LP2982 Micropower 50 mA Ultra Low-Dropout Regulator in SOT-23 Package

Literature Number: SNVS128I

LP2982 Micropower 50 mA Ultra Low-Dropout Regulator in SOT-23 Package

General Description

The LP2982 is a 50 mA, fixed-output voltage regulator designed to provide ultra low dropout and lower noise in battery powered applications.

Using an optimized VIP® (Vertically Integrated PNP) process, the LP2982 delivers unequaled performance in all specifications critical to battery-powered designs:

Dropout Voltage: Typically 120 mV @ 50 mA load, and 7 mV @ 1 mA load.

Ground Pin Current: Typically 375 μ A @ 50 mA load, and 80 μ A @ 1 mA load.

Sleep Mode: Less than 1 μ A quiescent current when on/off pin is pulled low.

Precision Output: 1.0% tolerance output voltages available (A grade).

Low Noise: By adding an external bypass capacitor, output noise can be reduced to 30 μ V (typical).

Four output voltage versions, from 3.0V to 5.0V, are available as standard products.

Features

- Ultra low dropout voltage
- Guaranteed 50 mA output current
- Typical dropout voltage 180 mV @ 80 mA
- Requires minimum external components
- < 1 μ A quiescent current when shutdown
- Low ground pin current at all loads
- Output voltage accuracy 1.0% (A Grade)
- High peak current capability (150 mA typical)
- Wide supply voltage range (16V max)
- Low Z_{OUT} 0.3 Ω typical (10 Hz to 1 MHz)
- Over-Temperature/Over-Current protection
- -40°C to +125°C junction temperature range

Applications

- Cellular Phone
- Palmtop/Laptop Computer
- Personal Digital Assistant (PDA)
- Camcorder, Personal Stereo, Camera

e _n	Output Noise Voltage (RMS)	BW = 300 Hz–50 kHz, C _{OUT} = 10 μF C _{BYPASS} = 0.01 μF	30					μV

Symbol	Parameter	Conditions	Typ	LP2982AI-X.X (Note 6)		LP2982I-X.X (Note 6)		Units
				Min	Max	Min	Max	
$\frac{\Delta V_{OUT}}{\Delta V_{IN}}$	Ripple Rejection	$f = 1 \text{ kHz}$ $C_{OUT} = 10 \mu\text{F}$	45					dB
$I_{O(MAX)}$	Short Circuit Current	$R_L = 0$ (Steady State) (Note 9)	150					mA

Note 1: Absolute maximum ratings indicate limits beyond which damage to the component may occur. Electrical specifications do not apply when operating the device outside of its rated operating conditions.

Note 2: The ESD rating of pins 3 and 4 for the SOT-23 package, or pins 5 and 2 for the micro SMD package, is 1 kV.

Note 3: The maximum allowable power dissipation is a function of the maximum junction temperature, $T_{J(MAX)}$, the junction-to-ambient thermal resistance, θ_{JA} , and the ambient temperature, T_A . The maximum allowable power dissipation at any ambient temperature is calculated using:

$$P (MAX) = \frac{T_{J(MAX)} - T_A}{\theta_{JA}}$$

The value of θ_{JA} for the SOT-23 package is 220°C/W. Exceeding the maximum allowable power dissipation will cause excessive die temperature, and the regulator will go into thermal shutdown.

Note 4: If used in a dual-supply system where the regulator load is returned to a negative supply, the LP2982 output must be diode-clamped to ground.

Note 5: The output PNP structure contains a diode between the V_{IN} and V_{OUT} terminals that is normally reverse-biased. Reversing the polarity from V_{IN} to V_{OUT} will turn on this diode. (See *REVERSE CURRENT PATH*.)

Note 6: Temperature range are guaranteed through correlation using Statistical Quality Control (SQC) methods. The limits are used to calculate National's Average Outgoing Quality Level (AOQL).

Note 7: Dropout voltage is defined as the input to output differential at which the output voltage drops 100 mV below the value measured with a 1V differential.

Note 8: The ON/OFF inputs must be properly driven to prevent possible misoperation. For details, refer to *Application Hints*.

Note 9: See *Typical Performance Characteristics* curve(s).

Typical Application Circuit

*ON/OFF input must be actively terminated. Tie to V_{IN} if this function is not to be used.

**Minimum capacitance is shown to insure stability over full load current range. More capacitance provides superior dynamic performance (see *Application Hints*).

***See *Application Hints*.

Application Hints

EXTERNAL CAPACITORS

Like any low-dropout regulator, the external capacitors used with the LP2982 must be carefully selected to assure regulator loop stability.

Input Capacitor: An input capacitor whose value is $\geq 1 \mu\text{F}$ is required with the LP2982 (amount of capacitance can be increased without limit).

This capacitor must be located a distance of not more than 0.5" from the input pin of the LP2982 and returned to a clean analog ground. Any good quality ceramic or tantalum can be used for this capacitor.

Output Capacitor: The output capacitor must meet both the requirement for minimum amount of capacitance and E.S.R. (equivalent series resistance) value. Curves are provided which show the allowable ESR range as a function of load current for various output voltages and capacitor values (refer to Figure 1, Figure 2).

Important: The output capacitor must maintain its ESR in the stable region over the full operating temperature to assure stability. Also, capacitor tolerance and variation with temperature must be considered to assure the minimum amount of capacitance is provided at all times.

This capacitor should be located not more than 0.5" from the output pin of the LP2982 and returned to a clean analog ground.

Low-current Operation: In applications where the load current is $< 1 \text{ mA}$, special consideration must be given to the output capacitor.

Circuitry inside the LP2982 is specially designed to reduce operating (quiescent) current at light loads down to about 65 μA .

The mode of operation which yields this very low quiescent current also means that the output capacitor ESR is critical.

For optimum stability and minimum output noise, it is recommended that a 10 Ω resistor be placed in series with the output capacitor in any applications where $I_L < 1 \text{ mA}$.

CAPACITOR CHARACTERISTICS

Tantalum: Tantalum capacitors are the best choice for use with the LP2982. Most good quality tantalum can be used with the LP2982, but check the manufacturer's data sheet to be sure the ESR is in range.

It is important to remember that ESR increases sharply at lower temperatures ($< 10^\circ\text{C}$) and a capacitor that is near the upper limit for stability at room temperature can cause instability when it gets cold.

In applications which must operate at very low temperatures, it may be necessary to parallel the output tantalum capacitor with a ceramic capacitor to prevent the ESR from going up too high (see next section for important information on ceramic capacitors).

Ceramic: Ceramic capacitors are not recommended for use at the output of the LP2982. This is because the ESR of a ceramic can be low enough to go below the minimum stable value for the LP2982. A good 2.2 μF ceramic was measured and found to have an ESR of about 15 m Ω , which is low enough to cause oscillations.

If a ceramic capacitor is used on the output, a 1 Ω resistor should be placed in series with the capacitor.

Aluminum: Because of large physical size, aluminum electrolytic are not typically used with the LP2982. They must meet the same ESR requirements over the operating tem-

perature range, which is more difficult because of their large increase in ESR at cold temperature.

An aluminum electrolytic can exhibit an ESR increase of as much as 50X when going from 20°C to -40°C . Also, some aluminum electrolytic are not operational below -25°C because the electrolyte can freeze.

FIGURE 1. 5V/2.2 μF ESR Curves

FIGURE 2. 3V/4.7 μF ESR Curves

BYPASS CAPACITOR

The 0.01 μF capacitor connected to the bypass pin to reduce noise must have very low leakage.

The current flowing out of the bypass pin comes from the bandgap reference, which is used to set the output voltage.

This capacitor leakage current causes the output voltage to decline by an amount proportional to the current. Typical values are $-0.015\%/n\text{A}$ @ -40°C , $-0.021\%/n\text{A}$ @ 25°C , and $-0.035\%/n\text{A}$ @ $+125^\circ\text{C}$.

This data is valid up to a maximum leakage current of about 500 nA, beyond which the bandgap is so severely loaded that it can not function.

Care must be taken to ensure that the capacitor selected will not have excessive leakage current over the operating temperature range of the application.

A high quality ceramic capacitor which uses either NPO or COG type dielectric material will typically have very low leakage. Small surface mount polypropylene or polycarbonate film capacitors also have extremely low leakage, but are slightly larger than ceramics.

REVERSE CURRENT PATH

The internal PNP power transistor used as the pass element in the LP2982 has an inherent diode connected between the regulator output and input. During normal operation (where the input voltage is higher than the output) this diode is reverse biased (See Figure 3).

FIGURE 3. LP2982 Reverse Current Path

However, if the input voltage is more than a V_{BE} below the output voltage, this diode will turn ON and current will flow into the regulator output. In such cases, a parasitic SCR can latch which will allow a high current to flow into the V_{IN} pin and out the ground pin, which can damage the part.

The internal diode can also be turned on if the input voltage is abruptly stepped down to a voltage which is a V_{BE} below the output voltage.

In any application where the output voltage may be higher than the input voltage, an external Schottky diode must be connected from V_{IN} to V_{OUT} (cathode on V_{IN} , anode on V_{OUT}). See Figure 4), to limit the reverse voltage across the LP2982 to 0.3V (see *Absolute Maximum Ratings*).

FIGURE 4. Adding External Schottky Diode Protection

ON/OFF INPUT OPERATION

The LP2982 is shut off by pulling the ON/OFF input low, and turned on by driving the input high. If this feature is not to be used, the ON/OFF input should be tied to V_{IN} to keep the regulator on at all times (the ON/OFF input must **not** be left floating).

To ensure proper operation, the signal source used to drive the ON/OFF input must be able to swing above and below the specified turn-on/turn-off voltage thresholds which guarantee an ON or OFF state (see *Electrical Characteristics*).

The ON/OFF signal may come from either a totem-pole output, or an open-collector output with pull-up resistor to the LP2982 input voltage or another logic supply. The high-level voltage may exceed the LP2982 input voltage, but must remain within the Absolute Maximum Ratings for the ON/OFF pin.

It is also important that the turn-on/turn-off voltage signals applied to the ON/OFF input have a slew rate which is greater than 40 mV/ μ s.

IMPORTANT: the regulator shutdown function will not operate correctly if a slow-moving signal is applied to the ON/OFF input.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
