

LP5996

LP5996 Dual Linear Regulator with 300mA and 150mA Outputs

Literature Number: SNVS415B

LP5996

Dual Linear Regulator with 300mA and 150mA Outputs

General Description

The LP5996 is a dual low dropout regulator. The first regulator can source 150mA, while the second is capable of sourcing 300mA.

The LP5996 provides 1.5% accuracy requiring an ultra low quiescent current of 35 μ A. Separate enable pins allow each output of the LP5996 to be shut down, drawing virtually zero current.

The LP5996 is designed to be stable with small footprint ceramic capacitors down to 1 μ F.

The LP5996 is available in fixed output voltages and comes in a 10 pin, 3mm x 3mm, LLP package. .

Features

- 2 LDO Outputs with Independent Enable
- 1.5% Accuracy at Room Temperature, 3% over Temperature
- Thermal Shutdown Protection
- Stable with Ceramic Capacitors

Key Specifications

- | | |
|-----------------------------------|----------------|
| ■ Input Voltage Range | 2.0V to 6.0V |
| ■ Low Dropout Voltage | 210mV at 300mA |
| ■ Ultra-Low I_Q (enabled) | 35 μ A |
| ■ Virtually Zero I_Q (disabled) | <10nA |

Package

All available in Lead Free option.
10 pin LLP 3mm x 3mm

For other package options contact your NSC sales office.

Applications

- Cellular Handsets
- PDA's
- Wireless Network Adaptors

Typical Application Circuit

20171501

Functional Block Diagram

Pin Descriptions

LLP-10 Package

Pin No	Symbol	Name and Function
1	V_{IN}	Voltage Supply Input. Connect a $1\mu\text{F}$ capacitor between this pin and GND.
2	EN1	Enable Input to Regulator 1. Active high input. High = On. Low = OFF.
3	EN2	Enable Input to Regulator 2. Active high input. High = On. Low = OFF.
4	C_{BYP}	Internal Voltage Reference Bypass. Connect a 10nF capacitor from this pin to GND to reduce noise and improve line transient and PSRR. This pin may be left open.
5	N/C	No Connection. Do not connect to any other pin.
6	GND	Common Ground pin. Connect externally to exposed pad.
7	N/C	No Connection. Do not connect to any other pin.
8	N/C	No Connection. Do not connect to any other pin.
9	V_{OUT2}	Output of Regulator 2. 300mA maximum current output. Connect a $1\mu\text{F}$ capacitor between this pin to GND.
10	V_{OUT1}	Output of Regulator 1. 150mA maximum current output. Connect a $1\mu\text{F}$ capacitor between this pin to GND.
Pad	GND	Common Ground. Connect to Pin 6.

Absolute Maximum Ratings

(Notes 1, 2)

If Military/Aerospace specified devices are required, please contact the National Semiconductor Sales Office/Distributors for availability and specifications.

Input Voltage	-0.3V to 6.5V
V_{OUT1} , V_{OUT2} , EN1, and EN2 Voltage to GND	-0.3V to ($V_{IN} + 0.3V$) with 6.5V (max)
Junction Temperature (T_{J-MAX})	150°C
Lead/Pad Temp. (Note 3)	235°C
Storage Temperature	-65°C to 150°C
Continuous Power Dissipation Internally Limited (Note 4)	
ESD Rating (Note 5)	

Human Body Model	2.0kV
Machine Model	200V

Operating Ratings

 (Notes 1, 2)

Input Voltage	2.0V to 6.0V
EN1, EN2 Voltage	0 to ($V_{IN} + 0.3V$) to 6.0V (max)
Junction Temperature	-40°C to 125°C
Ambient Temperature T_A Range (Note 6)	-40°C to 85°C

Thermal Properties

 (Note 1)

Junction To Ambient Thermal Resistance (Note 7)	
θ_{JA} LLP-10 Package	55°C/W

Electrical Characteristics

 (Notes 2, 8)

Unless otherwise noted, $V_{EN} = 950mV$, $V_{IN} = V_{OUT} + 1.0V$, or 2.0V, whichever is higher, where V_{OUT} is the higher of V_{OUT1} and V_{OUT2} . $C_{IN} = 1 \mu F$, $I_{OUT} = 1 mA$, $C_{OUT1} = C_{OUT2} = 1.0 \mu F$.

Typical values and limits appearing in normal type apply for $T_A = 25^\circ C$. Limits appearing in **boldface** type apply over the full junction temperature range for operation, -40 to +125°C.

Symbol	Parameter	Conditions	Typ	Limit		Units
				Min	Max

			V _{OUT} = 3.3V	75			
T _{SHUTDOWN}	Thermal Shutdown	Temperature	160			°C	
		Hysteresis	20				
Enable Control Characteristics							
I _{EN}	Input Current at V _{EN1} or V _{EN2}	V _{EN} = 0.0V	0.005		0.1	μA	
		V _{EN} = 6V	2		5		
V _{IL}	Low Input Threshold				0.4	V	
V _{IH}	High Input Threshold			0.95		V	
Timing Characteristics							
T _{ON}	Turn On Time (Note 11)	To 95% Level C _{BYP} = 10nF	300			μs	
Transient Response	Line Transient Response δV _{OUT} (Note 11)	T _{rise} = T _{fall} = 10μs δV _{IN} = 1V C _{BYP} = 10nF		20		mV (pk - pk)	
			Load Transient Response δV _{OUT} (Note 11)	T _{rise} = T _{fall} = 1μs	LDO 1 I _{OUT} = 1mA to 150mA		175
	LDO 2 I _{OUT} = 1mA to 300mA	150					

Note 1: Absolute Maximum Ratings are limits beyond which damage can occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

Note 2: All Voltages are with respect to the potential at the GND pin.

Note 3: For detailed soldering specifications and information, please refer to National Semiconductor Application Note AN-1187, Leadless Leadframe Package.

Note 4: Internal thermal shutdown circuitry protects the device from permanent damage.

Note 5: The human body model is 100pF discharged through a 1.5kΩ resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin.

Note 6: The maximum ambient temperature (T_{A(max)}) is dependant on the maximum operating junction temperature (T_{J(max-op)} = 125°C), the maximum power dissipation of the device in the application (P_{D(max)}), and the junction to ambient thermal resistance of the part/package in the application (θ_{JA}), as given by the following equation: T_{A(max)} = T_{J(max-op)} - (θ_{JA} × P_{D(max)}).

Note 7: Junction to ambient thermal resistance is dependant on the application and board layout. In applications where high maximum power dissipation is possible, special care must be paid to thermal dissipation issues in board design.

Note 8: Min Max limits are guaranteed by design, test or statistical analysis. Typical numbers are not guaranteed, but do represent the most likely norm.

Note 9: V_{IN(MIN)} = V_{OUT(NOM)} + 0.5V, or 2.0V, whichever is higher.

Note 10: Dropout voltage is voltage difference between input and output at which the output voltage drops to 100mV below its nominal value. This parameter only for output voltages above 2.0V

Note 11: This electrical specification is guaranteed by design.

Output Capacitor, Recommended Specifications

Symbol	Parameter	Conditions	Nom	Limit		Units
				Min	Max	
C _{OUT}	Output Capacitance	Capacitance (Note 12)	1.0	0.7		μF
		ESR		5	500	mΩ

Note 12: The Capacitor tolerance should be 30% or better over temperature. The full operating conditions for the application should be considered when selecting a suitable capacitor to ensure that the minimum value of capacitance is always met. Recommended capacitor is X7R. However, depending on the application, X5R, Y5V and Z5U can also be used. (See capacitor section in Applications Hints).

Typical Performance Characteristics. Unless otherwise specified, $C_{IN} = 1.0\mu\text{F}$ Ceramic, $C_{OUT1} = C_{OUT2} = 1.0\mu\text{F}$ Ceramic, $C_{BYP} = 10\text{nF}$, $V_{IN} = V_{OUT2(NOM)} + 1.0\text{V}$, $T_A = 25^\circ\text{C}$, $V_{OUT1(NOM)} = 3.3\text{V}$, $V_{OUT2(NOM)} = 3.3\text{V}$, Enable pins are tied to V_{IN} .

Application Hints

OPERATION DESCRIPTION

The LP5996 is a low quiescent current, power management IC, designed specifically for portable applications requiring minimum board space and smallest components. The LP5996 contains two independently selectable LDOs. The first is capable of sourcing 150mA at outputs between 0.8V and 3.3V. The second can source 300mA at an output voltage of 0.8V to 3.3V.

INPUT CAPACITOR

An input capacitor is required for stability. It is recommended that a 1.0 μ F capacitor be connected between the LP5996 input pin and ground (this capacitance value may be increased without limit).

This capacitor must be located a distance of not more than 1cm from the input pin and returned to a clean analogue ground. Any good quality ceramic, tantalum, or film capacitor may be used at the input.

Important: Tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it must be guaranteed by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the ESR (Equivalent Series Resistance) on the input capacitor, but tolerance and temperature coefficient must be considered when selecting the capacitor to ensure the capacitance will remain approximately 1.0 μ F over the entire operating temperature range.

OUTPUT CAPACITOR

The LP5996 is designed specifically to work with very small ceramic output capacitors. A 1.0 μ F ceramic capacitor (temperature types Z5U, Y5V or X7R) with ESR between 5m Ω to 500m Ω , is suitable in the LP5996 application circuit.

For this device the output capacitor should be connected between the V_{OUT} pin and ground.

It is also possible to use tantalum or film capacitors at the device output, C_{OUT} (or V_{OUT}), but these are not as attractive for reasons of size and cost (see the section Capacitor Characteristics).

The output capacitor must meet the requirement for the minimum value of capacitance and also have an ESR value that is within the range 5m Ω to 500m Ω for stability.

NO-LOAD STABILITY

The LP5996 will remain stable and in regulation with no external load. This is an important consideration in some circuits, for example CMOS RAM keep-alive applications.

CAPACITOR CHARACTERISTICS

The LP5996 is designed to work with ceramic capacitors on the output to take advantage of the benefits they offer. For capacitance values in the range of 0.47 μ F to 4.7 μ F, ceramic capacitors are the smallest, least expensive and have the lowest ESR values, thus making them best for eliminating high frequency noise. The ESR of a typical 1.0 μ F ceramic capacitor is in the range of 20m Ω to 40m Ω , which easily meets the ESR requirement for stability for the LP5996.

For both input and output capacitors, careful interpretation of the capacitor specification is required to ensure correct device operation. The capacitor value can change greatly, depending on the operating conditions and capacitor type.

In particular, the output capacitor selection should take account of all the capacitor parameters, to ensure that the specification is met within the application. The capacitance can vary with DC bias conditions as well as temperature and frequency of operation. Capacitor values will also show some decrease over time due to aging. The capacitor parameters are also dependant on the particular case size, with smaller sizes giving poorer performance figures in general. As an example, *Figure 1* shows a typical graph comparing different capacitor case sizes in a Capacitance vs. DC Bias plot. As shown in the graph, increasing the DC Bias condition can result in the capacitance value falling below the minimum value given in the recommended capacitor specifications table (0.7 μ F in this case). Note that the graph shows the capacitance out of spec for the 0402 case size capacitor at higher bias voltages. It is therefore recommended that the capacitor manufacturers' specifications for the nominal value capacitor are consulted for all conditions, as some capacitor sizes (e.g. 0402) may not be suitable in the actual application.

20171540

FIGURE 1. Graph Showing a Typical Variation in Capacitance vs DC Bias

The capacitance value of ceramic capacitors varies with temperature. The capacitor type X7R, which operates over a temperature range of -55 $^{\circ}$ C to +125 $^{\circ}$ C, will only vary the capacitance to within \pm 15%. The capacitor type X5R has a similar tolerance over a reduced temperature range of -55 $^{\circ}$ C to +85 $^{\circ}$ C. Many large value ceramic capacitors, larger than 1 μ F are manufactured with Z5U or Y5V temperature characteristics. Their capacitance can drop by more than 50% as the temperature varies from 25 $^{\circ}$ C to 85 $^{\circ}$ C. Therefore X7R is recommended over Z5U and Y5V in applications where the ambient temperature will change significantly above or below 25 $^{\circ}$ C.

Tantalum capacitors are less desirable than ceramic for use as output capacitors because they are more expensive when comparing equivalent capacitance and voltage ratings in the 0.47 μ F to 4.7 μ F range.

Another important consideration is that tantalum capacitors have higher ESR values than equivalent size ceramics. This means that while it may be possible to find a tantalum capacitor with an ESR value within the stable range, it would have to be larger in capacitance (which means bigger and more costly) than a ceramic capacitor with the same ESR value. It should also be noted that the ESR of a typical tantalum will

increase about 2:1 as the temperature goes from 25°C down to -40°C, so some guard band must be allowed.

ENABLE CONTROL

The LP5996 features active high enable pins for each regulator, EN1 and EN2, which turns the corresponding LDO off when pulled low. The device outputs are enabled when the enable pins are set to high. When not enabled the regulator output is off and the device typically consumes 2nA.

If the application does not require the Enable switching feature, one or both enable pins should be tied to V_{IN} to keep the regulator output permanently on.

To ensure proper operation, the signal source used to drive the enable inputs must be able to swing above and below the specified turn-on/off voltage thresholds listed in the Electrical Characteristics section under V_{IL} and V_{IH} .

BYPASS CAPACITOR

The internal voltage reference circuit of the LP5996 is connected to the C_{BYP} pin via a high value internal resistor. An external capacitor, connected to this pin, forms a low-pass

filter which reduces the noise level on both outputs of the device. There is also some improvement in PSSR and line transient performance. Internal circuitry ensures rapid charging of the C_{BYP} capacitor during start-up. A 10nF, high quality ceramic capacitor with either NPO or COG dielectric is recommended due to their low leakage characteristics and low noise performance.

SAFE AREA OF OPERATION

Due consideration should be given to operating conditions to avoid excessive thermal dissipation of the LP5996 or triggering its thermal shutdown circuit. When both outputs are enabled, the total power dissipation will be $P_{D(LDO1)} + P_{D(LDO2)}$ where $PD = (V_{IN} - V_{OUT}) \times I_{OUT}$ for each LDO

In general, device options which have a large difference in output voltage will dissipate more power with both outputs enabled, due to the input voltage required for the higher output voltage LDO. In such cases, especially at elevated ambient temperature, it may not be possible to operate both outputs at maximum current at the same time.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
