## Integrated 3-Port 10/100 Managed Switch with PHY

---

### Features

#### • Advanced Switch Features

- IEEE 802.1q VLAN Support for Up to 16 Groups (Full Range of VLAN IDs)
- VLAN ID Tag/Untag Options, Per Port Basis
- IEEE 802.1p/q Tag Insertion or Removal on a Per Port Basis (Egress)
- Programmable Rate Limiting at the Ingress and Egress on a Per Port Basis
- Broadcast Storm Protection with Percent Control (Global and Per Port Basis)
- IEEE 802.1d Rapid Spanning Tree Protocol Support
- Tail Tag Mode (1 byte Added before FCS) Support at Port 3 to Inform the Processor which Ingress Port Receives the Packets
- Bypass Feature that Automatically Sustains the Switch Function between Port 1 and Port 2 when CPU (Port 3 Interface) Goes into Sleep Mode
- Self-Address Filtering Support
- Individual MAC Address for Port 1 and Port 2
- IGMP Snooping (IPv4) Support for Multicast Packet Filtering
- IPv4/IPv6 QoS Support
- MAC Filtering Function to Forward Unknown Unicast Packets to Specified Port

#### • Comprehensive Configuration Register Access

- Serial Management Interface (SMI) to All Internal Registers
- MII Management (MIIM) Interface to PHY Registers
- High Speed SPI and I<sup>2</sup>C Interface to All Internal Registers
- I/O Pins Strapping and EEPROM to Program Selective Registers in Unmanaged Switch Mode
- Control Registers Configurable on the Fly (Port-Priority, 802.1p/d/q, AN...)

#### • QoS/CoS Packet Prioritization Support

- Per Port, 802.1p and DiffServ-Based
- Re-Mapping of 802.1p Priority Field Per Port Basis, Four Priority Levels

#### • Proven Integrated 3-Port 10/100 Ethernet Switch

- 3rd Generation Switch with Three MACs and One PHY Fully Compliant with IEEE 802.3u Standard
- Non-Blocking Switch Fabric Ensures Fast Packet Delivery by Utilizing a 1k MAC Address Lookup Table and a Store-and-Forward Architecture

- Full-Duplex IEEE 802.3x Flow Control (PAUSE) with Force Mode Option
- Half-Duplex Back Pressure Flow Control
- HP Auto MDI-X for Reliable Detection of and Correction for Straight-Through and Crossover Cables with Disable and Enable Option
- MAC MII Interface Supports both MAC Mode and PHY Mode
- LinkMD<sup>®</sup> TDR-Based Cable Diagnostics Permit Identification of Faulty Copper Cabling
- Comprehensive LED Indicator Support for Link, Activity, Full-/Half-Duplex, and 10/100 Speed
- HBM ESD Rating 3 kV

#### • Switch Monitoring Features

- Port Mirroring/Monitoring/Sniffing: Ingress and/or Egress Traffic to Any Port or MII
- MIB Counters for Fully Compliant Statistics Gathering, 34 MIB Counters Per Port
- Loopback Modes for Remote Diagnostic of Failure

#### • Low Power Dissipation

- Full-Chip Software Power-Down (Register Configuration Not Saved)
- Full-Chip Hardware Power-Down (Register Configuration Not Saved)
- Energy-Detect Mode Support
- Dynamic Clock Tree Shutdown Feature
- Per Port Based Software Power-Save on PHY (Idle Link Detection, Register Configuration Preserved)
- Voltages: Single 3.3V Supply with Internal 1.8V LDO for 3.3V VDDIO
- Optional 3.3V, 2.5V, and 1.8V for VDDIO
- Transceiver Power 3.3V for VDDA\_3.3

#### • Industrial Temperature Range: -40°C to +85°C

#### • Available in a 64-Pin LQFP, Lead-Free Package

### Applications

- VoIP Phone
- Set-Top/Game Box
- Automotive Ethernet
- Industrial Control
- IPTV POF
- SOHO Residential Gateway
- Broadband Gateway/Firewall/VPN
- Integrated DSL/Cable Modem
- Wireless LAN Access Point + Gateway
- Standalone 10/100 Switch

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at [docerrors@microchip.com](mailto:docerrors@microchip.com). We welcome your feedback.

### Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

<http://www.microchip.com>

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

### Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; <http://www.microchip.com>
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

### Customer Notification System

Register on our web site at [www.microchip.com](http://www.microchip.com) to receive the most current information on all of our products.

# KSZ8873MML

## 1.0 INTRODUCTION

### 1.1 General Description

The KSZ8873MML is a highly integrated 3-port switch on a chip IC in the industry's smallest footprint. It is designed to enable a new generation of low-port-count, cost-sensitive, and power efficient 10/100 Mbps switch systems. Low power consumption, advanced power management, and sophisticated QoS features (e.g., IPv6 priority classification support) make this device ideal for IPTV, IP-STB, VoIP, automotive, and industrial applications.

The KSZ8873MML is designed to support the GREEN requirement in today's switch systems. Advanced power management schemes include hardware power down, software power down, per port power down, and energy detect mode that shuts down the transceiver when a port is idle.

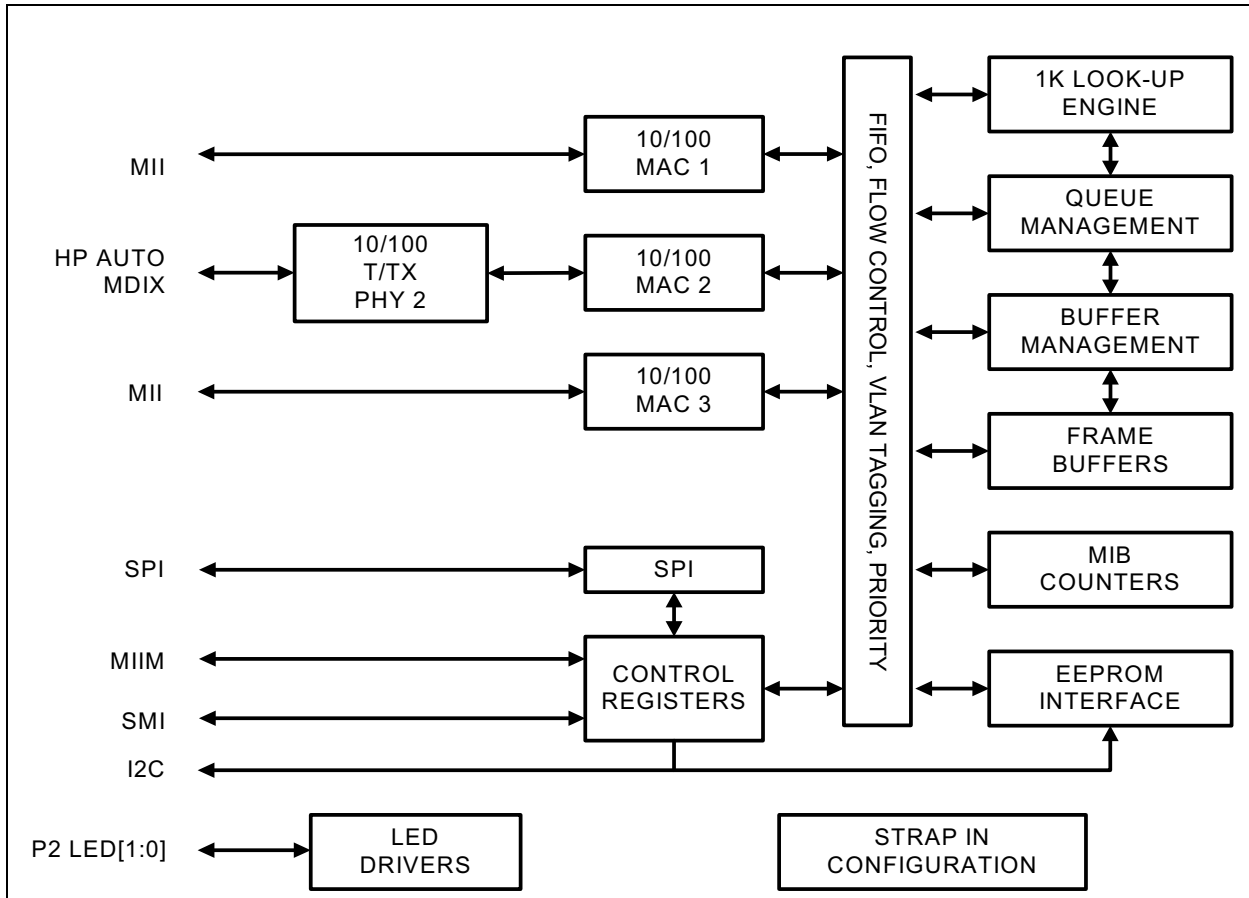

KSZ8873MML also offers a bypass mode that enables system-level power saving. In this mode, the processor connected to the switch through the MII interface can be shut down without impacting the normal switch operation.

The configuration provided by the KSZ8873MML enables the flexibility to meet requirements of different applications:

- KSZ8873MML: One 10/100BASE-T/TX transceiver and two MII interfaces.

The device is available in a RoHS-compliant 64-pin LQFP package. An industrial-grade temperature version is also available.

## 2.0 PIN DESCRIPTION AND CONFIGURATION

FIGURE 2-1: 64-PIN 10 MM X 10 MM LQFP ASSIGNMENT, (TOP VIEW)

# KSZ8873MML

TABLE 2-1: SIGNALS

Pin Number	Pin Name	Type Note 2-1	Description
1	RSTN	IPU	Hardware reset pin (active low)
2	VDDA_1.8	P	1.8V analog core power input from VDDCO (pin 59)
3	AGND	GND	Analog ground
4	NC	NC	Unused pin. No external connection.
5	NC	NC	Unused pin. No external connection.
6	VDDA_3.3	P	3.3V analog $V_{DD}$
7	AGND	GND	Analog ground.
8	ISSET	O	Set physical transmit output current. Pull-down this pin with an 11.8 k $\Omega$ 1% resistor to ground.
9	VDDA_1.8	P	1.8 analog $V_{DD}$ input power supply from VDDCO (pin 59) through external Ferrite bead and capacitor.
10	RXM2	I/O	Physical receive or transmit signal (– differential)
11	RXP2	I/O	Physical receive or transmit signal (+ differential)
12	AGND	GND	Analog ground.
13	TXM2	I/O	Physical transmit or receive signal (– differential)
14	TXP2	I/O	Physical transmit or receive signal (+ differential)
15	NC	NC	No Connection
16	PWRDN	IPU	Chip power down input (active low).
17	X1	I	25 MHz or 50 MHz crystal/oscillator clock connections. Pins (X1, X2) connect to a crystal. If an oscillator is used, X1 connects to a 3.3V tolerant oscillator and X2 is a no connect. Note: Clock is $\pm 50$ ppm for both crystal and oscillator, the clock should be applied to X1 pin before reset voltage goes high.
18	X2	O	
19	SMTXEN3	IPU	Switch MII transmit enable
20	SMTXD33	IPU	Switch MII transmit data bit 3
21	SMTXD32	IPU	Switch MII transmit data bit 2
22	SMTXD31	IPU	Switch MII transmit data bit 1
23	SMTXD30	IPU	Switch MII transmit data bit 0
24	GND	GND	Digital ground
25	VDDIO	P	3.3V, 2.5V, or 1.8V digital $V_{DD}$ input power supply for IO with well decoupling capacitors.
26	SMTXC3	I/O	Switch MII transmit clock (MII modes only) Output in PHY MII mode Input in MAC MII.

**TABLE 2-1: SIGNALS (CONTINUED)**

Pin Number	Pin Name	Type Note 2-1	Description
27	SMTXER3/ MII_LINK_3	IPU	Switch port 3 MII transmit error in MII mode 0 = MII link indicator from host in MII PHY mode. 1 = No link on port 3 MII PHY mode and enable Bypass mode.
28	SMRXDV3	IPU/O	Switch MII receive data valid Strap option: MII mode selection for port 3 PU = PHY mode. PD = MAC mode (In MAC mode, port 3 MII has to connect to a powered active external PHY for the normal operation)
29	SMRXD33	IPU/O	Switch MII receive data bit 3 Strap option: enable auto-negotiation on port 2 (P2ANEN) PU = Enable PD = Disable
30	SMRXD32	IPU/O	Switch MII receive data bit 2 Strap option: Force the speed on port 2 (P2SPD) PU = Force port 2 to 100BT if P2ANEN = 0 PD = Force port 2 to 10BT if P2ANEN = 0
31	SMRXD31	IPU/O	Switch MII receive data bit 1 Strap option: Force duplex mode (P2DPX) PU = Port 2 default to full-duplex mode if P2ANEN = 1 and auto-negotiation fails. Force port 2 in full-duplex mode if P2ANEN = 0. PD = Port 2 set to half-duplex mode if P2ANEN = 1 and auto-negotiation fails. Force port 2 in half-duplex mode if P2ANEN = 0.
32	SMRXD30	IPU/O	Switch MII receive data bit 0 Strap option: Force flow control on port 2 (P2FFC) PU = Always enable (force) port 2 flow control feature. PD = Port 2 flow control feature enable is determined by auto-negotiation result.
33	SCRS3	IPU/O	Switch MII carrier sense Output in PHY mode Input in MAC mode Note: Do not leave floating in MAC mode. If not driven by PHY, pull externally low.
34	SCOL3	IPU/O	Switch MII collision detect Output in PHY mode Input in MAC mode Note: Do not leave floating in MAC mode. If not driven by PHY, pull externally low.
35	SMRXC3	I/O	Switch MII receive clock. Output in PHY MII mode Input in MAC MII mode
36	GND	GND	Digital ground
37	VDDC	P	1.8V digital core power input from VDDCO (pin 59).
38	SPIQ	IPU/O	SPI slave mode: serial data output Note: an external pull-up is needed on this pin when it is in use.

# KSZ8873MML

**TABLE 2-1: SIGNALS (CONTINUED)**

Pin Number	Pin Name	Type Note 2-1	Description
39	SPISN	IPU	SPI slave mode: chip select (active low) When SPISN is high, the KSZ8873MML is deselected and SPIQ is held in high impedance state. A high-to-low transition is used to initiate SPI data transfer. Note: An external pull-up is needed on this pin when it is in use.
40	INTRN	OPU	Interrupt Active Low signal to host CPU to indicate an interrupt status bit is set. Refer to register 187 and 188.
41	SCL_MDC	I/O	SPI slave mode/I <sup>2</sup> C slave mode: Clock input I <sup>2</sup> C master mode: Clock output MIIM: Clock input
42	SDA_MDIO	IPU/O	SPI slave mode: serial data input I <sup>2</sup> C master/slave mode: Serial data input/output MIM: Data input/out Note: An external pull-up is needed on this pin when it is in use.
43	SCRS1	IPU/O	Switch MII carrier sense Output in PHY mode Input in MAC mode Note: Do not leave floating in MAC mode. If not driven by PHY, pull externally low.
44	SCOL1	IPU/O	Switch MII collision detect Output in PHY mode Input in MAC mode Note: Do not leave floating in MAC mode. If not driven by PHY, pull externally low.
45	SMRXC1	I/O	Switch MII receive clock. Output in PHY MII mode Input in MAC MII mode
46	SMRXD13	IPU/O	Switch MII receive data bit 3 Strap option: MII mode selection for port 1 PU = PHY mode. PD = MAC mode (In MAC mode, port 1 MII has to connect to an powered active external PHY for the normal operation)
47	SMRXD12	IPU/O	Switch MII receive data bit 2 Strap option: Force the speed on port 1 (P1SPD) PU = Force port 1 to 100BT PD = Force port 1 to 10BT
48	SMRXD11	IPU/O	Switch MII receive data bit 1 Strap option: Force duplex mode on port 1 (P1DPX) PU = Port 1 default to full-duplex mode. PD = Port 1 set to half-duplex mode.
49	SMRXD10	IPU/O	Switch MII receive data bit 0 Strap option: Force flow control on port 1 (P1FFC) PU = Always enable (force) port 1 flow control feature. PD = Disable.

**TABLE 2-1: SIGNALS (CONTINUED)**

Pin Number	Pin Name	Type Note 2-1	Description
50	SMRXDV1	IPD/O	Switch MII receive data valid Strap option: Force the speed on port 3 (P3SPD) PU = Force port 3 to 10BT PD = Force port 3 to 100BT
51	SMTXER1/ MII_LINK_1	IPD	Switch port 1 MII transmit error in MII mode 0 = MII link indicator from host in MII PHY mode. 1 = No link on port 1 MII PHY mode and enable Bypass mode.
52	SMTXD13	I	Switch MII transmit data bit 3
53	SMTXD12	I	Switch MII transmit data bit 2
54	SMTXD11	I	Switch MII transmit data bit 1
55	SMTXD10	I	Switch MII transmit data bit 0
56	SMTXC1	I/O	Switch MII transmit clock (MII modes only) Output in PHY MII mode Input in MAC MII.
57	VDDIO	P	3.3V, 2.5V, or 1.8V digital V <sub>DD</sub> input power supply for IO with well decoupling capacitors.
58	GND	GND	Digital ground
59	VDDCO	P	1.8V core power voltage output (internal 1.8V LDO regulator output), this 1.8V output pin provides power to both VDDA_1.8 and VDDC input pins. Note: Internally 1.8V LDO regulator input comes from VDDIO. Do not connect an external power supply to VDDCO pin. The ferrite bead is requested between analog and digital 1.8V core power.
60	SMTXEN1	I	Switch MII transmit enable
61	P1LED1	IPU/O	Port 1 LED Indicators: (Not used) Strap option: Port 3 flow control selection(P3FFC) PU = Always enable (force) port 3 flow control feature PD = Disable
62	P1LED0	IPD/O	Port 1 LED Indicators: (Not used) Strap option: Port 3 duplex mode selection(P3DPX) PU = Port 3 set to half-duplex mode PD = Port 3 set to full-duplex mode (default)

<b>[P2LED1, P2LED0] = [1, 1] – SMI/MIIM-mode</b> In SMI mode, the KSZ8873MML provides access to all its internal 8-bit registers through its SCL_MDC and SDA_MDIO pins. In MIIM mode, the KSZ8873MML provides access to its 16-bit MIIM registers through its SDC_MDC and SDA_MDIO pins.																		

**Note 2-1** P = power supply  
 GND = ground  
 I = input  
 O = output

I/O = bi-directional

Ipu/O = Input with internal pull-up during reset; output pin otherwise.

Ipu = Input with internal pull-up.

Ipd = Input with internal pull-down.

Opu = Output with internal pull-up.

Opd = Output with internal pull-down.

Speed: Low (100BASE-TX), High (10BASE-T)

Full-Duplex: Low (full-duplex), High (half-duplex)

Activity: Toggle (transmit/receive activity)

Link: Low (link), High (no link)

# KSZ8873MML

---

## 3.0 FUNCTIONAL DESCRIPTION

The KSZ8873MML contains one 10/100 physical layer transceivers and three MAC units with an integrated Layer 2 managed switch.

The KSZ8873MML has the flexibility to reside in either a managed or unmanaged design. In a managed design, the host processor has complete control of the KSZ8873MML via the SMI interface, MIIM interface, SPI bus, or I<sup>2</sup>C bus. An unmanaged design is achieved through I/O strapping and/or EEPROM programming at system reset time.

On the media side, the KSZ8873MML supports IEEE 802.3 10BASE-T and 100BASE-TX on both PHY ports. Physical signal transmission and reception are enhanced through the use of patented analog circuitries that make the design more efficient and allow for lower power consumption and smaller chip die size.

### 3.1 Physical Layer Transceiver

#### 3.1.1 100BASE-TX TRANSMIT

The 100BASE-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, and MLT3 encoding and transmission.

The circuitry starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125 MHz serial bit stream. The data and control stream is then converted into 4B/5B coding, followed by a scrambler. The serialized data is further converted from NRZ-to-NRZI format, and then transmitted in MLT3 current output. The output current is set by an external 1% 11.8 k $\Omega$  resistor for the 1:1 transformer ratio.

The output signal has a typical rise/fall time of 4 ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10BASE-T output is also incorporated into the 100BASE-TX transmitter.

#### 3.1.2 100BASE-TX RECEIVE

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion.

The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Because the amplitude loss and phase distortion is a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, and then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.

Next, the equalized signal goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and to improve the dynamic range. The differential data conversion circuit converts the MLT3 format back to NRZI. The slicing threshold is also adaptive.

The clock recovery circuit extracts the 125 MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the de-scrambler followed by the 4B/5B decoder. Finally, the NRZ serial data is converted to the MII format and provided as the input data to the MAC.

#### 3.1.3 PLL CLOCK SYNTHESIZER

The KSZ8873MML generates 125 MHz, 62.5 MHz, and 31.25 MHz clocks for system timing. Internal clocks are generated from an external 25 MHz or 50 MHz crystal or oscillator.

#### 3.1.4 SCRAMBLER/DE-SCRAMBLER (100BASE-TX ONLY)

The purpose of the scrambler is to spread the power spectrum of the signal to reduce electromagnetic interference (EMI) and baseline wander. Transmitted data is scrambled through the use of an 11-bit wide linear feedback shift register (LFSR). The scrambler generates a 2047-bit non-repetitive sequence, and the receiver then de-scrambles the incoming data stream using the same sequence as at the transmitter.

#### 3.1.5 10BASE-T TRANSMIT

The 10BASE-T driver is incorporated with the 100BASE-TX driver to allow for transmission using the same magnetics. They are internally wave-shaped and pre-emphasized into outputs with a typical 2.3V amplitude. The harmonic contents are at least 27 dB below the fundamental frequency when driven by an all-ones Manchester-encoded signal.

## 3.1.6 10BASE-T RECEIVE

On the receive side, input buffers and level detecting squelch circuits are employed. A differential input receiver circuit and a phase-locked loop (PLL) perform the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400 mV or with short pulse widths to prevent noise at the RXP or RXM input from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KSZ8873MML decodes a data frame. The receiver clock is maintained active during idle periods in between data reception.

## 3.1.7 MDI/MDI-X AUTO CROSSOVER

To eliminate the need for crossover cables between similar devices, the KSZ8873MML supports HP Auto MDI/MDI-X and IEEE 802.3u standard MDI/MDI-X auto crossover. HP Auto MDI/MDI-X is the default.

The auto-sense function detects remote transmit and receive pairs and correctly assigns transmit and receive pairs for the KSZ8873MML device. This feature is extremely useful when end users are unaware of cable types and also saves on an additional uplink configuration connection. The auto-crossover feature can be disabled through the port control registers or MIIM PHY registers.

The IEEE 802.3u standard MDI and MDI-X definitions are illustrated in [Table 3-1](#).

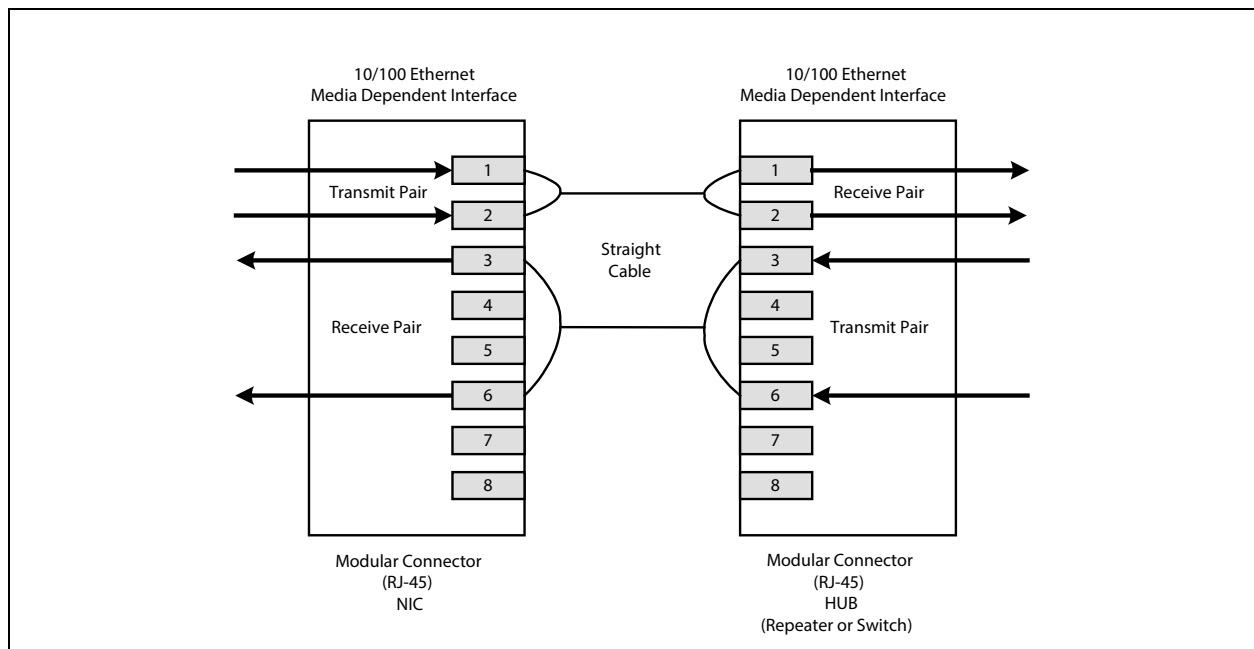

**TABLE 3-1: MDI/MDI-X PIN DEFINITIONS**

MDI		MDI-X	
RJ-45 Pins	Signals	RJ-45 Pins	Signals
1	TD+	1	RD+
2	TD–	2	RD–
3	RD+	3	TD+
6	RD–	6	TD–

### 3.1.7.1 Straight Cable

A straight cable connects an MDI device to an MDI-X device, or an MDI-X device to an MDI device. [Figure 3-1](#) depicts a typical straight cable connection between a NIC card (MDI) and a switch or hub (MDI-X).

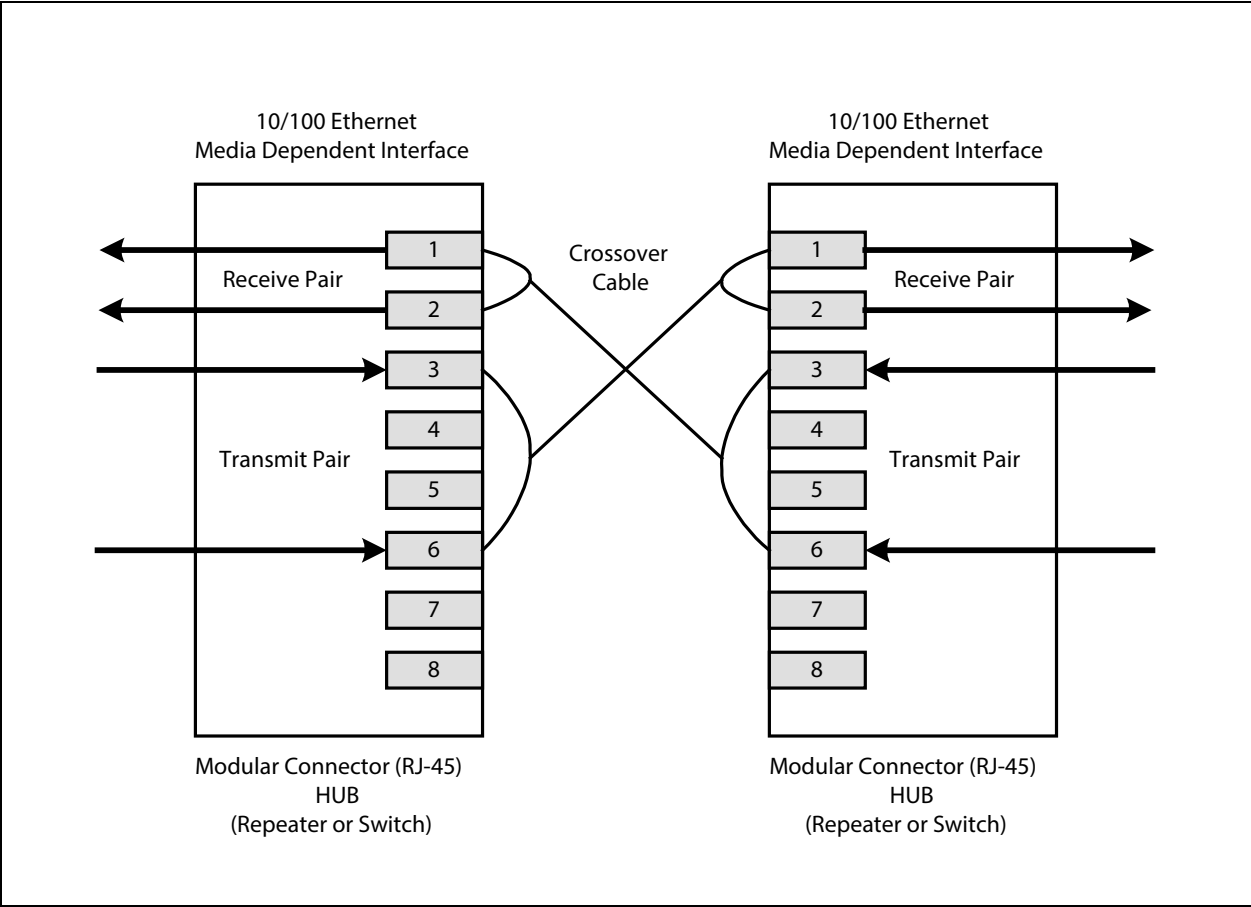

**FIGURE 3-1: TYPICAL STRAIGHT CABLE CONNECTION**

3.1.7.2 Crossover Cable

A crossover cable connects an MDI device to another MDI device, or an MDI-X device to another MDI-X device. [Figure 3-2](#) shows a typical crossover cable connection between two switches or hubs (two MDI-X devices).

FIGURE 3-2: TYPICAL CROSSOVER CABLE CONNECTION

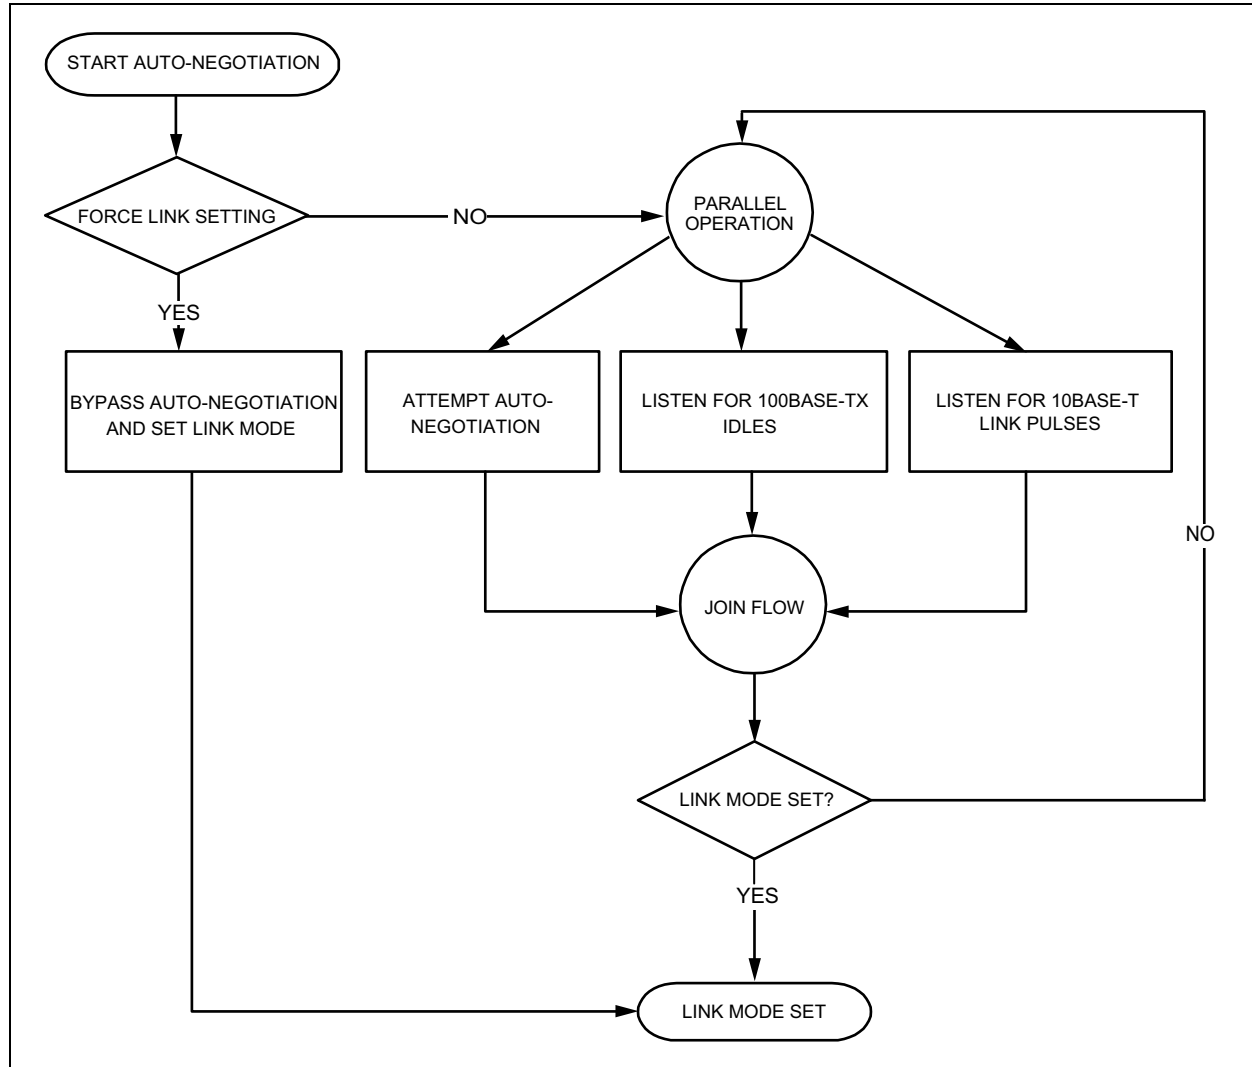

## 3.1.8 AUTO-NEGOTIATION

The KSZ8873MML conforms to the auto-negotiation protocol, defined in Clause 28 of the IEEE 802.3u specification.

Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the best common mode of operation. In auto-negotiation, link partners advertise their capabilities across the link to each other. If auto-negotiation is not supported or the KSZ8873MML link partner is forced to bypass auto-negotiation, the KSZ8873MML sets its operating mode by observing the signal at its receiver. This is known as parallel detection, and allows the KSZ8873MML to establish link by listening for a fixed signal protocol in the absence of auto-negotiation advertisement protocol.

The link up process is shown in [Figure 3-3](#).

**FIGURE 3-3: AUTO-NEGOTIATION AND PARALLEL OPERATION**

## 3.1.9 LINKMD® CABLE DIAGNOSTICS

Port 2 of KSZ8873MML supports LinkMD®. The LinkMD® feature utilizes time domain reflectometry (TDR) to analyze the cabling plant for common cabling problems such as open circuits, short circuits, and impedance mismatches.

LinkMD® works by sending a pulse of known amplitude and duration down the MDI and MDI-X pairs and then analyzes the shape of the reflected signal. Timing the pulse duration gives an indication of the distance to the cabling fault. Internal circuitry displays the TDR information in a user-readable digital format.

# KSZ8873MML

## 3.1.9.1 Access

LinkMD<sup>®</sup> is initiated by accessing registers {42, 43}, the LinkMD<sup>®</sup> Control/Status registers for port 2, and in conjunction with registers 45, Port Control Register 13.

Alternatively, the MIIM PHY registers 0 and 29 can be used for LinkMD<sup>®</sup> access.

## 3.1.9.2 Usage

The following is a sample procedure for using LinkMD with registers {42,43,45} on port 2.

1. Disable auto MDI/MDI-X by writing a '1' to register 45, bit [2] to enable manual control over the differential pair used to transmit the LinkMD pulse.
2. Start cable diagnostic test by writing a '1' to register 42, bit [4]. This enable bit is self-clearing.
3. Wait (poll) for register 42, bit [4] to return a '0', indicating cable diagnostic test is complete.
4. Read cable diagnostic test results in register 42, bits [6:5]. The results are as follows:

00 = normal condition (valid test)

01 = open condition detected in cable (valid test)

10 = short condition detected in cable (valid test)

11 = cable diagnostic test failed (invalid test)

The '11' case, invalid test, occurs when the KSZ8873MML is unable to shut down the link partner. In this instance, the test is not run, because it would be impossible for the KSZ8873MML to determine if the detected signal is a reflection of the signal generated or a signal from another source.

5. Get distance to fault by concatenating register 42, bit [0] and register 43, bits [7:0]; and multiplying the result by a constant of 0.4. The distance to the cable fault can be determined by the following formula:

### EQUATION 3-1:

$$D(\text{Distance to cable fault in meters}) = 0.4 \times (\text{Register 42 bit [0]} \times \text{Register 43 bits [7:0]})$$

Concatenated values of registers 42 and 43 are converted to decimal before multiplying by 0.4.

The constant (0.4) may be calibrated for different cabling conditions, including cables with a velocity of propagation that varies significantly from the norm.

## 3.2 Power Management

The KSZ8873MML supports enhanced power management feature in low power state with energy detection to ensure low-power dissipation during device idle periods. There are five operation modes under the power management function which is controlled by two bits in Register 195 (0xC3) and one bit in Register 29 (0x1D), 45(0x2D) as shown below:

Register 195 bit[1:0] = 00 Normal Operation Mode

Register 195 bit[1:0] = 01 Energy Detect Mode

Register 195 bit[1:0] = 10 Soft Power Down Mode

Register 195 bit[1:0] = 11 Power Saving Mode

Register 29, 45 bit 3 = 1 Port Based Power Down Mode

[Table 3-2](#) indicates all internal function blocks status under four different power management operation modes.

**TABLE 3-2: INTERNAL FUNCTION BLOCK STATUS**

KSZ8873MML Function Blocks	Power Management Operation Modes			
	Normal Mode	Power Saving Mode	Energy Detect Mode	Soft Power Down Mode
Internal PLL Clock	Enabled	Enabled	Disabled	Disabled
Tx/Rx PHY	Enabled	Rx unused block disabled	Energy detect at Rx	Disabled
MAC	Enabled	Enabled	Disabled	Disabled
Host Interface	Enabled	Enabled	Disabled	Disabled

## 3.2.1 NORMAL OPERATION MODE

This is the default setting bit[1:0] = 00 in register 195 after the chip power-up or hardware reset. When KSZ8873MML is in this normal operation mode, all PLL clocks are running, PHY and MAC are on, and the host interface is ready for CPU read or write.

During the normal operation mode, the host CPU can set the bit[1:0] in register 195 to transit the current normal operation mode to any one of the other three power management operation modes.

## 3.2.2 POWER SAVING MODE

The power saving mode is entered when auto-negotiation mode is enabled, cable is disconnected, and by setting bit[1:0] = 11 in register 195. When KSZ8873MML is in this mode, all PLL clocks are enabled, MAC is on, all internal registers value will not change, and host interface is ready for CPU read or write. In this mode, it mainly controls the PHY transceiver on or off based on line status to achieve power saving. The PHY remains transmitting and only turns off the unused receiver block. Once activity resumes due to plugging a cable or attempting by the far end to establish link, the KSZ8873MML can automatically enabled the PHY power up to normal power state from power saving mode.

During this power saving mode, the host CPU can set bit[1:0] = 0 in register 195 to transit the current power saving mode to any one of the other three power management operation modes.

## 3.2.3 ENERGY DETECT MODE

The energy detect mode provides a mechanism to save more power than in the normal operation mode when the KSZ8873MML is not connected to an active link partner. In this mode, the device will save up to 87% of the power. If the cable is not plugged, the KSZ8873MML can automatically enter to a low power state, a.k.a., the energy detect mode. In this mode, KSZ8873MML will keep transmitting 120 ns width pulses at a rate of one pulse per second. Once activity resumes due to plugging a cable or attempting by the far end to establish link, the KSZ8873MML can automatically power up to normal power state in energy detect mode.

Energy detect mode consists of two states, normal power state and low power state. While in low power state, the KSZ8873MML reduces power consumption by disabling all circuitry except the energy detect circuitry of the receiver. The energy detect mode is entered by setting bit[1:0] = 01 in register 195. When the KSZ8873MML is in this mode, it will monitor the cable energy. If there is no energy on the cable for a time longer than pre-configured value at bit[7:0] Go-Sleep time in register 196, KSZ8873MML will go into a low power state. When KSZ8873MML is in low power state, it will keep monitoring the cable energy. Once the energy is detected from the cable, KSZ8873MML will enter normal power state. When KSZ8873MML is at normal power state, it is able to transmit or receive packet from the cable.

It will save about 87% of the power when MII interface is in PHY mode, pin SMTXER3/MII\_LINK\_3 or SMTXER1/MII\_LINK\_1 is connected to High, register 195 bit [1:0] = 01, bit 2 = 1(Disable PLL), not cables are connected.

## 3.2.4 SOFT POWER DOWN MODE

The soft power down mode is entered by setting bit[1:0] = 10 in register 195. When KSZ8873MML is in this mode, all PLL clocks are disabled, the PHY and the MAC are off, all internal registers value will not change. When the host set bit[1:0] = 00 in register 195, this device will be back from current soft power down mode to normal operation mode.

## 3.2.5 PORT-BASED POWER DOWN MODE

In addition, the KSZ8873MML features a per-port power down mode. To save power, a PHY port that is not in use can be powered down via port control register 45 bit 3, or MIIM PHY register. It will saves about 15 mA per port.

# KSZ8873MML

---

## 3.2.6 HARDWARE POWER DOWN

KSZ8873 supports a hardware power down mode. When the pin PWRDN is active-low, the entire chip is powered down.

## 3.3 MAC and Switch

### 3.3.1 ADDRESS LOOKUP

The internal lookup table stores MAC addresses and their associated information. It contains a 1K unicast address table plus switching information.

The KSZ8873MML is guaranteed to learn 1K addresses and distinguishes itself from hash-based lookup tables, which depending on the operating environment and probabilities, may not guarantee the absolute number of addresses it can learn.

### 3.3.2 LEARNING

The internal lookup engine updates its table with a new entry if the following conditions are met:

- The received packet's source address (SA) does not exist in the lookup table.
- The received packet is good; the packet has no receiving errors, and is of legal length.

The lookup engine inserts the qualified SA into the table, along with the port number and time stamp. If the table is full, the last entry of the table is deleted to make room for the new entry.

### 3.3.3 MIGRATION

The internal lookup engine also monitors whether a station has moved. If a station has moved, it will update the table accordingly. Migration happens when the following conditions are met:

- The received packet's SA is in the table, but the associated source port information is different.
- The received packet is good; the packet has no receiving errors, and is of legal length.

The lookup engine will update the existing record in the table with the new source port information.

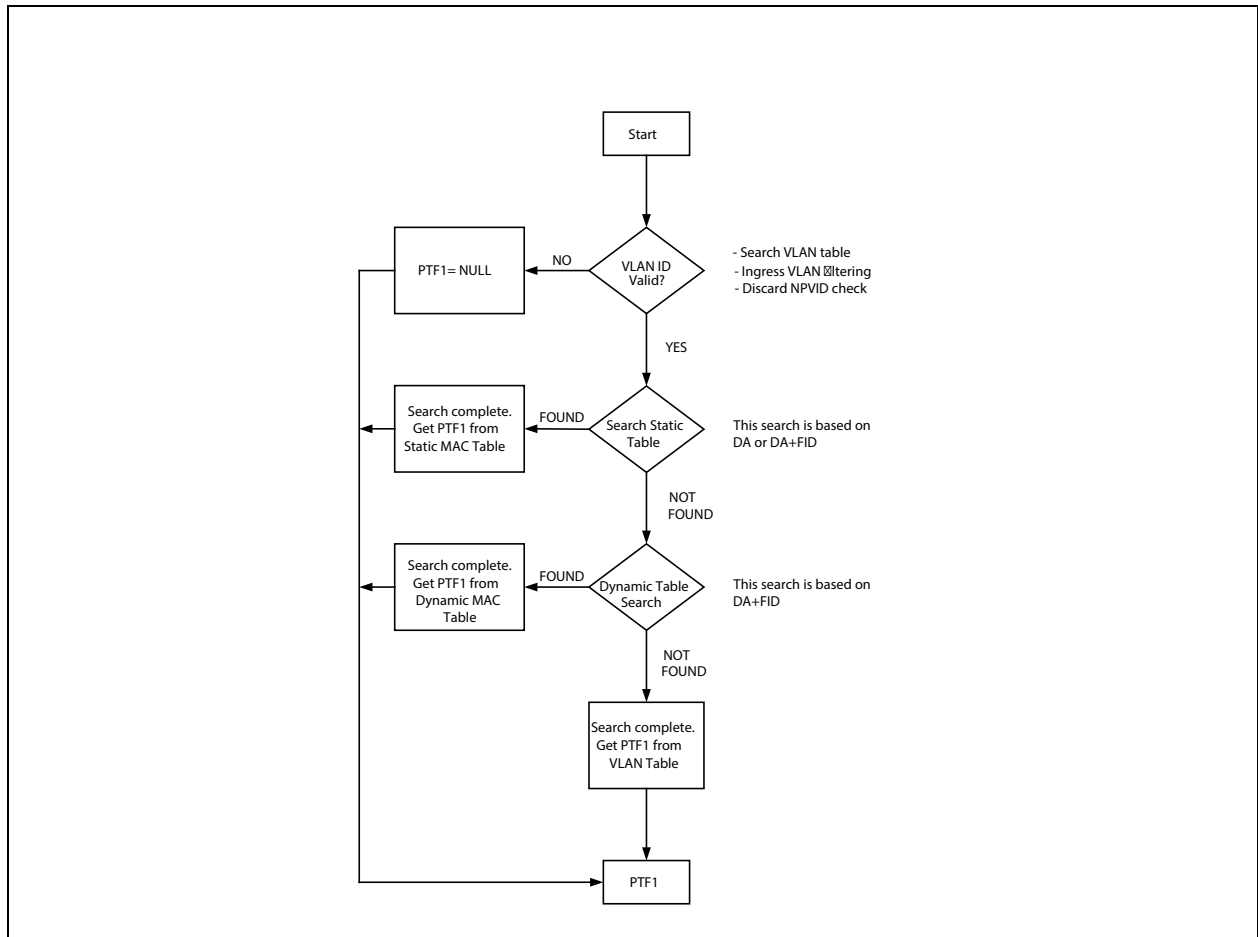

### 3.3.4 AGING

The lookup engine updates the time stamp information of a record whenever the corresponding SA appears. The time stamp is used in the aging process. If a record is not updated for a period of time, the lookup engine removes the record from the table. The lookup engine constantly performs the aging process and will continuously remove aging records. The aging period is about 200 seconds. This feature can be enabled or disabled through register 3 (0x03) bit [2].

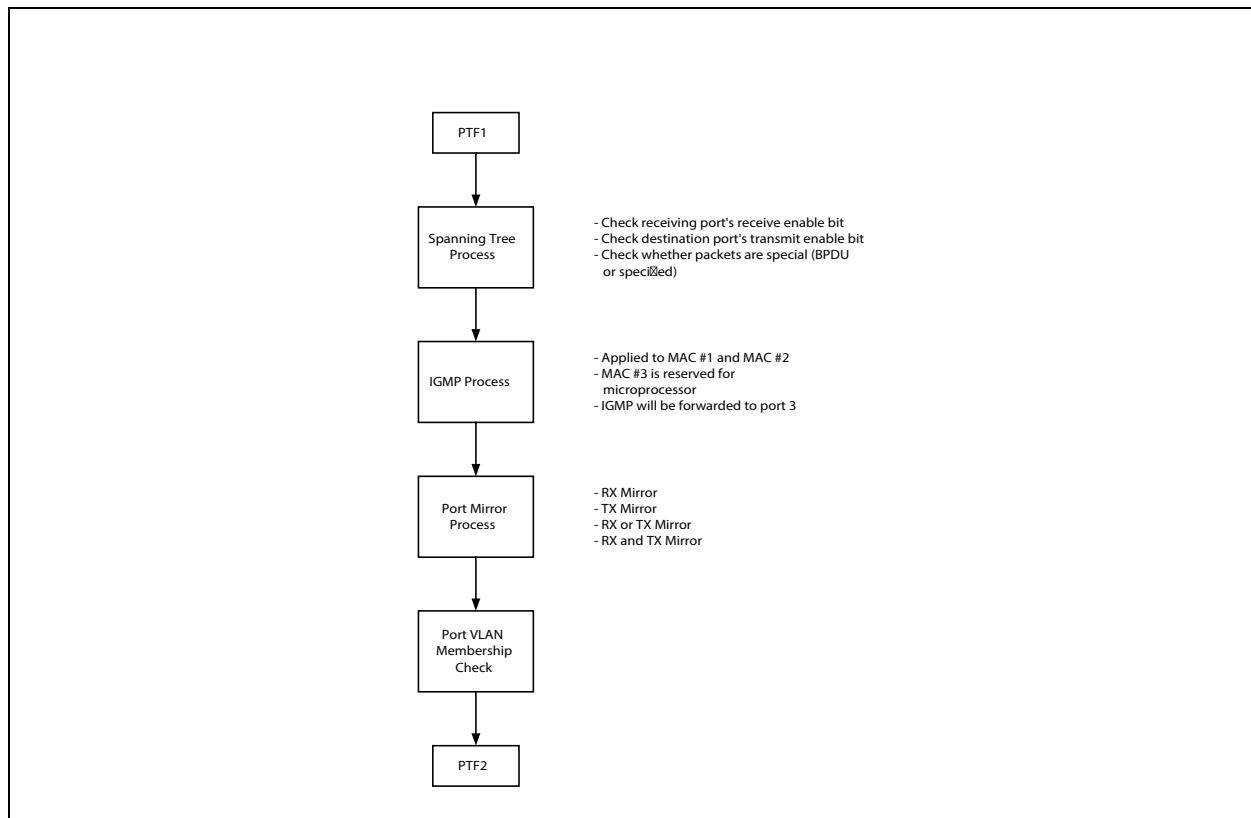

### 3.3.5 FORWARDING

The KSZ8873MML forwards packets using the algorithm that is depicted in the following flowcharts. [Figure 3-4](#) shows stage one of the forwarding algorithm where the search engine looks up the VLAN ID, static table, and dynamic table for the destination address, and comes up with "port to forward 1" (PTF1). PTF1 is then further modified by spanning tree, IGMP snooping, port mirroring, and port VLAN processes to come up with "port to forward 2" (PTF2), as shown in [Figure 3-5](#). The packet is sent to PTF2.

**FIGURE 3-4: DESTINATION ADDRESS LOOKUP FLOW CHART, STAGE 1**

**FIGURE 3-5: DESTINATION ADDRESS RESOLUTION FLOW CHART, STAGE 2**

The KSZ8873MML will not forward the following packets:

1. Error packets: These include framing errors, Frame Check Sequence (FCS) errors, alignment errors, and illegal size packet errors.
2. IEEE802.3x PAUSE frames: KSZ8873MML intercepts these packets and performs full-duplex flow control accordingly.
3. "Local" packets: Based on destination address (DA) lookup. If the destination port from the lookup table matches the port from which the packet originated, the packet is defined as local.

### 3.3.6 SWITCHING ENGINE

The KSZ8873MML features a high-performance switching engine to move data to and from the MAC's packet buffers. It operates in store and forward mode, while the efficient switching mechanism reduces overall latency.

The switching engine has a 32 kB internal frame buffer. This buffer pool is shared between all three ports. There are a total of 256 buffers available. Each buffer is sized at 128 bytes.

### 3.3.7 MAC OPERATION

The KSZ8873MML strictly abides by IEEE 802.3 standards to maximize compatibility.

#### 3.3.7.1 Inter Packet Gap (IPG)

If a frame is successfully transmitted, the 96 bits time IPG is measured between the two consecutive MTXEN. If the current packet is experiencing collision, the 96 bits time IPG is measured from MCRS and the next MTXEN.

#### 3.3.7.2 Back-Off Algorithm

The KSZ8873MML implements the IEEE 802.3 standard for the binary exponential back-off algorithm, and optional "aggressive mode" back-off. After 16 collisions, the packet is optionally dropped depending on the switch configuration for register 4 (0x04) bit [3].

### 3.3.7.3 Late Collision

If a transmit packet experiences collisions after 512 bit times of the transmission, the packet is dropped.

### 3.3.7.4 Illegal Frames

The KSZ8873MML discards frames less than 64 bytes and can be programmed to accept frames up to 1518 bytes, 1536 bytes, or 1916 bytes. These maximum frame size settings are programmed in register 4 (0x04). Because the KSZ8873MML supports VLAN tags, the maximum sizing is adjusted when these tags are present.

### 3.3.7.5 Full-Duplex Flow Control

The KSZ8873MML supports standard IEEE 802.3x flow control frames on both transmit and receive sides.

On the receive side, if the KSZ8873MML receives a pause control frame, the KSZ8873MML will not transmit the next normal frame until the timer, specified in the pause control frame, expires. If another pause frame is received before the current timer expires, the timer will be updated with the new value in the second pause frame. During this period (while it is flow controlled), only flow control packets from the KSZ8873MML are transmitted.

On the transmit side, the KSZ8873MML has intelligent and efficient ways to determine when to invoke flow control. The flow control is based on availability of the system resources, including available buffers, available transmit queues, and available receive queues.

The KSZ8873MML will flow control a port that has just received a packet if the destination port resource is busy. The KSZ8873MML issues a flow control frame (XOFF), containing the maximum pause time defined by the IEEE 802.3x standard. Once the resource is freed up, the KSZ8873MML sends out the other flow control frame (XON) with zero pause time to turn off the flow control (turn on transmission to the port). A hysteresis feature is provided to prevent the flow control mechanism from being constantly activated and deactivated.

The KSZ8873MML flow controls all ports if the receive queue becomes full.

### 3.3.7.6 Half-Duplex Backpressure

A half-duplex backpressure option (not in IEEE 802.3 standards) is also provided. The activation and deactivation conditions are the same as full-duplex flow control. If backpressure is required, the KSZ8873MML sends preambles to defer the other stations' transmission (carrier sense deference).

To avoid jabber and excessive deference (as defined in the 802.3 standard), after a certain time, the KSZ8873MML discontinues the carrier sense and then raises it again quickly. This short silent time (no carrier sense) prevents other stations from sending out packets thus keeping other stations in a carrier sense deferred state. If the port has packets to send during a backpressure situation, the carrier sense type backpressure is interrupted and those packets are transmitted instead. If there are no additional packets to send, carrier sense type backpressure is reactivated again until switch resources free up. If a collision occurs, the binary exponential back-off algorithm is skipped and carrier sense is generated immediately, thus reducing the chance of further collisions and carrier sense is maintained to prevent packet reception.

To ensure no packet loss in 10BASE-T or 100BASE-TX half-duplex modes, the user must enable the following:

- Aggressive back-off (register 3 (0x03), bit [0])
- No excessive collision drop (register 4 (0x04), bit [3])

Note that these bits are not set as defaults because this is not the IEEE standard.

### 3.3.7.7 Broadcast Storm Protection

The KSZ8873MML has an intelligent option to protect the switch system from receiving too many broadcast packets. As the broadcast packets are forwarded to all ports except the source port, an excessive number of switch resources (bandwidth and available space in transmit queues) may be utilized. The KSZ8873MML has the option to include "multicast packets" for storm control. The broadcast storm rate parameters are programmed globally, and can be enabled or disabled on a per port basis. The rate is based on a 67 ms interval for 100BT and a 500 ms interval for 10BT. At the beginning of each interval, the counter is cleared to zero, and the rate limit mechanism starts to count the number of bytes during the interval. The rate definition is described in register 6 (0x06) and 7 (0x07). The default setting is 0x63 (99 decimal). This is equal to a rate of 1%, calculated as follows:

$$148,800 \text{ frames/sec} \times 67 \text{ ms/interval} \times 1\% = 99 \text{ frames/interval (approx.)} = 0x63$$

Note: 148,800 frames/sec is based on 64-byte block of packets in 100BASE-TX with 12 bytes of IPG and 8 bytes of preamble between two packets.

# KSZ8873MML

## 3.3.7.8 Port Individual MAC Address and Source Port Filtering

The KSZ8873MML provide individual MAC address for port 1 and port 2 respectively. They can be set at register 142-147 and 148-153. The packet will be filtered if its source address matches the MAC address of port 1 or port 2 when the register 21 and 37 bit 6 is set to 1 respectively. For example, the packet will be dropped after it completes the loop of a ring network.

Note that for KSZ8873MML, port 1 means port 1's MII and an external PHY here.

## 3.3.8 MII INTERFACE OPERATION

The Media Independent Interface (MII) is specified in Clause 22 of the IEEE 802.3u Standard. It provides a common interface between physical layer and MAC layer devices. The MII provided by the KSZ8873MML is connected to device's first MAC as port 1 MII and third MAC as port 3 MII. The interface contains two distinct groups of signals: one for transmission and the other for reception. [Table 3-3](#) describes the signals used by the MII bus.

**TABLE 3-3: MII SIGNALS**

PHY Mode Connections		Pin Description	MAC Mode Connections	
External MAC Controller Signals	KSZ8873MML Port 1,3 PHY Signals		External PHY Signals	KSZ8873MML Port 1,3 MAC Signals
MTXEN	SMTXEN	Transmit Enable	MTXEN	SMRXDV
MTXER	SMTXER	Transmit Error	MTXER	(NOT USED)
MTXD3	SMTXD3	Transmit Data Bit 3	MTXD3	SMRXD3
MTXD2	SMTXD2	Transmit Data Bit 2	MTXD2	SMRXD2
MTXD1	SMTXD1	Transmit Data Bit 1	MTXD1	SMRXD1
MTXD0	SMTXD0	Transmit Data Bit 0	MTXD0	SMRXD0
MTXC	SMTXC	Transmit Clock	MTXC	SMRXC
MCOL	SCOL	Collision Detection	MCOL	SCOL
MCRS	SCRS	Carrier Sense	MCRS	SCRS
MRXDV	SMRXDV	Receive Data Valid	MRXDV	SMTXEN
MRXER	(NOT USED)	Receive Error	MRXER	SMTXER
MRXD3	SMRXD3	Receive Data Bit 3	MRXD3	SMTXD3
MRXD2	SMRXD2	Receive Data Bit 2	MRXD2	SMTXD2
MRXD1	SMRXD1	Receive Data Bit 1	MRXD1	SMTXD1
MRXD0	SMRXD0	Receive Data Bit 0	MRXD0	SMTXD0
MRXC	SMRXC	Receive Clock	MRXC	SMTXC

The MII operates in either PHY mode or MAC mode. The data interface is a nibble wide and runs at ¼ the network bit rate (not encoded). Additional signals on the transmit side indicate when data is valid or when an error occurs during transmission. Similarly, the receive side has signals that convey when the data is valid and without physical layer errors. For half duplex operation, the SCOL signal indicates if a collision has occurred during transmission. The selection of the PHY mode and MAC mode for port3 MII is by the strap pin SMRXDV3 and the port register 53 bit 7. The selection of the PHY mode and MAC mode for port1 MII is by the strap pin SMRXD13 and the port register 21bit 7.

The KSZ8873MML does not provide the MRXER signal for PHY mode operation and the MTXER signal for MAC mode operation. Normally, MRXER indicates a receive error coming from the physical layer device and MTXER indicates a transmit error from the MAC device. Since the switch filters error frames, these MII error signals are not used by the KSZ8873MML. So, for PHY mode operation, if the device interfacing with the KSZ8873MML has an MRXER input pin, it needs to be tied low. And, for MAC mode operation, if the device interfacing with the KSZ8873MML has an MTXER input pin, it also needs to be tied low.

The KSZ8873MML provides a bypass feature in the MII PHY mode. Pin SMTXER3/MII\_LINK is used for MII link status. If the host is power down, pin MII\_LINK will go to high. In this case, no new ingress frames from port1 or port 2 will be sent out through port 3, and the frames for port 3 already in packet memory will be flushed out.

## 3.3.9 MII MANAGEMENT (MIIM) INTERFACE

The KSZ8873MML supports the IEEE 802.3 MII Management Interface, also known as the Management Data Input/Output (MDIO) Interface. This interface allows upper-layer devices to monitor and control the states of the KSZ8873MML. An external device with MDC/MDIO capability is used to read the PHY status or configure the PHY settings. Further detail on the MIIM interface is found in Clause 22.2.4.5 of the IEEE 802.3u Specification and refer to 802.3 section 22.3.4 for the timing.

The MIIM interface consists of the following:

- A physical connection that incorporates the data line (SDA\_MDIO) and the clock line (SCL\_MDC).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with the KSZ8873MML device.
- Access to a set of eight 16-bit registers, consisting of six standard MIIM registers [0:5] and two custom MIIM registers [29, 31].

The MIIM Interface can operate up to a maximum clock speed of 5 MHz.

Table 3-4 depicts the MII Management Interface frame format.

**TABLE 3-4: MII MANAGEMENT FRAME FORMAT**

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits[4:0]	REG Address Bits[4:0]	TA	Data Bits[15:0]	Idle
<b>Read</b>	32 1's	01	10	AAAAA	RRRRR	Z0	DDDDDDDD_DDDDDDDD	Z
<b>Write</b>	32 1's	01	01	AAAAA	RRRRR	10	DDDDDDDD_DDDDDDDD	Z

## 3.3.10 SERIAL MANAGEMENT INTERFACE (SMI)

The SMI is the KSZ8873MML non-standard MIIM interface that provides access to all KSZ8873MML configuration registers. This interface allows an external device to completely monitor and control the states of the KSZ8873MML.

The SMI interface consists of the following:

- A physical connection that incorporates the data line (SDA\_MDIO) and the clock line (SCL\_MDC).
- A specific protocol that operates across the aforementioned physical connection that allows an external controller to communicate with the KSZ8873MML device.
- Access to all KSZ8873MML configuration registers. Register access includes the Global, Port, and Advanced Control Registers 0-198 (0x00 – 0xC6), and indirect access to the standard MIIM registers [0:5] and custom MIIM registers [29, 31].

Table 3-5 depicts the SMI frame format.

**TABLE 3-5: SERIAL MANAGEMENT INTERFACE (SMI) FRAME FORMAT**

	Preamble	Start of Frame	Read/Write OP Code	PHY Address Bits[4:0]	REG Address Bits[4:0]	TA	Data Bits[15:0]	Idle
<b>Read</b>	32 1's	01	00	1xRRR	RRRRR	Z0	0000_0000_DDDD_DDDD	Z
<b>Write</b>	32 1's	01	00	0xRRR	RRRRR	10	xxxx_xxxx_DDDD_DDDD	Z

SMI register read access is selected when OP Code is set to "00" and bit 4 of the PHY address is set to '1'. SMI register write access is selected when OP Code is set to "00" and bit 4 of the PHY address is set to '0'. PHY address bit[3] is undefined for SMI register access, and hence can be set to either '0' or '1' in read/write operations.

To access the KSZ8873MML registers 0-196 (0x00 – 0xC6), the following applies:

- PHYAD[2:0] and REGAD[4:0] are concatenated to form the 8-bit address; that is, {PHYAD[2:0], REGAD[4:0]} = bits [7:0] of the 8-bit address.
- TA bits [1:0] are 'Z0' means the processor MDIO pin is changed to input Hi-Z from output mode and the followed '0' is the read response from device.
- TA bits [1:0] are set to '10' when write registers.
- Registers are 8 data bits wide.
  - For read operation, data bits [15:8] are read back as 0's.
  - For write operation, data bits [15:8] are not defined, and hence can be set to either '0' or '1'.

# KSZ8873MML

SMI register access is the same as the MIIM register access, except for the register access requirements presented in this section.

## 3.4 Advanced Switch Functions

### 3.4.1 BYPASS MODE

The KSZ8873MML also offers a bypass mode that enables system-level power saving. When the CPU (connected to port 3 or port 1) enters a power saving mode, power down mode or a sleep mode, the CPU can control pin 27 SMTX-ER3/MII\_LINK\_3 or pin 51 SMTXER1/MII\_LINK\_1 which can be tied high so that the KSZ8873MML detects this change and automatically switches to bypass mode in which the switch function between port 2 and port 3/port 1 is sustained. In bypass mode, the packets with DA to port 3 or port 1 will be dropped and bypass the internal buffer memory, making the buffer memory more efficiency for data transfer. Specifically, energy detect mode with bypass mode enabled increases power savings.

### 3.4.2 IEEE 802.1Q VLAN SUPPORT

The KSZ8873MML supports 16 active VLANs out of the 4096 possible VLANs specified in the IEEE 802.1Q specification. KSZ8873MML provides a 16-entries VLAN table that converts the 12-bits VLAN ID (VID) to the 4-bits Filter ID (FID) for address lookup. If a non-tagged or null-VID-tagged packet is received, the ingress port default VID is used for lookup. In VLAN mode, the lookup process starts with VLAN table lookup to determine whether the VID is valid. If the VID is not valid, the packet is dropped and its address is not learned. If the VID is valid, the FID is retrieved for further lookup. The FID + Destination Address (FID+DA) are used to determine the destination port. The FID + Source Address (FID+SA) are used for address learning.

**TABLE 3-6: FID+DA LOOKUP IN VLAN MODE**

DA Found in Static MAC Table?	Use FID Flag?	FID Match?	FID+DA Found in Dynamic MAC Table?	Action
No	Don't care	Don't care	No	Broadcast to the membership ports defined in the VLAN Table bits [18:16]
No	Don't care	Don't care	Yes	Send to the destination port defined in the Dynamic MAC Address Table bits [53:52]
Yes	0	Don't care	Don't care	Send to the destination port(s) defined in the Static MAC Address Table bits [50:48]
Yes	1	No	No	Broadcast to the membership ports defined in the VLAN Table bits [18:16]
Yes	1	No	Yes	Send to the destination port defined in the Dynamic MAC Address Table bits [53:52]
Yes	1	Yes	Don't care	Send to the destination port(s) defined in the Static MAC Address Table bits [50:48]

**TABLE 3-7: FID+SA LOOKUP IN VLAN MODE**

FID+SA Found in Dynamic MAC Table?	Action
No	Learn and add FID+SA to the Dynamic MAC Address Table
Yes	Update time stamp

Advanced VLAN features, such as "Ingress VLAN filtering" and "Discard Non PVID packets" are also supported by the KSZ8873MML. These features can be set on a per port basis, and are defined in registers 18, 34, and 50 for ports 1, 2 and 3, respectively.

## 3.4.3 QOS PRIORITY SUPPORT

The KSZ8873MML provides Quality of Service (QoS) for applications such as VoIP and video conferencing. Offering four priority queues per port, the per-port transmit queue can be split into four priority queues: Queue 3 is the highest priority queue and Queue 0 is the lowest priority queue. Bit [0] of registers 16, 32, and 48 is used to enable split transmit queues for ports 1, 2, and 3, respectively. If a port's transmit queue is not split, high priority and low priority packets have equal priority in the transmit queue.

There is an additional option to either always deliver high priority packets first or use weighted fair queuing for the four priority queues. This global option is set and explained in bit [3] of register 5.

## 3.4.4 PORT-BASED PRIORITY

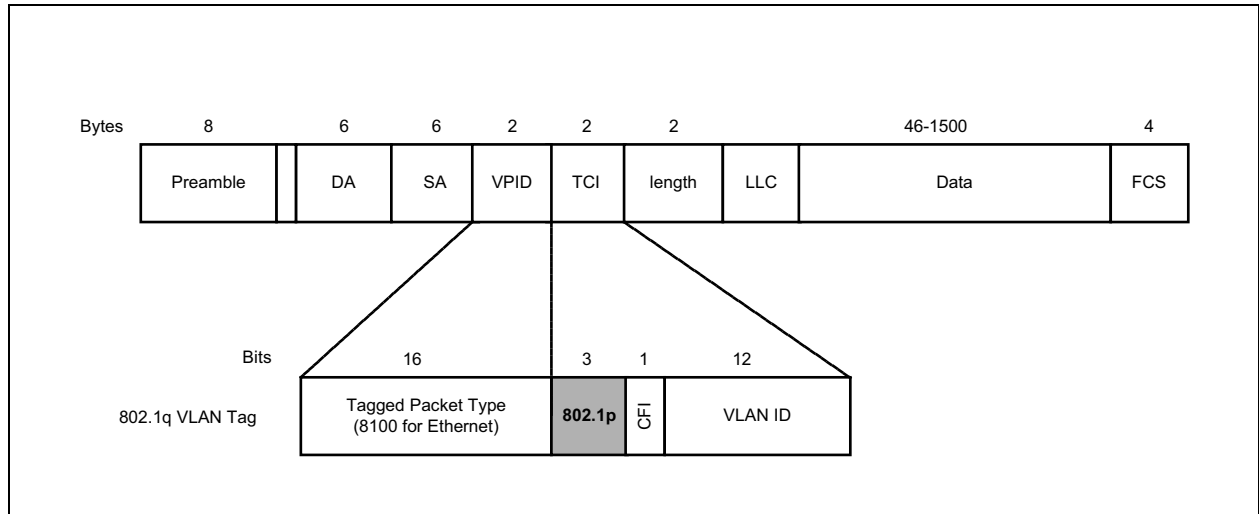

With port-based priority, each ingress port is individually classified as a high priority receiving port. All packets received at the high priority receiving port are marked as high priority and are sent to the high-priority transmit queue if the corresponding transmit queue is split. Bits [4:3] of registers 16, 32, and 48 are used to enable port-based priority for ports 1, 2, and 3, respectively.

## 3.4.5 802.1P-BASED PRIORITY

For 802.1p-based priority, the KSZ8873MML examines the ingress (incoming) packets to determine whether they are tagged. If tagged, the 3-bit priority field in the VLAN tag is retrieved and compared against the “priority mapping” value, as specified by the registers 12 and 13. The “priority mapping” value is programmable.

Figure 3-6 illustrates how the 802.1p priority field is embedded in the 802.1Q VLAN tag.

**FIGURE 3-6: 802.1P PRIORITY FIELD FORMAT**

802.1p-based priority is enabled by bit [5] of registers 16, 32, and 48 for ports 1, 2, and 3, respectively.

The KSZ8873MML provides the option to insert or remove the priority tagged frame's header at each individual egress port. This header, consisting of the 2 bytes VLAN Protocol ID (VPID) and the 2-byte Tag Control Information field (TCI), is also referred to as the IEEE 802.1Q VLAN tag.

Tag Insertion is enabled by bit [2] of the port registers control 0 and the register 194 to select which source port (ingress port) PVID can be inserted on the egress port for ports 1, 2, and 3, respectively. At the egress port, untagged packets are tagged with the ingress port's default tag. The default tags are programmed in register sets {19,20}, {35,36}, and {51,52} for ports 1, 2, and 3, respectively, and the source port VID has to be inserted at selected egress ports by bit[5:0] of register 194. The KSZ8873MML will not add tags to already tagged packets.

Tag Removal is enabled by bit [1] of registers 16, 32, and 48 for ports 1, 2, and 3, respectively. At the egress port, tagged packets will have their 802.1Q VLAN Tags removed. The KSZ8873MML will not modify untagged packets.

The CRC is recalculated for both tag insertion and tag removal.

# KSZ8873MML

802.1p Priority Field Re-mapping is a QoS feature that allows the KSZ8873MML to set the “User Priority Ceiling” at any ingress port. If the ingress packet’s priority field has a higher priority value than the default tag’s priority field of the ingress port, the packet’s priority field is replaced with the default tag’s priority field.

## 3.4.6 DIFFSERV-BASED PRIORITY

DiffServ-based priority uses the ToS registers (registers 96 to 111) in the Advanced Control Registers section. The ToS priority control registers implement a fully decoded, 64-bit Differentiated Services Code Point (DSCP) register to determine packet priority from the 6-bit ToS field in the IP header. When the most significant 6 bits of the ToS field are fully decoded, the resultant of the 64 possibilities is compared with the corresponding bits in the DSCP register to determine priority.

## 3.5 Spanning Tree Support

To support spanning tree, port 3 is designated as the processor port.

The other ports (port 1 and port 2) can be configured in one of the five spanning tree states via “transmit enable”, “receive enable”, and “learning disable” register settings in registers 18 and 34 for ports 1 and 2, respectively. The following table shows the port setting and software actions taken for each of the five spanning tree states.

**TABLE 3-8: SPANNING TREE STATES**

State	Setting	Action
<b>Disable State</b>	<b>Port Setting</b>	<b>Software Action</b>
The port should not forward or receive any packets. Learning is disabled.	“transmit enable = 0, receive enable = 0, learning disable = 1”	The processor should not send any packets to the port. The switch may still send specific packets to the processor (packets that match some entries in the “static MAC table” with “overriding bit” set) and the processor should discard those packets. Address learning is disabled on the port in this state.
<b>Blocking State</b>	<b>Port Setting</b>	<b>Software Action</b>
Only packets to the processor are forwarded. Learning is disabled.	“transmit enable = 0, receive enable = 0, learning disable = 1”	The processor should not send any packets to the port(s) in this state. The processor should program the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit should also be set so that the switch will forward those specific packets to the processor. Address learning is disabled on the port in this state.
<b>Listening State</b>	<b>Port Setting</b>	<b>Software Action</b>
Only packets to and from the processor are forwarded. Learning is disabled.	“transmit enable = 0, receive enable = 0, learning disable = 1”	The processor should program the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state. See <b>Section 3.7 “Tail Tagging Mode”</b> for details. Address learning is disabled on the port in this state.
<b>Learning State</b>	<b>Port Setting</b>	<b>Software Action</b>
Only packets to and from the processor are forwarded. Learning is enabled.	“transmit enable = 0, receive enable = 0, learning disable = 0”	The processor should program the “Static MAC table” with the entries that it needs to receive (for example, BPDU packets). The “overriding” bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state. See <b>Section 3.7 “Tail Tagging Mode”</b> for details. Address learning is enabled on the port in this state.

**TABLE 3-8: SPANNING TREE STATES**

State	Setting	Action
Forwarding State	Port Setting	Software Action
Packets are forwarded and received normally. Learning is enabled.	"transmit enable = 1, receive enable = 1, learning disable = 0"	The processor programs the "Static MAC table" with the entries that it needs to receive (for example, BPDU packets). The "overriding" bit is set so that the switch forwards those specific packets to the processor. The processor can send packets to the port(s) in this state. See <b>Section 3.7 "Tail Tagging Mode"</b> for details. Address learning is enabled on the port in this state.

## 3.6 Rapid Spanning Tree Support

There are three operational states of the Discarding, Learning, and Forwarding assigned to each port for RSTP:

Discarding ports do not participate in the active topology and do not learn MAC addresses.

Discarding state: The state includes three states of the disable, blocking and listening of STP.

Port setting: "transmit enable = 0, receive enable = 0, learning disable = 1."

Software action: the processor should not send any packets to the port. The switch may still send specific packets to the processor (packets that match some entries in the static table with "overriding bit" set) and the processor should discard those packets. When disable the port's learning capability (learning disable='1'), set the register 2 bit 5 and bit 4 will flush rapidly the port related entries in the dynamic MAC table and static MAC table.

Note: Processor is connected to port 3 via MII interface. Address learning is disabled on the port in this state.

Ports in Learning states learn MAC addresses, but do not forward user traffic.

Learning state: Only packets to and from the processor are forwarded. Learning is enabled.

Port setting: "transmit enable = 0, receive enable = 0, learning disable = 0."

Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The "overriding" bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see **Section 3.7 "Tail Tagging Mode"** for details. Address learning is enabled on the port in this state.

Ports in Forwarding states fully participate in both data forwarding and MAC learning.

Forwarding state: Packets are forwarded and received normally. Learning is enabled.

Port setting: "transmit enable = 1, receive enable = 1, learning disable = 0."

Software action: The processor should program the static MAC table with the entries that it needs to receive (e.g., BPDU packets). The "overriding" bit should be set so that the switch will forward those specific packets to the processor. The processor may send packets to the port(s) in this state, see **Section 3.7 "Tail Tagging Mode"** for details. Address learning is enabled on the port in this state.

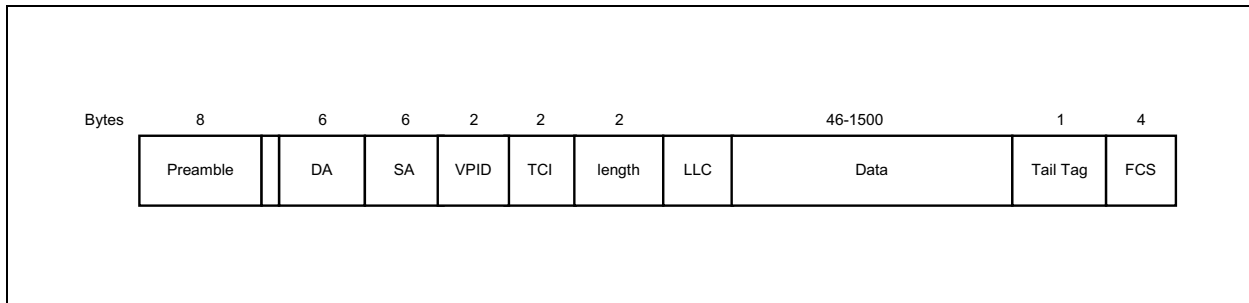

RSTP uses only one type of BPDU called RSTP BPDUs. They are similar to STP Configuration BPDUs with the exception of a type field set to "version 2" for RSTP and "version 0" for STP, and a flag field carrying additional information.

## 3.7 Tail Tagging Mode

The Tail Tag is only seen and used by the port 3 interface, which should be connected to a processor. It is an effective way to retrieve the ingress port information for spanning tree protocol IGMP snooping and other applications. The Bit 1 and bit 0 in the one byte tail tagging is used to indicate the source/destination port in port 3. Bit 3 and bit 2 are used for the priority setting of the ingress frame in port 3. Other bits are not used. The Tail Tag feature is enable by setting register 3 bit 6.

# KSZ8873MML

**FIGURE 3-7: TAIL TAG FRAME FORMAT**

**TABLE 3-9: TAIL TAG RULES**

Ingress to Port 3 (Host to KSZ8873)	
Bit [1,0]	Destination Port
0,0	Normal (address lookup)
0,1	Port 1
1,0	Port 2
1,1	Port 1 and 2
Bit [3,2]	Frame Priority
0,0	Priority 0
0,1	Priority 1
1,0	Priority 2
1,1	Priority 3
Egress from Port 3 (KSZ8873 to Host)	
Bit [0]	Source Port
0	Port 1
1	Port 2

## 3.8 IGMP Support

For Internet Group Management Protocol (IGMP) support in layer 2, the KSZ8873MML provides two components: IGMP snooping and IGMP send-back to the subscribed port.

### 3.8.1 IGMP SNOOPING

The KSZ8873MML traps IGMP packets and forwards them only to the processor (port 3). The IGMP packets are identified as IP packets (either Ethernet IP packets, or IEEE 802.3 SNAP IP packets) with IP version = 0x4 and protocol version number = 0x2.

### 3.8.2 IGMP SEND-BACK TO THE SUBSCRIBED PORT

Once the host responds the received IGMP packet, the host should know the original IGMP ingress port and send back the IGMP packet to this port only, otherwise this IGMP packet will be broadcasted to all ports to downgrade the performance.

Enable the tail tag mode, the host will know the IGMP packet received port from tail tag bits [0] and can send back the response IGMP packet to this subscribed port by setting the bits [1,0] in the tail tag. Enable tail tag mode by setting Register 3 bit 6. The tail tag will be removed automatically when the IGMP packet is sent out from the subscribed port.

## 3.9 Port Mirroring Support

KSZ8873MML supports “Port Mirroring” comprehensively as:

- “Receive only” mirror on a port
  - All the packets received on the port are mirrored on the sniffer port. For example, port 1 is programmed to be “receive sniff” and port 3 is programmed to be the “sniffer port”. A packet received on port 1 is destined to port 2 after the internal lookup. The KSZ8873MML forwards the packet to both port 2 and port 3. The KSZ8873MML can optionally even forward “bad” received packets to the “sniffer port”.
- “Transmit only” mirror on a port
  - All the packets transmitted on the port are mirrored on the sniffer port. For example, port 1 is programmed to be “transmit sniff” and port 3 is programmed to be the “sniffer port”. A packet received on port 2 is destined to port 1 after the internal lookup. The KSZ8873MML forwards the packet to both port 1 and port 3.
- “Receive and transmit” mirror on two ports
  - All the packets received on port A and transmitted on port B are mirrored on the sniffer port. To turn on the “AND” feature, set register 5 bit [0] to ‘1’. For example, port 1 is programmed to be “receive sniff”, port 2 is programmed to be “transmit sniff”, and port 3 is programmed to be the “sniffer port”. A packet received on port 1 is destined to port 2 after the internal lookup. The KSZ8873MML forwards the packet to both port 2 and port 3.

Multiple ports can be selected as “receive sniff” or “transmit sniff”. In addition, any port can be selected as the “sniffer port”. All these per port features can be selected through registers 17, 33, and 49 for ports 1, 2, and 3, respectively.

## 3.10 Rate Limiting Support

The KSZ8873MML provides a fine resolution hardware rate limiting from 64 kbps to 99 Mbps. The rate step is 64 kbps when the rate range is from 64 kbps to 960 kbps and 1 Mbps for 1 Mbps to 100 Mbps (100BT) or to 10 Mbps (10BT) (refer to Data Rate Limit Table). The rate limit is independently on the “receive side” and on the “transmit side” on a per port basis. For 10BASE-T, a rate setting above 10 Mbps means the rate is not limited. On the receive side, the data receive rate for each priority at each port can be limited by setting up Ingress Rate Control Registers. On the transmit side, the data transmit rate for each priority queue at each port can be limited by setting up Egress Rate Control Registers. The size of each frame has options to include minimum IFG (Inter Frame Gap) or Preamble byte, in addition to the data field (from packet DA to FCS).

For ingress rate limiting, KSZ8873MML provides options to selectively choose frames from all types, multicast, broadcast, and flooded unicast frames. The KSZ8873MML counts the data rate from those selected type of frames. Packets are dropped at the ingress port when the data rate exceeds the specified rate limit.

For egress rate limiting, the Leaky Bucket algorithm is applied to each output priority queue for shaping output traffic. Inter frame gap is stretched on a per frame base to generate smooth, non-burst egress traffic. The throughput of each output priority queue is limited by the egress rate specified.

If any egress queue receives more traffic than the specified egress rate throughput, packets may be accumulated in the output queue and packet memory. After the memory of the queue or the port is used up, packet dropping or flow control will be triggered. As a result of congestion, the actual egress rate may be dominated by flow control/dropping at the ingress end, and may be therefore slightly less than the specified egress rate.

To reduce congestion, it is a good practice to make sure the egress bandwidth exceeds the ingress bandwidth.

## 3.11 Unicast MAC Address Filtering

The unicast MAC address filtering function works in conjunction with the static MAC address table. First, the static MAC address table is used to assign a dedicated MAC address to a specific port. If a unicast MAC address is not recorded in the static table, it is also not learned in the dynamic MAC table. The KSZ8873MML is then configured with the option to either filter or forward unicast packets for an unknown MAC address. This option is enabled and configured in register 14.

This function is useful in preventing the broadcast of unicast packets that could degrade the quality of the port in applications such as voice over Internet Protocol (VoIP).

## 3.12 Configuration Interface

The KSZ8873MML can operate as both a managed switch and an unmanaged switch.

# KSZ8873MML

In unmanaged mode, the KSZ8873MML is typically programmed using an EEPROM. If no EEPROM is present, the KSZ8873MML/FLL/RLL is configured using its default register settings. Some default settings are configured via strap-in pin options. The strap-in pins are indicated in the “Pin Description and I/O Assignment” table.

## 3.12.1 I<sup>2</sup>C MASTER SERIAL BUS CONFIGURATION

With an additional I<sup>2</sup>C (“2-wire”) EEPROM, the KSZ8873MML can perform more advanced switch features like “broadcast storm protection” and “rate control” without the need of an external processor.

For KSZ8873MML I<sup>2</sup>C Master configuration, the EEPROM stores the configuration data for register 0 to register 120 (as defined in the KSZ8873MML register map) with the exception of the “Read Only” status registers. After the de-assertion of reset, the KSZ8873MML sequentially reads in the configuration data for all control registers, starting from register 0.

**FIGURE 3-8: EEPROM CONFIGURATION TIMING DIAGRAM**

The following is a sample procedure for programming the KSZ8873MML with a pre-configured EEPROM:

1. Connect the KSZ8873MML to the EEPROM by joining the SCL and SDA signals of the respective devices.
2. Enable I<sup>2</sup>C master mode by setting the KSZ8873MML strap-in pins, P2LED[1:0] to “00”.
3. Check to ensure that the KSZ8873MML reset signal input, RSTN, is properly connected to the external reset source at the board level.
4. Program the desired configuration data into the EEPROM.
5. Place the EEPROM on the board and power up the board.
6. Assert an active-low reset to the RSTN pin of the KSZ8873MML. After reset is de-asserted, the KSZ8873MML begins reading the configuration data from the EEPROM. The KSZ8873MML checks that the first byte read from the EEPROM is “88”. If this value is correct, EEPROM configuration continues. If not, EEPROM configuration access is denied and all other data sent from the EEPROM is ignored by the KSZ8873MML.

For proper operation, ensure that the KSZ8873MML PWRDN input signal is not asserted during the reset operation. The PWRDN input is active-low.

## 3.12.2 I<sup>2</sup>C SLAVE SERIAL BUS CONFIGURATION

In managed mode, the KSZ8873MML can be configured as an I<sup>2</sup>C slave device. In this mode, an I<sup>2</sup>C master device (external controller/CPU) has complete programming access to the KSZ8873MML’s 198 registers. Programming access includes the Global Registers, Port Registers, Advanced Control Registers, and indirect access to the “Static MAC Table”, “VLAN Table”, “Dynamic MAC Table,” and “MIB Counters.” The tables and counters are indirectly accessed via registers 121 to 131.

In I<sup>2</sup>C slave mode, the KSZ8873MML operates like other I<sup>2</sup>C slave devices. Addressing the KSZ8873MML’s 8-bit registers is similar to addressing the Microchip AT24C02 EEPROM’s memory locations. Details of I<sup>2</sup>C read/write operations and related timing information can be found in the AT24C02 data sheet.

Two fixed 8-bit device addresses are used to address the KSZ8873MML in I<sup>2</sup>C slave mode. One is for read; the other is for write. The addresses are as follows:

- 1011\_1111 <read>
- 1011\_1110 <write>

The following is a sample procedure for programming the KSZ8873MML using the I<sup>2</sup>C slave serial bus:

1. Enable I<sup>2</sup>C slave mode by setting the KSZ8873MML strap-in pins P2LED[1:0] to “01”.
2. Power up the board and assert reset to the KSZ8873MML.
3. Configure the desired register settings in the KSZ8873MML, using the I<sup>2</sup>C write operation.
4. Read back and verify the register settings in the KSZ8873MML, using the I<sup>2</sup>C read operation.

Some of the configuration settings, such as “Aging Enable”, “Auto Negotiation Enable”, “Force Speed”, and “Power down” can be programmed after the switch has been started.

### 3.12.3 SPI SLAVE SERIAL BUS CONFIGURATION

In managed mode, the KSZ8873MML can be configured as a SPI slave device. In this mode, a SPI master device (external controller/CPU) has complete programming access to the KSZ8873MML's 198 registers. Programming access includes the Global Registers, Port Registers, Advanced Control Registers and indirect access to the “Static MAC Table”, “VLAN Table”, “Dynamic MAC Table” and “MIB Counters”. The tables and counters are indirectly accessed via registers 121 to 131.

The KSZ8873MML supports two standard SPI commands: ‘0000\_0011’ for data read and ‘0000\_0010’ for data write. SPI multiple read and multiple write are also supported by the KSZ8873MML to expedite register read back and register configuration, respectively.

SPI multiple read is initiated when the master device continues to drive the KSZ8873MML SPISN input pin (SPI Slave Select signal) low after a byte (a register) is read. The KSZ8873MML internal address counter increments automatically to the next byte (next register) after the read. The next byte at the next register address is shifted out onto the KSZ8873MML SPIQ output pin. SPI multiple read continues until the SPI master device terminates it by de-asserting the SPISN signal to the KSZ8873MML.

Similarly, SPI multiple write is initiated when the master device continues to drive the KSZ8873MML SPISN input pin low after a byte (a register) is written. The KSZ8873MML internal address counter increments automatically to the next byte (next register) after the write. The next byte that is sent from the master device to the KSZ8873MML SDA input pin is written to the next register address. SPI multiple write continues until the SPI master device terminates it by de-asserting the SPISN signal to the KSZ8873MML.

For both SPI multiple read and multiple write, the KSZ8873MML internal address counter wraps back to register address zero once the highest register address is reached. This feature allows all 198 KSZ8873MML registers to be read, or written with a single SPI command from any initial register address.

The KSZ8873MML is capable of supporting a SPI bus.

The following is a sample procedure for programming the KSZ8873MML using the SPI bus:

1. At the board level, connect the KSZ8873MML pins as follows:

**TABLE 3-10: SPI CONNECTIONS**

Pin Number	Signal Name	External Processor Signal Description
39	SPISN	SPI Slave Select
41	SCL (SPIC)	SPI Clock
42	SDA (SPID)	SPI Data (Master output; Slave input)
38	SPIQ	SPI Data (Master input; Slave output)

2. Enable SPI slave mode by setting the KSZ8873MML strap-in pins P2LED[1:0] to “10”.
3. Power up the board and assert reset to the KSZ8873MML.
4. Configure the desired register settings in the KSZ8873MML, using the SPI write or multiple write command.
5. Read back and verify the register settings in the KSZ8873MML, using the SPI read or multiple read command.

Some of the configuration settings, such as “Aging Enable,” “Auto Negotiation Enable,” “Force Speed,” and “Power Down” can be programmed after the switch has been started.

The following four figures illustrate the SPI data cycles for “Write,” “Read,” “Multiple Write,” and “Multiple Read.” The read data is registered out of SPIQ on the falling edge of SPIC, and the data input on SPID is registered on the rising edge of SPIC.

FIGURE 3-9: SPI WRITE DATA CYCLE

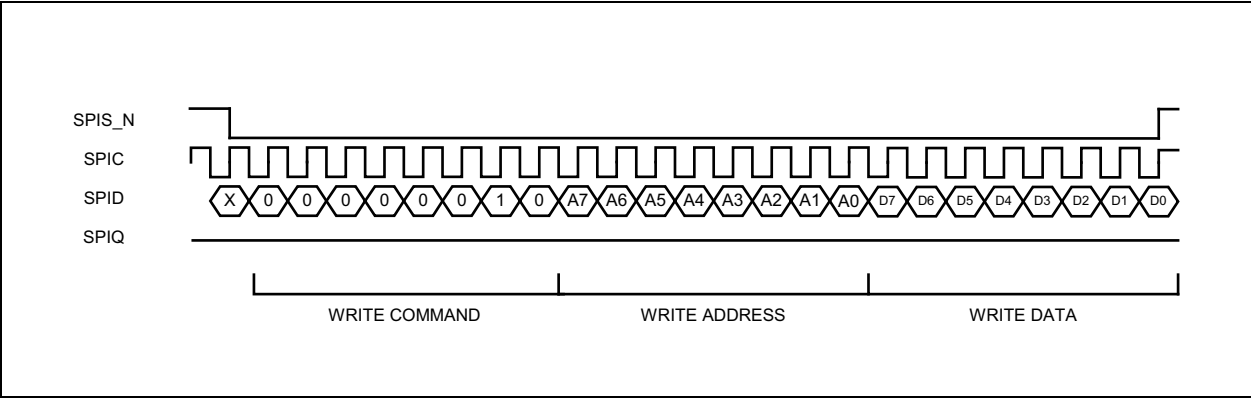

FIGURE 3-10: SPI READ DATA CYCLE

FIGURE 3-11: SPI MULTIPLE WRITE

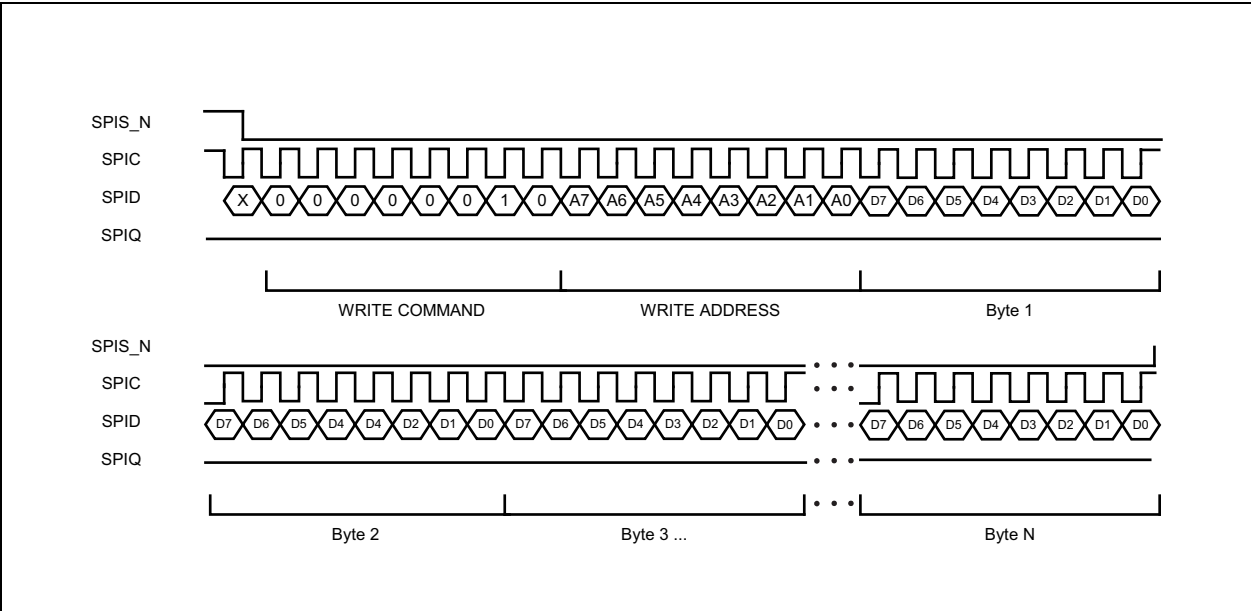

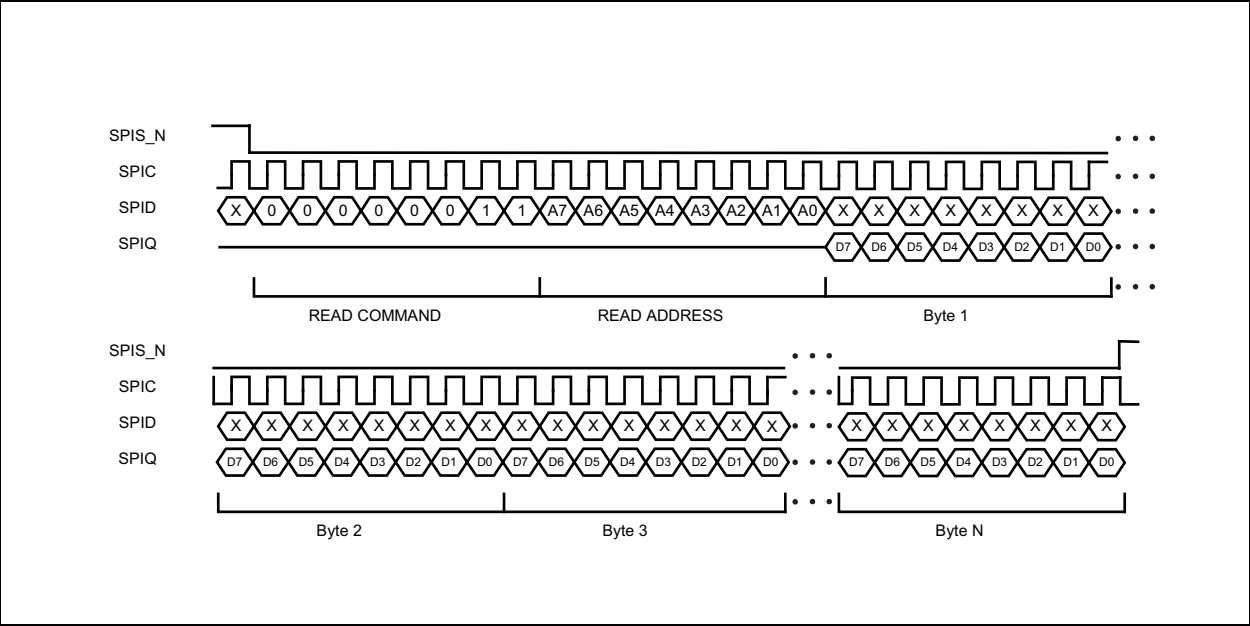

FIGURE 3-12: SPI MULTIPLE READ

## 3.13 Loopback Support

The KSZ8873MML provides loopback support for remote diagnostic of failure. In loopback mode, the speed at both PHY ports needs to be set to 100BASE-TX. The KSZ8873MML only supports Near-End (Remote) Loopback.

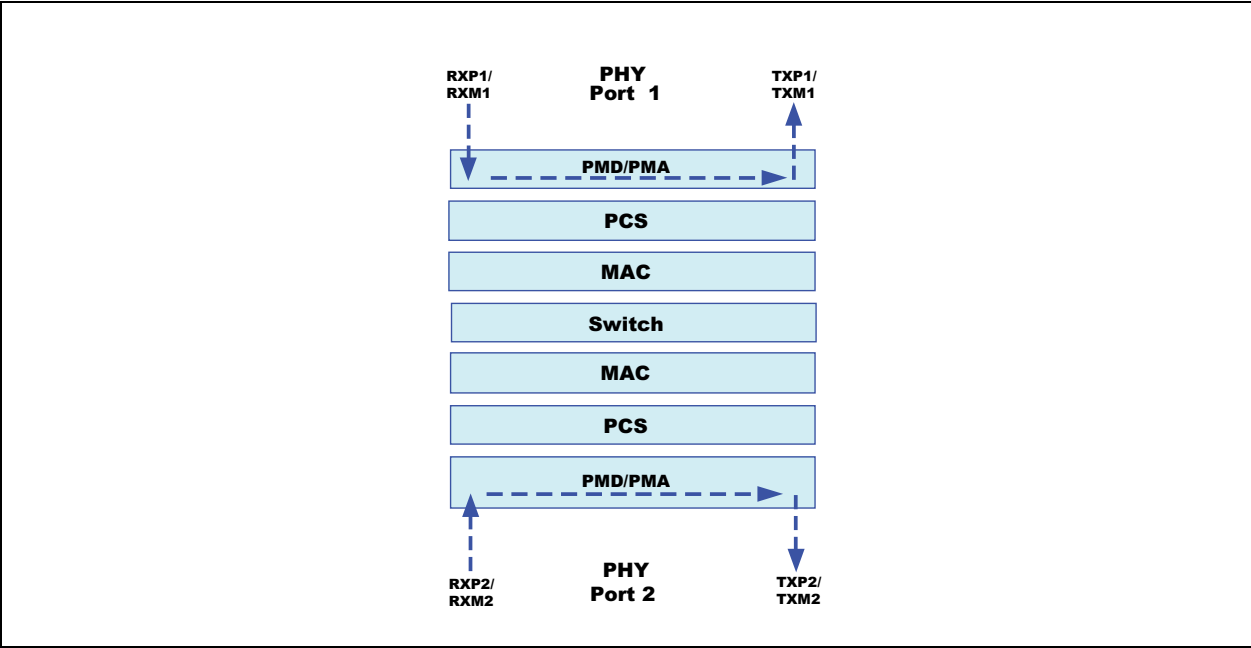

### 3.13.1 NEAR-END (REMOTE) LOOPBACK

Near-End (Remote) loopback is conducted at PHY port 2 of the KSZ8873MML. The loopback path starts at the PHY port's receive inputs (RXPx/RXMx), wraps around at the same PHY port's PMD/PMA, and ends at the PHY port's transmit outputs (TXPx/TXMx).

Bit [1] of registers 42 is used to enable near-end loopback for ports 2. Alternatively, the MII Management register 31, bit [1] can be used to enable near-end loopback.

The near-end loopback paths are illustrated in [Figure 3-13](#).

**FIGURE 3-13: NEAR-END (REMOTE) LOOPBACK PATH**

## 4.0 REGISTER DESCRIPTIONS

### 4.1 MII Management (MIIM) Registers

The MIIM interface is used to access the MII PHY registers defined in this section. The SPI, I<sup>2</sup>C, and SMI interfaces can also be used to access some of these registers. The latter three interfaces use a different mapping mechanism than the MIIM interface.

The “PHYADs” by defaults are assigned “0x1” for PHY1 as reserved in KSZ8873MML and “0x2” for PHY2 (port 2). Additionally, these “PHYADs” can be programmed to the PHY addresses specified in bits[7:3] of Register 15 (0x0F): Global Control 13.

The “REGAD” supported are 0x0-0x5, 0x1D, and 0x1F.

**TABLE 4-1: MIIM REGISTERS FOR KSZ8873MML/FLL/RLL**

Register Number	Description
PHYAD = 0x2, REGAD = 0x0	PHY2 Basic Control Register
PHYAD = 0x2, REGAD = 0x1	PHY2 Basic Status Register
PHYAD = 0x2, REGAD = 0x2	PHY2 Physical Identifier I
PHYAD = 0x2, REGAD = 0x3	PHY2 Physical Identifier II
PHYAD = 0x2, REGAD = 0x4	PHY2 Auto-Negotiation Advertisement Register
PHYAD = 0x2, REGAD = 0x5	PHY2 Auto-Negotiation Link Partner Ability Register
PHYAD = 0x2, 0x6 – 0x1C	PHY2 Not supported
PHYAD = 0x2, 0x1D	PHY2 LinkMD Control/Status
PHYAD = 0x2, 0x1E	PHY2 Not supported
PHYAD = 0x2, 0x1F	PHY2 Special Control/Status

# KSZ8873MML

## 4.2 Register Descriptions

TABLE 4-2: REGISTER DESCRIPTIONS

Bit	Name	R/W	Description	Default	Reference
<b>PHY1 Register 0 (PHYAD = 0x1, REGAD = 0x0): Reserved</b>

## 4.4 Register Descriptions

**TABLE 4-6: GLOBAL REGISTERS (0-15)**

Bit	Name	R/W	Description	Default
<b>Register 0 (0x00): Chip ID0</b>				
7-0	Family ID	RO	Chip family	0x88
<b>Register 1 (0x01): Chip ID1/Start Switch</b>				
7-4	Chip ID	RO	0x3 is assigned to M series. (73M)	0x3
3-1	Revision ID	RO	Revision ID	—
0	Start Switch	R/W	1 = Start the switch (default) 0 = Stop the switch	1
<b>Register 2 (0x02): Global Control 0</b>				
7	New Back-Off Enable	R/W	New back-off algorithm designed for UNH 1 = Enable 0 = Disable	0
6	Reserved	RO	Reserved	0
5	Flush Dynamic MAC Table	R/W	1 = Enable flush dynamic MAC table for spanning tree application 0 = Disable	0
4	Flush Static MAC Table	R/W	1 = Enable flush static MAC table for spanning tree application 0 = Disable	0
3	Pass Flow Control Packet	R/W	1 = Switch will pass 802.1x flow control packets 0 = Switch will drop 802.1x flow control packets	0
2	Reserved	R/W	Reserved Do not change the default value.	0
1	Reserved	R/W	Reserved Do not change the default value.	0
0	Reserved	RO	Reserved	0
<b>Register 3 (0x03): Global Control 1</b>				
7	Pass All Frames	R/W	1 = Switch all packets including bad ones. Used solely for debugging purposes. Works in conjunction with sniffer mode only.	0
6	Port 3 Tail Tag Mode Enable	R/W	1 = Enable port 3 tail tag mode. 0 = Disable.	0
5	IEEE 802.3x Transmit Direction Flow Control Enable	R/W	1 = Will enable transmit direction flow control feature. 0 = Will not enable transmit direction flow control feature. Switch will not generate any flow control (PAUSE) frame.	1
4	IEEE 802.3x Receive Direction Flow Control Enable	R/W	1 = Will enable receive direction flow control feature. 0 = Will not enable receive direction flow control feature. Switch will not react to any flow control (PAUSE) frame it receives.	1

**TABLE 4-6: GLOBAL REGISTERS (0-15) (CONTINUED)**

Bit	Name	R/W	Description	Default
3	Frame Length Field Check	R/W	1 = Will check frame length field in the IEEE packets. If the actual length does not match, the packet will be dropped (for Length/Type field < 1500). 0 = Will not check	0
2	Aging Enable	R/W	1 = Enable age function in the chip 0 = Disable age function in the chip	1
1	Fast Age Enable	R/W	1 = Turn on fast age (800 $\mu$ s)	0
0	Aggressive Back-Off Enable	R/W	1 = Enable more aggressive back off algorithm in half-duplex mode to enhance performance. This is not an IEEE standard.	0

**Register 4 (0x04): Global Control 2**

7	Unicast Port-VLAN Mismatch Discard	R/W	This feature is used with port-VLAN (described in reg. 17, reg. 33, etc.) 1 = All packets cannot cross VLAN boundary 0 = Unicast packets (excluding unknown/multicast/broadcast) can cross VLAN boundary Note: Port mirroring is not supported if this bit is set to "0".	1
6	Multicast Storm Protection Disable	R/W	1 = Broadcast Storm Protection does not include multicast packets. Only DA = FF-FF-FF-FF-FF-FF packets will be regulated. 0 = Broadcast Storm Protection includes DA = FF-FF-FF-FF-FF-FF and DA[40] = 1 packets.	1
5	Back Pressure Mode	R/W	1 = Carrier sense based back pressure is selected 0 = Collision based back pressure is selected	1
4	Flow Control and Back Pressure Fair Mode	R/W	1 = Fair mode is selected. In this mode, if a flow control port and a non-flow control port talk to the same destination port, packets from the non-flow control port may be dropped. This is to prevent the flow control port from being flow controlled for an extended period of time. 0 = In this mode, if a flow control port and a non-flow control port talk to the same destination port, the flow control port will be flow controlled. This may not be "fair" to the flow control port.	1
3	No Excessive Collision Drop	R/W	1 = The switch will not drop packets when 16 or more collisions occur. 0 = The switch will drop packets when 16 or more collisions occur.	0
2	Huge Packet Support	R/W	1 = Will accept packet sizes up to 1916 bytes (inclusive). This bit setting will override setting from bit 1 of this register. 0 = The max packet size will be determined by bit 1 of this register.	0
1	Legal Maximum Packet Size Check Enable	R/W	0 = Will accept packet sizes up to 1536 bytes (inclusive). 1 = 1522 bytes for tagged packets, 1518 bytes for untagged packets. Any packets larger than the specified value will be dropped.	0
0	Reserved	R/W	Reserved Do not change the default value.	0

**Register 5 (0x05): Global Control 3**

**TABLE 4-6: GLOBAL REGISTERS (0-15) (CONTINUED)**

Bit	Name	R/W	Description	Default
7	802.1Q VLAN Enable	R/W	1 = 802.1Q VLAN mode is turned on. VLAN table needs to set up before the operation. 0 = 802.1Q VLAN is disabled.	0
6	IGMP Snoop Enable on Switch MII Interface	R/W	1 = IGMP snoop is enabled. All IGMP packets will be forwarded to the Switch MII port. 0 = IGMP snoop is disabled.	0
5	Reserved	RO	Reserved Do not change the default values.	0
4	Reserved	RO	Reserved Do not change the default values.	0
3	Weighted Fair Queue Enable	R/W	0 = Priority method set by the registers 175-186 bit [7] = 0 for port 1, port 2, and port 3. 1 = Weighted Fair Queuing enabled. When all four queues have packets waiting to transmit, the bandwidth allocation is q3:q2:q1:q0 = 8:4:2:1. If any queues are empty, the highest non-empty queue gets one more weighting. For example, if q2 is empty, q3:q2:q1:q0 becomes (8+1):0:2:1.	0
2	Reserved	RO	Reserved Do not change the default values.	0
1	Reserved	RO	Reserved Do not change the default values.	0
0	Sniff Mode Select	R/W	1 = Will do RX AND TX sniff (both source port and destination port need to match) 0 = Will do RX OR TX sniff (either source port or destination port needs to match). This is the mode used to implement RX only sniff.	0
<b>Register 6 (0x06): Global Control 4</b>				
7	Reserved	RO	Reserved Do not change the default values.	0
6	Switch MII Half-Duplex Mode	R/W	1 = Enable Port 3 MII to half-duplex mode. 0 = Enable Port 3 MII to full-duplex mode.  <b>Defaults:</b> Port 3: Pin P1LED0 strap option. Pull-up(1): Half -duplex mode Pull-down(0): Full-duplex mode Note: P1LED0 has internal pull-down. Port 1: Pin SMRXD11 strap option. Pull-up(1): Full -duplex mode Pull-down(0): Half-duplex mode Note: SMRXD11 has internal pull-up.	0

**TABLE 4-6: GLOBAL REGISTERS (0-15) (CONTINUED)**

Bit	Name	R/W	Description	Default
5	Switch MII Flow Control Enable	R/W	1 = Enable full-duplex flow control on Switch port 3 MII interface. 0 = Disable full-duplex flow control on Switch port 3 MII interface.  <b>Defaults:</b> Port 3: Pin P1LED1 strap option. Pull-up(1): Enable flow control Pull-down(0): Disable flow control Note: P1LED1 has internal pull-up. Port 1: Pin SMRXD10 Pull-up(1): Enable flow control Pull-down(0): Disable flow control Note: SMRXD10 has internal pull-up.	1
4	Switch MII 10BT	R/W	1 = The Port 3 MII switch interface is in 10 Mbps mode 0 = The Port 3 MII switch interface is in 100 Mbps mode  <b>Defaults:</b> Port 3: Pin SMRXDV1 (P3SPD) strap option. Pull-up(1): Enable 10 Mbps Pull-down(0): Enable 100 Mbps Note: SMRXDV1 (P3SPD) has internal pull-down. Port 1: Pin SMRXD12 (P1SPD) strap option. Pull-up(1): Enable 100 Mbps Pull-down(0): enable 10 Mbps Note: SMRXD12 has internal pull-up.	0
3	Null VID Replacement	R/W	1 = Will replace NULL VID with port VID (12 bits) 0 = No replacement for NULL VID	0
2-0	Broadcast Storm Protection Rate Bit [10:8]	R/W	This register along with the next register determines how many “64 byte blocks” of packet data are allowed on an input port in a preset period. The period is 67 ms for 100BT or 500 ms for 10BT. The default is 1%.	000
<b>Register 7 (0x07): Global Control 5</b>				
7-0	Broadcast Storm Protection Rate Bit [7:0]	R/W	This register along with the previous register determines how many “64 byte blocks” of packet data are allowed on an input port in a preset period. The period is 67 ms for 100BT or 500 ms for 10BT. The default is 1%. Note: 100BT Rate: 148,800 frames/sec * 67 ms/interval * 1% = 99 frames/interval (approx.) = 0x63	0x63
<b>Register 8 (0x08): Global Control 6</b>				
7-0	Factory Testing	RO	Reserved Do not change the default values.	0x00
<b>Register 9 (0x09): Global Control 7</b>				
7-0	Factory Testing	RO	Reserved Do not change the default values.	0x24
<b>Register 10 (0x0A): Global Control 8</b>				
7-0	Factory Testing	RO	Reserved Do not change the default values.	0x35

2-0	Reserved	RO	Reserved Do not change the default values.	000

# KSZ8873MML

The following registers are used to enable features that are assigned on a per port basis. The register bit assignments are the same for all ports, but the address for each port is different, as indicated.

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95)**

Bit	Name	R/W	Description	Default
<b>Register 16 (0x10): Port 1 Control 0</b> <b>Register 32 (0x20): Port 2 Control 0</b> <b>Register 48 (0x30): Port 3 Control 0</b>				
7	Broadcast Storm Protection Enable	R/W	1 = Enable broadcast storm protection for ingress packets on port 0 = Disable broadcast storm protection	0
6	DiffServ Priority Classification Enable	R/W	1 = Enable DiffServ priority classification for ingress packets (IPv4) on port 0 = Disable DiffServ function	0
5	802.1p Priority Classification Enable	R/W	1 = Enable 802.1p priority classification for ingress packets on port 0 = Disable 802.1p	0
4-3	Port-based Priority Classification	R/W	00 = Ingress packets on port will be classified as priority 0 queue if "Diffserv" or "802.1p" classification is not enabled or fails to classify. 01 = Ingress packets on port will be classified as priority 1 queue if "Diffserv" or "802.1p" classification is not enabled or fails to classify. 10 = Ingress packets on port will be classified as priority 2 queue if "Diffserv" or "802.1p" classification is not enabled or fails to classify. 11 = Ingress packets on port will be classified as priority 3 queue if "Diffserv" or "802.1p" classification is not enabled or fails to classify. Note: "DiffServ," "802.1p," and port priority can be enabled at the same time. The OR'ed result of 802.1p and DSCP overwrites the port priority.	00
2	Tag Insertion	R/W	1 = When packets are output on the port, the switch will add 802.1p/q tags to packets without 802.1p/q tags when received. The switch will not add tags to packets already tagged. The tag inserted is the ingress port's "port VID". 0 = Disable tag insertion Note: For the tag insertion available, the register 194 bits [5:0] have to be set first.	0
1	Tag Removal	R/W	1 = When packets are output on the port, the switch will remove 802.1p/q tags from packets with 802.1p/q tags when received. The switch will not modify packets received without tags. 0 = Disable tag removal	0
0	TXQ Split Enable	R/W	1 = Split TXQ to 4 queue configuration. It cannot be enable at the same time with split 2 queue at register 18, 34, 50 bit 7. 0 = No split, treated as 1 queue configuration	0
<b>Register 17 (0x11): Port 1 Control 1</b> <b>Register 33 (0x21): Port 2 Control 1</b> <b>Register 49 (0x31): Port 3 Control 1</b>				
7	Sniffer Port	R/W	1 = Port is designated as sniffer port and will transmit packets that are monitored. 0 = Port is a normal port	0

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95) (CONTINUED)**

Bit	Name	R/W	Description	Default
6	Receive Sniff	R/W	1 = All packets received on the port will be marked as "monitored packets" and forwarded to the designated "sniffer port" 0 = No receive monitoring	0
5	Transmit Sniff	R/W	1 = All packets transmitted on the port will be marked as "monitored packets" and forwarded to the designated "sniffer port" 0 = No transmit monitoring	0
4	Double Tag	R/W	1 = All packets will be tagged with port default tag of ingress port regardless of the original packets are tagged or not 0 = Do not double tagged on all packets	0
3	User Priority Ceiling	R/W	1 = If the packet's "user priority field" is greater than the "user priority field" in the port default tag register, replace the packet's "user priority field" with the "user priority field" in the port default tag register. 0 = Do not compare and replace the packet's 'user priority field'	0
2-0	Port VLAN Membership	R/W	Define the port's egress port VLAN membership. The port can only communicate within the membership. Bit 2 stands for port 3, bit 1 stands for port 2, bit 0 stands for port 1. A '1' includes a port in the membership. A '0' excludes a port from membership.	111
<b>Register 18 (0x12): Port 1 Control 2</b> <b>Register 34 (0x22): Port 2 Control 2</b> <b>Register 50 (0x32): Port 3 Control 2</b>				
7	Enable 2 Queue Split of Tx Queue	R/W	1 = Enable It cannot be enable at the same time with split 4 queue at register 16, 32, and 48 bit 0. 0 = Disable	0
6	Ingress VLAN Filtering	R/W	1 = The switch will discard packets whose VID port membership in VLAN table bits [18:16] does not include the ingress port. 0 = No ingress VLAN filtering.	0
5	Discard non-PVID Packets	R/W	1 = The switch will discard packets whose VID does not match ingress port default VID. 0 = No packets will be discarded	0
4	Force Flow Control	R/W	1 = Will always enable full-duplex flow control on the port, regardless of AN result. 0 = Full-duplex flow control is enabled based on AN result.	Pin value during reset: For port 1, P1FFC pin For port 2, SMRDXD30 pin For port 3, this bit has no meaning. Flow control is set by Reg. 6 bit 5.
3	Back Pressure Enable	R/W	1 = Enable port's half-duplex back pressure 0 = Disable port's half-duplex back pressure	0

# KSZ8873MML

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95) (CONTINUED)**

Bit	Name	R/W	Description	Default
2	Transmit Enable	R/W	1 = Enable packet transmission on the port 0 = Disable packet transmission on the port Note: This bit is used for spanning tree support.	1
1	Receive Enable	R/W	1 = Enable packet reception on the port 0 = Disable packet reception on the port Note: This bit is used for spanning tree support.	1
0	Learning Disable	R/W	1 = Disable switch address learning capability 0 = Enable switch address learning Note: This bit is used for spanning tree support.	0
<b>Register 19 (0x13): Port 1 Control 3</b> <b>Register 35 (0x23): Port 2 Control 3</b> <b>Register 51 (0x33): Port 3 Control 3</b>				
7-0	Default Tag [15:8]	R/W	Port's default tag, containing 7-5 = User priority bits 4 = CFI bit 3-0 = VID[11:8]	0x00
<b>Register 20 (0x14): Port 1 Control 4</b> <b>Register 36 (0x24): Port 2 Control 4</b> <b>Register 52 (0x34): Port 3 Control 4</b>				
7-0	Default Tag [7:0]	R/W	Port's default tag, containing 7-0: VID[7:0]	0x01
Note: Registers 19 and 20 (and those corresponding to other ports) serve two purposes: Associated with the ingress untagged packets, and used for egress tagging. Default VID for the ingress untagged or null-VID-tagged packets, and used for address lookup.				
<b>Register 21 (0x15): Port 1 Control 5</b> <b>Register 37 (0x25): Port 2 Control 5</b> <b>Register 53 (0x35): Port 3 Control 5</b>				
7	Port 1 or Port 3 MII Mode Selection	R/W	1 = Port 3 MII MAC mode 0 = Port 3 MII PHY mode Note: Bit 7 is reserved in the port 2.	0 Inversion of power strapped value of SMRXD13 (Port 1) and SMRXDV3 (Port 3).
6	Self-Address Filtering Enable MACA1 (not for 0x35)	R/W	1 = Enable port 1 self-address filtering MACA1 0 = Disable Note: Port 1 MII connect to an external PHY for KSZ8873MML.	0
5	Self-Address Filtering Enable MACA2 (not for 0x35)	R/W	1 = Enable port 2 self-address filtering MACA2 0 = Disable	0
4	Drop Ingress Tagged Frame	R/W	1 = Enable 0 = Disable	0
3-2	Limit Mode	R/W	Ingress Limit Mode These bits determine what kinds of frames are limited and counted against ingress rate limiting. 00 = Limit and count all frames 01 = Limit and count Broadcast, Multicast, and flooded unicast frames 10 = Limit and count Broadcast and Multicast frames only 11 = Limit and count Broadcast frames only	00

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95) (CONTINUED)**

Bit	Name	R/W	Description	Default
1	Count IFG	R/W	Count IFG bytes 1 = Each frame's minimum inter frame gap (IFG) bytes (12 per frame) are included in Ingress and Egress rate limiting calculations. 0 = IFG bytes are not counted.	0
0	Count Pre	R/W	Count Preamble bytes 1 = Each frame's preamble bytes (8 per frame) are included in Ingress and Egress rate limiting calculations. 0 = Preamble bytes are not counted.	0
<b>Register 22 [6:0] (0x16): Port 1 Q0 Ingress Data Rate Limit</b> <b>Register 38 [6:0] (0x26): Port 2 Q0 Ingress Data Rate Limit</b> <b>Register 54 [6:0] (0x36): Port 3 Q0 Ingress Data Rate Limit</b>				
7	Reserved	RO	Reserved	0
6-0	Q0 Ingress Data Rate Limit	R/W	Ingress data rate limit for priority 0 frames Ingress traffic from this priority queue is shaped according to the ingress Data Rate Selected Table.	0
<b>Register 23 [6:0] (0x17): Port 1 Q1 Ingress Data Rate Limit</b> <b>Register 39 [6:0] (0x27): Port 2 Q1 Ingress Data Rate Limit</b> <b>Register 55 [6:0] (0x37): Port 3 Q1 Ingress Data Rate Limit</b>				
7	Reserved	R/W	Reserved Do not change the default values.	0
6-0	Q1 Ingress Data Rate Limit	R/W	Ingress data rate limit for priority 1 frames Ingress traffic from this priority queue is shaped according to the ingress Data Rate Selected Table.	0
<b>Register 24 [6:0] (0x18): Port 1 Q2 Ingress Data Rate Limit</b> <b>Register 40 [6:0] (0x28): Port 2 Q2 Ingress Data Rate Limit</b> <b>Register 56 [6:0] (0x38): Port 3 Q2 Ingress Data Rate Limit</b>

6-0	Q2 Ingress Data Rate Limit	R/W	Ingress data rate limit for priority 2 frames Ingress traffic from this priority queue is shaped according to ingress Data Rate Selection Table.	0
<b>Register 25 [6:0] (0x19): Port 1 Q3 Ingress Data Rate Limit</b> <b>Register 41 [6:0] (0x29): Port 2 Q3 Ingress Data Rate Limit</b> <b>Register 57 [6:0] (0x39): Port 3 Q3 Ingress Data Rate Limit</b>				
7	Reserved	R/W	Reserved Do not change the default values.	0
6-0	Q3 Ingress Data Rate Limit	R/W	Ingress data rate limit for priority 3 frames Ingress traffic from this priority queue is shaped according to ingress Data Rate Selection Table.	0
Note: Most of the contents in registers 26-31 and registers 42-47 for ports 1 and 2, respectively, can also be accessed with the MIIM PHY registers.				
<b>Register 26 (0x1A): Port 1, Not Supported</b> <b>Register 42 (0x2A): Port 2 PHY Special Control/Status</b> <b>Register 58 (0x3A): Reserved, Not Applicable to Port 3</b>				
7	Vct 10M Short	RO	1 = Less than 10 meter short	0
6-5	Vct_result	RO	00 = Normal condition 01 = Open condition detected in cable 10 = Short condition detected in cable 11 = Cable diagnostic test has failed	00

# KSZ8873MML

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95) (CONTINUED)**

Bit	Name	R/W	Description	Default
4	Vct_en	R/W (SC)	1 = Enable cable diagnostic test. After VCT test has completed, this bit will be self-cleared. 0 = Indicate cable diagnostic test (if enabled) has completed and the status information is valid for read.	0
3	Force_Ink	R/W	1 = Force link pass 0 = Normal Operation	0
2	Reserved	RO	Reserved Do not change the default value.	1
1	Remote Loopback	R/W	1 = Perform Remote loopback, as follows: Port 2 (reg. 42, bit 1 = '1') Start: RXP2/RXM2 (port 2) Loopback: PMD/PMA of port 2's PHY End: TXP2/TXM2 (port 2) 0 = Normal Operation	0
0	Vct_fault_count[8]	RO	Bit[8] of VCT fault count Distance to the fault. It's approximately 0.4m*vct_fault_count[8:0]	0
<b>Register 27 (0x1B): Port 1, Not Supported</b> <b>Register 43 (0x2B): Port 2 LinkMD Result</b> <b>Register 59 (0x3B): Reserved, Not Applicable to Port 3</b>				
7-0	Vct_fault_count[7:0]	RO	Bits[7:0] of VCT fault count Distance to the fault. It's approximately 0.4m*Vct_fault_count[8:0]	0x00
<b>Register 28 (0x1C): Port 1, Not Supported</b> <b>Register 44 (0x2C): Port 2 Control 12</b> <b>Register 60 (0x3C): Reserved, Not Applicable to Port 3</b>				
7	Auto Negotiation Enable	R/W	1 = Auto negotiation is on 0 = Disable auto negotiation; speed and duplex are determined by bits 6 and 5 of this register.	1 For port 2, SMRDX33 pin value during reset
6	Force Speed	R/W	1 = Forced 100BT if AN is disabled (bit 7) 0 = Forced 10BT if AN is disabled (bit 7)	1 For port 1, P1SPD pin value during reset. For port 2, SMRDX32 pin value during reset.
5	Force Duplex	R/W	1 = Forced full-duplex if (1) AN is disabled or (2) AN is enabled, but failed. 0 = Forced half-duplex if (1) AN is disabled or (2) AN is enabled, but failed. Note: This bit or strap pin should be set to '0' for the correct duplex mode indication of LED and register status when the link-up is AN to force mode.	1 For port 1, P1DPX pin value during reset. For port 2, SMRDX31 pin value during reset.
4	Advertise Flow Control Capability	R/W	1 = Advertise flow control (pause) capability 0 = Suppress flow control (pause) capability from transmission to link partner	1

**TABLE 4-7: PORT REGISTERS (REGISTERS 16 - 95) (CONTINUED)**

Bit	Name	R/W	Description	Default
3	Advertise 100BT Full-Duplex Capability	R/W	1 = Advertise 100BT full-duplex capability 0 = Suppress 100BT full-duplex capability from transmission to link partner	1
2	Advertise 100BT Half-Duplex Capability	R/W	1 = Advertise 100BT half-duplex capability 0 = Suppress 100BT half-duplex capability from transmission to link partner	1
1	Advertise 10BT Full-Duplex Capability	R/W	1 = Advertise 10BT full-duplex capability 0 = Suppress 10BT full-duplex capability from transmission to link partner	1
0	Advertise 10BT Half-Duplex Capability	R/W	1 = Advertise 10BT half-duplex capability 0 = Suppress 10BT half-duplex capability from transmission to link partner	1
<b>Register 29 (0x1D): Port 1, Not Supported</b> <b>Register 45 (0x2D): Port 2 Control 13</b> <b>Register 61 (0x3D): Reserved, Not Applicable to Port 3</b>				
7	LED Off	R/W	1 = Turn off all port's LEDs (LEDx_1, LEDx_0, where "x" is the port number). These pins will be driven high if this bit is set to '1'. 0 = Normal operation	0
6	Txdis	R/W	1 = Disable the port's transmitter 0 = Normal operation	0
5	Restart AN	R/W	1 = Restart auto-negotiation 0 = Normal operation	0
4	Disable Far-End Fault	R/W	1 = Disable far-end fault detection and pattern transmission. 0 = Enable far-end fault detection and pattern transmission	0
3	Power Down	R/W	1 = Power down 0 = Normal operation	0
2	Disable Auto MDI/MDI-X	R/W	1 = Disable auto MDI/MDI-X function 0 = Enable auto MDI/MDI-X function	0
1	Force MDI	R/W	If auto MDI/MDI-X is disabled, 1 = Force PHY into MDI mode (transmit on RXP/RXM pins) 0 = Force PHY into MDI-X mode (transmit on TXP/TXM pins)	0
0	Loopback	R/W	1 = Perform loopback, as indicated: Port 2 Loopback (reg. 45, bit 0 = '1') Start: RXP1/RXM1 (port 1) Loopback: PMD/PMA of port 2's PHY End: TXP1/TXM1 (port 1) 0 = Normal operation	0

## 4.5 Advanced Control Registers (Registers 96-198)

The IPv4/IPv6 Type of Service (TOS) Priority Control Registers implement a fully decoded, 128-bit Differentiated Services Code Point (DSCP) register set that is used to determine priority from the TOS field in the IP header. The most significant 6 bits of the TOS field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bits in the DSCP register to determine the priority.

**TABLE 4-9: ADVANCED CONTROL REGISTERS (REGISTERS 96-198)**

Bit	Name	R/W	Description	Default
<b>Register 96 (0x60): TOS Priority Control Register 0</b>				
7-6	DSCP[7:6]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x03.	00
5-4	DSCP[5:4]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x02.	00
3-2	DSCP[3:2]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x01.	00
1-0	DSCP[1:0]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x00.	00
<b>Register 97 (0x61): TOS Priority Control Register 1</b>				
7-6	DSCP[15:14]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x07.	00
5-4	DSCP[13:12]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x06.	00
3-2	DSCP[11:10]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x05.	00
1-0	DSCP[9:8]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x04.	00
<b>Register 98 (0x62): TOS Priority Control Register 2</b>				
7-6	DSCP[23:22]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x0B.	00
5-4	DSCP[21:20]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x0A.	00
3-2	DSCP[19:18]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x09.	00
1-0	DSCP[17:16]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x08.	00
<b>Register 99 (0x63): TOS Priority Control Register 3</b>				
7-6	DSCP[31:30]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x0F.	00
5-4	DSCP[29:28]	R/W	The value in this field is used as the frame's priority when bits [7:2] of the frame's IP TOS/DiffServ/Traffic Class value is 0x0E.	00

3	LED Output Mode	R/W	1 = The internal stretched energy signal from the analog module will be negated and output to LED1 and the internal device ready signal will be negated and output to LED0. 0 = The LED1/LED0 pins will indicate the regular LED outputs. Note: This is for debugging purposes.	0
2	PLL Off Enable	R/W	1 = PLL power down enable 0 = Disable Note: This bit is used in Energy Detect mode with pin 27 MII_LINK_3 pull-up in bypass mode for saving power	0
1-0	Power Management Mode	R/W	Power management mode 00 = Normal Mode 01 = Energy Detection Mode 10 = Software Power Down Mode 11 = Power Saving Mode	00
<b>Register 196 (0xC4): Sleep Mode</b>				
7-0	Sleep Mode	R/W	This value is used to control the minimum period the no energy event has to be detected consecutively before the device enters the low power state when the ED mode is on. The unit is 20 ms. The default go_sleep time is 1.6 seconds.	0x50
<b>Register 198 (0xC6): Forward Invalid VID Frame and Host Mode</b>				
7	Reserved	RO	Reserved Do not change the default value.	0
6-4	Forward Invid VID Frame	R/W	Forwarding ports for frame with invalid VID	3b'0
3	Reserved	RO	Reserved Do not change the default value.	0
2	Reserved	RO	Reserved Do not change the default value.	0
1-0	Host Interface Mode	R/W	00 = I <sup>2</sup> C master mode 01 = I <sup>2</sup> C slave mode 10 = SPI slave mode 11 = SMI mode	Strapped value of P2LED1, P2LED0.

## 4.6 Static MAC Address Table

The KSZ8873 supports both a static and a dynamic MAC address table. In response to a Destination Address (DA) look up, the KSZ8873 searches both tables to make a packet forwarding decision. In response to a Source Address (SA) look up, only the dynamic table is searched for aging, migration and learning purposes.

The static DA look up result takes precedence over the dynamic DA look up result. If there is a DA match in both tables, the result from the static table is used. The entries in the static table will not be aged out by the KSZ8873.

The static table is accessed by an external processor via the SMI, SPI, or I<sup>2</sup>C interfaces. The external processor performs all addition, modification and deletion of static MAC table entries.

**TABLE 4-10: FORMAT OF STATIC MAC TABLE (8 ENTRIES)**

Bit	Name	R/W	Description	Default
57-54	FID	R/W	Filter VLAN ID – identifies one of the 16 active VLANs	0000
53	Use FID	R/W	1 = Use (FID+MAC) for static table look ups 0 = Use MAC only for static table look ups	0
52	Override	R/W	1 = Override port setting “transmit enable=0” or “receive enable=0” setting 0 = No override	0
51	Valid	R/W	1 = This entry is valid, the lookup result will be used 0 = This entry is not valid	0
50-48	Forwarding Ports	R/W	These 3 bits control the forwarding port(s): 001 = Forward to port 1 010 = Forward to port 2 100 = Forward to port 3 011 = Forward to port 1 and port 2 110 = Forward to port 2 and port 3 101 = Forward to port 1 and port 3 111 = Broadcasting (excluding the ingress port)	000
47-0	MAC Address	R/W	48-bit MAC Address	0x0000_0000_0000

# KSZ8873MML

Examples:

## 1. Static Address Table Read (Read the 2nd Entry)

Write to reg. 121 (0x79) with 0x10 // Read static table selected

Write to reg. 122 (0x7A) with 0x01 // Trigger the read operation

Then,

Read reg. 124 (0x7C), static table bits [57:56]

Read reg. 125 (0x7D), static table bits [55:48]

Read reg. 126 (0x7E), static table bits [47:40]

Read reg. 127 (0x7F), static table bits [39:32]

Read reg. 128 (0x80), static table bits [31:24]

Read reg. 129 (0x81), static table bits [23:16]

Read reg. 130 (0x82), static table bits [15:8]

Read reg. 131 (0x83), static table bits [7:0]

## 2. Static Address Table Write (Write the 8th Entry)

Write to reg. 124 (0x7C), static table bits [57:56]

Write to reg. 125 (0x7D), static table bits [55:48]

Write to reg. 126 (0x7E), static table bits [47:40]

Write to reg. 127 (0x7F), static table bits [39:32]

Write to reg. 128 (0x80), static table bits [31:24]

Write to reg. 129 (0x81), static table bits [23:16]

Write to reg. 130 (0x82), static table bits [15:8]

Write to reg. 131 (0x83), static table bits [7:0]

Write to reg. 121 (0x79) with 0x00 // Write static table selected

Write to reg. 122 (0x7A) with 0x07 // Trigger the write operation

## 4.7 VLAN Table

The KSZ8873 uses the VLAN table to perform look ups. If 802.1Q VLAN mode is enabled (register 5, bit 7 = 1), this table will be used to retrieve the VLAN information that is associated with the ingress packet. This information includes FID (filter ID), VID (VLAN ID), and VLAN membership as described in [Table 4-11](#).

**TABLE 4-11: FORMAT OF STATIC VLAN TABLE (16 ENTRIES)**

Bit	Name	R/W	Description	Default
19	Valid	R/W	1 = Entry is valid 0 = Entry is invalid	1
18-16	Membership	R/W	Specify which ports are members of the VLAN. If a DA lookup fails (no match in both static and dynamic tables), the packet associated with this VLAN will be forwarded to ports specified in this field. For example, 101 means port 3 and 1 are in this VLAN.	111
15-12	FID	R/W	Filter ID. KSZ8873 supports 16 active VLANs represented by these four bit fields. FID is the mapped ID. If 802.1Q VLAN is enabled, the look up will be based on FID+DA and FID+SA.	0x0
11-0	VID	R/W	IEEE 802.1Q 12 bits VLAN ID	0x001

If 802.1Q VLAN mode is enabled, KSZ8873 will assign a VID to every ingress packet. If the packet is untagged or tagged with a null VID, the packet is assigned with the default port VID of the ingress port. If the packet is tagged with non-null VID, the VID in the tag will be used. The look up process will start from the VLAN table look up. If the VID is not valid, the packet will be dropped and no address learning will take place. If the VID is valid, the FID is retrieved. The FID+DA

and FID+SA lookups are performed. The FID+DA look up determines the forwarding ports. If FID+DA fails, the packet will be broadcast to all the members (excluding the ingress port) of the VLAN. If FID+SA fails, the FID+SA will be learned.

Examples:

## 1. VLAN Table Read (read the 3rd entry)

Write to reg. 121 (0x79) with 0x14 // Read VLAN table selected

Write to reg. 122 (0x7A) with 0x02 // Trigger the read operation

Then,

Read reg. 129 (0x81), VLAN table bits [19:16]

Read reg. 130 (0x82), VLAN table bits [15:8]

Read reg. 131 (0x83), VLAN table bits [7:0]

## 2. VLAN Table Write (write the 7th entry)

Write to reg. 129 (0x81), VLAN table bits [19:16]

Write to reg. 130 (0x82), VLAN table bits [15:8]

Write to reg. 131 (0x83), VLAN table bits [7:0]

Write to reg. 121 (0x79) with 0x04 // Write VLAN table selected

Write to reg. 122 (0x7A) with 0x06 // Trigger the write operation

## 4.8 Dynamic MAC Address Table

The KSZ8873 maintains the dynamic MAC address table. Only read access is allowed.

**TABLE 4-12: FORMAT OF DYNAMIC MAC ADDRESS TABLE (1K ENTRIES)**

Bit	Name	R/W	Description	Default
71	Data Not Ready	RO	1 = Entry is not ready, continue retrying until this bit is set to 0 0 = Entry is ready	—
70-67	Reserved	RO	Reserved	—
66	MAC Empty	RO	1 = There is no valid entry in the table 0 = There are valid entries in the table	1
65-56	Number of Valid Entries	RO	Indicates how many valid entries in the table 0x3ff means 1k entries 0x001 means 2 entries 0x000 and bit 66 = 0 means 1 entry 0x000 and bit 66 = 1 means 0 entry	00_0000_0000
55-54	Time Stamp	RO	2 bits counter for internal aging	—
53-52	Source Port	RO	The source port where FID+MAC is learned 00 = Port 1 01 = Port 2 10 = Port 3	00
51-48	FID	RO	Filter ID	0x0
47-0	MAC Address	RO	48-bit MAC Address	0x0000_0000_0000

Example:

Dynamic MAC Address Table Read (read the 1st entry and retrieve the MAC table size)

Write to reg. 121 (0x79) with 0x18 // Read dynamic table selected

Write to reg. 122 (0x7A) with 0x00 // Trigger the read operation

Then,

Read reg. 123 (0x7B), bit [7] // if bit 7 = 1, restart (reread) from this register dynamic table bits [66:64]

# KSZ8873MML

Read reg. 124 (0x7C), dynamic table bits [63:56]

Read reg. 125 (0x7D), dynamic table bits [55:48]

Read reg. 126 (0x7E), dynamic table bits [47:40]

Read reg. 127 (0x7F), dynamic table bits [39:32]

Read reg. 128 (0x80), dynamic table bits [31:24]

Read reg. 129 (0x81), dynamic table bits [23:16]

Read reg. 130 (0x82), dynamic table bits [15:8]

Read reg. 131 (0x83), dynamic table bits [7:0]

## 4.9 Management Information Base (MIB) Counters

The KSZ8873 provides 34 MIB counters per port. These counters are used to monitor the port activity for network management. The MIB counters have two format groups: “Per Port” and “All Port Dropped Packet.”

**TABLE 4-13: FORMAT OF “PER PORT” MIB COUNTERS**

Bit	Name	R/W	Description	Default
31	Overflow	RO	1 = Counter overflow 0 = No counter overflow	0
30	Count Valid	RO	1 = Counter value is valid 0 = Counter value is not valid	0
29-0	Counter Values	RO	Counter value	0

“Per Port” MIB counters are read using indirect memory access. The base address offsets and address ranges for all three ports are:

- Port 1, base is 0x00 and range is (0x00-0x1f)
- Port 2, base is 0x20 and range is (0x20-0x3f)
- Port 3, base is 0x40 and range is (0x40-0x5f)

Port 1 MIB counters are read using the indirect memory offsets in [Table 4-14](#).

**TABLE 4-14: PORT 1’S “PER PORT” MIB COUNTERS INDIRECT MEMORY OFFSETS**

Offset	Counter Name	Description
0x0	RxLoPriorityByte	Rx lo-priority (default) octet count including bad packets
0x1	RxHiPriorityByte	Rx hi-priority octet count including bad packets
0x2	RxUndersizePkt	Rx undersize packets w/ good CRC
0x3	RxFragments	Rx fragment packets w/ bad CRC, symbol errors or alignment errors
0x4	RxOversize	Rx oversize packets w/ good CRC (max: 1536 or 1522 bytes)
0x5	RxJabbers	Rx packets longer than 1522 bytes w/ either CRC errors, alignment errors, or symbol errors (depends on max packet size setting)
0x6	RxSymbolError	Rx packets w/ invalid data symbol and legal packet size.
0x7	RxCRCError	Rx packets within (64,1522) bytes w/ an integral number of bytes and a bad CRC (upper limit depends on max packet size setting)
0x8	RxAlignmentError	Rx packets within (64,1522) bytes w/ a non-integral number of bytes and a bad CRC (upper limit depends on max packet size setting)
0x9	RxControl8808Pkts	Number of MAC control frames received by a port with 88-08h in Ether-Type field
0xA	RxPausePkts	Number of PAUSE frames received by a port. PAUSE frame is qualified with EtherType (88-08h), DA, control opcode (00-01), data length (64B min), and a valid CRC
0xB	RxBroadcast	Rx good broadcast packets (not including error broadcast packets or valid multicast packets)
0xC	RxMulticast	Rx good multicast packets (not including MAC control frames, error multicast packets or valid broadcast packets)

**TABLE 4-14: PORT 1'S "PER PORT" MIB COUNTERS INDIRECT MEMORY OFFSETS**

Offset	Counter Name	Description
0xD	RxUnicast	Rx good unicast packets
0xE	Rx64Octets	Total Rx packets (bad packets included) that were 64 octets in length
0xF	Rx65to127Octets	Total Rx packets (bad packets included) that are between 65 and 127 octets in length
0x10	Rx128to255Octets	Total Rx packets (bad packets included) that are between 128 and 255 octets in length
0x11	Rx256to511Octets	Total Rx packets (bad packets included) that are between 256 and 511 octets in length
0x12	Rx512to1023Octets	Total Rx packets (bad packets included) that are between 512 and 1023 octets in length
0x13	Rx1024to1522Octets	Total Rx packets (bad packets included) that are between 1024 and 1522 octets in length (upper limit depends on max packet size setting)
0x14	TxLoPriorityByte	Tx lo-priority good octet count, including PAUSE packets
0x15	TxHiPriorityByte	Tx hi-priority good octet count, including PAUSE packets
0x16	TxLateCollision	The number of times a collision is detected later than 512 bit-times into the Tx of a packet
0x17	TxPausePkts	Number of PAUSE frames transmitted by a port
0x18	TxBroadcastPkts	Tx good broadcast packets (not including error broadcast or valid multi-cast packets)
0x19	TxMulticastPkts	Tx good multicast packets (not including error multicast packets or valid broadcast packets)
0x1A	TxUnicastPkts	Tx good unicast packets
0x1B	TxDeferred	Tx packets by a port for which the 1st Tx attempt is delayed due to the busy medium
0x1C	TxTotalCollision	Tx total collision, half duplex only
0x1D	TxExcessiveCollision	A count of frames for which Tx fails due to excessive collisions
0x1E	TxSingleCollision	Successfully Tx frames on a port for which Tx is inhibited by exactly one collision
0x1F	TxMultipleCollision	Successfully Tx frames on a port for which Tx is inhibited by more than one collision

**TABLE 4-15: FORMAT OF "ALL PORT DROPPED PACKET" MIB COUNTERS**

Bit	Name	R/W	Description	Default
30-16	Reserved	N/A	Reserved	N/A
15-0	Counter Value	RO	Counter Value	0

"All Port Dropped Packet" MIB counters are read using indirect memory access. The address offsets for these counters are shown in [Table 4-16](#).

**TABLE 4-16: "ALL PORT DROPPED PACKET" MIB COUNTERS INDIRECT MEMORY OFFSETS**

Offset	Counter Name	Description
0x100	Port 1 TX Drop Packets	TX packets dropped due to lack of resources
0x101	Port 2 TX Drop Packets	TX packets dropped due to lack of resources
0x102	Port 3 TX Drop Packets	TX packets dropped due to lack of resources
0x103	Port 1 RX Drop Packets	RX packets dropped due to lack of resources
0x104	Port 2 RX Drop Packets	RX packets dropped due to lack of resources
0x105	Port 3 RX Drop Packets	RX packets dropped due to lack of resources

Examples:

# KSZ8873MML

---

## 1. MIB Counter Read (Read port 1 “Rx64Octets” Counter)

Write to reg. 121 (0x79) with 0x1c // Read MIB counters selected

Write to reg. 122 (0x7A) with 0x0e // Trigger the read operation

Then

Read reg. 128 (0x80), overflow bit [31] // If bit 31 = 1, there was a counter overflow

valid bit [30] // If bit 30 = 0, restart (reread) from this register counter bits [29:24]

Read reg. 129 (0x81), counter bits [23:16]

Read reg. 130 (0x82), counter bits [15:8]

Read reg. 131 (0x83), counter bits [7:0]

## 2. MIB Counter Read (Read port 2 “Rx64Octets” Counter)

Write to reg. 121 (0x79) with 0x1c // Read MIB counter selected

Write to reg. 122 (0x7A) with 0x2e // Trigger the read operation

Then,

Read reg. 128 (0x80), overflow bit [31] // If bit 31 = 1, there was a counter overflow

valid bit [30] // If bit 30 = 0, restart (reread) from this register counter bits [29:24]

Read reg. 129 (0x81), counter bits [23:16]

Read reg. 130 (0x82), counter bits [15:8]

Read reg. 131 (0x83), counter bits [7:0]

## 3. MIB Counter Read (Read “Port1 TX Drop Packets” Counter)

Write to reg. 121 (0x79) with 0x1d // Read MIB counter selected

Write to reg. 122 (0x7A) with 0x00 // Trigger the read operation

Then

Read reg. 130 (0x82), counter bits [15:8]

Read reg. 131 (0x83), counter bits [7:0]

### 4.9.1 ADDITIONAL MIB COUNTER INFORMATION

“Per Port” MIB counters are designed as “read clear.” These counters will be cleared after they are read.

“All Port Dropped Packet” MIB counters are not cleared after they are accessed and do not indicate overflow or validity; therefore, the application must keep track of overflow and valid conditions.

To read out all the counters, the best performance over the SPI bus is  $(160+3) \times 8 \times 200 = 260$  ms, where there are 160 registers, 3 overheads, 8 clocks per access, at 5 MHz. In the heaviest condition, the counters will overflow in 2 minutes. It is recommended that the software read all the counters at least every 30 seconds.

A high performance SPI master is also recommended to prevent counters overflow.

## 5.0 OPERATIONAL CHARACTERISTICS

### 5.1 Absolute Maximum Ratings\*

Supply Voltage	
(V <sub>DDA_1.8</sub> , V <sub>DDC</sub> )	–0.5V to +2.4V
(V <sub>DDA_3.3</sub> , V <sub>DDIO</sub> )	–0.5V to +4.0V
Input Voltage	–0.5V to +4.0V
Output Voltage	–0.5V to +4.0V
Lead Temperature (soldering, 10s)	+260°C
Storage Temperature (T <sub>S</sub> )	–55°C to +150°C
HBM ESD Rating	±3 kV

\*Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.

### 5.2 Operating Ratings\*\*

Supply Voltage (Note 5-1)	
(V <sub>DDA_1.8</sub> , V <sub>DDC</sub> )	+1.690V to +1.890V
(V <sub>DDA_3.3</sub> )	+2.5V to +3.465V
(V <sub>DDIO</sub> )	+1.71V to +3.465V
Ambient Temperature (T <sub>A</sub> )	
(Commercial)	0°C to +70°C
(Industrial)	–40°C to +85°C
Junction Temperature (T <sub>J</sub> )	+125°C
Thermal Resistance LQFP (Note 5-2) (Θ <sub>JA</sub> )	+47.24°C/W
Thermal Resistance LQFP (Note 5-2) (Θ <sub>JC</sub> )	+19.37°C/W**The device is not guaranteed to function outside its operating ratings.

**Note 5-1** The device also supports a single 2.5V supply.

**Note 5-2** No heat spreader (HS) in this package.

**Note:** Do not drive input signals without power supplied to the device.

# KSZ8873MML

## 6.0 ELECTRICAL CHARACTERISTICS

$T_A = 25^\circ\text{C}$ . Specification is for packaged product only. Current consumption is for the single 3.3V supply device only and includes the 1.8V supply voltages ( $V_{DDA}$ ,  $V_{DDC}$ ) that are provided via power output pin 56 ( $V_{DDCO}$ ).

Each PHY port's transformer consumes an additional 45 mA at 3.3V for 100BASE-TX and 70 mA at 3.3V for 10BASE-T at full traffic.

**TABLE 6-1: ELECTRICAL CHARACTERISTICS**

Parameters	Symbol	Min.	Typ.	Max.	Units	Note
<b>100BASE-TX Operation (All Ports @ 100% Utilization)</b>						
100BASE-TX (analog core + digital core + transceiver + digital I/O)	$I_{DDXIO}$	—	105	—	mA	$V_{DDA\_3.3}, V_{DDIO} = 3.3\text{V}$ Core power is provided from the internal 1.8V LDO with input voltage $V_{DDIO}$
<b>10BASE-T Operation (All Ports @ 100% Utilization)</b>						
10BASE-T (analog core + digital core + transceiver + digital I/O)	$I_{DDXIO}$	—	86	—	mA	$V_{DDA\_3.3}, V_{DDIO} = 3.3\text{V}$ Core power is provided from the internal 1.8V LDO with input voltage $V_{DDIO}$
<b>Power Management Mode (with MII/RMII in Default PHY Mode)</b>						
Power Saving Mode	$I_{DD3}$	—	80	—	mA	$V_{DDA\_3.3}, V_{DDIO} = 3.3\text{V}$ Unplug Port 1 and Port 2 Set Register 195 bit[1,0] = [1,1]
Soft Power Down Mode	$I_{DD4}$	—	5	—	mA	$V_{DDA\_3.3}, V_{DDIO} = 3.3\text{V}$ Set Register 195 bit[1,0] = [1,0]
Energy Detect Mode	$I_{DD5}$	—	15	—	mA	$V_{DDA\_3.3}, V_{DDIO} = 3.3\text{V}$ Unplug Port 1 and Port 2 Set Register 195 bit[7,0] = 0x05 with port 3 PHY mode and bypass mode.
<b>CMOS Inputs (<math>V_{DDIO} = 3.3\text{V}/2.5\text{V}/1.8\text{V}</math>)</b>						
Input High Voltage	$V_{IH}$	2.0/2.0/ 1.3	—	—	V	—
Input Low Voltage	$V_{IL}$	—	—	0.8/0.6/ 0.3	V	—
Input Current	$I_{IN}$	-10	—	10	$\mu\text{A}$	$V_{IN} = \text{GND} \sim V_{DDIO}$
<b>CMOS Outputs (<math>V_{DDIO} = 3.3\text{V}/2.5\text{V}/1.8\text{V}</math>)</b>						
Output High Voltage	$V_{OH}$	2.4/1.9/ 1.5	—	—	V	$I_{OH} = -8\text{ mA}$
Output Low Voltage	$V_{OL}$	—	—	0.4/0.4/ 0.2	V	$I_{OL} = 8\text{ mA}$
Output Tri-State Leakage	$ I_{OZ} $	—	—	10	$\mu\text{A}$	—
<b>100BASE-TX Transmit (measured differentially after 1:1 transformer)</b>						
Peak Differential Output Voltage	$V_O$	0.95	—	1.05	V	100 $\Omega$ termination across differential output

$t_{MD1}$	MDIO (PHY Input) setup to rising edge of MDC	10	—	—	ns
$t_{MD2}$	MDIO (PHY Input) hold from rising edge of MDC	4	—	—	ns
$t_{MD3}$	MDIO (PHY Output) delay from rising edge of MDC	—	222	—	ns

# KSZ8873MML

## 7.8 Reset Timing

The KSZ8873MML reset timing requirement is summarized in [Figure 7-15](#) and [Table 7-8](#).

FIGURE 7-15: RESET TIMING

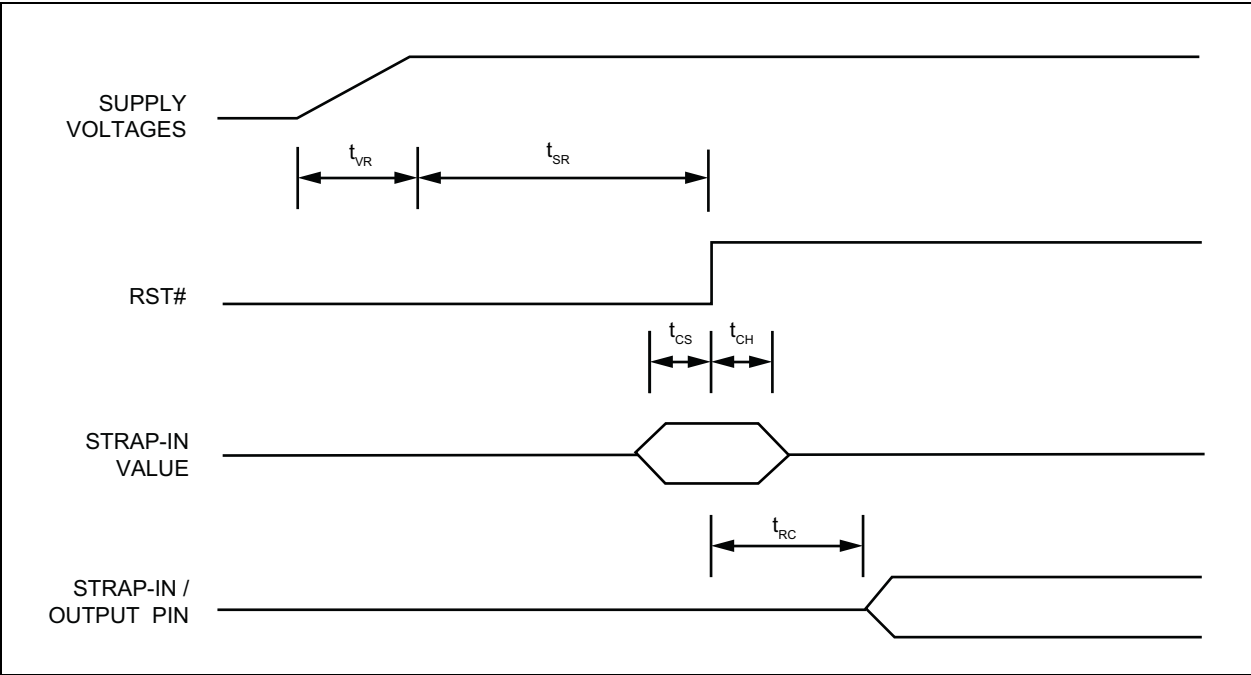

TABLE 7-8: RESET TIMING PARAMETERS

Parameter	Description	Min.	Typ.	Max.	Units
$t_{SR}$	Stable supply voltages to reset high	10	—	—	ms
$t_{CS}$	Configuration setup time	50	—	—	ns
$t_{CH}$	Configuration hold time	50	—	—	ns
$t_{RC}$	Reset to strap-in pin output	50	—	—	ns
$t_{VR}$	3.3V rise time	100	—	—	$\mu$ s

After the deassertion of reset, wait a minimum of 100  $\mu$ s before starting programming on the managed interface (I<sup>2</sup>C slave, SPI slave, SMI, MIIM).

## 8.0 RESET CIRCUIT

Figure 8-1 shows a reset circuit recommended for powering up the KSZ8873MML if reset is triggered only by the power supply.

**FIGURE 8-1: RECOMMENDED RESET CIRCUIT**

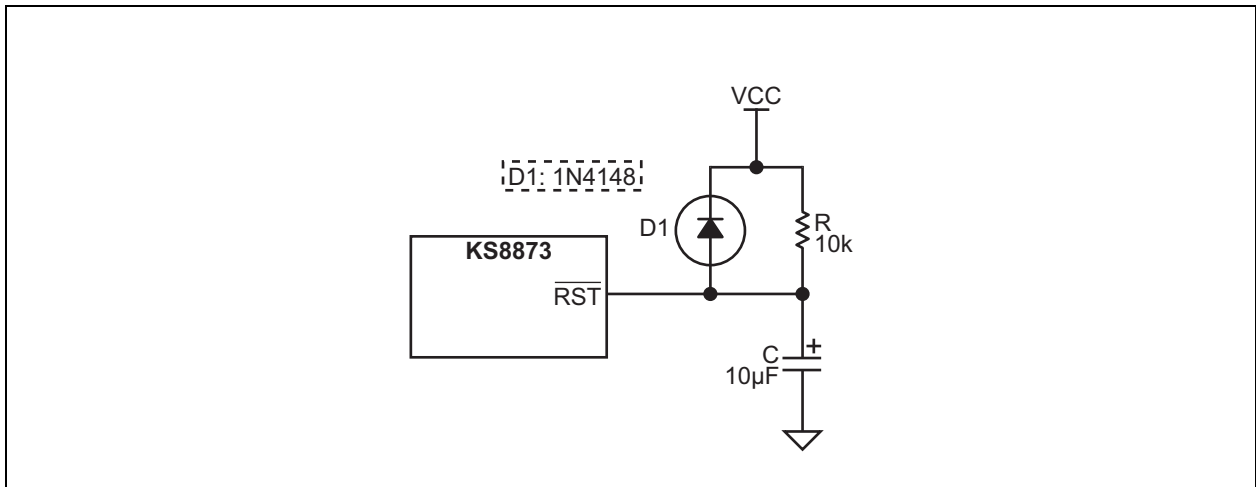

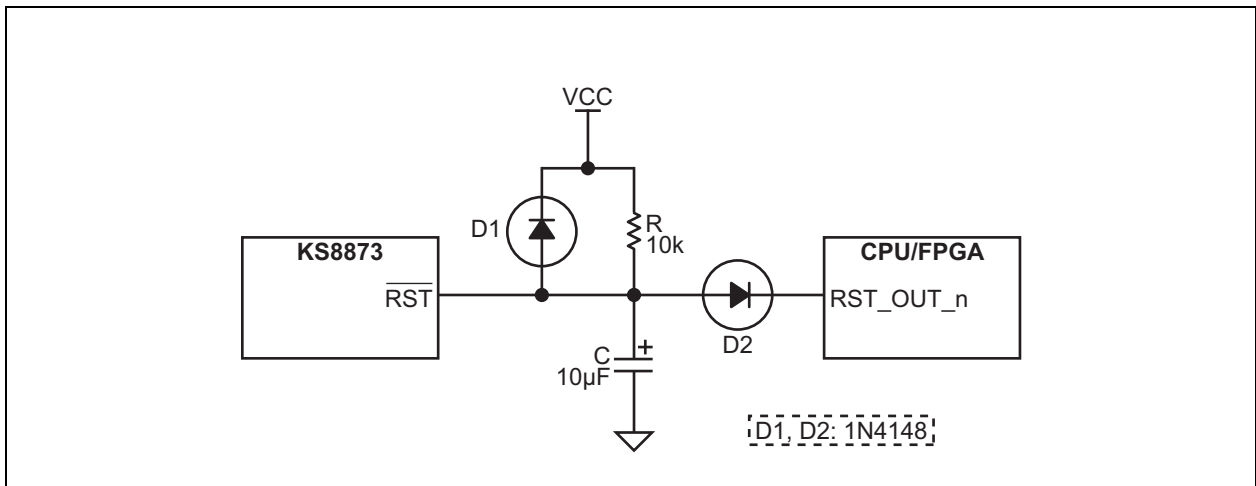

Figure 8-2 shows a reset circuit recommended for applications where reset is driven by another device (for example, the CPU or an FPGA). At power-on-reset, R, C, and D1 provide the necessary ramp rise time to reset the KSZ8873MML device. The RST\_OUT\_N from the CPU/FPGA provides the warm reset after power-up.

**FIGURE 8-2: RECOMMENDED RESET CIRCUIT FOR CPU/FPGA RESET OUTPUT**

# KSZ8873MML

## 9.0 SELECTION OF ISOLATION TRANSFORMERS

A 1:1 isolation transformer is required at the line interface. Use one with integrated common-mode chokes for designs exceeding FCC requirements.

Table 9-1 lists recommended transformer characteristics.

**TABLE 9-1: TRANSFORMER SELECTION CRITERIA**

Parameter	Value	Test Conditions
Turns Ratio	1 CT : 1 CT	—
Open-Circuit Inductance (min.)	350 $\mu$ H	100 mV, 100 kHz, 8 mA
Leakage Inductance (max.)	0.4 $\mu$ H	1 MHz (min.)
Interwinding Capacitance (max.)	12 pF	—
D.C. Resistance (max.)	0.9 $\Omega$	—
Insertion Loss (max.)	–1.0 dB	0 MHz to 65 MHz
HIPO (min.)	1500 V <sub>RMS</sub>	—

**TABLE 9-2: QUALIFIED SINGLE-PORT MAGNETICS**

Manufacturer	Part Number	Auto MDI-X
Bel Fuse	S558-5999-U7	Yes
Bel Fuse (MagJack)	SI-46001	Yes
Bel Fuse (MagJack)	SI-50170	Yes
Delta	LF8505	Yes
LanKom	LF-H41S	Yes
Pulse	H1102	Yes
Pulse (Low Cost)	H1260	Yes
Datatronic	NT79075	Yes
Transpower	HB726	Yes
YCL	LF-H41S	Yes
TDK (MagJack)	TLA-6T718	Yes

**TABLE 9-3: TYPICAL REFERENCE CRYSTAL CHARACTERISTICS**

Characteristic	Value
Frequency	25.00000 MHz
Frequency Tolerance (max.)	$\pm$ 50 ppm
Load Capacitance (max.)	20 pF
Series Resistance	40 $\Omega$

10.0 PACKAGE OUTLINE

10.1 Package Marking Information

64-Lead LQFP\*

Example

**Legend:** XX...X    Product code or customer-specific information  
Y            Year code (last digit of calendar year)  
YY          Year code (last 2 digits of calendar year)  
WW         Week code (week of January 1 is week '01')  
NNN        Alphanumeric traceability code  
(e3)        Pb-free JEDEC® designator for Matte Tin (Sn)  
\*            This package is Pb-free. The Pb-free JEDEC designator ((e3)) can be found on the outer packaging for this package.  
  
●, ▲, ▼    Pin one index is identified by a dot, delta up, or delta down (triangle mark).

**Note:** In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.  
  
Underbar ( \_ ) and/or Overbar ( ¯ ) symbol may not be to scale.

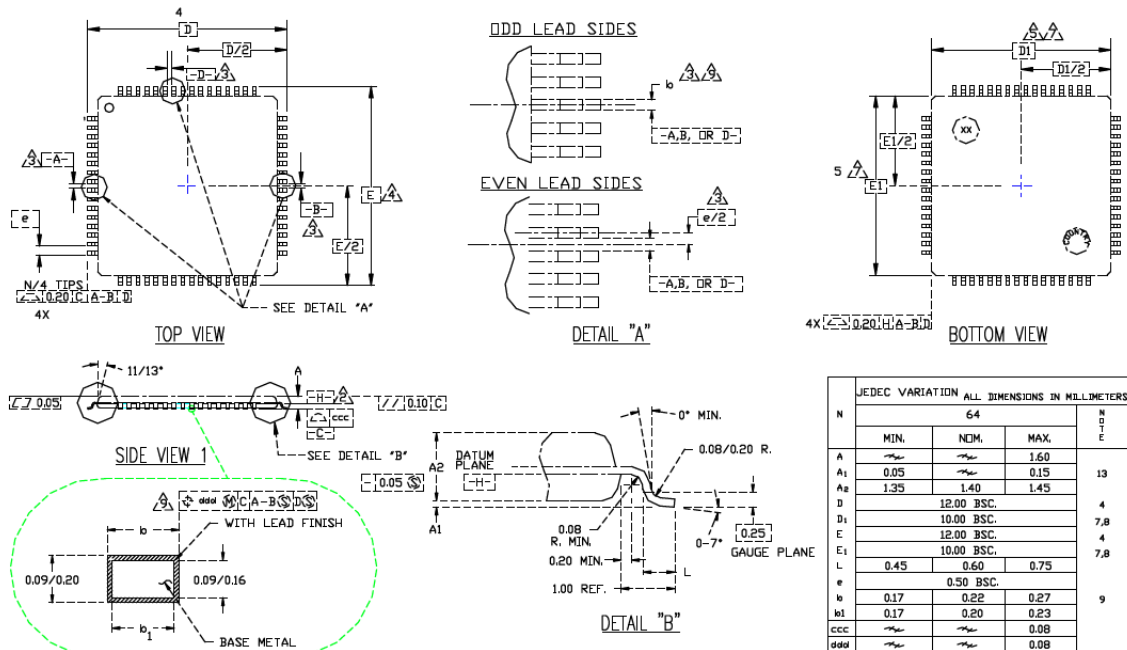

# KSZ8873MML

FIGURE 10-1: 64-LEAD LQFP 10 MM X 10 MM PACKAGE

## TITLE

64 LEAD LQFP 10x10mm PACKAGE OUTLINE & RECOMMENDED LAND PATTERN

DRAWING #	LQFP10x10-64LD-PL-1	UNIT	MM
-----------	---------------------	------	----

## NOTES:

- ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5-1982.
- DATUM PLANE [A-A] LOCATED AT MOLD PARTING LINE AND COINCIDENT WITH LEAD, WHERE LEAD EXITS PLASTIC BODY AT BOTTOM OF PARTING LINE.
- DATUMS [A-A] AND [D-D] TO BE DETERMINED AT CENTERLINE BETWEEN LEADS WHERE LEADS EXIT PLASTIC BODY AT DATUM PLANE [B-B].
- TO BE DETERMINED AT SEATING PLANE [C-C].
- DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE MOLD PROTRUSION IS 0.254 MM ON D1 AND E1 DIMENSIONS.
- "N" IS THE TOTAL NUMBER OF TERMINALS.
- THESE DIMENSIONS TO BE DETERMINED AT DATUM PLANE [B-B].
- THE TOP OF PACKAGE IS SMALLER THAN THE BOTTOM OF PACKAGE BY 0.15 MILLIMETERS.
- DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08mm TOTAL IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.
- CONTROLLING DIMENSION: MILLIMETER.
- MAXIMUM ALLOWABLE DIE THICKNESS TO BE ASSEMBLED IN THIS PACKAGE FAMILY IS 0.38 MILLIMETERS.
- THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MS-026, VARIATIONS BCB, BCC, BCD & BCE.
- A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

RECOMMENDED LAND PATTERN

Note: For the most current package drawings, please see the Microchip Packaging Specification located at <http://www.microchip.com/packaging>.

## APPENDIX A: DATA SHEET REVISION HISTORY

TABLE A-1: REVISION HISTORY

Revision	Section/Figure/Entry	Correction
DS00002776B (05-11-22)	TABLE 2-1: "Signals"	Updated Type for pins 43 and 44 from "I/O" to "IPU/O". Added description for pins 33, 34, 43 and 44: MAC Mode = input (do not leave pins floating) PHY Mode = output If not driven by PHY, pull externally low
	"Register 28 (0x1C): Port 1, Not Supported"	Updated bit 7 definition to remove "For port 1, P1ANEN pin value during reset"
	"Product Identification System"	Updated product part numbers in examples and removed line for Supply Voltage.
	FIGURE 1-1: "SYSTEM Block Diagram"	Updated Port 1 and 3 labels from "2 X MII" to "MII".
DS00002776A (8-14-18)	—	Converted Micrel data sheet KSZ8873MML to Microchip DS00002776A. Minor text changes throughout.

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at [www.microchip.com](http://www.microchip.com). This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at [www.microchip.com](http://www.microchip.com). Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

**PART NO.**

**Device**   **Interface**   **Package**   **Temperature**   **Media Type**

**Device:**                    KSZ8873

**Interface:**                M = two MII

**Package:**                L = 64-lead 10 mm x 10 mm LQFP

**Temperature:**            blank = 0°C to +70°C (Commercial)  
                                  I = -40°C to +85°C (Industrial)

**Media Type:**            blank = 160/Tray

**Examples:**

a)    KSZ8873MML  
      MII Interface  
      64-lead 10 mm x 10 mm LQFP  
      Single 3.3V Supply  
      Commercial Temperature Range  
      160/Tray

b)    KSZ8873MMLI  
      MII Interface  
      64-lead 10 mm x 10 mm LQFP  
      Single 3.3V Supply  
      Industrial Temperature Range  
      160/Tray

**Note the following details of the code protection feature on Microchip products:**

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
  - Microchip believes that its family of products is secure when used in the intended manner, within operating specifications, and under normal conditions.
  - Microchip values and aggressively protects its intellectual property rights. Attempts to breach the code protection features of Microchip product is strictly prohibited and may violate the Digital Millennium Copyright Act.
  - Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable". Code protection is constantly evolving. Microchip is committed to continuously improving the code protection features of our products.
- 

This publication and the information herein may be used only with Microchip products, including to design, test, and integrate Microchip products with your application. Use of this information in any other manner violates these terms. Information regarding device applications is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. Contact your local Microchip sales office for additional support or, obtain additional support at <https://www.microchip.com/en-us/support/design-help/client-support-services>.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE, OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL, OR CONSEQUENTIAL LOSS, DAMAGE, COST, OR EXPENSE OF ANY KIND WHATSOEVER RELATED TO THE INFORMATION OR ITS USE, HOWEVER CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION.

Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

## Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, CryptoMemory, CryptoRF, dsPIC, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Klear, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, Flashtec, Hyper Speed Control, HyperLight Load, IntellIMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, TrueTime, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, AnyIn, AnyOut, Augmented Switching, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, GridTime, IdealBridge, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, Inter-Chip Connectivity, JitterBlocker, Knob-on-Display, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, NVM Express, NVMe, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SmartHLS, SMART-I.S., storClad, SQL, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, TSHARC, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.

The Adaptec logo, Frequency on Demand, Silicon Storage Technology, Symmcom, and Trusted Time are registered trademarks of Microchip Technology Inc. in other countries.

GestIC is a registered trademark of Microchip Technology Germany II GmbH & Co. KG, a subsidiary of Microchip Technology Inc., in other countries.
