DESCRIPTION

The DG444B/445B are monolithic quad analog switches designed to provide high speed, low error switching of analog and audio signals. The DG444B/445B are upgrades to the original DG444/445.

Combining low on-resistance (45 Ω , typ.) with high speed (t_{ON} 120 ns, typ.), the DG444B/445B are ideally suited for Data Acquisition, Communication Systems, Automatic Test Equipment, or Medical Instrumentation. Charge injection has

been minimized on the drain for use in sample-and-hold circuits.

The DG444B/445B are built using Vishay Siliconix's high-voltage silicon-gate process. An epitaxial layer prevents latchup.

When on, each switch conducts equally well in both directions and blocks input voltages to the supply levels when off.

Notes:

- Signals on S_X , D_X , or IN_X exceeding V_+ or V_- will be clamped by internal diodes. Limit forward diode current to maximum current ratings.
- All leads welded or soldered to PC Board.
- Derate 6 mW/ $^\circ\text{C}$ above 75°C
- Derate 8 mW/ $^\circ\text{C}$ above 75°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
