

PCM3501

Low Voltage, Low Power, 16-Bit, Mono *SoundPLUS*™ VOICE/MODEM CODEC

FEATURES

- 16-BIT DELTA-SIGMA DAC AND ADC
- DIFFERENTIAL INPUT AND OUTPUT
- DESIGNED FOR MODEM ANALOG FRONT END:
Supports up to 56kbps Operation
- ANALOG PERFORMANCE:
Sampling Frequency: 7.2kHz to 26kHz
Dynamic Range: 88dB (typ) at $f_s = 8\text{kHz}$, $f_{in} = 1\text{kHz}$
- SYSTEM CLOCK: $512f_s$
- MASTER OR SLAVE OPERATION
- ON-CHIP CRYSTAL OSCILLATOR CIRCUIT
- ADC-TO-DAC LOOP-BACK MODE
- TIME SLOT MODE SUPPORTS UP TO
FOUR CODECS ON A SINGLE SERIAL
INTERFACE

- POWER-DOWN MODE: $60\mu\text{A}$ (typ)
- SINGLE +2.7V TO +3.6V POWER SUPPLY
- SMALL PACKAGE: 24-Lead SSOP

APPLICATIONS

- SOFTWARE MODEMS FOR:
Personal Digital Assistant
Notebook and Hand-Held PCs
Set-Top Box
Digital Television
Embedded Systems
- PORTABLE VOICE RECORDER/PLAYER
- SPEECH RECOGNITION/SYNTHESIS
- TELECONFERENCING PRODUCTS

DESCRIPTION

The PCM3501 is a low cost, 16-bit CODEC designed for modem Analog Front End (AFE) and speech processing applications. The PCM3501's low power operation from +2.7V to +3.6V power supplies, along with an integrated power-down mode, make it ideal for portable applications.

The PCM3501 integrates all of the functions needed for a modem or voice CODEC, including delta-sigma

digital-to-analog and analog-to-digital converters, input anti-aliasing filter, digital high-pass filter for DC blocking, and an output low-pass filter. The synchronous serial interface provides for a simple, or glue-free interface to popular DSP and RISC processors. The serial interface also supports Time Division Multiplexing (TDM), allowing up to four CODECs to share a single 4-wire serial bus.

ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Burr-Brown recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

PACKAGE/ORDERING INFORMATION

PRODUCT	PACKAGE	PACKAGE DRAWING NUMBER	SPECIFIED TEMPERATURE RANGE	PACKAGE MARKING	ORDERING NUMBER ⁽¹⁾	TRANSPORT MEDIA
PCM3501E "	24-Lead SSOP "	338 "	−25°C to +85°C "	PCM3501E "	PCM3501E PCM3501E/2K	Rails Tape and Reel

NOTE: (1) Models with a slash (/) are available only in Tape and Reel in the quantities indicated (e.g., /2K indicates 2000 devices per reel). Ordering 2,000 pieces of "PCM3501E/2K" will get a single 2000-piece Tape and Reel.

PIN CONFIGURATION

PIN ASSIGNMENTS

PIN	NAME	I/O	DESCRIPTION
1	V _{COM}	OUT	Common-Mode Voltage (0.5V _{CC}). This pin should be connected to ground through a capacitor.
2	V _{REF1}	—	Decouple Pin for Reference Voltage 1 (0.99V _{CC}). This pin should be connected to ground through a capacitor.
3	V _{REF2}	—	Decouple Pin for Reference Voltage 2 (0.2V _{CC}). This pin should be connected to ground through a capacitor.
4	V _{IN+}	IN	Non-Inverting input to on-chip AFE.
5	V _{IN-}	IN	Inverting input to on-chip AFE.
6	M/S	IN	Master/Slave Select. This pin is used to determine the operating mode for the serial interface. A logic '0' on this pin selects the Slave Mode. A logic '1' on this pin selects the Master Mode. ⁽²⁾
7	TSC	IN	Time Slot Mode Control. This pin is used to select the time slot operating mode. A logic '0' on this pin disables Time Slot Mode. A logic '1' on this pin enables Time Slot Mode. ⁽²⁾
8	BCK	I/O	Bit Clock. This pin serves as the bit (or shift) clock for the serial interface. This pin is an input in Slave Mode and an output in Master Mode. ⁽¹⁾
9	FS	I/O	Frame Sync. This pin serves as the frame synchronization clock for the serial interface. This pin is an input in Slave Mode and an output in Master Mode. ⁽¹⁾
10	DIN	IN	Serial Data Input. This pin is used to write 16-bit data to the DAC. ⁽¹⁾
11	DOUT	OUT	Serial Data Output. The ADC outputs 16-bit data on this pin. ⁽³⁾
12	FSO	OUT	Frame Sync Output. Active only when Time Slot Mode is enabled. This pin is set to a high impedance state when Time Slot mode is disabled (TSC = 0).
13	V _{DD}	—	Digital Power Supply. Used to power the digital section of the ADC and DAC, as well as the serial interface and mode control logic. This pin is not internally connected to V _{CC} .
14	DGND	—	Digital Ground. Internally connected through the substrate to analog ground.
15	SCKIO	I/O	System Clock Input/Output. This pin is a system clock output when using the crystal oscillator or XTI as the system clock input; when XTI is connected to ground, this pin is a system clock input. ⁽¹⁾
16	XTO	OUT	Crystal Oscillator Output.
17	XTI	IN	Crystal Oscillator Input or an External System Clock Input.
18	HPFD	IN	High-Pass Filter Disable. When this pin is set to a logic '1', the HPF function in the ADC is disabled. ⁽²⁾
19	LOOP	IN	ADC-to-DAC Loop-Back Control. When this pin is set to logic '1', the ADC data is fed to the DAC input. ⁽²⁾
20	PDWN	IN	Power Down and Reset Control. When this pin is logic '0', Power-Down Mode is enabled. The PCM3500 is reset on the rising edge of this signal. ⁽²⁾
21	V _{OUT-}	OUT	Inverting output.
22	V _{OUT+}	OUT	Non-inverting output.
23	AGND	—	Analog Ground. This is the ground for the internal analog circuitry.
24	V _{CC}	—	Analog Power Supply. Used to power the analog circuitry of the ADC and DAC.

NOTES: (1) Schmitt-Trigger input. (2) Schmitt-Trigger input with an internal pull-down resistor. (3) Tri-state output in Time Slot Mode.

SUPPLY CURRENT vs SUPPLY VOLTAGE AND SAMPLING FREQUENCY

SYSTEM CLOCK AND RESET/ POWER DOWN

SYSTEM CLOCK INPUT AND OUTPUT

The PCM3501 requires a system clock for operating the digital filters and delta-sigma data converters.

The system clock may be supplied from an external master clock or generated using the on-chip crystal oscillator circuit. Figure 1 shows the required connections for external and crystal clock operation. The system clock must operate at 512 times the sampling frequency, f_s , with sampling frequencies from 7.2kHz to 26kHz. This gives an effective system clock frequency range of 3.6864MHz to 13.312MHz.

Table I shows system clock frequencies for common sampling frequencies.

For external clock operation, XTI (pin 17) or SCKIO (pin 15) is driven by a master clock source. If SCKIO is used as the system clock input, then XTI must be connected to ground.

SAMPLING FREQUENCY (kHz)	SYSTEM CLOCK FREQUENCY (MHz)
8	4.096
11.025	5.6448
16	8.192
22.05	11.2896
24	12.288

TABLE I. System Clock Frequencies for Common Sampling Frequencies.

For either case, XTO (pin 16) should be left open. The system clock source should be free of noise and exhibit low phase jitter in order to obtain optimal dynamic performance from the PCM3501. Figure 2 shows the system clock timing requirements associated with an external master clock.

For crystal oscillator operation, a crystal is connected between XTI (pin 17) and XTO (pin 16), along with the necessary load capacitors (10pF to 33pF per pin, as shown in Figure 1). A fundamental-mode, parallel resonant crystal is required.

FIGURE 1. System Clock Generation.

FIGURE 2. External System Clock Timing Requirements.

Reset and Power Down

The PCM3501 supports power-on reset, external reset, and power-down operations. Power-on reset is performed by internal circuitry automatically at power up, while the external reset is initiated using the $\overline{\text{PDWN}}$ input (pin 20).

Power-on reset occurs when power and system clock are initially applied to the PCM3501. The internal reset circuitry requires that the system clock be active at power up, with at least three system clock cycles occurring prior to $V_{\text{DD}} = 2.2\text{V}$. When V_{DD} exceeds 2.2V, the power-on reset comparator enables the initialization sequence, which requires 1024 system clock periods for completion. During the initialization sequence, the DAC output is forced to AGND, and the ADC output is forced to a high impedance state. After the initialization sequence has completed, the DAC and ADC outputs experience a delay before they output a valid signal or data. Refer to Figures 3 and 5 for power-on reset and post-reset delay timing.

External reset is performed by first setting $\overline{\text{PDWN}} = '0'$ and then setting $\overline{\text{PDWN}} = '1'$. The LOW to HIGH transition on

$\overline{\text{PDWN}}$ causes the reset initialization sequence to start. During the initialization sequence, the DAC output is forced to AGND, and the ADC output is forced to a high impedance state. After the initialization sequence has completed, the DAC and ADC outputs experience a delay before they output a valid signal or data. Refer to Figures 4 and 5 for external reset and post-reset delay timing.

Power-down mode is enabled by setting $\overline{\text{PDWN}} = '0'$. During power-down mode, minimum current is drawn when the system clock is removed, resulting in 60 μA (typical) power supply current. The $\overline{\text{PDWN}}$ input includes an internal pull-down resistor, which places the PCM3501 in power-down mode at power-up if the $\overline{\text{PDWN}}$ pin is left unconnected. Ideally, the $\overline{\text{PDWN}}$ input should be driven by active logic in order to control reset and power-down operation. If the $\overline{\text{PDWN}}$ pin is to be unused in the system application, it should be connected to V_{DD} to enable normal operation. By setting $\overline{\text{PDWN}} = '1'$ when exiting power-down mode, the PCM3501 will initiate an external reset as described earlier in this section.

FIGURE 3. Power-On Reset Timing.

FIGURE 4. External Reset Timing.

FIGURE 5. DAC and ADC Output for Reset and Power Down.

SERIAL INTERFACE

The serial interface of the PCM3501 is a 4-wire synchronous serial port. It includes FS (pin 9), BCK (pin 8), DIN (pin 10) and DOUT (pin 11). FS is the frame synchronization clock, BCK is the serial bit or shift clock, DIN is the serial data input for the DAC, and DOUT is the serial data output for the ADC.

The frame sync, FS, operates at the sampling frequency (f_s). The bit clock, BCK, operates at $16f_s$ for normal operation. DIN and DOUT also operate at the bit clock rate. Both FS and BCK must be synchronous with the system clock (guar-

anteed in Master Mode). Data for DIN is clocked into the serial interface on the rising edge of BCK, while data for DOUT is clocked out of the serial interface on the falling edge of BCK.

Figure 6 shows the serial interface format for the PCM3501. The serial data for DIN and DOUT must be in Binary Two's Complement, MSB-first format. Figures 7 and 8 show the timing specifications for the serial interface when used in Slave and Master Modes.

FIGURE 6. Serial Interface Format.

NOTES: Timing measurement reference level is $(V_{IH}/V_{IL})/2$. Rising and falling time is measured from 10% to 90% of IN/OUT signal swing. Load capacitance of DOUT signal is 50pF.

FIGURE 7. Serial Interface Timing for Slave Mode.

FIGURE 8. Serial Interface Timing for Master Mode.

FIGURE 9. Slave and Master Mode Connections.

MASTER/SLAVE OPERATION

The serial interface supports both Slave and Master Mode operation. The mode is selected by the M/S input (pin 6). Table II shows mode and pin settings corresponding to the M/S input selection. Figure 9 shows connections for Slave and Master mode operation.

M/S (PIN 6)	SERIAL INTERFACE MODE	FS (PIN)	BCK (PIN 8)
0	Slave	Input	Input
1	Master	Output	Output

TABLE II. Master/Slave Mode Selection.

Slave Mode Operation

In Slave Mode, the FS and BCK pins are inputs to the PCM3501. Both FS and BCK should be derived from the system clock signal (XTI or SCKIO) to ensure proper synchronization. Slave Mode is best suited for applications where the DSP or controller is capable of generating the FS, BCK, and system clocks using an on-chip serial port and/or timing generator.

Master Mode Operation

In Master Mode operation, both FS and BCK are clock outputs generated by the PCM3501 from the system clock input (XTI, SCKIO, or a crystal). In Master Mode, the timing and phase relationships between system clock, FS, and BCK are managed internally to provide optimal synchronization.

SYNCHRONIZATION REQUIREMENTS

The PCM3501 requires that FS and BCK be synchronous with the system clock. Internal circuitry is included to detect a loss of synchronization between FS and the system clock input. If the phase relationship between FS and the system clock varies more than ± 1.5 BCK periods, the PCM3501 will detect a loss of synchronization. Upon detection, the DAC output is forced to $0.5V_{CC}$ and the DOUT pin is forced to a high impedance state. This occurs within one sampling clock (FS) period of initial detection. Figure 10 shows the loss of synchronization operation and the DAC and ADC output delays associated with it.

TIME SLOT OPERATION

The PCM3501 serial interface supports Time Division Multiplexing (TDM) using the Time Slot Mode. Up to four PCM3501s may be connected on the same 4-wire serial

interface bus. This is useful for system applications that require multiple modem or voice channels. Figure 11 shows examples of Time Slot Mode connections.

Time Slot Mode defines a 64-bit long frame, composed of four time slots. Each slot is 16 bits long and corresponds to one of four CODECs. The FS pin on the first PCM3501 (CODEC A, Slot 0) is used as the master frame sync, and operates at the sampling frequency, f_s . The bit clock, BCK, operates at $64f_s$. DIN and DOUT of each CODEC also operate at $64f_s$. Figure 12 shows the operation of the Time Slot Mode.

Time Slot operation is enabled or disabled using the TSC input (pin 7). The state of the TSC pin is updated at power-on reset, or on the rising edge of PWDN input (if using external reset or power-down mode). A forced reset is required when changing from Slave to Master Mode, or visa versa, in real time.

FIGURE 10. Loss of Synchronization Operation and Timing.

FIGURE 11. Time Slot Mode Connections.

FIGURE 12. Time Slot Mode Operation.

Table III shows the TSC pin settings and corresponding mode selections. When Time Slot Mode is enabled, FSO (pin 12) is used as a frame sync output, which is connected to the FS input of the next PCM3501 in the Time Slot sequence. Figures 13 and 14 provide detailed timing for Time Slot Mode operation.

TSC (PIN 7)	TIME SLOT MODE
0	Time Slot Mode Disabled, Normal Operation
1	Time Slot Operation Enable

TABLE III. Time Slot Mode Selection.

ADC-TO-DAC LOOP BACK

The PCM3501 includes a Loop-Back Mode, which directly feeds the ADC data to the DAC input. This mode is designed for diagnostic testing and system adjustment. Loop-Back Mode is enabled and disabled using the LOOP input (pin 19). Table IV shows the LOOP pin settings and corresponding mode selections. The serial interface continues to operate in Loop-Back Mode, allowing the host to read the ADC data at the DOUT pin.

LOOP (PIN 19)	LOOP-BACK MODE
0	Loop-Back Mode Disabled, Normal Operation
1	Loop-Back Mode Enabled

TABLE IV. Loop-Back Mode Selection.

HIGH-PASS FILTER

The PCM3501 includes a digital high-pass filter in the ADC which may be used to remove the DC offset created by the analog front-end (AFE) section. The high-pass filter response is shown in Figure 15. The high-pass filter may be enabled or disabled using the HPFD input (pin 18). Table V shows the HPFD pin settings and corresponding mode selections.

HPFD (PIN 18)	HIGH-PASS FILTER MODE
0	High-Pass Filter On
1	High-Pass Filter Off

TABLE V. High-Pass Filter Mode Selection.

NOTES: Timing measurement reference level is $(V_{IH}/V_{IL})/2$. Rising and falling time is measured from 10% to 90% of IN/OUT signal swing. Load capacitance of DOUT, and FSO signal is 50pF.

APPLICATIONS INFORMATION

BASIC CIRCUIT CONNECTIONS

The basic connection diagram for the PCM3501 is shown in Figure 16. Included are the required power supply bypass and reference decoupling capacitors. The DAC output, V_{OUT} , and the ADC input, V_{IN} , should be AC-coupled to external circuitry.

Reference Pin Connections

The V_{COM} voltage is used internally to bias the input and output amplifier stages of the PCM3501. It is brought out

unbuffered on pin 1 for decoupling. A $1\mu\text{F}$ to $10\mu\text{F}$ aluminum electrolytic or tantalum capacitor is recommended for decoupling purposes. This capacitor should be located as close as possible to pin 1.

The V_{COM} voltage is typically equal to $V_{CC}/2$, and may be used to bias external input and output circuitry. However, since the V_{COM} pin is not a buffered output, it must drive a high impedance load to avoid excessive loading. Buffering the V_{COM} pin with an external op amp configured as a voltage follower is recommended when driving multiple bias nodes. Figure 17 shows an example of using V_{COM} with external circuitry.

FIGURE 16. Basic Connection Diagram.

FIGURE 17. Using V_{COM} to Bias External Circuitry.

V_{REF1} (pin 2) and V_{REF2} (pin 3) are reference voltages used by the delta-sigma modulators. They are brought out strictly for decoupling purposes. V_{REF1} and V_{REF2} are not to be used to bias external circuits. A $1\mu\text{F}$ to $10\mu\text{F}$ aluminum electrolytic or tantalum capacitor is recommended for decoupling on each pin. These capacitors should be located as close as possible to pins 2 and 3.

Power Supplies and Grounding

V_{CC} (pin 24) and V_{DD} (pin 13) should be connected directly to the +2.7V to +3.6V analog power supply, as shown in Figure 16. The AGNDs (pins 5, 21, and 23) and DGND (pin 14) should be connected directly to the analog ground. Power supply bypass capacitors should be located as close to the power supply pins as possible in order to ensure a low impedance connection. A combination of a $10\mu\text{F}$ aluminum electrolytic or tantalum capacitor in parallel with a $0.1\mu\text{F}$ ceramic capacitor is recommended for both V_{CC} and V_{DD} . V_{DD} and V_{CC} should not be connected to separate digital and analog power supplies. This can lead to an SCR latch-up condition, which can cause either degraded device performance or catastrophic failures.

PCB LAYOUT GUIDELINES

The recommended PCB layout technique is shown in Figure 18. The analog and digital section of the board are separated

by a split ground plane, with the PCM3501 positioned entirely over the analog section of the board. The AGNDs (pins 5, 20, and 23) and DGND (pin 14) are connected directly to the analog ground plane. The power supply pins, V_{CC} (pin 13) and V_{DD} (pin 24), are routed directly to the +2.7V to +3.6V analog power supply using wide copper traces (100 mils or wider recommended) or a power plane. Power supply bypass and reference decoupling capacitors are shown located as close as possible to the PCM3501.

The PCM3501 is oriented so that the digital pins are facing the ground plane split. Digital connections should be made as short and direct as possible to limit high frequency radiation and coupling. Series resistors (from 20Ω to 100Ω) may be put in series with the system clock, FS, BCK, and FSO lines to reduce or eliminate overshoot on clock edges, further reducing radiated emissions. The split ground plane should be connected at one point by a trace, wire, or ferrite bead. Often the board will be designed to have several jumper points for the common ground connection, so that the best performance can be derived through experimentation.

An alternative technique, using a single power supply or battery, is shown in Figure 19. This technique is more suitable for portable applications.

FIGURE 18. Recommended PCB Layout Technique.

FIGURE 19. PCB Layout Using a Single-Supply or Battery.

OUTPUT FILTER CIRCUITS FOR THE DAC

The PCM3501's DAC uses delta-sigma conversion techniques. It uses oversampling and noise shaping to improve in-band ($f = f_s/2$) signal-to-noise performance at the expense of increased out-of-band noise. The DAC output must be low-pass filtered to attenuate the out-of-band noise to a reasonable level.

The PCM3501 includes a low-pass filter in the on-chip output amplifier circuit. The frequency response for this filter is shown in Figure 20. Although this filter helps to lower the out-of-band noise, it is not adequate for many applications. This is especially true for applications where the sampling frequency is below 16kHz, since the out-of-band noise above $f_s/2$ is in the audio spectrum. An external filter circuit, either passive or active, is required to provide additional attenuation of the out-of-band noise. The low-pass filter order will be dependent upon the out-of-band

noise requirements for a particular system. Generally, a 2nd-order or better low-pass circuit will be required, with the cut-off frequency set to $f_s/2$ or less.

Burr-Brown Application Bulletin AB-034 provides information for designing both Multiple Feedback and Sallen-Key active filter circuits using software available from Burr-Brown's web site. Another excellent reference for both passive and active filter design is the *"Electronic Filter Design Handbook, Third Edition"* by Williams and Taylor, published by McGraw-Hill.

ON-CHIP ANALOG FRONT END FOR THE ADC

The PCM3501 A/D converter includes a fully differential input delta-sigma modulator. In order to simplify external circuitry, an analog front end (AFE) circuit has been included on the PCM3501 just prior to the modulator. The AFE circuit is shown in Figure 21.

FIGURE 20. DAC Output Amplifier Filter Response.

FIGURE 21. On-Chip AFE Circuit for the ADC.

The AFE circuit consists of a buffer/filter for each input of the converter. The frequency response for the filter is shown in Figure 22. Since the delta-sigma modulator oversamples the input at $64f_s$, the anti-alias filter requirements are relaxed, with only a single-pole filter being required. If an application requires further band limiting of the input signal, a simple RC filter at the inputs can be used, as shown in Figure 23.

FIGURE 23. Optional External Low-Pass Filter for the ADC.

THEORY OF OPERATION

ADC SECTION

The PCM3501 A/D converter consists of two reference circuits, differential input buffer, a fully differential 5th-order delta-sigma modulator, a decimation filter (including digital high pass), and a serial interface circuit. The block diagram on the front page of this data sheet illustrates the architecture of the ADC section, Figure 21 shows the input buffers, and Figure 24 illustrates the architecture of the 5th-order delta-sigma modulator and transfer functions.

An internal reference circuit with three external capacitors provides all reference voltages which are required by the ADC, which defines the full-scale range for the converter. The internal input buffers save the design, space and extra parts needed for external circuitry required by many delta-sigma converters. The internal full-differential signal processing architecture provides a wide dynamic range and excellent power supply rejection performance. The input signal is sampled at a 64x oversampling rate, eliminating the need for a sample-and-hold circuit, and simplifying anti-alias filtering requirements. The 5th-order delta-sigma noise

FIGURE 22. Anti-Alias Filter Frequency Response.

FIGURE 24. Simplified 5th-Order Delta-Sigma Modulator.

shaper consists of five integrators which use a switched-capacitor topology, a comparator, and a feedback loop consisting of a one-bit DAC. The delta-sigma modulator shapes the quantization noise, shifting it out of the audio band in the frequency domain. The high order of the modulator enables it to randomize the modulator outputs, reducing idle tone levels.

The $64f_s$ one-bit data stream from the modulator is converted to $1f_s$, 16-bit data words by the decimation filter, which also acts as a low-pass filter to remove the shaped quantization noise. The DC components can be removed by a high-pass filter function contained within the decimation filter.

DAC SECTION

The delta-sigma DAC section of PCM3501 is based on a 5-level amplitude quantizer and a 3rd-order noise shaper. This section converts the oversampled input data to 5-level delta-sigma format. A block diagram of the 5-level delta-sigma modulator is shown in Figure 25. This 5-level delta-sigma modulator has the advantage of stability and clock jitter sensitivity over the typical one-bit (2 level) delta-sigma modulator. The combined oversampling rate of the delta-sigma modulator and the internal 8x interpolation filter is $64f_s$ for a $512f_s$ system clock.

PACKAGING INFORMATION

Orderable Device	Status ⁽¹⁾	Package Type	Package Drawing	Pins	Package Qty	Eco Plan ⁽²⁾	Lead/Ball Finish	MSL Peak Temp ⁽³⁾
PCM3501E	ACTIVE	SSOP	DB	24	58	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
PCM3501E/2K	ACTIVE	SSOP	DB	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
PCM3501E/2KG4	ACTIVE	SSOP	DB	24	2000	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM
PCM3501EG4	ACTIVE	SSOP	DB	24	58	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-1-260C-UNLIM

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
