

# **LMC660 CMOS Quad Operational Amplifier**

Check for Samples: LMC660

### **FEATURES**

- Rail-to-Rail Output Swing
- Specified for 2 k $\Omega$  and 600 $\Omega$  Loads
- High Voltage Gain: 126 dB
- Low Input Offset Voltage: 3 mV
- Low Offset Voltage Drift: 1.3 μV/°C
- Ultra Low Input Bias Current: 2 fA
- Input Common-Mode Range Includes V
- Operating Range from +5V to +15.5V Supply
- I<sub>SS</sub> = 375 μA/Amplifier; Independent of V<sup>+</sup>
- Low Distortion: 0.01% at 10 kHz
- Slew Rate: 1.1 V/µs

#### **APPLICATIONS**

- **High-Impedance Buffer or Preamplifier**
- **Precision Current-to-Voltage Converter**
- **Long-Term Integrator**
- Sample-and-Hold Circuit
- **Peak Detector**
- **Medical Instrumentation**
- **Industrial Controls**
- **Automotive Sensors**

## **Connection Diagrams**

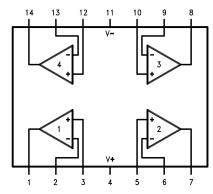

Figure 1. 14-Pin SOIC/PDIP

### DESCRIPTION

The LMC660 CMOS Quad operational amplifier is ideal for operation from a single supply. It operates from +5V to +15.5V and features rail-to-rail output swing in addition to an input common-mode range that includes ground. Performance limitations that have plagued CMOS amplifiers in the past are not a problem with this design. Input Vos, drift, and broadband noise as well as voltage gain into realistic loads (2 k $\Omega$  and 600 $\Omega$ ) are all equal to or better than widely accepted bipolar equivalents.

This chip is built with TI's advanced Double-Poly Silicon-Gate CMOS process.

See the LMC662 datasheet for a dual CMOS operational amplifier with these same features.

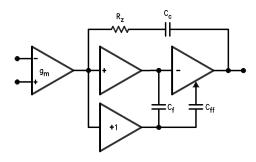

Figure 2. LMC660 Circuit Topology (Each Amplifier)

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet. All trademarks are the property of their respective owners.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings(1)

Aboolate maximum ratings	
Differential Input Voltage	±Supply Voltage
Supply Voltage	16V
Output Short Circuit to V <sup>+</sup>	See <sup>(2)</sup>
Output Short Circuit to V <sup>-</sup>	See <sup>(3)</sup>
Lead Temperature (Soldering, 10 sec.)	260°C
Storage Temp. Range	−65°C to +150°C
Voltage at Input/Output Pins	(V <sup>+</sup> ) + 0.3V, (V <sup>−</sup> ) − 0.3V
Current at Output Pin	±18 mA
Current at Input Pin	±5 mA
Current at Power Supply Pin	35 mA
Power Dissipation	See <sup>(4)</sup>
Junction Temperature	150°C
ESD tolerance (5)	1000V

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but do not ensure specific performance limits. For ensured specifications and test conditions, see the Electrical Characteristics. The ensured specifications apply only for the test conditions listed.
- (2) Do not connect output to V<sup>+</sup> when V<sup>+</sup> is greater than 13V or reliability may be adversely affected.
- (3) Applies to both single supply and split supply operation. Continuous short circuit operation at elevated ambient temperature and/or multiple Op Amp shorts can result in exceeding the maximum allowed junction temperature of 150°C. Output currents in excess of ±30 mA over long term may adversely affect reliability.
- (4) The maximum power dissipation is a function of  $T_{J(MAX)}$ ,  $\theta_{JA}$ , and  $T_A$ . The maximum allowable power dissipation at any ambient temperature is  $P_D = (T_{J(MAX)} T_A)/\theta_{JA}$ .
- (5) Human Body Model is  $1.5 \text{ k}\Omega$  in series with 100 pF.

### **Operating Ratings**

Temperature Range	
LMC660AI	-40°C ≤ T <sub>J</sub> ≤ +85°C
LMC660C	0°C ≤ T <sub>J</sub> ≤ +70°C
Supply Voltage Range	4.75V to 15.5V
Power Dissipation	See <sup>(1)</sup>
Thermal Resistance (θ <sub>JA</sub> ) <sup>(2)</sup>	
14-Pin SOIC	115°C/W
14-Pin PDIP	85°C/W

- For operating at elevated temperatures the device must be derated based on the thermal resistance θ<sub>JA</sub> with P<sub>D</sub> = (T<sub>J</sub> T<sub>A</sub>)/θ<sub>JA</sub>.
- (2) All numbers apply for packages soldered directly into a PC board.

## **DC Electrical Characteristics**

Unless otherwise specified, all limits ensured for  $T_J = 25^{\circ}C$ . **Boldface** limits apply at the temperature extremes.  $V^+ = 5V$ ,  $V^- = 0V$ ,  $V_{CM} = 1.5V$ ,  $V_O = 2.5V$  and  $R_L > 1M\Omega$  unless otherwise specified.

### Non-Inverting Large Signal Pulse Response

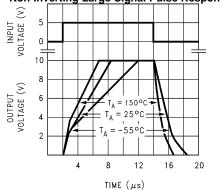

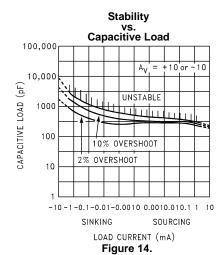

Figure 12.

#### APPLICATION INFORMATION

### **AMPLIFIER TOPOLOGY**

The topology chosen for the LMC660, shown in Figure 15, is unconventional (compared to general-purpose op amps) in that the traditional unity-gain buffer output stage is not used; instead, the output is taken directly from the output of the integrator, to allow rail-to-rail output swing. Since the buffer traditionally delivers the power to the load, while maintaining high op amp gain and stability, and must withstand shorts to either rail, these tasks now fall to the integrator.

As a result of these demands, the integrator is a compound affair with an embedded gain stage that is doubly fed forward (via  $C_f$  and  $C_{ff}$ ) by a dedicated unity-gain compensation driver. In addition, the output portion of the integrator is a push-pull configuration for delivering heavy loads. While sinking current the whole amplifier path consists of three gain stages with one stage fed forward, whereas while sourcing the path contains four gain stages with two fed forward.

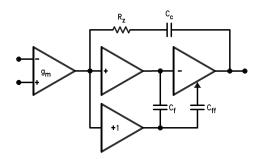

Figure 15. LMC660 Circuit Topology (Each Amplifier)

The large signal voltage gain while sourcing is comparable to traditional bipolar op amps, even with a  $600\Omega$  load. The gain while sinking is higher than most CMOS op amps, due to the additional gain stage; however, under heavy load  $(600\Omega)$  the gain will be reduced as indicated in DC Electrical Characteristics. Avoid resistive loads of less than  $500\Omega$ , as they may cause instability.

### COMPENSATING INPUT CAPACITANCE

The high input resistance of the LMC660 op amps allows the use of large feedback and source resistor values without losing gain accuracy due to loading. However, the circuit will be especially sensitive to its layout when these large-value resistors are used.

Every amplifier has some capacitance between each input and AC ground, and also some differential capacitance between the inputs. When the feedback network around an amplifier is resistive, this input capacitance (along with any additional capacitance due to circuit board traces, the socket, etc.) and the feedback resistors create a pole in the feedback path. In the following General Operational Amplifier circuit, Figure 16 the frequency of this pole is:

$$fp = \frac{1}{2\pi C_S R_P} \tag{1}$$

where  $C_S$  is the total capacitance at the inverting input, including amplifier input capacitance and any stray capacitance from the IC socket (if one is used), circuit board traces, etc., and  $R_P$  is the parallel combination of  $R_F$  and  $R_{IN}$ . This formula, as well as all formulae derived below, apply to inverting and non-inverting op amp configurations.

When the feedback resistors are smaller than a few  $k\Omega$ , the frequency of the feedback pole will be quite high, since  $C_S$  is generally less than 10 pF. If the frequency of the feedback pole is much higher than the "ideal" closed-loop bandwidth (the nominal closed-loop bandwidth in the absence of  $C_S$ ), the pole will have a negligible effect on stability, as it will add only a small amount of phase shift.

However, if the feedback pole is less than approximately 6 to 10 times the "ideal"  $\neg 3$  dB frequency, a feedback capacitor,  $C_F$ , should be connected between the output and the inverting input of the op amp. This condition can also be stated in terms of the amplifier's low-frequency noise gain: To maintain stability a feedback capacitor will probably be needed if:

where:

$$\left(\frac{\mathsf{R}_\mathsf{F}}{\mathsf{R}_\mathsf{IN}} + 1\right) \tag{3}$$

is the amplifier's low-frequency noise gain and GBW is the amplifier's gain bandwidth product. An amplifier's low-frequency noise gain is represented by the formula:

$$\left(\frac{\mathsf{R}_\mathsf{F}}{\mathsf{R}_\mathsf{IN}} + 1\right) \tag{4}$$

regardless of whether the amplifier is being used in inverting or non-inverting mode. Note that a feedback capacitor is more likely to be needed when the noise gain is low and/or the feedback resistor is large.

If the above condition is met (indicating a feedback capacitor will probably be needed), and the noise gain is large enough that:

$$\left(\frac{\mathsf{R}_{\mathsf{F}}}{\mathsf{R}_{\mathsf{IN}}} + 1\right) \ge 2\sqrt{\mathsf{GBW} \times \mathsf{R}_{\mathsf{F}} \times \mathsf{C}_{\mathsf{S}}},\tag{5}$$

the following value of feedback capacitor is recommended:

$$C_{\mathsf{F}} = \frac{C_{\mathsf{S}}}{2\left(\frac{\mathsf{R}_{\mathsf{F}}}{\mathsf{R}_{\mathsf{IN}}} + 1\right)} \tag{6}$$

lf

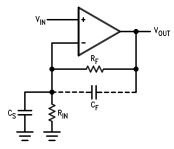

$$\left(\frac{\mathsf{R}_{\mathsf{F}}}{\mathsf{R}_{\mathsf{IN}}} + 1\right) < 2\sqrt{\mathsf{GBW} \times \mathsf{R}_{\mathsf{F}} \times \mathsf{C}_{\mathsf{S}}} \tag{7}$$

the feedback capacitor should be:

$$C_{F} = \sqrt{\frac{C_{S}}{GBW \times R_{F}}} \tag{8}$$

Note that these capacitor values are usually significant smaller than those given by the older, more conservative formula:

$$C_{\mathsf{F}} = \frac{C_{\mathsf{S}}\mathsf{R}_{\mathsf{IN}}}{\mathsf{R}_{\mathsf{F}}} \tag{9}$$

 $C_S$  consists of the amplifier's input capacitance plus any stray capacitance from the circuit board and socket.  $C_F$  compensates for the pole caused by  $C_S$  and the feedback resistors.

Figure 16. General Operational Amplifier Circuit

Using the smaller capacitors will give much higher bandwidth with little degradation of transient response. It may be necessary in any of the above cases to use a somewhat larger feedback capacitor to allow for unexpected stray capacitance, or to tolerate additional phase shifts in the loop, or excessive capacitive load, or to decrease the noise or bandwidth, or simply because the particular circuit implementation needs more feedback capacitance to be sufficiently stable. For example, a printed circuit board's stray capacitance may be larger or smaller than the breadboard's, so the actual optimum value for  $C_F$  may be different from the one estimated using the breadboard. In most cases, the values of  $C_F$  should be checked on the actual circuit, starting with the computed value.

#### **CAPACITIVE LOAD TOLERANCE**

Like many other op amps, the LMC660 may oscillate when its applied load appears capacitive. The threshold of oscillation varies both with load and circuit gain. The configuration most sensitive to oscillation is a unity-gain follower. See Typical Performance Characteristics.

The load capacitance interacts with the op amp's output resistance to create an additional pole. If this pole frequency is sufficiently low, it will degrade the op amp's phase margin so that the amplifier is no longer stable at low gains. As shown in Figure 17, the addition of a small resistor ( $50\Omega$  to  $100\Omega$ ) in series with the op amp's output, and a capacitor (5 pF to 10 pF) from inverting input to output pins, returns the phase margin to a safe value without interfering with lower-frequency circuit operation. Thus larger values of capacitance can be tolerated without oscillation. Note that in all cases, the output will ring heavily when the load capacitance is near the threshold for oscillation.

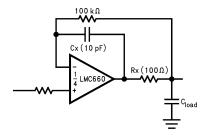

Figure 17. Rx, Cx Improve Capacitive Load Tolerance

Capacitive load driving capability is enhanced by using a pull up resistor to V $^+$  (Figure 18). Typically a pull up resistor conducting 500  $\mu$ A or more will significantly improve capacitive load responses. The value of the pull up resistor must be determined based on the current sinking capability of the amplifier with respect to the desired output swing. Open loop gain of the amplifier can also be affected by the pull up resistor (see DC Electrical Characteristics).

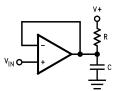

Figure 18. Compensating for Large Capacitive Loads with a Pull Up Resistor

### PRINTED-CIRCUIT-BOARD LAYOUT FOR HIGH-IMPEDANCE WORK

It is generally recognized that any circuit which must operate with less than 1000 pA of leakage current requires special layout of the PC board. When one wishes to take advantage of the ultra-low bias current of the LMC662, typically less than 0.04 pA, it is essential to have an excellent layout. Fortunately, the techniques for obtaining low leakages are quite simple. First, the user must not ignore the surface leakage of the PC board, even though it may sometimes appear acceptably low, because under conditions of high humidity or dust or contamination, the surface leakage will be appreciable.

To minimize the effect of any surface leakage, lay out a ring of foil completely surrounding the LMC660's inputs and the terminals of capacitors, diodes, conductors, resistors, relay terminals, etc. connected to the op amp's inputs. See Figure 19. To have a significant effect, guard rings should be placed on both the top and bottom of the PC board. This PC foil must then be connected to a voltage which is at the same voltage as the amplifier inputs, since no leakage current can flow between two points at the same potential. For example, a PC board trace-to-pad resistance of  $10^{12}\Omega$ , which is normally considered a very large resistance, could leak 5 pA if the trace were a 5V bus adjacent to the pad of an input. This would cause a 100 times degradation from the LMC660's actual performance. However, if a guard ring is held within 5 mV of the inputs, then even a resistance of  $10^{11}\Omega$  would cause only 0.05 pA of leakage current, or perhaps a minor (2:1) degradation of the amplifier's performance. See Figure 20a, Figure 20b, and Figure 20c for typical connections of guard rings for standard op amp configurations. If both inputs are active and at high impedance, the guard can be tied to ground and still provide some protection; see Figure 20d.

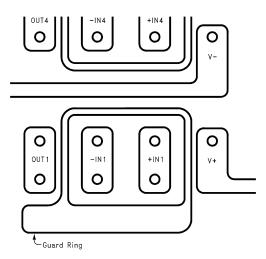

Figure 19. Example, using the LMC660, of Guard Ring in P.C. Board Layout

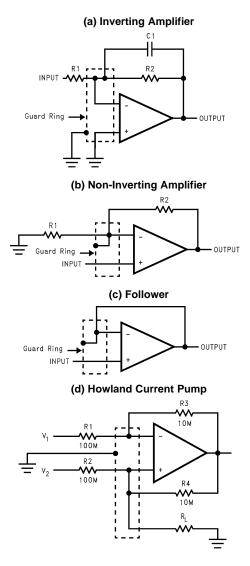

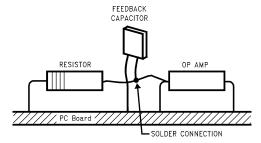

Figure 20. Guard Ring Connections

The designer should be aware that when it is inappropriate to lay out a PC board for the sake of just a few circuits, there is another technique which is even better than a guard ring on a PC board: Don't insert the amplifier's input pin into the board at all, but bend it up in the air and use only air as an insulator. Air is an excellent insulator. In this case you may have to forego some of the advantages of PC board construction, but the advantages are sometimes well worth the effort of using point-to-point up-in-the-air wiring. See Figure 21.

(Input pins are lifted out of PC board and soldered directly to components. All other pins connected to PC board.)

Figure 21. Air Wiring

### **BIAS CURRENT TESTING**

The test method of Figure 21 is appropriate for bench-testing bias current with reasonable accuracy. To understand its operation, first close switch S2 momentarily. When S2 is opened, then:

$$I_{b}^{-} = \frac{dV_{OUT}}{dt} \times C2. \tag{10}$$

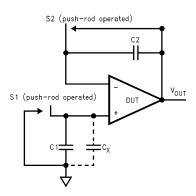

Figure 22. Simple Input Bias Current Test Circuit

A suitable capacitor for C2 would be a 5 pF or 10 pF silver mica, NPO ceramic, or air-dielectric. When determining the magnitude of  $I_b$ -, the leakage of the capacitor and socket must be taken into account. Switch S2 should be left shorted most of the time, or else the dielectric absorption of the capacitor C2 could cause errors.

Similarly, if S1 is shorted momentarily (while leaving S2 shorted):

$$I_b^{+} = \frac{dV_{OUT}}{dt} \times (C1 + C_x)$$
 (11)

where  $C_x$  is the stray capacitance at the + input.

### TYPICAL SINGLE-SUPPLY APPLICATIONS

 $(V^+ = 5.0 VDC)$ 

Additional single-supply applications ideas can be found in the LM324 datasheet. The LMC660 is pin-for-pin compatible with the LM324 and offers greater bandwidth and input resistance over the LM324. These features will improve the performance of many existing single-supply applications. Note, however, that the supply voltage range of the LMC660 is smaller than that of the LM324.

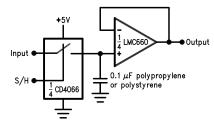

Figure 23. Low-Leakage Sample-and-Hold

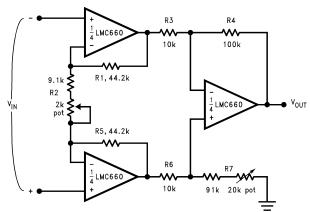

Figure 24. Instrumentation Amplifier

If 
$$R1 = R5$$
,  $R3 = R6$ , and  $R4 = R7$ ; then

$$\frac{\mathsf{V}_{\mathsf{O}\mathsf{O}\mathsf{I}}}{\mathsf{V}_{\mathsf{IN}}} = \frac{\mathsf{H}\mathsf{2} + \mathsf{2}\mathsf{H}\mathsf{3}}{\mathsf{R}\mathsf{2}} \times \frac{\mathsf{H}\mathsf{3}}{\mathsf{R}\mathsf{3}} \tag{12}$$

∴  $A_V \approx 100$  for circuit shown.

For good CMRR over temperature, low drift resistors should be used. Matching of R3 to R6 and R4 to R7 affect CMRR. Gain may be adjusted through R2. CMRR may be adjusted through R7.

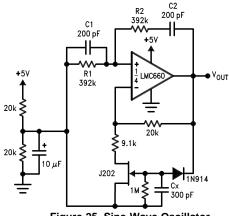

Figure 25. Sine-Wave Oscillator

Oscillator frequency is determined by R1, R2, C1, and C2:

# **TYPICAL SINGLE-SUPPLY APPLICATIONS (continued)**

 $(V^+ = 5.0 VDC)$ 

fosc =  $1/2\pi RC$ , where R = R1 = R2 and C = C1 = C2.

This circuit, as shown, oscillates at 2.0 kHz with a peak-to-peak output swing of 4.5V.

<sup>(1)</sup> The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes. **Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between

the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.

# PACKAGE OPTION ADDENDUM

11-Feb-2015

- (3) MSL, Peak Temp. The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
- (4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
- (5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
- (6) Lead/Ball Finish Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## PLASTIC SMALL OUTLINE

NOTES:

- A. All linear dimensions are in inches (millimeters).
- B. This drawing is subject to change without notice.
- Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.006 (0,15) each side.
- Body width does not include interlead flash. Interlead flash shall not exceed 0.017 (0,43) each side.
- E. Reference JEDEC MS-012 variation AB.

#### IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have *not* been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
