

SY88403BL Evaluation Board

3.3V, 4.25Gbps CML Limiting Post Amplifier
with TTL LOS

General Description

The SY88403BL evaluation board enables fast and thorough evaluation of the SY88403BL. The board is an easy-to-use, single supply design, designed to be driven by a high-speed, pattern generator. The SY88403BL evaluation board is intended to terminate to a 50Ω scope and provides for simple user adjustability of the LOS threshold through the adjustment of an on-board potentiometer.

All data sheets and support documentation can be found on Micrel's web site at: www.micrel.com.

Features

- SY88403BL CML Limiting Post Amplifier with High-Sensitivity TTL LOS
- Single +3.3V power supply
- AC-coupled configuration for direct interface with 50Ω test equipment
- On-board LOS sensitivity adjustment

Related Documentation

- 3.3V, 4.25Gbps CML Limiting Post Amplifier with High-Sensitivity TTL LOS.

Evaluation Board

Evaluation Board Description

The SY88403BL evaluation board is designed to operate with a single 3.3V $\pm 10\%$ power supply and is configured with AC-coupled inputs and outputs. The high-speed input and output channels are brought out to SMA connectors through matched length AC-coupled differential strip-line traces.

AC-Coupled Input

The AC-Coupled inputs automatically bias the input levels to the correct DC-operating point set by the VT jumper input. Therefore, the inputs can be driven by a differential signal smaller than 100mV (200mV_{pp}) without level shifting or termination resistor network in the signal path.

AC-Coupled Output

The SY88403BL is configured with AC-coupled outputs allowing the board to interface directly with 50 Ω equipment. AC-coupling allows the board to use a single power supply. If only one output is being used, the unused complimentary output should be terminated into 50 Ω to ground.

SY88403BL AC-Coupled Evaluation Board Setup

This section explains how to connect and setup the SY88403BL evaluation board per Figure 1. Ensure proper ESD precautionary measures are taken before handling sensitive electronic equipment, including the SY88403BL evaluation board.

Measurements

Evaluating DOUT and /DOUT

1. Set a DC power supply to +3.3V and turn it off. Connect the positive lead to V_{CC} post and the negative lead to GND post.
2. Connect the /EN input to the GND to enable the DOUT and /DOUT output buffers.
3. Set the desired frequency on a pattern generator with an amplitude between 20mV_{pp} and 1800mV_{pp}. Typical data patterns are 2⁷-1 or 2²³-1 PRBS patterns depending on the application. Since the inputs to the board are AC-Coupled, the voltage offset of the pattern generator is not significant so it can be set between GND and V_{CC}.
4. Connect the pattern generator with differential outputs as a data source to the DIN and /DIN inputs on the SY88403BL evaluation board. Use matched length differential cables.
5. Turn the power supply on.
6. Observe the DOUT and /DOUT outputs with a 50 Ω scope. The output rise and fall times should be less than 120ps, with an amplitude around 400mV (800mV_{pp} differential).

LOS Hysteresis Measurements

The SY88403BL evaluation board provides a potentiometer to allow for convenient adjustment of LOS_{LVL} without the need for an extra power supply. LOS_{LVL} taps off a potentiometer connected between V_{CC} and V_{REF}. V_{REF} is a reference voltage of approximately V_{CC} -1.3V. Hence, LOS_{LVL} can be set to any voltage between V_{CC} and V_{CC}-1.3, as specified in the SY88403BL data sheet. The potentiometer creates a voltage divider. Thus,

$$\text{LOS}_{\text{LVL}} = V_{\text{CC}} - \left[\frac{1.3 \times R(\text{k}\Omega)}{(R(\text{k}\Omega) + 2.8\Omega)} \right]$$

Where R is the resistance of the potentiometer from V_{CC} to the tap at LOS_{LVL}, the steps below show how to measure the LOS hysteresis as a function of the input voltage swing at the DIN and /DIN inputs:

Minimum Input Swing Hysteresis Measurement

The minimum acceptable input swing for the SY88403BL is 20mV_{pp}.

1. Set a DC power supply to +3.3V and turn it off. Connect the positive lead to V_{CC} post and the negative lead to GND post.
2. Connect the /EN input to the GND to enable the DOUT and /DOUT output buffers.
3. Connect a DMM or similar voltage measurement device between the LOS_{LVL} pin and V_{CC}.
4. Connect a second DMM or similar voltage measurement device between the LOS output and GND. For the remainder of this document this DMM will be referred to as the LOS DMM.
5. Connect the pattern generator with differential outputs as a data source to the DIN and /DIN inputs on the SY88403BL evaluation board. Use matched length differential cables.
6. Turn the power supply on.
7. Adjust the trimpot VAR1 so the voltage at the LOS_{LVL} pin is around 1.3V below V_{CC}. This sets the LOS for maximum sensitivity. At this level the LOS output should go HIGH or LOW (measured with the LOS DMM set up in step 4) as the input voltage swing at DIN and /DIN is varied around 5mV_{pp}.
8. Now adjust the trimpot is to vary the voltage so it is closer to V_{CC}. Note that as the voltage at the LOS_{LVL} pin approaches V_{CC} a larger input voltage swing is required to trigger the assert and deassert levels, while as the LOS_{LVL} voltage moves away from V_{CC} the assert and de-assert levels are triggered by input voltage swings as small as 5mV_{pp}.
9. The hysteresis between the assert and de-assert levels can be calculated with the following equation:
Hysteresis (dB) = 20log (LOS de-assert voltage/LOS assert voltage). This hysteresis should be >2dB.

Evaluation Board Layout

The evaluation boards are constructed with Rogers 4003 material and are coplanar in design, fabricated to minimize noise, achieve high bandwidth and minimize crosstalk.
