
|            | CAN0Rx     | I        | TTL                      | CAN module 0 receive.                                                                            |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U1CTS      | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                           |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 35         | PA7       | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx    | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA   | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1      | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD     | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
| 36         | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
|            | PG7       | I/O      | TTL                      | GPIO port G bit 7.                                                                                        |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S31   | I/O      | TTL                      | EPI module 0 signal 31.                                                                                   |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
| 37         | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                                                     |
|            | PG6       | I/O      | TTL                      | GPIO port G bit 6.                                                                                        |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | I2S0RXWS  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                            |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | PhA1      | I        | TTL                      | QEI module 1 phase A.                                                                                     |
| 38         | U1RI      | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |
|            | VDDC      | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.        |
| 39         | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | EPI0S18   | I/O      | TTL                      | EPI module 0 signal 18.                                                                                   |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | PJ2       | I/O      | TTL                      | GPIO port J bit 2.                                                                                        |
| 40         | PG5       | I/O      | TTL                      | GPIO port G bit 5.                                                                                        |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | I2S0RXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                                                  |
|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                       |
|            | PWM7      | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | U1DTR     | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                                              |
| 41         | PG4       | I/O      | TTL                      | GPIO port G bit 4.                                                                                        |
|            | CCP3      | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S15   | I/O      | TTL                      | EPI module 0 signal 15.                                                                                   |
|            | Fault1    | I        | TTL                      | PWM Fault 1.                                                                                              |
|            | PWM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | U1RI      | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |
|------------|------------|----------|--------------------------|-------------------------------------------------------------------------------------------|
| 42         | PF7        | I/O      | TTL                      | GPIO port F bit 7.                                                                        |
|            | CCP4       | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                    |
|            | EPI0S12    | I/O      | TTL                      | EPI module 0 signal 12.                                                                   |
|            | Fault1     | I        | TTL                      | PWM Fault 1.                                                                              |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                     |
| 43         | PF6        | I/O      | TTL                      | GPIO port F bit 6.                                                                        |
|            | C20        | O        | TTL                      | Analog comparator 2 output.                                                               |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                    |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                          |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                                     |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                  |
| 44         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                                                   |
| 45         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                  |
| 46         | PF5        | I/O      | TTL                      | GPIO port F bit 5.                                                                        |
|            | C10        | O        | TTL                      | Analog comparator 1 output.                                                               |
|            | CCP2       | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                    |
|            | EPI0S15    | I/O      | TTL                      | EPI module 0 signal 15.                                                                   |
|            | SSI1TX     | O        | TTL                      | SSI module 1 transmit.                                                                    |
| 47         | PF0        | I/O      | TTL                      | GPIO port F bit 0.                                                                        |
|            | CAN1Rx     | I        | TTL                      | CAN module 1 receive.                                                                     |
|            | I2S0TXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                  |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                      |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                     |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                   |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                  |
|------------|------------|----------|--------------------------|--------------------------------------------------------------|
| 54         | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                       |
|            | EPI0S30    | I/O      | TTL                      | EPI module 0 signal 30.                                      |
|            | PJ6        | I/O      | TTL                      | GPIO port J bit 6.                                           |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.     |
| 55         | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                       |
|            | PJ7        | I/O      | TTL                      | GPIO port J bit 7.                                           |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal. |
| 56         | VDD        | -        | Power                    | Positive supply for I/O and some logic.                      |
| 57         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                     |
| 58         | PF4        | I/O      | TTL                      | GPIO port F bit 4.                                           |
|            | C0o        | O        | TTL                      | Analog comparator 0 output.                                  |
|            | CCP0       | I/O      | TTL                      | Capture/Compare/PWM 0.                                       |
|            | EPI0S12    | I/O      | TTL                      | EPI module 0 signal 12.                                      |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                 |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                        |
| 59         | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                           |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.         |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.         |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                          |
| 60         | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                           |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.         |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | SSI1C1k    | I/O      | TTL                      | SSI module 1 clock.                                          |
| 61         | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                           |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                       |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                       |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.             |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                          |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.         |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.     |
| 62         | PH6        | I/O      | TTL                      | GPIO port H bit 6.                                           |
|            | EPI0S26    | I/O      | TTL                      | EPI module 0 signal 26.                                      |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | SSI1Rx     | I        | TTL                      | SSI module 1 receive.                                        |
| 63         | PH5        | I/O      | TTL                      | GPIO port H bit 5.                                           |
|            | EPI0S11    | I/O      | TTL                      | EPI module 0 signal 11.                                      |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                 |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                          |
| 64         | RST        | I        | TTL                      | System reset input.                                          |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|------------|-----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 65         | PB3       | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                                            |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                  |

|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| 75         | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                                                        |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                                       |
| 76         | PH4      | I/O      | TTL                      | GPIO port H bit 4.                                                                                        |
|            | EPI0S10  | I/O      | TTL                      | EPI module 0 signal 10.                                                                                   |
|            | SSI1Clk  | I/O      | TTL                      | SSI module 1 clock.                                                                                       |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| 77         | PC3      | I/O      | TTL                      | GPIO port C bit 3.                                                                                        |
|            | SW0      | O        | TTL                      | JTAG TDO and SWO.                                                                                         |
|            | TD0      | O        | TTL                      | JTAG TDO and SWO.                                                                                         |
| 78         | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                                                                        |
|            | TDI      | I        | TTL                      | JTAG TDI.                                                                                                 |
| 79         | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                                                                        |
|            | SWDIO    | I/O      | TTL                      | JTAG TMS and SWDIO.                                                                                       |
|            | TMS      | I        | TTL                      | JTAG TMS and SWDIO.                                                                                       |
| 80         | PC0      | I/O      | TTL                      | GPIO port C bit 0.                                                                                        |
|            | SWCLK    | I        | TTL                      | JTAG/SWD CLK.                                                                                             |
|            | TCK      | I        | TTL                      | JTAG/SWD CLK.                                                                                             |
| 81         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                   |
| 82         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                                                  |
| 83         | PH3      | I/O      | TTL                      | GPIO port H bit 3.                                                                                        |
|            | EPI0S0   | I/O      | TTL                      | EPI module 0 signal 0.                                                                                    |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                              |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |
| 84         | PH2      | I/O      | TTL                      | GPIO port H bit 2.                                                                                        |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | EPI0S1   | I/O      | TTL                      | EPI module 0 signal 1.                                                                                    |
|            | Fault3   | I        | TTL                      | PWM Fault 3.                                                                                              |
|            | IDX1     | I        | TTL                      | QEI module 1 index.                                                                                       |
| 85         | PH1      | I/O      | TTL                      | GPIO port H bit 1.                                                                                        |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                    |
|            | EPI0S7   | I/O      | TTL                      | EPI module 0 signal 7.                                                                                    |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|------------|-----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 86         | PH0       | I/O      | TTL                      | GPIO port H bit 0.                                                                                                                                                                                                                                                                                                        |
|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                                                                                                                                                                    |
|            | EPI0S6    | I/O      | TTL                      | EPI module 0 signal 6.                                                                                                                                                                                                                                                                                                    |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                                      |
|            | PWM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                                                                                                                                                                                                                                      |
| 87         | EPI0S17   | I/O      | TTL                      | EPI module 0 signal 17.                                                                                                                                                                                                                                                                                                   |

|            | CCP6      | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                                                                                                                                                                                                                                    |
|            | EPI0S22   | I/O      | TTL                      | EPI module 0 signal 22.                                                                                                                                                                                                                                                                                                   |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                               |

Table 24-2. Signals by Pin Number (*continued*)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                |
|------------|----------|----------|--------------------------|----------------------------------------------------------------------------|
| 92         | PB4      | I/O      | TTL                      | GPIO port B bit 4.                                                         |
|            | AIN10    | I        | Analog                   | Analog-to-digital converter input 10.                                      |
|            | C0-      | I        | Analog                   | Analog comparator 0 negative input.                                        |
|            | CAN0RX   | I        | TTL                      | CAN module 0 receive.                                                      |
|            | EPI0S23  | I/O      | TTL                      | EPI module 0 signal 23.                                                    |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                        |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Rx     | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation. |
| 93         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                    |
| 94         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                   |
| 95         | PE2      | I/O      | TTL                      | GPIO port E bit 2.                                                         |
|            | AIN9     | I        | Analog                   | Analog-to-digital converter input 9.                                       |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                     |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                     |
|            | EPI0S24  | I/O      | TTL                      | EPI module 0 signal 24.                                                    |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                      |
|            | PhB1     | I        | TTL                      | QEI module 1 phase B.                                                      |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                      |
| 96         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                         |
|            | AIN8     | I        | Analog                   | Analog-to-digital converter input 8.                                       |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                     |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                     |
|            | EPI0S25  | I/O      | TTL                      | EPI module 0 signal 25.                                                    |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                      |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                     |
| 97         | PD4      | I/O      | TTL                      | GPIO port D bit 4.                                                         |
|            | AIN7     | I        | Analog                   | Analog-to-digital converter input 7.                                       |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                     |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                     |
|            | EPI0S19  | I/O      | TTL                      | EPI module 0 signal 19.                                                    |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                    |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                    |

Table 24-2. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------|
| 98         | PD5       | I/O      | TTL                      | GPIO port D bit 5.                                                          |
|            | AIN6      | I        | Analog                   | Analog-to-digital converter input 6.                                        |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S28   | I/O      | TTL                      | EPI module 0 signal 28.                                                     |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                             |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.  |
| 99         | PD6       | I/O      | TTL                      | GPIO port D bit 6.                                                          |
|            | AIN5      | I        | Analog                   | Analog-to-digital converter input 5.                                        |
|            | EPI0S29   | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                   |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| 100        | PD7       | I/O      | TTL                      | GPIO port D bit 7.                                                          |
|            | AIN4      | I        | Analog                   | Analog-to-digital converter input 4.                                        |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-3. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | 1          | PE7                      | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | 2          | PE6                      | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | 5          | PE5                      | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | 6          | PE4                      | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | 100        | PD7                      | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | 99         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | 98         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | 97         | PD4                      | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | 96         | PE3                      | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | 95         | PE2                      | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | 92         | PB4                      | I        | Analog                   | Analog-to-digital converter input 10. |
| AIN11    | 91         | PB5                      | I        | Analog                   | Analog-to-digital converter input 11. |
| AIN12    | 13         | PD3                      | I        | Analog                   | Analog-to-digital converter input 12. |
| AIN13    | 12         | PD2                      | I        | Analog                   | Analog-to-digital converter input 13. |

Table 24-3. Signals by Signal Name (continued)

| Pin Name | Pin Number     | Pin Mux / Pin Assignment      | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                    |
|----------|----------------|-------------------------------|----------|--------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IDX1     | 17<br>61<br>84 | PG2 (8)<br>PF1 (2)<br>PH2 (1) | I        | TTL                      | QEI module 1 index.                                                                                                                                                                                                                                                                                            |
| LD0      | 7              | fixed                         | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| NC       | 51             | fixed                         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| NMI      | 89             | PB7 (4)                       | I        | TTL                      | Non-maskable interrupt.                                                                                                                                                                                                                                                                                        |

| USB0RBIAS | 73                                          | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                                                                  |
| USB0VBUS  | 67                                          | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                                        |
| VDD       | 8<br>20<br>32<br>44<br>56<br>68<br>81<br>93 | fixed                                                                     | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                   |
| VDDA      | 3                                           | fixed                                                                     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                       |
| VDDC      | 38<br>88                                    | fixed                                                                     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                        |
| VREFA     | 90                                          | PB6                                                                       | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1145. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-4. Signals by Function, Except for GPIO

| Function           | Pin Name | Pin Number                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |

|                    | VREFA    | 90                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1145. |

|          | USB0DP    | 71                                     | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |
|          | USB0EPEN  | 19<br>24<br>34<br>72<br>83             | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | 66                                     | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | 22<br>23<br>35<br>65<br>74<br>76<br>87 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | 73                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | 67                                     | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |
|          |           |                                        |          |                          |                                                                                                                                                                                                                                                               |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 24.2 108-Pin BGA Package Pin Tables

Table 24-7. Signals by Pin Number

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                  |
|------------|----------|----------|--------------------------|--------------------------------------------------------------|
| A1         | PE6      | I/O      | TTL                      | GPIO port E bit 6.                                           |
|            | AIN1     | I        | Analog                   | Analog-to-digital converter input 1.                         |
|            | C1o      | O        | TTL                      | Analog comparator 1 output.                                  |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.         |
|            | U1CTS    | I        | TTL                      | UART module 1 Clear To Send modem status input signal.       |
| A2         | PD7      | I/O      | TTL                      | GPIO port D bit 7.                                           |
|            | AIN4     | I        | Analog                   | Analog-to-digital converter input 4.                         |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                  |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                       |
|            | EPI0S30  | I/O      | TTL                      | EPI module 0 signal 30.                                      |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.              |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                          |
|            | U1DTR    | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|------------|-----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| A3         | PD6       | I/O      | TTL                      | GPIO port D bit 6.                                                                                                                                                                                                                                                                                                        |
|            | AIN5      | I        | Analog                   | Analog-to-digital converter input 5.                                                                                                                                                                                                                                                                                      |
|            | EPI0S29   | I/O      | TTL                      | EPI module 0 signal 29.                                                                                                                                                                                                                                                                                                   |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                                                                              |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                                                                                                                                                                                                                                                 |
|            | U2Tx      | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                               |
| A4         | PE2       | I/O      | TTL                      | GPIO port E bit 2.                                                                                                                                                                                                                                                                                                        |
|            | AIN9      | I        | Analog                   | Analog-to-digital converter input 9.                                                                                                                                                                                                                                                                                      |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                                    |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                                                                                                                                                                                                                                    |
|            | EPI0S24   | I/O      | TTL                      | EPI module 0 signal 24.                                                                                                                                                                                                                                                                                                   |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                                                                                                                                                                                                                                                                     |
|            | PhB1      | I        | TTL                      | QEI module 1 phase B.                                                                                                                                                                                                                                                                                                     |
|            | SSI1Rx    | I        | TTL                      | SSI module 1 receive.                                                                                                                                                                                                                                                                                                     |
| A5         | GNDA      | -        | Power                    | The ground reference for the analog circuits (ADC, Analog Comparators, etc.). These are separated from GND to minimize the electrical noise contained on VDD from affecting the analog functions.                                                                                                                         |
| A6         | PB4       | I/O      | TTL                      | GPIO port B bit 4.                                                                                                                                                                                                                                                                                                        |
|            | AIN10     | I        | Analog                   | Analog-to-digital converter input 10.                                                                                                                                                                                                                                                                                     |
|            | C0-       | I        | Analog                   | Analog comparator 0 negative input.                                                                                                                                                                                                                                                                                       |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                                                                                                                                                                                                                                                     |

|            | IDX0      | I        | TTL                      | QEI module 0 index.                                                                                                                                                                                                                                                                                                       |
|            | VREFA     | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1145. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|----------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| A8         | PB7      | I/O      | TTL                      | GPIO port B bit 7.                                                                               |
|            | NMI      | I        | TTL                      | Non-maskable interrupt.                                                                          |
| A9         | PC0      | I/O      | TTL                      | GPIO port C bit 0.                                                                               |
|            | SWCLK    | I        | TTL                      | JTAG/SWD CLK.                                                                                    |
|            | TCK      | I        | TTL                      | JTAG/SWD CLK.                                                                                    |
| A10        | PC3      | I/O      | TTL                      | GPIO port C bit 3.                                                                               |
|            | SW0      | O        | TTL                      | JTAG TDO and SWO.                                                                                |
|            | TD0      | O        | TTL                      | JTAG TDO and SWO.                                                                                |
| A11        | PB2      | I/O      | TTL                      | GPIO port B bit 2.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | I2C0SCL  | I/O      | OD                       | I <sup>2</sup> C module 0 clock.                                                                 |
|            | IDX0     | I        | TTL                      | QEI module 0 index.                                                                              |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |
| A12        | PE1      | I/O      | TTL                      | GPIO port E bit 1.                                                                               |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                           |
|            | EPI0S9   | I/O      | TTL                      | EPI module 0 signal 9.                                                                           |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Fss  | I/O      | TTL                      | SSI module 1 frame.                                                                              |
| B1         | PE7      | I/O      | TTL                      | GPIO port E bit 7.                                                                               |
|            | AIN0     | I        | Analog                   | Analog-to-digital converter input 0.                                                             |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                     |
| B2         | PE4      | I/O      | TTL                      | GPIO port E bit 4.                                                                               |
|            | AIN3     | I        | Analog                   | Analog-to-digital converter input 3.                                                             |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                  |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation.                      |
| B3         | PE5      | I/O      | TTL                      | GPIO port E bit 5.                                                                               |
|            | AIN2     | I        | Analog                   | Analog-to-digital converter input 2.                                                             |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                           |
|            | I2S0TXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                         |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| B4         | PE3      | I/O      | TTL                      | GPIO port E bit 3.                                                                                        |
|            | AIN8     | I        | Analog                   | Analog-to-digital converter input 8.                                                                      |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                                                    |
|            | EPI0S25  | I/O      | TTL                      | EPI module 0 signal 25.                                                                                   |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                                                     |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
| B5         | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                                    |
|            | PD4      | I/O      | TTL                      | GPIO port D bit 4.                                                                                        |
|            | AIN7     | I        | Analog                   | Analog-to-digital converter input 7.                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S19  | I/O      | TTL                      | EPI module 0 signal 19.                                                                                   |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                                   |
| B6         | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                                   |
|            | EPI0S17  | I/O      | TTL                      | EPI module 0 signal 17.                                                                                   |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PJ1      | I/O      | TTL                      | GPIO port J bit 1.                                                                                        |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
| B7         | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
|            | PB5      | I/O      | TTL                      | GPIO port B bit 5.                                                                                        |
|            | AIN11    | I        | Analog                   | Analog-to-digital converter input 11.                                                                     |
|            | C0o      | O        | TTL                      | Analog comparator 0 output.                                                                               |
|            | C1-      | I        | Analog                   | Analog comparator 1 negative input.                                                                       |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                                    |
|            | EPI0S22  | I/O      | TTL                      | EPI module 0 signal 22.                                                                                   |
| B8         | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | PC2      | I/O      | TTL                      | GPIO port C bit 2.                                                                                        |
| B9         | TDI      | I        | TTL                      | JTAG TDI.                                                                                                 |
|            | PC1      | I/O      | TTL                      | GPIO port C bit 1.                                                                                        |
|            | SWDIO    | I/O      | TTL                      | JTAG TMS and SWDIO.                                                                                       |
| B9         | TMS      | I        | TTL                      | JTAG TMS and SWDIO.                                                                                       |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                         |

|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                                                                                                                                                                                                                         |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                                                                           |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                                                                    |
|            | USB0VBUS | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                             |
| E1         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| E2         | NC       | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                                                                   |
| E3         | LDO      | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LDO pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |
| E10        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                        |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                   |
|------------|-----------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| E11        | PB3       | I/O      | TTL                      | GPIO port B bit 3.                                                                                                                                                                                                                                            |
|            | Fault0    | I        | TTL                      | PWM Fault 0.                                                                                                                                                                                                                                                  |
|            | Fault3    | I        | TTL                      | PWM Fault 3.                                                                                                                                                                                                                                                  |
|            | I2C0SDA   | I/O      | OD                       | I <sup>2</sup> C module 0 data.                                                                                                                                                                                                                               |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
| E12        | PB0       | I/O      | TTL                      | GPIO port B bit 0.                                                                                                                                                                                                                                            |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                                                                                                                                                                        |
|            | PWM2      | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                                                                                                                                                                                          |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |
|            | USB0ID    | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
| F1         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                  |
| F2         | NC        | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                                                                                                                                                                                                  |

|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                                                                                                                                                                        |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |
|            | U2Rx      | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                                                                                                                                                                                    |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| G2         | PD1      | I/O      | TTL                      | GPIO port D bit 1.                                                          |
|            | AIN14    | I        | Analog                   | Analog-to-digital converter input 14.                                       |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | I2S0RXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                              |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PhA0     | I        | TTL                      | QEI module 0 phase A.                                                       |
|            | PhB1     | I        | TTL                      | QEI module 1 phase B.                                                       |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| G3         | PH6      | I/O      | TTL                      | GPIO port H bit 6.                                                          |
|            | EPI0S26  | I/O      | TTL                      | EPI module 0 signal 26.                                                     |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                       |
| G10        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G11        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| G12        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| H1         | PD3      | I/O      | TTL                      | GPIO port D bit 3.                                                          |
|            | AIN12    | I        | Analog                   | Analog-to-digital converter input 12.                                       |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | CCP7     | I/O      | TTL                      | Capture/Compare/PWM 7.                                                      |
|            | EPI0S21  | I/O      | TTL                      | EPI module 0 signal 21.                                                     |
|            | PWM3     | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                        |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation. |
| H2         | PD2      | I/O      | TTL                      | GPIO port D bit 2.                                                          |
|            | AIN13    | I        | Analog                   | Analog-to-digital converter input 13.                                       |
|            | CCP5     | I/O      | TTL                      | Capture/Compare/PWM 5.                                                      |
|            | CCP6     | I/O      | TTL                      | Capture/Compare/PWM 6.                                                      |
|            | EPI0S20  | I/O      | TTL                      | EPI module 0 signal 20.                                                     |
|            | PWM2     | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                        |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.  |
| H3         | PH7      | I/O      | TTL                      | GPIO port H bit 7.                                                          |
|            | EPI0S27  | I/O      | TTL                      | EPI module 0 signal 27.                                                     |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                      |
| H10        | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |

Table 24-7. Signals by Pin Number (*continued*)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|------------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| H11        | RST        | I        | TTL                      | System reset input.                                                                              |
| H12        | PF1        | I/O      | TTL                      | GPIO port F bit 1.                                                                               |
|            | CAN1Tx     | O        | TTL                      | CAN module 1 transmit.                                                                           |
|            | CCP3       | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                                 |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                                              |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                         |
| J1         | PG2        | I/O      | TTL                      | GPIO port G bit 2.                                                                               |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | I2S0RXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                          |
|            | IDX1       | I        | TTL                      | QEI module 1 index.                                                                              |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
| J2         | PG3        | I/O      | TTL                      | GPIO port G bit 3.                                                                               |
|            | Fault0     | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | Fault2     | I        | TTL                      | PWM Fault 2.                                                                                     |
|            | I2S0RXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                  |
|            | PWM1       | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                             |
| J3         | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| J10        | GND        | -        | Power                    | Ground reference for logic and I/O pins.                                                         |
| J11        | PF2        | I/O      | TTL                      | GPIO port F bit 2.                                                                               |
|            | PWM2       | O        | TTL                      | PWM 2. This signal is controlled by PWM Generator 1.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1C1k    | I/O      | TTL                      | SSI module 1 clock.                                                                              |
| J12        | PF3        | I/O      | TTL                      | GPIO port F bit 3.                                                                               |
|            | PWM3       | O        | TTL                      | PWM 3. This signal is controlled by PWM Generator 1.                                             |
|            | PWM5       | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                             |
|            | SSI1Fss    | I/O      | TTL                      | SSI module 1 frame.                                                                              |
| K1         | PG0        | I/O      | TTL                      | GPIO port G bit 0.                                                                               |
|            | EPI0S13    | I/O      | TTL                      | EPI module 0 signal 13.                                                                          |
|            | I2C1SCL    | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                 |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                             |
|            | PWM4       | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                             |
|            | U2Rx       | I        | TTL                      | UART module 2 receive. When in IrDA mode, this signal has IrDA modulation.                       |
|            | USB0EPEN   | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                 |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------|
| K2         | PG1      | I/O      | TTL                      | GPIO port G bit 1.                                                          |
|            | EPI0S14  | I/O      | TTL                      | EPI module 0 signal 14.                                                     |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                             |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                        |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                        |
|            | U2Tx     | O        | TTL                      | UART module 2 transmit. When in IrDA mode, this signal has IrDA modulation. |
| K3         | PG4      | I/O      | TTL                      | GPIO port G bit 4.                                                          |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                      |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                     |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                        |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                     |
| K4         | PF7      | I/O      | TTL                      | GPIO port F bit 7.                                                          |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                     |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                       |
| K5         | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| K6         | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                      |
|            | EPI0S18  | I/O      | TTL                      | EPI module 0 signal 18.                                                     |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                |
|            | PJ2      | I/O      | TTL                      | GPIO port J bit 2.                                                          |
| K7         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| K8         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| K9         | VDD      | -        | Power                    | Positive supply for I/O and some logic.                                     |
| K10        | GND      | -        | Power                    | Ground reference for logic and I/O pins.                                    |
| K11        | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                      |
|            | EPI0S28  | I/O      | TTL                      | EPI module 0 signal 28.                                                     |
|            | PJ4      | I/O      | TTL                      | GPIO port J bit 4.                                                          |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                |
| K12        | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                      |
|            | EPI0S29  | I/O      | TTL                      | EPI module 0 signal 29.                                                     |
|            | PJ5      | I/O      | TTL                      | GPIO port J bit 5.                                                          |
|            | U1DSR    | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                     |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|-----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| L1         | PC4       | I/O      | TTL                      | GPIO port C bit 4.                                                                                        |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | CCP2      | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                                    |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | CCP5      | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                                    |
|            | EPI0S2    | I/O      | TTL                      | EPI module 0 signal 2.                                                                                    |
|            | PwM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | PhA0      | I        | TTL                      | QEI module 0 phase A.                                                                                     |
| L2         | PC7       | I/O      | TTL                      | GPIO port C bit 7.                                                                                        |
|            | C10       | O        | TTL                      | Analog comparator 1 output.                                                                               |
|            | C2-       | I        | Analog                   | Analog comparator 2 negative input.                                                                       |
|            | CCP0      | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP4      | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | EPI0S5    | I/O      | TTL                      | EPI module 0 signal 5.                                                                                    |
|            | PhB0      | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Tx      | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | USB0PFLT  | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| L3         | PA0       | I/O      | TTL                      | GPIO port A bit 0.                                                                                        |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                          |
|            | U0Rx      | I        | TTL                      | UART module 0 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | U1Rx      | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
| L4         | PA3       | I/O      | TTL                      | GPIO port A bit 3.                                                                                        |
|            | I2S0RXCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 receive master clock.                                                           |
|            | PwM5      | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI0Fss   | I/O      | TTL                      | SSI module 0 frame.                                                                                       |
| L5         | PA4       | I/O      | TTL                      | GPIO port A bit 4.                                                                                        |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                                     |
|            | I2S0TXSCK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit clock.                                                                 |
|            | PwM6      | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                                      |
|            | SSI0Rx    | I        | TTL                      | SSI module 0 receive.                                                                                     |
| L6         | PA6       | I/O      | TTL                      | GPIO port A bit 6.                                                                                        |
|            | CAN0Rx    | I        | TTL                      | CAN module 0 receive.                                                                                     |
|            | CCP1      | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                                    |
|            | I2C1SCL   | I/O      | OD                       | I <sup>2</sup> C module 1 clock.                                                                          |
|            | PwM0      | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                                      |
|            | PwM4      | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | U1CTS     | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                                    |
|            | USB0EPEN  | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.          |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                      |
|------------|----------|----------|--------------------------|--------------------------------------------------------------------------------------------------|
| L7         | PG6      | I/O      | TTL                      | GPIO port G bit 6.                                                                               |
|            | Fault1   | I        | TTL                      | PWM Fault 1.                                                                                     |
|            | I2S0RXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 receive word select.                                                   |
|            | PWM6     | O        | TTL                      | PWM 6. This signal is controlled by PWM Generator 3.                                             |
|            | PhA1     | I        | TTL                      | QEI module 1 phase A.                                                                            |
|            | U1RI     | I        | TTL                      | UART module 1 Ring Indicator modem status input signal.                                          |
| L8         | PF5      | I/O      | TTL                      | GPIO port F bit 5.                                                                               |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                      |
|            | CCP2     | I/O      | TTL                      | Capture/Compare/PWM 2.                                                                           |
|            | EPI0S15  | I/O      | TTL                      | EPI module 0 signal 15.                                                                          |
|            | SSI1Tx   | O        | TTL                      | SSI module 1 transmit.                                                                           |
| L9         | PF4      | I/O      | TTL                      | GPIO port F bit 4.                                                                               |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                      |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | EPI0S12  | I/O      | TTL                      | EPI module 0 signal 12.                                                                          |
|            | Fault0   | I        | TTL                      | PWM Fault 0.                                                                                     |
|            | SSI1Rx   | I        | TTL                      | SSI module 1 receive.                                                                            |
| L10        | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | EPI0S30  | I/O      | TTL                      | EPI module 0 signal 30.                                                                          |
|            | PJ6      | I/O      | TTL                      | GPIO port J bit 6.                                                                               |
|            | U1RTS    | O        | TTL                      | UART module 1 Request to Send modem output control line.                                         |
| L11        | OSC0     | I        | Analog                   | Main oscillator crystal input or an external clock reference input.                              |
| L12        | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                           |
|            | PJ7      | I/O      | TTL                      | GPIO port J bit 7.                                                                               |
|            | U1DTR    | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                                     |
| M1         | PC5      | I/O      | TTL                      | GPIO port C bit 5.                                                                               |
|            | C00      | O        | TTL                      | Analog comparator 0 output.                                                                      |
|            | C1+      | I        | Analog                   | Analog comparator 1 positive input.                                                              |
|            | C10      | O        | TTL                      | Analog comparator 1 output.                                                                      |
|            | CCP1     | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                           |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                           |
|            | EPI0S3   | I/O      | TTL                      | EPI module 0 signal 3.                                                                           |
|            | Fault2   | I        | TTL                      | PWM Fault 2.                                                                                     |
|            | USB0EPEN | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                               |
|------------|----------|----------|--------------------------|-----------------------------------------------------------------------------------------------------------|
| M2         | PC6      | I/O      | TTL                      | GPIO port C bit 6.                                                                                        |
|            | C2+      | I        | Analog                   | Analog comparator 2 positive input.                                                                       |
|            | C2o      | O        | TTL                      | Analog comparator 2 output.                                                                               |
|            | CCP0     | I/O      | TTL                      | Capture/Compare/PWM 0.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | EPI0S4   | I/O      | TTL                      | EPI module 0 signal 4.                                                                                    |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | PhB0     | I        | TTL                      | QEI module 0 phase B.                                                                                     |
|            | U1Rx     | I        | TTL                      | UART module 1 receive. When in IrDA mode, this signal has IrDA modulation.                                |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |
| M3         | PA1      | I/O      | TTL                      | GPIO port A bit 1.                                                                                        |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | U0Tx     | O        | TTL                      | UART module 0 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
|            | U1Tx     | O        | TTL                      | UART module 1 transmit. When in IrDA mode, this signal has IrDA modulation.                               |
| M4         | PA2      | I/O      | TTL                      | GPIO port A bit 2.                                                                                        |
|            | I2S0RXSD | I/O      | TTL                      | I <sup>2</sup> S module 0 receive data.                                                                   |
|            | PWM4     | O        | TTL                      | PWM 4. This signal is controlled by PWM Generator 2.                                                      |
|            | SSI0C1k  | I/O      | TTL                      | SSI module 0 clock.                                                                                       |
| M5         | PA5      | I/O      | TTL                      | GPIO port A bit 5.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | I2S0TXWS | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit word select.                                                           |
|            | PWM7     | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                                      |
|            | SSI0Tx   | O        | TTL                      | SSI module 0 transmit.                                                                                    |
| M6         | PA7      | I/O      | TTL                      | GPIO port A bit 7.                                                                                        |
|            | CAN0Tx   | O        | TTL                      | CAN module 0 transmit.                                                                                    |
|            | CCP3     | I/O      | TTL                      | Capture/Compare/PWM 3.                                                                                    |
|            | CCP4     | I/O      | TTL                      | Capture/Compare/PWM 4.                                                                                    |
|            | I2C1SDA  | I/O      | OD                       | I <sup>2</sup> C module 1 data.                                                                           |
|            | PWM1     | O        | TTL                      | PWM 1. This signal is controlled by PWM Generator 0.                                                      |
|            | PWM5     | O        | TTL                      | PWM 5. This signal is controlled by PWM Generator 2.                                                      |
|            | U1DCD    | I        | TTL                      | UART module 1 Data Carrier Detect modem status input signal.                                              |
|            | USB0PFLT | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source. |

Table 24-7. Signals by Pin Number (continued)

| Pin Number | Pin Name   | Pin Type | Buffer Type <sup>a</sup> | Description                                                                               |
|------------|------------|----------|--------------------------|-------------------------------------------------------------------------------------------|
| M7         | PG5        | I/O      | TTL                      | GPIO port G bit 5.                                                                        |
|            | CCP5       | I/O      | TTL                      | Capture/Compare/PWM 5.                                                                    |
|            | Fault1     | I        | TTL                      | PWM Fault 1.                                                                              |
|            | I2S0RXSCK  | I/O      | TTL                      | I <sup>2</sup> S module 0 receive clock.                                                  |
|            | IDX0       | I        | TTL                      | QEI module 0 index.                                                                       |
|            | PWM7       | O        | TTL                      | PWM 7. This signal is controlled by PWM Generator 3.                                      |
|            | U1DTR      | O        | TTL                      | UART module 1 Data Terminal Ready modem status input signal.                              |
| M8         | PF6        | I/O      | TTL                      | GPIO port F bit 6.                                                                        |
|            | C20        | O        | TTL                      | Analog comparator 2 output.                                                               |
|            | CCP1       | I/O      | TTL                      | Capture/Compare/PWM 1.                                                                    |
|            | I2S0TXMCLK | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit master clock.                                          |
|            | PhA0       | I        | TTL                      | QEI module 0 phase A.                                                                     |
|            | U1RTS      | O        | TTL                      | UART module 1 Request to Send modem output control line.                                  |
| M9         | PF0        | I/O      | TTL                      | GPIO port F bit 0.                                                                        |
|            | CAN1Rx     | I        | TTL                      | CAN module 1 receive.                                                                     |
|            | I2S0TXSD   | I/O      | TTL                      | I <sup>2</sup> S module 0 transmit data.                                                  |
|            | PWM0       | O        | TTL                      | PWM 0. This signal is controlled by PWM Generator 0.                                      |
|            | PhB0       | I        | TTL                      | QEI module 0 phase B.                                                                     |
|            | U1DSR      | I        | TTL                      | UART module 1 Data Set Ready modem output control line.                                   |
| M10        | CCP6       | I/O      | TTL                      | Capture/Compare/PWM 6.                                                                    |
|            | EPI0S19    | I/O      | TTL                      | EPI module 0 signal 19.                                                                   |
|            | PJ3        | I/O      | TTL                      | GPIO port J bit 3.                                                                        |
|            | U1CTS      | I        | TTL                      | UART module 1 Clear To Send modem status input signal.                                    |
| M11        | OSC1       | O        | Analog                   | Main oscillator crystal output. Leave unconnected when using a single-ended clock source. |
| M12        | NC         | -        | -                        | No connect. Leave the pin electrically unconnected/isolated.                              |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

Table 24-8. Signals by Signal Name

| Pin Name | Pin Number | Pin Mux / Pin Assignment | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|------------|--------------------------|----------|--------------------------|---------------------------------------|
| AIN0     | B1         | PE7                      | I        | Analog                   | Analog-to-digital converter input 0.  |
| AIN1     | A1         | PE6                      | I        | Analog                   | Analog-to-digital converter input 1.  |
| AIN2     | B3         | PE5                      | I        | Analog                   | Analog-to-digital converter input 2.  |
| AIN3     | B2         | PE4                      | I        | Analog                   | Analog-to-digital converter input 3.  |
| AIN4     | A2         | PD7                      | I        | Analog                   | Analog-to-digital converter input 4.  |
| AIN5     | A3         | PD6                      | I        | Analog                   | Analog-to-digital converter input 5.  |
| AIN6     | C6         | PD5                      | I        | Analog                   | Analog-to-digital converter input 6.  |
| AIN7     | B5         | PD4                      | I        | Analog                   | Analog-to-digital converter input 7.  |
| AIN8     | B4         | PE3                      | I        | Analog                   | Analog-to-digital converter input 8.  |
| AIN9     | A4         | PE2                      | I        | Analog                   | Analog-to-digital converter input 9.  |
| AIN10    | A6         | PB4                      | I        | Analog                   | Analog-to-digital converter input 10. |

Table 24-8. Signals by Signal Name (*continued*)

| Pin Name | Pin Number                                                  | Pin Mux / Pin Assignment                                                                                    | Pin Type | Buffer Type <sup>a</sup> | Description                           |
|----------|-------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|----------|--------------------------|---------------------------------------|
| AIN11    | B7                                                          | PB5                                                                                                         | I        | Analog                   | Analog-to-digital converter input 11. |
| AIN12    | H1                                                          | PD3                                                                                                         | I        | Analog                   | Analog-to-digital converter input 12. |

| LD0      | E3                                                  | fixed                                                          | -        | Power                    | Low drop-out regulator output voltage. This pin requires an external capacitor between the pin and GND of 1 $\mu$ F or greater. When the on-chip LDO is used to provide power to the logic, the LD0 pin must also be connected to the VDDC pins at the board level in addition to the decoupling capacitor(s). |

| Pin Name  | Pin Number                                        | Pin Mux / Pin Assignment                                                  | Pin Type | Buffer Type <sup>a</sup> | Description                                                                                                                                                                                                                                                                                                               |
|-----------|---------------------------------------------------|---------------------------------------------------------------------------|----------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10                      | PG0 (7)<br>PC5 (6)<br>PA6 (8)<br>PB2 (8)<br>PH3 (4)                       | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                                                                                          |
| USB0ID    | E12                                               | PB0                                                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side).                                                             |
| USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6         | PC7 (6)<br>PC6 (7)<br>PA7 (8)<br>PB3 (8)<br>PE0 (9)<br>PH4 (4)<br>PJ1 (9) | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                                                                                 |
| USB0RBIAS | B12                                               | fixed                                                                     | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                                                                                  |
| USB0VBUS  | D12                                               | PB1                                                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                                                                                        |
| VDD       | K7<br>G12<br>K8<br>K9<br>H10<br>G10<br>E10<br>G11 | fixed                                                                     | -        | Power                    | Positive supply for I/O and some logic.                                                                                                                                                                                                                                                                                   |
| VDDA      | C7                                                | fixed                                                                     | -        | Power                    | The positive supply (3.3 V) for the analog circuits (ADC, Analog Comparators, etc.). These are separated from VDD to minimize the electrical noise contained on VDD from affecting the analog functions. VDDA pins must be connected to 3.3 V, regardless of system implementation.                                       |
| VDDC      | D3<br>C3                                          | fixed                                                                     | -        | Power                    | Positive supply for most of the logic function, including the processor core and most peripherals.                                                                                                                                                                                                                        |
| VREFA     | A7                                                | PB6                                                                       | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1145. |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

|                    | VREFA    | A7                          | I        | Analog                   | This input provides a reference voltage used to specify the input voltage at which the ADC converts to a maximum value. In other words, the voltage that is applied to VREFA is the voltage with which an AINn signal is converted to 1023. The VREFA input is limited to the range specified in Table 26-2 on page 1145. |

|          | USB0DP    | C12                                       | I/O      | Analog                   | Bidirectional differential data pin (D+ per USB specification).                                                                                                                                                                                               |
|          | USB0EPEN  | K1<br>M1<br>L6<br>A11<br>D10              | O        | TTL                      | Optionally used in Host mode to control an external power source to supply power to the USB bus.                                                                                                                                                              |
|          | USB0ID    | E12                                       | I        | Analog                   | This signal senses the state of the USB ID signal. The USB PHY enables an integrated pull-up, and an external element (USB connector) indicates the initial state of the USB controller (pulled down is the A side of the cable and pulled up is the B side). |
|          | USB0PFLT  | L2<br>M2<br>M6<br>E11<br>B11<br>B10<br>B6 | I        | TTL                      | Optionally used in Host mode by an external power source to indicate an error state by that power source.                                                                                                                                                     |
|          | USB0RBIAS | B12                                       | O        | Analog                   | 9.1-kΩ resistor (1% precision) used internally for USB analog circuitry.                                                                                                                                                                                      |
|          | USB0VBUS  | D12                                       | I/O      | Analog                   | This signal is used during the session request protocol. This signal allows the USB PHY to both sense the voltage level of VBUS, and pull up VBUS momentarily during VBUS pulsing.                                                                            |

a. The TTL designation indicates the pin has TTL-compatible voltage levels.

## 24.3 Connections for Unused Signals

Table 24-12 on page 1142 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 100-pin LQFP package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

Table 24-12. Connections for Unused Signals (100-pin LQFP)

| Function       | Signal Name | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|-------------|------------|--------------------------------------------|----------------------------------------------------------------|
| No Connects    | NC          | -          | NC                                         | NC                                                             |
| System Control | OSC0        | 48         | NC                                         | GND                                                            |
|                | OSC1        | 49         | NC                                         | NC                                                             |
|                | RST         | 48         | Pull up as shown in Figure 6-1 on page 101 | Connect through a capacitor to GND as close to pin as possible |
| USB            | USB0RBIA5   | 73         | Connect to GND through 10-kΩ resistor.     | Connect to GND through 10-kΩ resistor.                         |
|                | USB0DM      | 70         | NC                                         | GND                                                            |
|                | USB0DP      | 71         | NC                                         | GND                                                            |

Table 24-13 on page 1143 show how to handle signals for functions that are not used in a particular system implementation for devices that are in a 108-pin BGA package. Two options are shown in the table: an acceptable practice and a preferred practice for reduced power consumption and improved EMC characteristics. If a module is not used in a system, and its inputs are grounded, it is important that the clock to the module is never enabled by setting the corresponding bit in the **RCGCx** register.

**Table 24-13. Connections for Unused Signals, 108-pin BGA**

| Function       | Signal Name | Pin Number | Acceptable Practice                        | Preferred Practice                                             |
|----------------|-------------|------------|--------------------------------------------|----------------------------------------------------------------|
| No Connects    | NC          | -          | NC                                         | NC                                                             |
| System Control | OSC0        | L11        | NC                                         | GND                                                            |
|                | OSC1        | M11        | NC                                         | NC                                                             |
|                | RST         | H11        | Pull up as shown in Figure 6-1 on page 101 | Connect through a capacitor to GND as close to pin as possible |
| USB            | USB0RBIAS   | B12        | Connect to GND through 10-kΩ resistor.     | Connect to GND through 10-kΩ resistor.                         |
|                | USB0DM      | C11        | NC                                         | GND                                                            |
|                | USB0DP      | C12        | NC                                         | GND                                                            |

## 25 Operating Characteristics

**Table 25-1. Temperature Characteristics**

| Characteristic                         | Symbol | Value       | Unit |
|----------------------------------------|--------|-------------|------|
| Industrial operating temperature range | $T_A$  | -40 to +85  | °C   |
| Unpowered storage temperature range    | $T_S$  | -65 to +150 | °C   |

**Table 25-2. Thermal Characteristics**

| Characteristic                                        | Symbol        | Value                               | Unit |
|-------------------------------------------------------|---------------|-------------------------------------|------|
| Thermal resistance (junction to ambient) <sup>a</sup> | $\Theta_{JA}$ | 34                                  | °C/W |
| Average junction temperature <sup>b</sup>             | $T_J$         | $T_A + (P_{AVG} \cdot \Theta_{JA})$ | °C   |

a. Junction to ambient thermal resistance  $\Theta_{JA}$  numbers are determined by a package simulator.

b. Power dissipation is a function of temperature.

**Table 25-3. ESD Absolute Maximum Ratings<sup>a</sup>**

| Parameter Name | Min | Nom | Max | Unit |
|----------------|-----|-----|-----|------|
| $V_{ESDHBM}$   | -   | -   | 2.0 | kV   |
| $V_{ESDCDM}$   | -   | -   | 1.0 | kV   |
| $V_{ESDMM}$    | -   | -   | 100 | V    |

a. All Stellaris parts are ESD tested following the JEDEC standard.

## 26 Electrical Characteristics

### 26.1 DC Characteristics

#### 26.1.1 Maximum Ratings

The maximum ratings are the limits to which the device can be subjected without permanently damaging the device.

**Note:** The device is not guaranteed to operate properly at the maximum ratings.

**Table 26-1. Maximum Ratings**

| Parameter        | Parameter Name <sup>a</sup>               | Value |     | Unit |
|------------------|-------------------------------------------|-------|-----|------|
|                  |                                           | Min   | Max |      |
| V <sub>DD</sub>  | I/O supply voltage (V <sub>DD</sub> )     | 0     | 4   | V    |
| V <sub>DDA</sub> | Analog supply voltage (V <sub>DDA</sub> ) | 0     | 4   | V    |
| V <sub>IN</sub>  | Input voltage                             | -0.3  | 5.5 | V    |
| I                | Maximum current per output pins           | -     | 25  | mA   |

a. Voltages are measured with respect to GND.

**Important:** This device contains circuitry to protect the inputs against damage due to high-static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are connected to an appropriate logic voltage level (for example, either GND or V<sub>DD</sub>).

#### 26.1.2 Recommended DC Operating Conditions

For special high-current applications, the GPIO output buffers may be used with the following restrictions. With the GPIO pins configured as 8-mA output drivers, a total of four GPIO outputs may be used to sink current loads up to 18 mA each. At 18-mA sink current loading, the V<sub>OL</sub> value is specified as 1.2 V. The high-current GPIO package pins must be selected such that there are only a maximum of two per side of the physical package or BGA pin group with the total number of high-current GPIO outputs not exceeding four for the entire package.

**Table 26-2. Recommended DC Operating Conditions**

| Parameter                     | Parameter Name            | Min  | Nom | Max  | Unit |
|-------------------------------|---------------------------|------|-----|------|------|
| V <sub>DD</sub>               | I/O supply voltage        | 3.0  | 3.3 | 3.6  | V    |
| V <sub>DDA</sub>              | Analog supply voltage     | 3.0  | 3.3 | 3.6  | V    |
| V <sub>DDC</sub> <sup>a</sup> | Core supply voltage       | 1.08 | 1.2 | 1.32 | V    |
| V <sub>IH</sub>               | High-level input voltage  | 2.0  | -   | 5.0  | V    |
| V <sub>IL</sub>               | Low-level input voltage   | -0.3 | -   | 1.3  | V    |
| V <sub>OH</sub> <sup>b</sup>  | High-level output voltage | 2.4  | -   | -    | V    |
| V <sub>OL</sub> <sup>a</sup>  | Low-level output voltage  | -    | -   | 0.4  | V    |

Table 26-2. Recommended DC Operating Conditions (*continued*)

| Parameter | Parameter Name                            | Min | Nom | Max | Unit |
|-----------|-------------------------------------------|-----|-----|-----|------|
| $I_{OH}$  | High-level source current, $V_{OH}=2.4$ V |     |     |     |      |
|           | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|           | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|           | 8-mA Drive                                | 8.0 | -   | -   | mA   |
| $I_{OL}$  | Low-level sink current, $V_{OL}=0.4$ V    |     |     |     |      |
|           | 2-mA Drive                                | 2.0 | -   | -   | mA   |
|           | 4-mA Drive                                | 4.0 | -   | -   | mA   |
|           | 8-mA Drive                                | 8.0 | -   | -   | mA   |

a.  $V_{DDC}$  is supplied from the output of the LDO.

b.  $V_{OL}$  and  $V_{OH}$  shift to 1.2 V when using high-current GPIOs.

### 26.1.3 On-Chip Low Drop-Out (LDO) Regulator Characteristics

Table 26-3. LDO Regulator Characteristics

| Parameter | Parameter Name                                           | Min  | Nom | Max  | Unit    |
|-----------|----------------------------------------------------------|------|-----|------|---------|
| $C_{LDO}$ | External filter capacitor size for internal power supply | 1.0  | -   | 3.0  | $\mu$ F |
| $V_{LDO}$ | LDO output voltage                                       | 1.08 | 1.2 | 1.32 | V       |

### 26.1.4 Flash Memory Characteristics

Table 26-4. Flash Memory Characteristics

| Parameter   | Parameter Name                                                             | Min    | Nom | Max | Unit   |
|-------------|----------------------------------------------------------------------------|--------|-----|-----|--------|
| $PE_{CYC}$  | Number of guaranteed mass program/erase cycles before failure <sup>a</sup> | 15,000 | -   | -   | cycles |
| $T_{RET}$   | Data retention at average operating temperature of 125°C                   | 10     | -   | -   | years  |
| $T_{PROG}$  | Word program time                                                          | -      | -   | 1   | ms     |
| $T_{BPROG}$ | Buffer program time                                                        | -      | -   | 1   | ms     |
| $T_{ERASE}$ | Page erase time                                                            | -      | -   | 12  | ms     |
| $T_{ME}$    | Mass erase time                                                            | -      | -   | 16  | ms     |

a. A program/erase cycle is defined as switching the bits from 1-> 0 -> 1. Caution should be used when performing block erases, as repeated block erases can shorten the number of guaranteed erase cycles, see "Flash Memory Programming" on page 208.

### 26.1.5 GPIO Module Characteristics

Table 26-5. GPIO Module DC Characteristics

| Parameter    | Parameter Name                   | Min | Nom | Max | Unit       |
|--------------|----------------------------------|-----|-----|-----|------------|
| $R_{GPIOU}$  | GPIO internal pull-up resistor   | 50  | -   | 110 | k $\Omega$ |
| $R_{GPIOPD}$ | GPIO internal pull-down resistor | 55  | -   | 180 | k $\Omega$ |

## 26.1.6 USB Module Characteristics

The Stellaris® USB controller DC electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*. Some components of the USB system are integrated within the LM3S5791 microcontroller and specific to the Stellaris® microcontroller design. An external component resistor is needed as specified in Table 26-6.

**Table 26-6. USB Controller DC Characteristics**

| Parameter          | Parameter Name                                       | Value      | Unit |
|--------------------|------------------------------------------------------|------------|------|
| R <sub>UBIAS</sub> | Value of the pull-down resistor on the USB0RBIAS pin | 9.1K ± 1 % | Ω    |

## 26.1.7 Current Specifications

This section provides information on typical and maximum power consumption under various conditions.

### 26.1.7.1 Preliminary Current Consumption Specifications

The following table provides preliminary figures for current consumption while ongoing characterization is completed.

**Table 26-7. Preliminary Current Consumption**

| Parameter                 | Parameter Name          | Conditions                                                                                                                               | Nom | Max | Unit |
|---------------------------|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------|-----|-----|------|
| I <sub>DD_RUN</sub>       | Run mode 1 (Flash loop) | V <sub>DD</sub> = 3.3 V<br>Code= while(1){} executed in Flash<br>Peripherals = All ON<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C | 56  | -   | mA   |
| I <sub>DD_SLEEP</sub>     | Sleep mode              | V <sub>DD</sub> = 3.3 V<br>Peripherals = All clock gated<br>System Clock = 50 MHz (with PLL)<br>Temp = 25°C                              | 8   | -   | mA   |
| I <sub>DD_DEEPSLEEP</sub> | Deep-sleep mode         | Peripherals = All OFF<br>System Clock = IOS30KHZ/64<br>Temp = 25°C                                                                       | 550 | -   | μA   |

## 26.2 AC Characteristics

### 26.2.1 Load Conditions

Unless otherwise specified, the following conditions are true for all timing measurements.

**Figure 26-1. Load Conditions**

## 26.2.2 Clocks

The following sections provide specifications on the various clock sources and mode.

### 26.2.2.1 PLL Specifications

The following tables provide specifications for using the PLL.

**Table 26-8. Phase Locked Loop (PLL) Characteristics**

| Parameter       | Parameter Name                        | Min                | Nom | Max               | Unit |
|-----------------|---------------------------------------|--------------------|-----|-------------------|------|
| $f_{REF\_XTAL}$ | Crystal reference <sup>a</sup>        | 3.579545           | -   | 16.384            | MHz  |
| $f_{REF\_EXT}$  | External clock reference <sup>a</sup> | 3.579545           | -   | 16.384            | MHz  |
| $f_{PLL}$       | PLL frequency <sup>b</sup>            | -                  | 400 | -                 | MHz  |
| $T_{READY}$     | PLL lock time                         | 0.562 <sup>c</sup> | -   | 1.38 <sup>d</sup> | ms   |

a. The exact value is determined by the crystal value programmed into the XTAL field of the **Run-Mode Clock Configuration (RCC)** register.

b. PLL frequency is automatically calculated by the hardware based on the XTAL field of the **RCC** register.

c. Using a 16.384-MHz crystal

d. Using 3.5795-MHz crystal

Table 26-9 on page 1148 shows the actual frequency of the PLL based on the crystal frequency used (defined by the XTAL field in the **RCC** register).

**Table 26-9. Actual PLL Frequency**

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|
| 0x04 | 3.5795                  | 400.904             | 0.0023% |
| 0x05 | 3.6864                  | 398.1312            | 0.0047% |
| 0x06 | 4.0                     | 400                 | -       |
| 0x07 | 4.096                   | 401.408             | 0.0035% |
| 0x08 | 4.9152                  | 398.1312            | 0.0047% |
| 0x09 | 5.0                     | 400                 | -       |
| 0x0A | 5.12                    | 399.36              | 0.0016% |
| 0x0B | 6.0                     | 400                 | -       |
| 0x0C | 6.144                   | 399.36              | 0.0016% |
| 0x0D | 7.3728                  | 398.1312            | 0.0047% |
| 0x0E | 8.0                     | 400                 | 0.0047% |
| 0x0F | 8.192                   | 398.6773333         | 0.0033% |
| 0x10 | 10.0                    | 400                 | -       |
| 0x11 | 12.0                    | 400                 | -       |

**Table 26-9. Actual PLL Frequency (continued)**

| XTAL | Crystal Frequency (MHz) | PLL Frequency (MHz) | Error   |
|------|-------------------------|---------------------|---------|

## 26.2.5 Sleep Modes

**Table 26-17. Sleep Modes AC Characteristics<sup>a</sup>**

| Parameter No | Parameter          | Parameter Name                                                             | Min | Nom | Max         | Unit          |
|--------------|--------------------|----------------------------------------------------------------------------|-----|-----|-------------|---------------|
| D1           | $t_{WAKE\_S}$      | Time to wake from interrupt in sleep or deep-sleep mode, not using the PLL | -   | -   | 7           | system clocks |
| D2           | $t_{WAKE\_PLL\_S}$ | Time to wake from interrupt in sleep or deep-sleep mode when using the PLL | -   | -   | $T_{READY}$ | ms            |
| D3           | $t_{ENTER\_DS}$    | Time to enter deep-sleep mode from sleep request                           | -   | 0   | $16^b$      | ms            |

a. Values in this table assume the IOSCL is the clock source during sleep or deep-sleep mode.

b. Nominal specification occurs 99.9995% of the time.

## 26.2.6 General-Purpose I/O (GPIO)

**Note:** All GPIOs are 5-V tolerant.

**Table 26-18. GPIO Characteristics**

| Parameter   | Parameter Name                                | Condition                         | Min | Nom | Max | Unit |
|-------------|-----------------------------------------------|-----------------------------------|-----|-----|-----|------|
| $t_{GPIOR}$ | GPIO Rise Time (from 20% to 80% of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 20  | ns   |
|             |                                               | 4-mA drive                        |     | 7   | 10  | ns   |
|             |                                               | 8-mA drive                        |     | 4   | 5   | ns   |
|             |                                               | 8-mA drive with slew rate control |     | 6   | 8   | ns   |
| $t_{GPIOF}$ | GPIO Fall Time (from 80% to 20% of $V_{DD}$ ) | 2-mA drive                        | -   | 14  | 21  | ns   |
|             |                                               | 4-mA drive                        |     | 7   | 11  | ns   |
|             |                                               | 8-mA drive                        |     | 4   | 6   | ns   |
|             |                                               | 8-mA drive with slew rate control |     | 6   | 8   | ns   |

## 26.2.7 External Peripheral Interface (EPI)

When the EPI module is in SDRAM mode, the drive strength must be configured to 8 mA. Table 26-19 on page 1153 shows the rise and fall times in SDRAM mode with 16 pF load conditions. When the EPI module is in Host-Bus or General-Purpose mode, the values in Table 26-18 on page 1153 should be used.

**Table 26-19. EPI SDRAM Characteristics**

| Parameter    | Parameter Name                               | Condition                 | Min | Nom | Max | Unit |
|--------------|----------------------------------------------|---------------------------|-----|-----|-----|------|
| $t_{SDRAMR}$ | EPI Rise Time (from 20% to 80% of $V_{DD}$ ) | 8-mA drive, $C_L = 16$ pF | -   | 2   | 3   | ns   |

Table 26-19. EPI SDRAM Characteristics (*continued*)

| Parameter           | Parameter Name                                      | Condition                         | Min | Nom | Max | Unit |
|---------------------|-----------------------------------------------------|-----------------------------------|-----|-----|-----|------|
| $t_{\text{SDRAMF}}$ | EPI Fall Time (from 80% to 20% of $V_{\text{DD}}$ ) | 8-mA drive, $C_L = 16 \text{ pF}$ | -   | 2   | 3   | ns   |

Table 26-20. EPI SDRAM Interface Characteristics<sup>a</sup>

| Parameter No | Parameter        | Parameter Name         | Min | Nom | Max | Unit          |

a. The EPI SDRAM interface must use 8-mA drive.

Figure 26-10. SDRAM Initialization and Load Mode Register Timing

## Notes:

1. If CS is high at clock high time, all applied commands are NOP.
2. The **Mode** register may be loaded prior to the auto refresh cycles if desired.
3. JEDEC and PC100 specify three clocks.
4. Outputs are guaranteed High-Z after command is issued.

| $R_{\text{ADC}}$     | ADC equivalent resistance                                                       | -    | -   | 10                  | $\text{k}\Omega$   |
| $C_{\text{ADC}}$     | ADC equivalent capacitance                                                      | 0.9  | 1.0 | 1.1                 | pF                 |
| $E_{\text{L}}$       | Integral nonlinearity error                                                     | -    | -   | $\pm 1$             | LSB                |
| $E_{\text{D}}$       | Differential nonlinearity error                                                 | -    | -   | $\pm 1$             | LSB                |
| $E_{\text{O}}$       | Offset error                                                                    | -    | -   | $\pm 1$             | LSB                |
| $E_{\text{G}}$       | Full-scale gain error                                                           | -    | -   | $\pm 3$             | LSB                |
| $E_{\text{TS}}$      | Temperature sensor accuracy                                                     | -    | -   | $\pm 5$             | $^{\circ}\text{C}$ |

a. The ADC reference voltage is 3.0 V. This reference voltage is internally generated from the 3.3 VDDA supply by a band gap circuit.

b. The ADC must be clocked from the PLL or directly from an external clock source to operate properly.

c. The conversion time and rate scale from the specified number if the ADC internal clock frequency is any value other than 16 MHz.

Figure 26-17. ADC Input Equivalency Diagram

Table 26-24. ADC Module External Reference Characteristics<sup>a</sup>

| Parameter  | Parameter Name                                  | Min | Nom       | Max      | Unit    |
|------------|-------------------------------------------------|-----|-----------|----------|---------|
| $V_{REFA}$ | External voltage reference for ADC <sup>b</sup> | 2.4 | -         | $V_{DD}$ | V       |
| $I_L$      | External voltage reference leakage current      | -   | $\pm 1.0$ | -        | $\mu A$ |

a. Care must be taken to supply a reference voltage of acceptable quality.

b. Ground is always used as the reference level for the minimum conversion value.

### 26.2.12 Universal Serial Bus (USB) Controller

The Stellaris® USB controller AC electrical specifications are compliant with the *Universal Serial Bus Specification Rev. 2.0* (full-speed and low-speed support) and the *On-The-Go Supplement to the USB 2.0 Specification Rev. 1.0*.

### 26.2.13 Analog Comparator

Table 26-31. Analog Comparator Characteristics

| Parameter        | Parameter Name                         | Min | Nom | Max                  | Unit |
|------------------|----------------------------------------|-----|-----|----------------------|------|
| V <sub>OS</sub>  | Input offset voltage                   | -   | ±10 | ±25                  | mV   |
| V <sub>CM</sub>  | Input common mode voltage range        | 0   | -   | V <sub>DD</sub> -1.5 | V    |
| C <sub>MRR</sub> | Common mode rejection ratio            | 50  | -   | -                    | dB   |
| T <sub>RT</sub>  | Response time                          | -   | -   | 1                    | μs   |
| T <sub>MC</sub>  | Comparator mode change to Output Valid | -   | -   | 10                   | μs   |

Table 26-32. Analog Comparator Voltage Reference Characteristics

| Parameter       | Parameter Name               | Min | Nom                 | Max  | Unit |
|-----------------|------------------------------|-----|---------------------|------|------|
| R <sub>HR</sub> | Resolution high range        | -   | V <sub>DD</sub> /31 | -    | LSB  |
| R <sub>LR</sub> | Resolution low range         | -   | V <sub>DD</sub> /23 | -    | LSB  |
| A <sub>HR</sub> | Absolute accuracy high range | -   | -                   | ±1/2 | LSB  |
| A <sub>LR</sub> | Absolute accuracy low range  | -   | -                   | ±1/4 | LSB  |

## B Ordering and Contact Information

### B.1 Ordering Information

**Table B-1. Part Ordering Information**

| Orderable Part Number | Description                                                                           |
|-----------------------|---------------------------------------------------------------------------------------|
| LM3S5791-IQC80-C1     | Stellaris® LM3S5791 Microcontroller Industrial Temperature 100-pin LQFP               |
| LM3S5791-IBZ80-C1     | Stellaris® LM3S5791 Microcontroller Industrial Temperature 108-ball BGA               |
| LM3S5791-IQC80-C1T    | Stellaris® LM3S5791 Microcontroller Industrial Temperature 100-pin LQFP Tape-and-reel |
| LM3S5791-IBZ80-C1T    | Stellaris® LM3S5791 Microcontroller Industrial Temperature 108-ball BGA Tape-and-reel |

### B.2 Part Markings

The Stellaris® microcontrollers are marked with an identifying number. This code contains the following information:

- The first line indicates the part number. In the example below, this is the LM3S9B90.
- In the second line, the first seven characters indicate the temperature, package, speed, and revision. In the example below, this is an Industrial temperature (I), 100-pin LQFP package (QC), 80-MHz (80), revision C0 (C0) device.
- The third line contain internal tracking numbers.

## B.3 Kits

The Stellaris<sup>®</sup> Family provides the hardware and software tools that engineers need to begin development quickly.

- Reference Design Kits accelerate product development by providing ready-to-run hardware and comprehensive documentation including hardware design files
- Evaluation Kits provide a low-cost and effective means of evaluating Stellaris<sup>®</sup> microcontrollers before purchase
- Development Kits provide you with all the tools you need to develop and prototype embedded applications right out of the box

See the website at [www.ti.com/stellaris](http://www.ti.com/stellaris) for the latest tools available, or ask your distributor.

## B.4 Support Information

For support on Stellaris<sup>®</sup> products, contact the TI Worldwide Product Information Center nearest you: <http://www-k.ext.ti.com/sc/technical-support/product-information-centers.htm>.

## C Package Information

Figure C-1. 100-Pin LQFP Package

**Note:** The following notes apply to the package drawing.

1. All dimensions shown in mm.
2. Dimensions shown are nominal with tolerances indicated.
3. Foot length 'L' is measured at gage plane 0.25 mm above seating plane.

| Body +2.00 mm Footprint, 1.4 mm package thickness |             |                     |

Figure C-2. 108-Ball BGA Package

**Note:** The following notes apply to the package drawing.

1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. 'e' REPRESENTS THE BASIC SOLDER BALL GRID PITCH.
3. 'M' REPRESENTS THE BASIC SOLDER BALL MATRIX SIZE.  
AND SYMBOL 'N' IS THE NUMBER OF BALLS AFTER DEPOPULATING.
4. 'b' IS MEASURABLE AT THE MAXIMUM SOLDER BALL DIAMETER AFTER REFLOW  
PARALLEL TO PRIMARY DATUM [C].
5. DIMENSION 'ccc' IS MEASURED PARALLEL TO PRIMARY DATUM [C].
6. PRIMARY DATUM [C] AND SEATING PLANE ARE DEFINED BY THE SPHERICAL  
CROWNS OF THE SOLDER BALLS.
7. PACKAGE SURFACE SHALL BE MATTE FINISH CHARMILLES 24 TO 27.
8. SUBSTRATE MATERIAL BASE IS BT RESIN.
9. THE OVERALL PACKAGE THICKNESS "A" ALREADY CONSIDERS COLLAPSE BALLS
10. DIMENSIONING AND TOLERANCING PER ASME Y14.5M 1994.
11. EXCEPT DIMENSION b.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
