Microsemi makes no warranty, representation, or guarantee regarding the information contained herein or the suitability of its products and services for any particular purpose, nor does Microsemi assume any liability whatsoever arising out of the application or use of any product or circuit. The products sold hereunder and any other products sold by Microsemi have been subject to limited testing and should not be used in conjunction with mission-critical equipment or applications. Any performance specifications are believed to be reliable but are not verified, and Buyer must conduct and complete all performance and other testing of the products, alone and together with, or installed in, any end-products. Buyer shall not rely on any data and performance specifications or parameters provided by Microsemi. It is the Buyer's responsibility to independently determine suitability of any products and to test and verify the same. The information provided by Microsemi hereunder is provided "as is, where is" and with all faults, and the entire risk associated with such information is entirely with the Buyer. Microsemi does not grant, explicitly or implicitly, to any party any patent rights, licenses, or any other IP rights, whether with regard to such information itself or anything described by such information. Information provided in this document is proprietary to Microsemi, and Microsemi reserves the right to make any changes to the information in this document or to any products and services at any time without notice.

About Microsemi

Microsemi, a wholly owned subsidiary of Microchip Technology Inc. (Nasdaq: MCHP), offers a comprehensive portfolio of semiconductor and system solutions for aerospace & defense, communications, data center and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; enterprise storage and communication solutions, security technologies and scalable anti-tamper products; Ethernet solutions; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. 1 Revision History

The revision history describes the changes that were implemented in the document. The changes are listed by revision, starting with the most current publication.

1.1 Revision 4.2

Revision 4.2 of this datasheet was published in February 2019. In revision 4.2, VeriPHY descriptions were updated and VeriPHY register information was deleted. For functional details of the VeriPHY suite and operating instructions, see the ENT-AN0125 PHY, Integrated PHY-Switch VeriPHY - Cable Diagnostics application note.

1.2 Revision 4.1

Revision 4.1 of this document was published in October 2018. The following is a summary of the changes.

- Details of LED blink or pulse-stretch behavior were corrected. For more information, see [LED Blink or Pulse-Stretch](#), page 22.
- Information about fast link failure indication was updated. For more information, see [Fast Link Failure Indication](#), page 23 and [Fast Link Failure 2™ \(FLF2™\) Indication](#), page 23.
- Forced Mode link-up times were updated. For more information, see [Table 17](#), page 23.
- Clause 45 Registers list was updated. For more information, see [Table 71](#), page 54.
- 802.3bf register names were corrected. For more information, see [Table 78](#), page 57.
- Conditions were added for the input high voltage parameters of VDDMAC and VDDMDIO DC specifications (1.5 V and 1.8 V). For more information, see [Table 81](#), page 59 and [Table 82](#), page 59.
- Extended Mode Control register bits were designated as “sticky” where applicable. For more information, see [Table 47](#), page 42.
- [Table 55](#), page 48 Bits 4 and 0 of the WoL and MAC Interface Control register were designated as “sticky.” For more information, see [Table 62](#), page 50.
- REF_CLK was clarified as RMII_CLKIN in the RMII AC characteristics parameters. For more information, see [Table 98](#), page 65.
- The SMI reference description was corrected. For more information, see [Pins by Function](#), page 72.
- The RESERVED[10:13] pin names were corrected to RXD[7:4]. For more information, see [Pins by Function](#), page 72.
- Additional design considerations were added. For more information, see [Design Considerations](#), page 81.

1.3 Revision 4.0

Revision 4.0 of this document was published in March 2017. This was the first publication.

2 Overview

The VSC8540-04 device is designed for space-constrained 10/100BASE-TX applications. It features integrated, line-side termination to conserve board space, lower EMI, and improve system performance. Additionally, integrated RGMII timing compensation eliminates the need for on-board delay lines.

Microsemi's EcoEthernet™ v2.0 technology supports IEEE 802.3az Energy-Efficient Ethernet (EEE) and power-saving features to reduce power based on link state and cable reach. VSC8540-04 optimizes power consumption in all link operating speeds and features a Wake-on-LAN (WoL) power management mechanism for bringing the PHY out of a low-power state using designated magic packets.

Fast link failure (FLF) indication for high availability networks identifies the onset of a link failure for 10BASE-T/100BASE-TX links. Potential link failure events can be more flexibly monitored using an enhanced FLF2 state machine, which goes beyond FLF indication by enabling signaling of the link potentially going down within 150 μS.

The device includes recovered clock output for Synchronous Ethernet applications. Programmable clock squelch control is included to inhibit undesirable clocks from propagating and to help prevent timing loops.

The following illustration shows a high-level, general view of a typical VSC8540-04 application.

Figure 1 • Application Diagram

2.1 Key Features

This section lists the main features and benefits of the VSC8540-04 device.

2.1.1 Superior PHY and Interface Technology

- Integrated 10/100BASE-TX Ethernet copper transceiver with the industry's only non-TDR-based VeriPHY™ cable diagnostics algorithm
- Patented line driver with low EMI voltage mode architecture and integrated line-side termination resistors
- Wake-on-LAN using magic packets
- HP Auto-MDIX and manual MDI/MDIX support
- RGMII/MII/RMII MAC interface
- Jumbo frame support up to 16 kilobytes with programmable synchronization FIFOs

2.1.2 Synchronous Ethernet and IEEE 1588 Time Stamp Support

- Recovered clock output with programmable clock squelch control for G.8261 Synchronous Ethernet applications
- Clock output squelch to inhibit clocks during auto-negotiation and no link status
- Clause 45 registers to support IEEE 802.3bf

2.1.3 Fast Link Up/Link Drop Modes

- Fast link failure indication (programmable down to <150 μS)

2.1.4 Best-in-Class Power Consumption

- EcoEthernet™ v2.0 green energy efficiency with ActiPHY™, PerfectReach™, and IEEE 802.3az Energy-Efficient Ethernet

- Fully optimized power consumption for all link speeds
- Clause 45 registers to support Energy-Efficient Ethernet

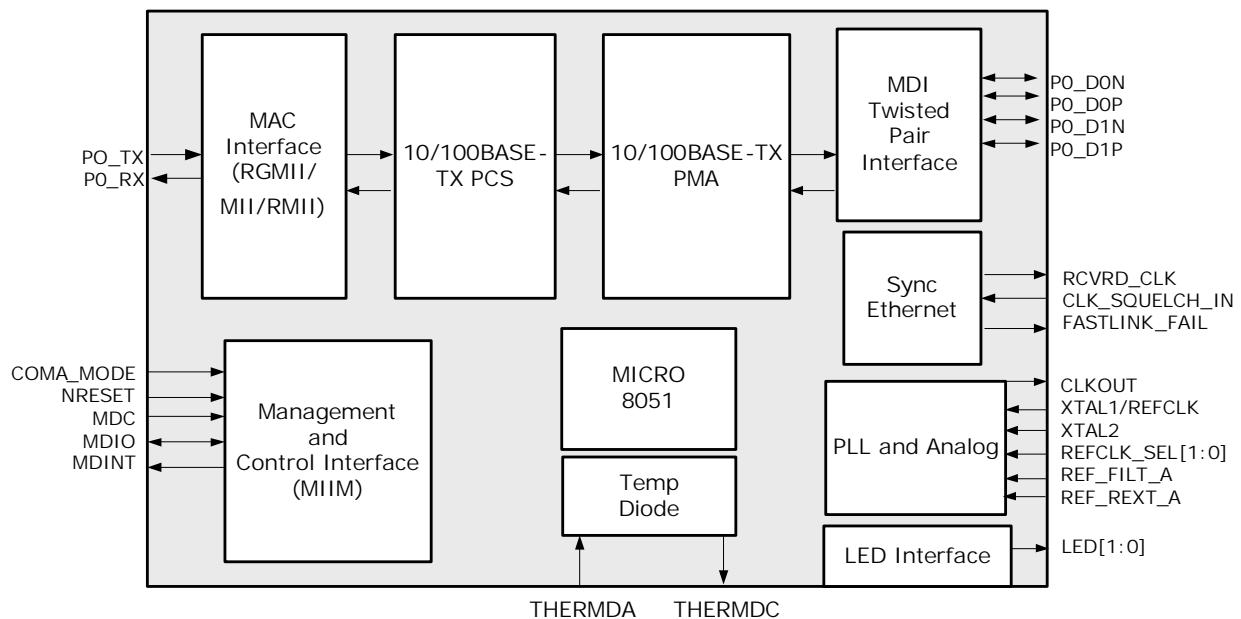

2.1.5 Key Specifications

- Compliant with IEEE 802.3 (10BASE-T, 100BASE-TX) specifications
- Supports RGMII, MII, RMII
- Supports 1.5 V, 1.8 V, 2.5 V, and 3.3 V CMOS for RGMII versions 1.3 and 2.0 (without HSTL support), MII as well as RMII version 1.2
- Supports a variety of clock sources: 25 MHz Xtal, 25 MHz OSC, 50 MHz OSC, 125 MHz OSC
- Supports programmable output frequencies of 25 MHz, 50 MHz, or 125 MHz, regardless of chosen Xtal or OSC frequencies
- Supports a wide array of stand-alone hardware configuration options
- Supports all 5 bits of MDIO/MDC addressing possible for managed mode designs using pull-up/pull-down resistors
- Device supports operating temperature of -40°C ambient to 125°C junction
- Optionally reports if a link partner is requesting inline Power-over-Ethernet (PoE and PoE+)
- Available in 8 mm x 8 mm, 68-pin QFN package

2.2 Block Diagram

The following illustration shows the primary functional blocks of the VSC8540-04 device.

Figure 2 • Block Diagram

3 Functional Descriptions

This section describes the functional aspects of the VSC8540-04 device, including available configurations, operational features, and testing functionality. It also defines the device setup parameters that configure the device for a particular application.

3.1 Operating Modes

The following table lists the operating modes of the VSC8540-04 device.

Table 1 • Operating Modes

| Operating Mode | Supported Media |
|----------------|-----------------|
| RGMII-Cat5 | 10/100BASE-TX |
| MII-Cat5 | 10/100BASE-TX |
| RMII-Cat5 | 10/100BASE-TX |

3.2 MAC Interface

The VSC8540-04 device supports RMII version 1.2, RGMII versions 1.3 and 2.0, and MII MAC interfaces at 1.5 V, 1.8 V, 2.5 V, and 3.3 V operating voltages. In order to help reduce EMI, the VSC8540-04 device also includes edge rate programmability for the MAC interface signals through register 27E2.7:5.

The recommended values for R_S (as shown in [Figure 3](#), page 5, [Figure 6](#), page 7, and [Figure 7](#), page 7) are listed in the following table.

Table 2 • Recommended Values for R_S ($\pm 5\%$)

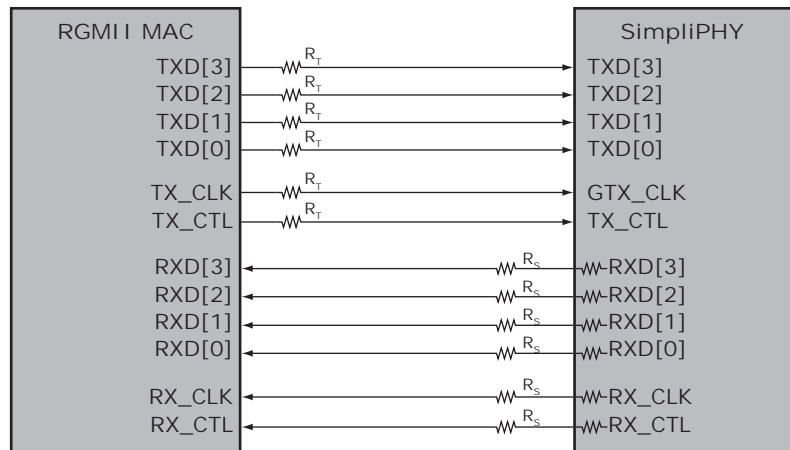

| VDDMAC Value | R_S Value |
|--------------|-------------|
| 1.5 V | 27 Ω |
| 1.8 V | 33 Ω |
| 2.5 V | 39 Ω |
| 3.3 V | 39 Ω |

Refer to the MAC datasheet for the value to use for R_T .

3.2.1 RGMII MAC Interface Mode

The VSC8540-04 device supports RGMII versions 1.3 and 2.0 (without HSTL modes). The RGMII interface supports 10 Mbps and 100 Mbps speeds, and is used as an interface to a RGMII-compatible MAC. The device is compliant with the RGMII interface specification when VDDMAC is operating at 2.5 V. While the RGMII specification only specifies operation at 2.5 V, the device can also support the RGMII interface at 1.5 V, 1.8 V, and 3.3 V.

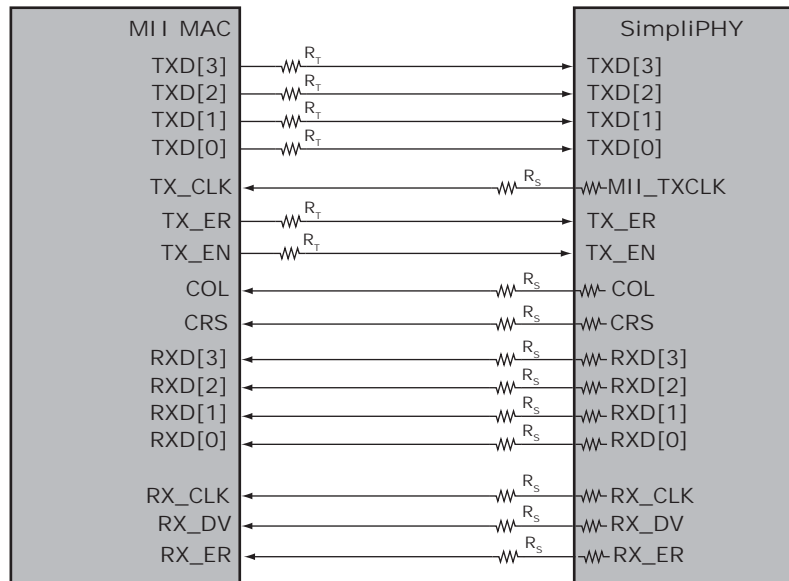

Figure 3 • RGMII MAC Interface

3.2.2 MII Interface Mode

The MII interface supports 10 Mbps and 100 Mbps speeds, and is used as an interface to a MII-compatible MAC. The device is compliant with the MII interface specification when VDDMAC is operating at 3.3 V. While the MII specification only specifies operation at 3.3 V, the device can also support the MII interface at 1.5 V, 1.8 V, and 2.5 V.

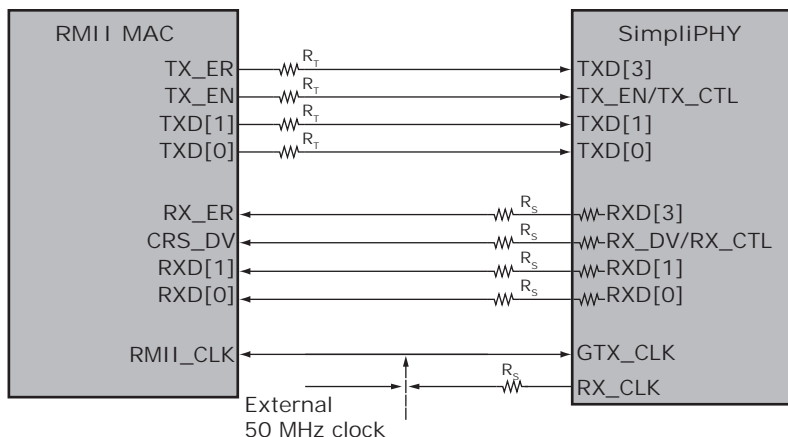

Figure 4 • MII MAC Interface

3.2.3 RMII Mode

The RMII interface supports 10 Mbps and 100 Mbps speeds, and is used as an interface to a RMII-compatible MAC. The device is compliant with the RMII interface specification when VDDMAC is operating at 3.3 V. While the RMII specification only specifies operation at 3.3 V, the device can also support the RMII interface at 1.5 V, 1.8 V, and 2.5 V.

Figure 5 • RMII MAC Interface

3.2.3.1 RMII Pin Allocation

The following table lists the chip pins used for RMII signaling in RMII mode.

Table 3 • RMII Pin Allocation

| Chip Pin | RMII Signal |
|--------------|----------------------------|
| TX_CLK | RMII_CLKIN |
| RX_CLK | RMII_CLKOUT |
| TXD3 | TX_ER (to support 802.3az) |
| TXD1 | TXD1 |
| TXD0 | TXD0 |
| TX_EN/TX_CTL | TX_EN |
| RXD1 | RXD1 |
| RXD0 | RXD0 |
| RXD3 | RX_ER |
| RX_DV/RX_CTL | CRS_DV |

Even though the RMII specification does not call for the use of TX_ER signal, it is required in order to support Energy-Efficient Ethernet (802.3az).

3.2.3.2 RMII Clocking Overview

When the device is in RMII mode, the clock inputs to the device need to support the various modes in which RMII devices can operate. There are two basic modes of operation in RMII mode:

- Mode 1—system provides a 50 MHz clock that is used to clock the RMII interface and must be used as the chip reference clock.
- Mode 2—PHY operates from a 25 MHz or 125 MHz reference clock, and sources the 50 MHz clock used for the RMII interface.

These two modes of operation and the clocking schemes are described in the following sections.

3.2.3.2.1 Mode 1

In this mode of operation, an external source is used to provide a 50 MHz clock through the RMII_CLKIN and the XTAL1 pin. This 50 MHz clock is used as the main clock for the RMII interface, and must be used as the reference clock for the PHY connected to the XTAL1 pin. In this mode, the RMII_CLKOUT signal from the PHY is not used. The RMII_CLKOUT is enabled by default and that clock output should be disabled through register 27E2.4. The following figure illustrates RMII signal connections at the system level.

Figure 6 • Mode 1

3.2.3.2.2 Mode 2

In this mode of operation, the PHY operates from a 25 MHz crystal (XTAL1 and XTAL2) or 25 MHz/125 MHz single-ended external clock (XTAL1), and sources the 50 MHz clock required for the RMI interface. This 50 MHz clock is output from the PHY on the RMI_CLKOUT pin and then connected to the MAC and PHY RMI_CLKIN signals. In this mode, the PHY generates a 50 MHz clock for the system and that clock output is enabled. The following figure illustrates RMI signal connections at the system level.

Figure 7 • Mode 2

3.2.4 MAC Interface Edge Rate Control

The VSC8540-04 device includes programmable control of the rise/fall times for the MAC interface signals. The default setting will select the fastest rise/fall times. However, the fast edge rate will result in higher power consumption on the MAC interface and may result in higher EMI.

It is recommended that the user select the appropriate edge rate setting based on the VDDMAC supply voltage, as shown in the following table.

Table 4 • Recommended Edge Rate Settings

| VDDMAC Voltage | Edge Rate Setting |
|----------------|-------------------|
| 3.3 V | 100 |
| 2.5 V | 100 |
| 1.8 V | 111 |
| 1.5 V | 111 |

In order to further reduce power consumption and EMI, the user may elect to choose a slower edge rate than recommended if the end application supports it.

The MAC interface signal rise/fall times can be changed by writing to register bits 27E2.7:5. The typical change in edge rate for each setting at various VDDMAC voltages is shown in the following table.

Table 5 • MAC Interface Edge Rate Control

| Register Setting | Edge Rate Change (VDDMAC) | | | |
|------------------|---------------------------|-----------------------|--------------------------|--------------------------|
| | 3.3 V | 2.5 V | 1.8 V | 1.5 V |
| 111 (fastest) | Default | Default | Default (recommended) | Default (recommended) |
| 110 | -2% | -3% | -5% | -6% |
| 101 | -4% | -6% | -9% | -14% |
| 100 | -7% (recommended) | -10% (recommended) | -16% | -21% |
| 011 | -10% | -14% | -23% | -29% |
| 010 | -17% | -23% | -35% | -42% |
| 001 | -29% | -37% | -52% | -58% |
| 000 (slowest) | -53% | -63% | -76% | -77% |

These values are based on measurements performed on typical silicon at nominal supply and room temperature settings.

3.3 Hardware Mode Strapping and PHY Addressing

The VSC8540-04 device provides hardware-configured modes of operation that are achieved by sampling output pins on the rising edge of reset and externally pulling the pin to a logic HIGH or LOW (based on the desired configuration). These output pins are required by the device as inputs while NRESET is asserted and the logic state of the pin is latched in the device upon de-assertion of NRESET. To ensure correct operation of the hardware strapping function, any other device connected to these pins must not actively drive a signal onto them.

The following table describes the pins used for this purpose and their respective modes.

Table 6 • Hardware Mode Strapping and PHY Addressing

| Pin(s) | Operation Mode |
|--------------|---|
| CLKOUT | Enable/disable CLKOUT signal |
| RX_CLK | Managed or unmanaged mode |
| RXD0 | Signal A |
| RXD1 | Signal B |
| RXD2 | Signal C |
| RXD3 | Signal D |
| RX_DV/RX_CTL | Signal E |
| MII_TXCLK | Select MII or RGMII/RMII MAC interface mode |
| RXD4 | PHY address bit 0 in unmanaged mode |
| RXD5 | PHY address bit 1 in unmanaged mode |
| RXD6 | CLKOUT frequency selection bit 0 |
| RXD7 | CLKOUT frequency selection bit 1 |

3.3.1 CLKOUT Signal Configuration

When the CLKOUT signal is pulled LOW and the state of that signal is latched to logic 0 on the rising edge of reset, the CLKOUT output is disabled and the device will drive a logic low level on that pin after reset de-assertion. When the CLKOUT signal is pulled HIGH externally and the state of that signal is latched to logic 1, the CLKOUT output is enabled. This behavior can also be controlled through register 13G.15.

The CLKOUT signal is frequency-locked to the reference clock signal input through XTAL1/XTAL2 pins. The frequency of CLKOUT can be programmed to the following values through register 13G.14:13:

- 25 MHz
- 50 MHz
- 125 MHz

3.3.2 Managed Mode

When RX_CLK pin is pulled LOW and the state of that signal is latched to logic 0 on the rising edge of reset, the device operates in a managed mode. In managed mode, the remaining 5 signals (A–E) are used to set the PHY address, allowing up to 32 devices to reside on the shared MDIO bus. In this mode, the device can be configured using register access and no additional hardware configurability is provided. The following table lists the assigned PHY address values in managed mode.

Table 7 • Managed Mode

| Signal | PHY Address Values |
|----------|--------------------|
| Signal A | PHY address bit 0 |
| Signal B | PHY address bit 1 |
| Signal C | PHY address bit 2 |
| Signal D | PHY address bit 3 |
| Signal E | PHY address bit 4 |

3.3.3 Unmanaged Mode

When RX_CLK is pulled HIGH externally and the state of that signal is latched to logic 1 on the rising edge of reset, the device operates in an unmanaged mode. The signals A–E are used to set default chip configurations, as described in the following sections.

Note: Operating the device in unmanaged mode requires that the NRESET pin is asserted twice during device configuration (for more information, see [Configuration](#), page 25).

Note: The default values for the following registers depend on the chosen hardware strapping options.

- 0.13, 0.6—Forced speed selection
- 0.12—Enable autonegotiation
- 0.8—Duplex
- 23.12:11—MAC interface selection
- 19E1.3:2—Force MDI crossover
- 20E2.6:4—RX_CLK delay
- 20E2.2:0—TX_CLK delay

Additionally, the following registers are set to 1 by default in unmanaged mode.

- 28.6—ActiPHY enable

3.3.3.1 Signals A and B

Signals A and B are used to set the RGMII RX_CLK and TX_CLK delay settings (as defined in register 20E2), as per the following table.

Table 8 • Signals A and B

| Signals A, B | RX_CLK and TX_CLK Delay Setting |
|--------------|---------------------------------|
| 0, 0 | 000 - 0.2 ns |
| 0, 1 | 010 - 1.1 ns |
| 1, 0 | 100 - 2.0 ns |
| 1, 1 | 110 - 2.6 ns |

3.3.3.2 Signals C and D

Signals C and D are used to select the link advertisement settings, as defined in the following table.

Table 9 • Signals C and D

| Signals C, D | Link Advertisement |
|--------------|---|
| 0, 0/1 | Default mode of operation, 10/100 FDX/HDX, autoneg ON |
| 1, 0 | 100BTX, HDX forced mode, autoneg OFF |
| 1, 1 | 10BT, HDX forced mode, autoneg OFF |

3.3.3.3 Signal E

Signal E is used to select between RMII and RGMII MAC interface modes. When the state of Signal E is latched to logic 0 on the rising edge of reset, the device operates in RGMII mode. When the state of Signal E is latched to logic 1 on the rising edge of reset, the device operates in RMII mode.

Note: RMII only supports 10/100 Mbps speeds. When RMII mode is selected, the link advertisement selection must also be changed to either 01, 10, or 11 settings, as defined in [Table 9](#), page 10.

Note: Correct configuration of the device is an end user responsibility, and no attempt is made in the device to disallow incorrect configurations.

Additionally, in unmanaged mode, the following settings are changed from their default values:

- Enable ActiPHY (register 28.6 set to 1)

3.3.3.4 PHY Address Bit 0/1 Selection in Unmanaged Mode

The RXD4 and RXD5 pins can be pulled LOW or HIGH externally to set the bit 0 and bit 1 of the device PHY address. The upper 3 bits of the PHY address are always set to 0, and the lower 2 bits can be set to one of 4 possible combinations through this external strapping option to provide a total of 4 PHY addresses in unmanaged operation.

3.3.4 MII or RGMII/RMII MAC Interface Mode

When MII_TXCLK pin is pulled LOW externally and the state of that signal is latched to logic 0 on the rising edge of reset, the device operates in a RGMII mode. When MII_TXCLK pin is pulled HIGH externally and the state of that signal is latched to logic 1 on the rising edge of reset, the device operates in MII mode. This signal is bonded out to a package pin.

Note: If unmanaged mode is selected and Signal E is latched as a logic 1 (indicating RMII mode), the device will default to RMII mode regardless of the latched state of the MII_TXCLK.

3.3.5 CLKOUT Frequency Selection

The RXD6 and RXD7 pins can be pulled LOW or HIGH externally to set the bit 0 and bit 1 default values of the CLKOUT frequency selection register 13G.14:13. The following table describes the allowed default CLKOUT frequency settings.

Table 10 • CLKOUT Frequency Selection

| CLKOUT Frequency Selection | CLKOUT Frequency |
|----------------------------|------------------|
| 00 | 25 MHz |
| 01 | 50 MHz |
| 10 | 125 MHz |
| 11 | Reserved |

The CLKOUT frequency can be changed from the default setting to any of the other settings on any device variant by modifying the register bits through the SMI interface.

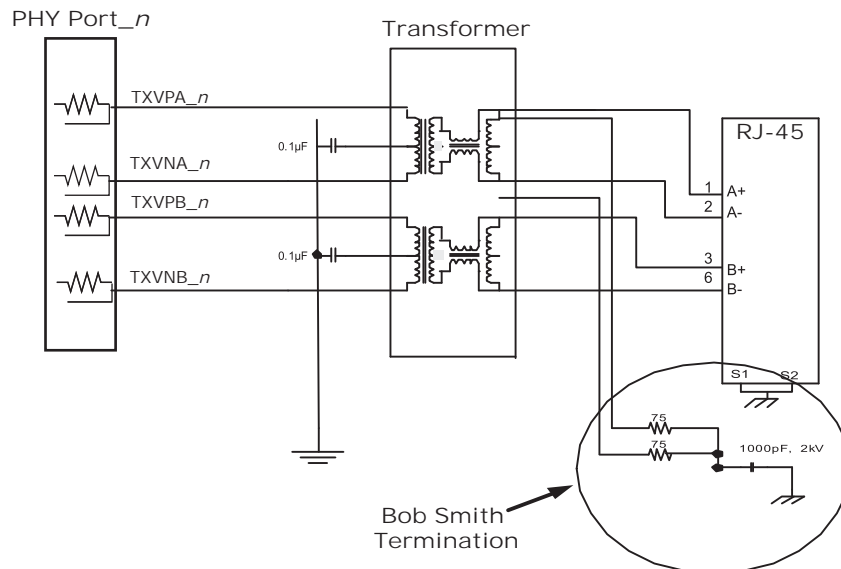

3.4 Cat5 Twisted Pair Media Interface

The twisted pair interface is compliant with IEEE 802.3-2008 and the IEEE 802.3az-2010 standard for Energy-Efficient Ethernet.

3.4.1 Voltage Mode Line Driver

The VSC8540-04 device uses a patented voltage mode line driver that allows it to fully integrate the series termination resistors that are required to connect the PHY's Cat5 interface to an external 1:1 transformer. The interface does not require the user to place an external voltage on the center tap of the magnetic. The following figure illustrates the connections.

Figure 8 • Cat5 Media Interface

3.4.2 Cat5 Auto-Negotiation and Parallel Detection

The VSC8540-04 device supports twisted pair auto-negotiation, as defined by IEEE 802.3-2008 Clause 28 and IEEE 802.3az-2010. The auto-negotiation process evaluates the advertised capabilities of the local PHY and its link partner to determine the best possible operating mode. In particular, auto-negotiation can determine speed and duplex configuration. Auto-negotiation also enables a connected MAC to communicate with its link partner MAC through the VSC8540-04 device using optional next pages to set attributes that may not otherwise be defined by the IEEE standard.

If the Category 5 (Cat5) link partner does not support auto-negotiation, the VSC8540-04 device automatically uses parallel detection to select the appropriate link speed.

Auto-negotiation is disabled by clearing register 0, bit 12. When auto-negotiation is disabled, the state of register bits 0.6, 0.13, and 0.8 determine the device operating speed and duplex mode.

3.4.3 Automatic Crossover and Polarity Detection

For trouble-free configuration and management of Ethernet links, the VSC8540-04 device includes a robust automatic crossover detection feature for allspeeds on the twisted pair interface. Known as HP Auto-MDIX, the function is fully compliant with Clause 40 of IEEE 802.3-2008.

Additionally, the device detects and corrects polarity errors on all MDI pairs—a useful capability that exceeds the requirements of the standard.

Both HP Auto-MDIX detection and polarity correction are enabled in the device by default. Default settings can be changed using device register bits 18.5:4. Status bits for each of these functions are located in register 28.

Note: The VSC8540-04 device can be configured to perform HP Auto-MDIX, even when auto-negotiation is disabled and the link is forced into 10/100 speeds. To enable this feature, set register 18.7 to 0. To use the feature, also set register 0.12 to 0.

The HP Auto-MDIX algorithm successfully detects, corrects, and operates with any of the MDI wiring pair combinations listed in the following table, which shows that twisted pair A is connected to the RJ45 connector 1, 2 in normal MDI mode.

Table 11 • Supported MDI Pair Combinations

| RJ45 Connections | | |
|------------------|------|--------------|
| 1, 2 | 3, 6 | Mode |
| A | B | Normal MDI |
| B | A | Normal MDI-X |

3.4.4 Manual MDI/MDIX Setting

As an alternative to HP Auto-MDIX detection, the PHY can be forced to be MDI or MDI-X using register 19E1, bits 3:2. Setting these bits to 10 forces MDI and setting 11 forces MDI-X. Leaving the bits 00 enables the HP Auto-MDIX setting to be based on register 18, bits 7 and 5.

3.4.5 Energy-Efficient Ethernet

The VSC8540-04 device supports the IEEE 802.3az-2010 Energy-Efficient Ethernet standard to provide a method for reducing power consumption on an Ethernet link during times of low utilization. It uses low power idles (LPI) to achieve this objective.

Figure 9 • Low Power Idle Operation

Using LPI, the usage model for the link is to transmit data as fast as possible and then return to a low power idle state. Energy is saved on the link by cycling between active and low power idle states. During LPI, power is reduced by turning off unused circuits and using this method, energy use scales with bandwidth utilization. The VSC8540-04 device uses LPI to optimize power dissipation in 100BASE-TX mode.

In addition, the IEEE 802.3az-2010 standard defines a 10BASE-Te mode that reduces transmit signal amplitude from 5 V peak-to-peak to approximately 3.3 V peak-to-peak. This mode reduces power consumption in 10 Mbps link speed and fully interoperates with legacy 10BASE-T-compliant PHYs over 100 m Cat5 cable or better.

To configure the VSC8540-04 device in 10BASE-Te mode, set register 17E2.15 to 1 for each port. Additional energy-efficient Ethernet features are controlled through Clause 45 registers. For more information, see [Clause 45 Registers to Support Energy-Efficient Ethernet and 802.3bf](#), page 54.

3.5 Reference Clock

The VSC8540-04 device supports multiple reference clock input options to allow maximum system level flexibility. There are two REFCLK_SEL signals available to allow an end user to select between the various options. The following table shows the functionality and associated reference clock frequency.

Table 12 • REFCLK Frequency Selection

| REFCLK_SEL [1:0] | Reference Clock Mode |
|------------------|--|
| 00 | 25 MHz, on-chip oscillator ON (XTAL1/2 pins) |
| 01 | 25 MHz, on-chip oscillator OFF (XTAL1 pin) |
| 10 | 50 MHz, on-chip oscillator OFF (XTAL1 pin) |
| 11 | 125 MHz, on-chip oscillator OFF (XTAL1 pin) |

The following figure shows a reference tank circuit for a fundamental mode crystal.

Note: For best performance, traces on PCB should be of similar length and Kelvin-connected to ground.

Figure 10 • XTAL Reference Clock

with REFCLK_SEL [1:0] = 00

Note: Routing capacitance less than 1 pF from each XTAL pin to crystal device.

The following figure shows an external 3.3 V reference clock.

Figure 11 • External 3.3 V Reference Clock

Note: Reference clock source less than $\lambda/10$ from XTAL1.

Note: No voltage scaling is required for a 2.5 V external reference.

3.6 Ethernet Inline-Powered Devices

The VSC8540-04 device can detect legacy inline-powered devices in Ethernet network applications. Inline-powered detection capability is useful in systems that enable IP phones and other devices (such as wireless access points) to receive power directly from their Ethernet cable, similar to office digital phones receiving power from a private branch exchange (PBX) office switch over telephone cabling. This type of setup eliminates the need for an external power supply and enables the inline-powered device to remain active during a power outage, assuming that the Ethernet switch is connected to an uninterrupted power supply, battery, back-up power generator, or other uninterruptable power source.

For more information about legacy inline-powered device detection, visit the Cisco website at www.cisco.com. The following illustration shows an example of an inline-powered Ethernet switch application.

Figure 12 • Inline-Powered Ethernet Switch Diagram

The following procedure describes the steps that an Ethernet switch must perform to process inline-power requests made by a link partner that is, in turn, capable of receiving inline-power:

1. Enable the inline-powered device detection mode on each VSC8540-04 PHY using its serial management interface. Set register bit 23E1.10 to 1.
2. Ensure that the auto-negotiation enable bit (register 0.12) is also set to 1. In the application, the device sends a special fast link pulse signal to the link partner. Reading register bit 23E1.9:8 returns 00 during the search for devices that require Power-over-Ethernet (PoE).
3. The VSC8540-04 PHY monitors its inputs for the fast link pulse signal looped back by the link partner. A link partner capable of receiving PoE loops back the fast link pulses when the link partner is in a powered down state. This is reported when register bit 23E1.9:8 reads back 01. It can also be verified as an inline-power detection interrupt by reading register bit 26.9, which should be a 1, and which is subsequently cleared and the interrupt de-asserted after the read. When a link partner device does not loop back the fast link pulse after a specific time, register bit 23E1.9:8 automatically resets to 10.
4. If the VSC8540-04 PHY reports that the link partner requires PoE, the Ethernet switch must enable inline-power on this port, independent of the PHY.
5. The PHY automatically disables inline-powered device detection when the register bits 23E1.9:8 automatically reset to 10, and then automatically changes to its normal auto-negotiation process. A link is then autonegotiated and established when the link status bit is set (register bit 1.2 is set to 1).
6. In the event of a link failure (indicated when register bit 1.2 reads 0), it is recommended that the inline-power be disabled to the inline-powered device independent of the PHY. The VSC8540-04 PHY disables its normal auto-negotiation process and re-enables its inline-powered device detection mode.

3.7 IEEE 802.3af Power-over-Ethernet Support

The VSC8540-04 device is compatible with designs intended for use in systems that supply power to data terminal equipment (DTE) by means of the MDI or twisted pair cable, as described in IEEE 802.3af Clause 33.

3.8 ActiPHY Power Management

In addition to the IEEE-specified power down control bit (device register bit 0.11), the VSC8540-04 device also includes an ActiPHY power management mode for each PHY. This mode enables support for power-sensitive applications. It utilizes a signal-detect function that monitors the media interface for the presence of a link to determine when to automatically power down the PHY. The PHY wakes up at a programmable interval and attempts to wake up the link partner PHY by sending a burst of fast link pulse over copper media.

The ActiPHY power management mode is enabled on a per-port basis during normal operation at any time by setting register bit 28.6 to 1.

The following operating states are possible when ActiPHY mode is enabled:

- Low power state
- Link partner wake-up state
- Normal operating state (link-up state)

The VSC8540-04 device switches between the low power state and link partner wake-up state at a programmable rate (the default is two seconds) until signal energy has been detected on the media interface pins. When signal energy is detected, the PHY enters the normal operating state. If the PHY is in its normal operating state and the link fails, the PHY returns to the low power state after the expiration of the link status time-out timer. After reset, the PHY enters the low power state.

When auto-negotiation is enabled in the PHY, the ActiPHY state machine operates as described.

When auto-negotiation is disabled and the link is forced to use 10BASE-T or 100BASE-TX modes while the PHY is in its low power state, the PHY continues to transition between the low power and link partner wake-up states until signal energy is detected on the media pins. At that time, the PHY transitions to the normal operating state and stays in that state even when the link is dropped. When auto-negotiation is disabled while the PHY is in the normal operation state, the PHY stays in that state when the link is dropped and does not transition back to the low power state.

The following illustration shows the relationship between ActiPHY states and timers.

Figure 13 • ActiPHY State Diagram

3.8.1 Low Power State

In the low power state, all major digital blocks are powered down. However, the SMI interface (MDC, MDIO, and MDINT) functionality is provided.

In this state, the PHY monitors the media interface pins for signal energy. The PHY comes out of low power state and transitions to the normal operating state when signal energy is detected on the media. This happens when the PHY is connected to an auto-negotiation-capable link partner or another PHY in enhanced ActiPHY link partner wake-up state

In the absence of signal energy on the media pins, the PHY periodically transitions from low-power state to link partner wake-up state, based on the programmable sleep timer (register bits 20E1.14:13). The actual sleep time duration is randomized from –80 ms to 60 ms to avoid two linked PHYs in ActiPHY mode entering a lock-up state during operation.

3.8.2 Link Partner Wake-Up State

In the link partner wake-up state, the PHY attempts to wake up the link partner. Up to three complete fast link pulse bursts are sent on alternating pairs A and B of the Cat5 media for a duration based on the wake-up timer, which is set using register bits 20E1.12:11.

In this state, SMI interface (MDC, MDIO, and MDINT) functionality is provided.

After sending signal energy on the relevant media, the PHY returns to the low power state.

3.8.3 Normal Operating State

In the normal operating state, the PHY establishes a link with a link partner. When the media is unplugged or the link partner is powered down, the PHY waits for the duration of the programmable link status time-out timer, which is set using register bit 28.7 and bit 28.2. It then enters the low power state.

3.9 Media Recovered Clock Output

For Synchronous Ethernet applications, VSC8540-04 includes a recovered clock output pin, RCVRD_CLK, controlled by register 23G. The recovered clock pin is synchronized to the clock of the active media link.

To enable recovered clock output, set register 23G bit 15 and bit 0 to 1. By default, the recovered clock output pin is disabled and held low, including when NRESET is asserted. Register 23G also controls the clock source, the clock frequency (either 25 MHz, 31.25 MHz, or 125 MHz), and squelch conditions.

Note: When EEE is enabled on a link, the use of the recovered clock output is not recommended due to long holdovers occurring during EEE quiet/refresh cycles.

3.9.1 Clock Output Squelch

Under certain conditions, such as when there is no link present or during auto-negotiation, the PHY outputs a clock based on the REFCLK pin. To prevent an undesirable clock from appearing on the recovered clock pins, the VSC8540-04 device squelches, or inhibits, the clock output based on any of the following criteria:

- No link is detected (the link status register 1, bit 2 = 0).
- The link is found to be unstable using the fast link failure detection feature. The FASTLINK-FAIL pin is asserted high when enabled.
- The active link is in 10BASE-T. This mode produces unreliable recovered clock sources.
- CLK_SQUELCH_IN is enabled to squelch the clock.

Use register 23G bits 5:4 to configure the clock squelch criteria. This register can also disable the squelch feature. The CLK_SQUELCH_IN pin controls the squelching of the clock. The recovered clock output is squelched when the CLK_SQUELCH_IN pin is high. This pin should not be left floating.

3.10 Serial Management Interface

The VSC8540-04 device includes an IEEE 802.3-compliant Serial Management Interface (SMI) that is affected by use of its MDC and MDIO pins. The SMI provides access to device control and status

registers. The register set that controls the SMI consists of 32 16-bit registers, including all required IEEE-specified registers. Additional pages of registers are accessible using device register 31.

Energy-efficient Ethernet control registers are available through the SMI using Clause 45 registers and Clause 22 register access in registers 13 through 14.

The SMI is a synchronous serial interface with input data to the VSC8540-04 device on the MDIO pin that is clocked on the rising edge of the MDC pin. The output data is sent on the MDIO pin on the rising edge of the MDC signal. The interface can be clocked at a rate from 0 MHz to 12.5 MHz, depending on the total load on MDIO. An external 2 kΩ pull-up resistor is required on the MDIO pin.

3.10.1 SMI Frames

Data is transferred over the SMI using 32-bit frames with an optional, arbitrary-length preamble. Before the first frame can be sent, at least two clock pulses on MDC must be provided with the MDIO signal at logic one to initialize the SMI state machine. The following illustrations show the SMI frame format for read and write operations.

Figure 14 • SMI Read Frame

Figure 15 • SMI Write Frame

The following list defines the terms used in the SMI read and write timing diagrams.

- **Idle**—During idle, the MDIO node goes to a high-impedance state. This allows an external pull-up resistor to pull the MDIO node up to a logical 1 state. Because the idle mode does not contain any transitions on MDIO, the number of bits is undefined during idle.
- **Preamble**—By default, preambles are not expected or required. The preamble is a string of ones. If it exists, the preamble must be at least 1 bit; otherwise, it can be of an arbitrary length.
- **Start of Frame Delimiter (SFD)**—A pattern of 01 indicates the start of frame. If the pattern is not 01, all following bits are ignored until the next preamble pattern is detected.
- **Read or Write Opcode**—A pattern of 10 indicates a read. A 01 pattern indicates a write. If the bits are not either 01 or 10, all following bits are ignored until the next preamble pattern is detected.
- **PHY Address**—The particular VSC8540-04 device responds to a message frame only when the received PHY address matches its physical address. The physical address is 5 bits long (4:0).
- **Register Address**—The next five bits are the register address.
- **Turnaround**—The two bits used to avoid signal contention when a read operation is performed on the MDIO are called the turnaround (TA) bits. During read operations, the VSC8540-04 device drives the second TA bit, a logical 0.

- **Data**—The 16-bits read from or written to the device are considered the data or data stream. When data is read from a PHY, it is valid at the output from one rising edge of MDC to the next rising edge of MDC. When data is written to the PHY, it must be valid around the rising edge of MDC.
- **Idle**—The sequence is repeated.

3.10.2 SMI Interrupt

The SMI includes an interrupt signal, MDINT, for signaling the station manager when certain events occur in the VSC8540-04 device.

When a PHY generates an interrupt, the MDINT pin is asserted by driving low if the interrupt pin enable bit (register 25.15) is set. The MDINT pin is configured for open-drain (active-low) operation. Tie the pin to a pull-up resistor to VDDMDIO. The following illustration shows the configuration.

Figure 16 • MDINT Configured as an Open-Drain (Active-Low) Pin

3.11 LED Interface

The LED interface supports direct drive and basic serial LED mode configuration. The polarity of the LED outputs is programmable and can be changed using register 17E2, bits 13:10. The default polarity is active low.

Direct drive mode provides two LED signals, LED0 and LED1. The mode and function of each LED signal can be configured independently.

In basic serial LED mode, all signals that can be displayed on LEDs are sent as LED_Data and LED_CLK for external processing.

The following table shows the bit 9 settings for register 14G that are used to control the LED behavior for all the LEDs in the VSC8540-04 device.

Table 13 • LED Drive State

| Setting | Active | Not Active |
|-------------------------------|--------|-----------------|
| 14G.9 = 1 (default) | Ground | Tristate |
| 14G.9 = 0 (alternate setting) | Ground | V _{DD} |

3.11.1 LED Modes

Each LED pin can be configured to display different status information that can be selected by setting the LED mode in register 29. The default LED state is active low and can be changed by modifying the value in register 17E2, bits 13:10. The blink/pulse stretch is dependent on the LED behavior setting in register 30.

The following table provides a summary of the LED modes and functions. The modes listed are equivalent to the setting used in register 29 to configure each LED pin.

Table 14 • LED Mode and Function Summary

| Mode | Function Name | LED State and Description |
|------|-----------------------|---|
| 0 | Link/Activity | 1: No link in any speed on any media interface. 0: Valid link at any speed on any media interface. Blink or pulse-stretch = Valid link at any speed on any media interface with activity present. |
| 1 | Reserved | Reserved. |
| 2 | Link100/Activity | 1: No link in 100BASE-TX. 0: Valid 100BASE-TX. Blink or pulse-stretch = Valid 100BASE-TX link with activity present. |
| 3 | Link10/Activity | 1: No link in 10BASE-T. 0: Valid 10BASE-T link. Blink or pulse-stretch = Valid 10BASE-T link with activity present. |
| 4 | Reserved | Reserved. |
| 5 | Reserved | Reserved. |
| 6 | Link10/100/Activity | 1: No link in 10BASE-T or 100BASE-TX. 0: Valid 10BASE-T or 100BASE-TX link. Blink or pulse-stretch = Valid 10BASE-T or 100BASE-TX link with activity present. |
| 7 | Reserved | Reserved. |
| 8 | Duplex/Collision | 1: Link established in half-duplex mode, or no link established. 0: Link established in full-duplex mode. Blink or pulse-stretch = Link established in half-duplex mode but collisions are present. |
| 9 | Collision | 1: No collision detected. Blink or pulse-stretch = Collision detected. |
| 10 | Activity | 1: No activity present. Blink or pulse-stretch = Activity present (becomes TX activity present when register bit 30.14 is set to 1). |
| 11 | Reserved | Reserved. |
| 12 | Autonegotiation Fault | 1: No auto-negotiation fault present. 0: Auto-negotiation fault occurred. |
| 13 | Serial Mode | Serial stream. See Basic Serial LED Mode , page 20. Only relevant on PHY port 0. Reserved in others. |
| 14 | Force LED Off | 1: De-asserts the LED ¹ . |
| 15 | Force LED On | 0: Asserts the LED ¹ . |

1. Setting this mode suppresses LED blinking after reset.

3.11.2 Basic Serial LED Mode

The VSC8540-04 device can be configured so that access to all its LED signals is available through two pins. This option is enabled by setting LED0 to serial LED mode in register 29, bits 3:0 to 0xD. When serial LED mode is enabled, the LED0 pin becomes the serial data pin, and the LED1 pin becomes the serial clock pin. The serial LED mode clocks the LED status bits on the rising edge of the serial clock.

The LED behavior settings can also be used in serial LED mode. The LED combine and LED blink or pulse-stretch setting of LED0 is used to control the behavior of each bit of the serial LED stream. To configure LED behavior, set device register 30.

The following table shows the serial output bitstream of each LED signal.

Table 15 • LED Serial Bitstream Order

| Output | |
|-----------------------|----|
| Link/activity | 1 |
| Reserved | 2 |
| Link100/activity | 3 |
| Link10/activity | 4 |
| Reserved | 5 |
| Duplex/collision | 6 |
| Collision | 7 |
| Activity | 8 |
| Reserved | 9 |
| Tx activity | 10 |
| Rx activity | 11 |
| Autonegotiation fault | 12 |

3.11.3 Extended LED Modes

In addition to the LED modes in register 29, there are also additional LED modes that are enabled on the LED pin whenever the corresponding register 19E1, bits 13 to 12 are set to 1. Each of these bits enable an extended mode shown in the following table. For example, LED0 = mode 22 means that register 19E1 bit 12 = 1 and register 29 bits 3 to 0 = 0110.

The following table provides a summary of the extended LED modes and functions.

Table 16 • Extended LED Mode and Function Summary

| Mode | Function Name | LED State and Description |
|-------|----------------|---|
| 16-19 | Reserved | Reserved. |
| 20 | Force LED Off | 1: De-asserts the LED. |
| 21 | Force LED On | 0: Asserts the LED. LED pulsing is disabled in this mode. |
| 22 | Fast Link Fail | Enable fast link fail on the LED pin. |
| 23 | WoL interrupt | Enable WoL interrupt indication on the LED pin. |

3.11.4 LED Behavior

Several LED behaviors can be programmed into the VSC8540-04 device. Use the settings in register 30 and 19E1 to program LED behavior, as described in the following sections.

3.11.4.1 LED Combine

Enables an LED to display the status for a combination of primary and secondary modes. This can be enabled or disabled for each LED pin. For example, a copper link running in 100BASE-TX mode and activity present can be displayed with one LED by configuring an LED pin to Link100/Activity mode. The LED asserts when linked to a 100BASE-TX partner and also blinks or performs pulse-stretch when activity is either transmitted by the PHY or received by the link partner. When disabled, the combine feature only provides the status of the selected primary function. In this example, only Link100 asserts the LED, and the secondary mode, Activity, does not display when the combine feature is disabled.

3.11.4.2 LED Blink or Pulse-Stretch

This behavior is available for the LED mode 9 (collision) and LED mode 10 (activity) indications only, and can be uniquely configured for each LED pin. For more information, see [Table 14](#), page 20. Activity and collision events can occur randomly and intermittently throughout the link-up period. Blink is a 50% duty cycle oscillation of asserting and de-asserting an LED pin. Pulse-stretch ensures that an LED is asserted and de-asserted for a specific period of time when activity is either present or not present. These rates can also be configured using a register setting.

3.11.4.3 Rate of LED Blink or Pulse-Stretch

This behavior controls the LED blink rate or pulse-stretch length when blink/pulse-stretch is enabled on a LED pin. The blink rate, which alternates between a high and low voltage level at a 50% duty cycle, can be set to 2.5 Hz, 5 Hz, 10 Hz, or 20 Hz. For pulse-stretch, the rate can be set to 50 ms, 100 ms, 200 ms, or 400 ms.

3.11.4.4 LED Pulsing Enable

To provide additional power savings, the LEDs (when asserted) can be pulsed at 5 kHz programmable duty cycle. The pulsing enable is controlled through register 30, bit 12 and the duty cycle through register 25G, bits 15:8.

3.11.4.5 LED Blink After Reset

The LEDs will blink for one second after COMA_MODE is deasserted (as described in [Configuration](#), page 25) or a software reset is applied. This feature can be enabled by setting register 19E1, bit 11 = 1.

3.11.4.6 Pulse Programmable Control

These bits add the ability to width and frequency of LED pulses. This feature facilitates power reduction options.

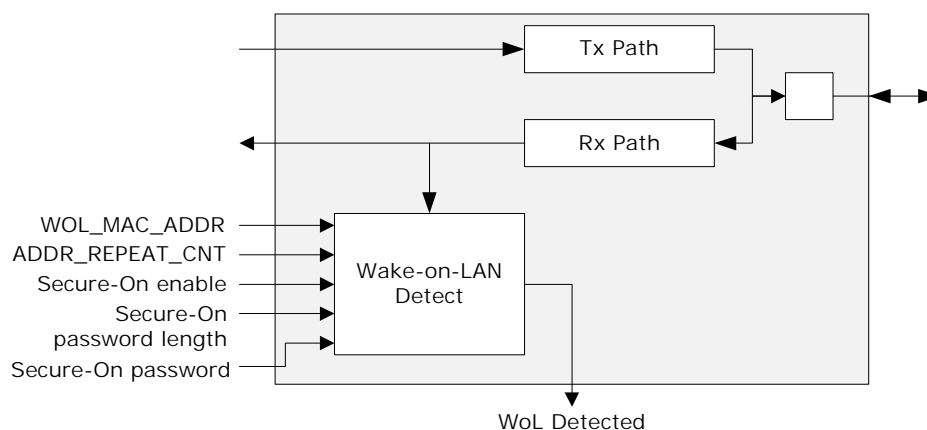

3.11.4.7 Fast Link Failure

For more information about this feature, see [Fast Link Failure Indication](#), page 23.

3.12 Wake-On-LAN and SecureOn

The VSC8540-04 device supports Wake-on-LAN, an Ethernet networking standard to awaken hosts by using a “magic packet” that is decoded to ascertain the source, and then assert an interrupt pin or a LED. The VSC8540-04 device also supports SecureOn to secure Wake-on-LAN against unauthorized access. The following illustration shows an overview of the Wake-on-LAN functionality.

Figure 17 • Wake-on-LAN Functionality

Wake-on-LAN detection is available in 10BASE-T and 100BASE-TX modes. It is enabled by setting the interrupt mask register (25.6) and its status is read in the interrupt status register (26.6). Wake-on-LAN and SecureOn are configured using register 27E2. The MAC address is saved in its local register space (21E2, 22E2, and 23E2).

3.13 Fast Link Failure Indication

For 10BASE-T links, the fast link failure indication matches the link status register (address 1, bit 2). For 100BASE-TX links, the link failure is based on a circuit that analyzes the integrity of the link and will assert at the indication of failure (< 3 ms, worst case).

FLF indication works for all copper media speeds through the FASTLINK_FAIL pin. Fast link failure is supported through the MDINT (active low) pin only in 100BASE-TX mode. It is not supported through the MDINT pin and interrupt status register 26 (bit 7) in 10BASE-T mode.

Note: A system can later confirm the fast link down indication for system management purposes by actively polling the link status bit to determine if a link has failed.

Note: Fast Link Failure Indication and Fast Link Failure 2 Indication should not be used when EEE is enabled on a link.

3.14 Fast Link Failure 2™ (FLF2™) Indication

In order to enable specific industrial applications in which the system must be warned as quickly as possible that a link might be going down, the VSC8540-04 device features the FLF2 indicator function. This new feature enables the PHY to indicate the onset of a potential link failure in less than 150 μs for 100BASE-TX operation. FLF2 is supported through the FASTLINK_FAIL pin.

This new functionality goes beyond the normal FLF indicator function, which must be enabled concurrently with FLF2, and is enabled by writing a 1 to bit 15 of register 20E2.

A system can later confirm the fast link down indication for system management purposes by actively polling the link status bit to determine if a link has failed.

Note: For 10/100 links, the notification timing performance is only guaranteed for link loss due to failure of the PHY MDI pair operating as the ingress (receive) pair to the PHY.

Note: FLF2 should not be used when EEE is enabled on a link.

3.15 Forced Speed Mode Link-Up Timing

The following table specifies the time the device will take to establish a link when operating in a forced speed mode.

Table 17 • Forced Speed Mode Link-Up Timing

| Forced Mode | Minimum | Maximum | Units |
|-----------------------------------|---------|---------|-------|
| 100Base-TX, HP Auto-MDIX Disabled | 43 | 240 | ms |
| 100Base-TX, HP Auto-MDIX Enabled | 43 | 4000 | ms |

In 100Base-TX mode, HP Auto-MDIX can be disabled by setting register 18 bit 7.

Link-up times are given for previously-configured PHYs on each side of the link— that is, the times do not include configuration time prior to attempting link-up. Both the device and link partner must be configured in forced speed mode to achieve the listed link-up times.

3.16 Testing Features

The VSC8540-04 device includes several testing features designed to facilitate performing system-level debugging and in-system production testing. This section describes the available features.

3.16.1 Ethernet Packet Generator

The Ethernet Packet Generator (EPG) can be used at each of the 10/100BASE-TX speed settings for copper Cat5 media to isolate problems between the MAC and the VSC8540-04 device, or between a locally connected PHY and its remote link partner. Enabling the EPG feature disables all MAC interface transmit pins and selects the EPG as the source for all data transmitted onto the twisted pair interface.

Note: The EPG is intended for use with laboratory or in-system testing equipment only. Do not use the EPG testing feature when the VSC8540-04 device is connected to a live network.

To enable the EPG feature, set the device register bit 29E1.15 to 1.

When the EPG is enabled, packet loss occurs during transmission of packets from the MAC to the PHY. However, the PHY receive output pins to the MAC are still active when the EPG is enabled. When it is necessary to disable the MAC receive pins as well, set the register bit 0.10 to 1.

When the device register bit 29E1.14 is set to 1, the PHY begins transmitting Ethernet packets based on the settings in registers 29E1 and 30E1. These registers set:

- Source and destination addresses for each packet
- Packet size
- Interpacket gap
- FCS state
- Transmit duration
- Payload pattern

When register bit 29E1.13 is set to 0, register bit 29E1.14 is cleared automatically after 30,000,000 packets are transmitted.

3.16.2 Far-End Loopback

The far-end loopback testing feature is enabled by setting register bit 23.3 to 1. When enabled, it forces incoming data from a link partner on the media interface into the MAC interface of the PHY where it is retransmitted back to the link partner on the media interface, as shown in the following illustration. In addition, the incoming data also appears on the receive data pins of the MAC interface. Data present on the transmit data pins of the MAC interface is ignored when using this testing feature.

Figure 18 • Far-End Loopback Diagram

3.16.3 Near-End Loopback

When the near-end loopback testing feature is enabled, transmitted data (TXD) is looped back in the PCS block onto the receive data signals (RXD), as shown in the following illustration. When using this testing feature, no data is transmitted over the network. To enable near-end loopback, set the device register bit 0.14 to 1.

Figure 19 • Near-End Loopback Diagram

3.16.4 Connector Loopback

The connector loopback testing feature allows the twisted pair interface to be looped back externally. When using this feature, the PHY must be connected to a loopback connector or a loopback cable. Connect pair A to pair B, as shown in the following illustration. The connector loopback feature functions at all available interface speeds.

Figure 20 • Connector Loopback Diagram

When using the connector loopback testing feature, the device auto-negotiation, speed, and duplex configuration is set using device registers 0 and 4.

3.16.5 VeriPHY Cable Diagnostics

The VSC8540-04 includes a comprehensive suite of cable diagnostic functions that are available using SMI reads and writes. These functions enable a variety of cable operating conditions and status to be accessed and checked. The VeriPHY suite has the ability to identify the cable length and operating conditions and to isolate a variety of common faults that can occur on Cat5 twisted pair cabling.

For functional details of the VeriPHY suite and the operating instructions, see the ENT-AN0125 PHY, Integrated PHY-Switch VeriPHY - Cable Diagnostics application note.

3.17 Configuration

The VSC8540-04 device can be configured by setting internal memory registers using the management interface or by using the unmanaged mode as described in [Unmanaged Mode](#), page 9.

3.17.1 Managed Applications

To configure the device using the management interface, perform the following steps:

1. COMA_MODE active, drive high (optional).
2. Apply power.
3. Apply RefClk.
4. Release reset, drive high. Power and clock must be high before releasing reset.
5. Wait 15 ms minimum.
6. Apply patch from PHY_API if available (required for production release, optional for board testing).
7. Configure register 23 for MAC interface mode.
 - Read register 23 (to access register 23, register 31 must be 0).
 - Set bits 12:11, MAC configuration, as follows:
 - 00: MII
 - 10: RGMII
 - 01: RMII
 - Write new register 23.
8. Software reset.
 - Read register 0 (to access register 0, register 31 must be 0).
 - Set bit 15 to 1.
 - Write new register 0.
9. Read register 0 until bit 15 equals to 0.
10. For RGMII mode: configure register 20E2 (to access register 20E2, register 31 must be set to 2). Set bit 11 to 0 and set RX_CLK delay and TX_CLK delay accordingly through bit [6:4] and/or bit [2:0] respectively.
11. Release the COMA_MODE pin, drive low (only necessary if COMA_MODE pin is driven high or unconnected).

3.17.2 Unmanaged Applications

To configure the device using unmanaged mode, perform the following steps:

1. Apply power.
2. Apply RefClk.
3. Release reset, drive high. Power and clock must be high before releasing reset.

Note: For unmanaged mode operation, the NRESET pin must have two rising edges (logical 0-1-0-1 transition sequence) applied at this step.

4. Wait 15 ms minimum.
5. (Optional) For applications that gain register access to the device using the management interface, steps 6–10 can then be performed in order to modify default settings.

3.17.3 Initialization

The COMA_MODE pin provides an optional feature that may be used to control when the PHYs become active. The typical usage is to keep the PHYs from becoming active before they have been fully initialized. For more information, see [Configuration](#), page 25. Alternatively, the COMA_MODE pin may be connected low (ground) and the PHYs will be fully active once out of reset.

4 Registers

This section provides information about how to configure the VSC8540-04 device using its internal memory registers and the management interface. The registers marked reserved and factory test should not be read or written to, because doing so may produce undesired effects.

The default value documented for registers is based on the value at reset; in some cases, that value may change immediately after reset.

The access type for each register is shown using the following abbreviations:

- RO: Read Only
- ROCR: Read Only, Clear on Read
- RO/LH: Read Only, Latch High
- RO/LL: Read Only, Latch Low
- R/W: Read and Write
- RWSC: Read and Write, Self-Clearing

The VSC8540-04 device uses several different types of registers:

- IEEE Clause 22 device registers with addresses from 0 to 31
- Two pages of extended registers with addresses from 17E1–30E1 and 16E2–30E2
- General-purpose registers with addresses from 0G to 30G
- IEEE Clause 45 devices registers accessible through the Clause 22 registers 13 and 14 to support IEEE 802.3az-2010 Energy-Efficient Ethernet registers and IEEE 802.3bf-2011 registers

The following illustration shows the relationship between the device registers and their address spaces.

Figure 21 • Register Space Diagram

Reserved Registers

For main registers 16–31, extended registers 17E1–30E1, 16E2–30E2, and general purpose registers 0G–30G, any bits marked as Reserved should be processed as read-only and their states as undefined.

Reserved Bits

In writing to registers with reserved bits, use a read-modify-then-write technique, where the entire register is read but only the intended bits to be changed are modified. Reserved bits cannot be changed and their read state cannot be considered static or unchanging.

4.1 Register and Bit Conventions

This document refers to registers by their address and bit number in decimal notation. A range of bits is indicated with a colon. For example, a reference to address 26, bits 15 through 14 is shown as 26.15:14.

A register with an E and a number attached (such as 27E1) means it is a register contained within extended register page number 1. A register with a G attached (such as 13G) means it is a GPIO page register.

Bit numbering follows the IEEE standard with bit 15 being the most significant bit and bit 0 being the least significant bit.

4.2 IEEE 802.3 and Main Registers

In the VSC8540-04 device, the page space of the standard registers consists of the IEEE 802.3 standard registers and the Microsemi standard registers. The following table lists the names of the registers associated with the addresses as specified by IEEE 802.3.

Table 18 • IEEE 802.3 Registers

| Address | Name |
|---------|---|
| 0 | Mode Control |
| 1 | Mode Status |
| 2 | PHY Identifier 1 |
| 3 | PHY Identifier 2 |
| 4 | Auto-negotiation Advertisement |
| 5 | Auto-negotiation Link Partner Ability |
| 6 | Auto-negotiation Expansion |
| 7 | Auto-negotiation Next-Page Transmit |
| 8 | Auto-negotiation Link Partner Next-Page Receive |
| 9–12 | Reserved |
| 13 | MMD EEE Access |
| 14 | MMD Address or Data Register |
| 15 | Reserved |

The following table lists the names of the registers in the main page space of the device. These registers are accessible only when register address 31 is set to 0x0000.

Table 19 • Main Registers

| Address | Name |
|---------|-----------------------------|
| 16 | 100BASE-TX status extension |
| 17 | Reserved |
| 18 | Bypass control |
| 19 | Error Counter 1 |
| 20 | Error Counter 2 |
| 21 | Error Counter 3 |
| 22 | Extended control and status |
| 23 | Extended PHY control 1 |
| 24 | Extended PHY control 2 |
| 25 | Interrupt mask |
| 26 | Interrupt status |
| 27 | Reserved |

Table 19 • Main Registers (continued)

| Address | Name |
|---------|-------------------------------|
| 28 | Auxiliary control and status |
| 29 | LED mode select |
| 30 | LED behavior |
| 31 | Extended register page access |

4.2.1 Mode Control

The device register at memory address 0 controls several aspects of the VSC8540-04 device functionality. The following table shows the available bit settings in this register and what they control.

Table 20 • Mode Control, Address 0 (0x00)

| Bit | Name | Access | Description | Default |
|-----|----------------------------|--------|--|---------|
| 15 | Software reset | R/W | Self-clearing. Restores all serial management interface (SMI) registers to default state, except for sticky and super-sticky bits. 1: Reset asserted. 0: Reset de-asserted. Wait 1 μ s after setting this bit to initiate another SMI register access. | 0 |
| 14 | Loopback | R/W | 1: Loopback enabled. 0: Loopback disabled. When loopback is enabled, the device functions at the current speed setting and with the current duplex mode setting (bits 6, 8, and 13 of this register). | 0 |
| 13 | Forced speed selection LSB | R/W | Least significant bit. MSB is bit 6. 00: 10 Mbps 01: 100 Mbps 10: Reserved 11: Reserved | 1 |
| 12 | Autonegotiation enable | R/W | 1: Autonegotiation enabled. 0: Autonegotiation disabled. | 1 |
| 11 | Power-down | R/W | 1: Power down enabled. | 0 |
| 10 | Isolate | R/W | 1: Disable MAC interface outputs and ignore MAC interface inputs. | 0 |
| 9 | Restart autonegotiation | R/W | Self-clearing bit. 1: Restart autonegotiation on media interface. | 0 |
| 8 | Duplex | R/W | 1: Full-duplex. 0: Half-duplex. | 0 |
| 7 | Collision test enable | R/W | 1: Collision test enabled. | 0 |
| 6 | Forced speed selection MSB | R/W | Most significant bit. LSB is bit 13. 00: 10 Mbps 01: 100 Mbps 10: Reserved 11: Reserved | 0 |
| 5:0 | Reserved | | Reserved. | 00000 |

4.2.2 Mode Status

The register at address 1 in the device main registers space enables reading the currently enabled mode setting. The following table shows possible readouts of this register.

Table 21 • Mode Status, Address 1 (0x01)

| Bit | Name | Access | Description | Default |
|-----|---------------------------------|--------|--|---------|
| 15 | 100BASE-T4 capability | RO | 1: 100BASE-T4 capable. | 0 |
| 14 | 100BASE-TX FDX capability | RO | 1: 100BASE-TX FDX capable. | 1 |
| 13 | 100BASE-TX HDX capability | RO | 1: 100BASE-TX HDX capable. | 1 |
| 12 | 10BASE-T FDX capability | RO | 1: 10BASE-T FDX capable. | 1 |
| 11 | 10BASE-T HDX capability | RO | 1: 10BASE-T HDX capable. | 1 |
| 10 | 100BASE-T2 FDX capability | RO | 1: 100BASE-T2 FDX capable. | 0 |
| 9 | 100BASE-T2 HDX capability | RO | 1: 100BASE-T2 HDX capable. | 0 |
| 8 | Extended status enable | RO | 1: Extended status information present in register 15. | 1 |
| 7 | Reserved | RO | Reserved. | |
| 6 | Preamble suppression capability | RO | 1: MF preamble can be suppressed. 0: MF required. | 1 |
| 5 | Autonegotiation complete | RO | 1: Auto-negotiation complete. | 0 |
| 4 | Remote fault | RO | Latches high. 1: Far-end fault detected. | 0 |
| 3 | Autonegotiation capability | RO | 1: Auto-negotiation capable. | 1 |
| 2 | Link status | RO | Latches low. 1: Link is up. | 0 |
| 1 | Jabber detect | RO | Latches high. 1: Jabber condition detected. | 0 |
| 0 | Extended capability | RO | 1: Extended register capable. | 1 |

4.2.3 Device Identification

All 16 bits in both register 2 and register 3 in the VSC8540-04 device are used to provide information associated with aspects of the device identification. The following tables list the expected readouts.

Table 22 • Identifier 1, Address 2 (0x02)

| Bit | Name | Access | Description | Default |
|------|--|--------|----------------------------------|---------|
| 15:0 | Organizationally unique identifier (OUI) | RO | OUI most significant bits (3:18) | 0x0007 |

Table 23 • Identifier 2, Address 3 (0x03)

| Bit | Name | Access | Description | Default |
|-------|------------------------|--------|------------------------------------|---------|
| 15:10 | OUI | RO | OUI least significant bits (19:24) | 000001 |
| 9:4 | Microsemi model number | RO | VSC8540-04 | 110110 |
| 3:0 | Device revision number | RO | Revision B | 0001 |

4.2.4 Auto-Negotiation Advertisement

The bits in address 4 in the main registers space control the ability to notify other devices of the status of its auto-negotiation feature. The following table shows the available settings and readouts.

Table 24 • Device Auto-Negotiation Advertisement, Address 4 (0x04)

| Bit | Name | Access | Description | Default |
|-----|--------------------------------|--------|--------------------------------|---------|
| 15 | Next page transmission request | R/W | 1: Request enabled | 0 |
| 14 | Reserved | RO | Reserved | |
| 13 | Transmit remote fault | R/W | 1: Enabled | 0 |
| 12 | Reserved | R/W | Reserved | 0 |
| 11 | Advertise asymmetric pause | R/W | 1: Advertises asymmetric pause | 0 |
| 10 | Advertise symmetric pause | R/W | 1: Advertises symmetric pause | 0 |
| 9 | Advertise100BASE-T4 | R/W | 1: Advertises 100BASE-T4 | 0 |
| 8 | Advertise100BASE-TX FDX | R/W | 1: Advertise 100BASE-TX FDX | 1 |
| 7 | Advertise100BASE-TX HDX | R/W | 1: Advertises 100BASE-TX HDX | 1 |
| 6 | Advertise10BASE-T FDX | R/W | 1: Advertises 10BASE-T FDX | 1 |
| 5 | Advertise10BASE-T HDX | R/W | 1: Advertises 10BASE-T HDX | 1 |
| 4:0 | Advertise selector | R/W | | 00001 |

4.2.5 Link Partner Auto-Negotiation Capability

The bits in main register 5 can be used to determine if the Cat5 link partner (LP) used with the VSC8540-04 device is compatible with the auto-negotiation functionality.

Table 25 • Auto-Negotiation Link Partner Ability, Address 5 (0x05)

| Bit | Name | Access | Description | Default |
|-----|-----------------------------------|--------|--------------------------------|---------|
| 15 | LP next page transmission request | RO | 1: Requested | 0 |
| 14 | LP acknowledge | RO | 1: Acknowledge | 0 |
| 13 | LP remote fault | RO | 1: Remote fault | 0 |
| 12 | Reserved | RO | Reserved | |
| 11 | LP advertise asymmetric pause | RO | 1: Capable of asymmetric pause | 0 |
| 10 | LP advertise symmetric pause | RO | 1: Capable of symmetric pause | 0 |
| 9 | LP advertise 100BASE-T4 | RO | 1: Capable of 100BASE-T4 | 0 |
| 8 | LP advertise 100BASE-TX FDX | RO | 1: Capable of 100BASE-TX FDX | 0 |
| 7 | LP advertise 100BASE-TX HDX | RO | 1: Capable of 100BASE-TX HDX | 0 |
| 6 | LP advertise 10BASE-T FDX | RO | 1: Capable of 10BASE-T FDX | 0 |
| 5 | LP advertise 10BASE-T HDX | RO | 1: Capable of 10BASE-T HDX | 0 |
| 4:0 | LP advertise selector | RO | | 00000 |

4.2.6 Auto-Negotiation Expansion

The bits in main register 6 work together with those in register 5 to indicate the status of the LP auto-negotiation functioning. The following table shows the available settings and readouts.

Table 26 • Auto-Negotiation Expansion, Address 6 (0x06)

| Bit | Name | Access | Description | Default |
|------|-------------------------------|--------|--|---------|
| 15:5 | Reserved | RO | Reserved. | |
| 4 | Parallel detection fault | RO | This bit latches high. 1: Parallel detection fault. | 0 |
| 3 | LP next page capable | RO | 1: LP is next page capable. | 0 |
| 2 | Local PHY next page capable | RO | 1: Local PHY is next page capable. | 1 |
| 1 | Page received | RO | This bit latches high. 1: New page is received. | 0 |
| 0 | LP is autonegotiation capable | RO | 1: LP is capable of auto-negotiation. | 0 |

4.2.7 Transmit Auto-Negotiation Next Page

The settings in register 7 in the main registers space provide information about the number of pages in an auto-negotiation sequence. The following table shows the settings available.

Table 27 • Auto-Negotiation Next Page Transmit, Address 7 (0x07)

| Bit | Name | Access | Description | Default |
|------|--------------------------|--------|--|------------|
| 15 | Next page | R/W | 1: More pages follow. | 0 |
| 14 | Reserved | RO | Reserved. | |
| 13 | Message page | R/W | 1: Message page. 0: Unformatted page. | 1 |
| 12 | Acknowledge 2 | R/W | 1: Complies with request. 0: Cannot comply with request. | 0 |
| 11 | Toggle | RO | 1: Previous transmitted LCW = 0. 0: Previous transmitted LCW = 1. | 0 |
| 10:0 | Message/unformatted code | R/W | | 0000000001 |

4.2.8 Auto-Negotiation Link Partner Next Page Receive

The bits in register 8 of the main register space work together with register 7 to determine certain aspects of the LP auto-negotiation. The following table shows the possible readouts.

Table 28 • Auto-Negotiation LP Next Page Receive, Address 8 (0x08)

| Bit | Name | Access | Description | Default |
|------|-----------------------------|--------|--|-----------|
| 15 | LP next page | RO | 1: More pages follow. | 0 |
| 14 | Acknowledge | RO | 1: LP acknowledge. | 0 |
| 13 | LP message page | RO | 1: Message page. 0: Unformatted page. | 0 |
| 12 | LP acknowledge 2 | RO | 1: LP complies with request. | 0 |
| 11 | LP toggle | RO | 1: Previous transmitted LCW = 0. 0: Previous transmitted LCW = 1. | 0 |
| 10:0 | LP message/unformatted code | RO | | All zeros |

4.2.9 MMD Access Control Register

The bits in register 13 of the main register space are a window to the EEE registers as defined in IEEE 802.3az-2010 Clause 45.

Table 29 • MMD EEE Access, Address 13 (0x0D)

| Bit | Name | Access | Description |
|-------|----------|--------|--|
| 15:14 | Function | R/W | 00: Address. 01: Data, no post increment. 10: Data, post increment for read and write. 11: Data, post increment for write only. |
| 13:5 | Reserved | RO | Reserved. |
| 4:0 | DVAD | R/W | Device address as defined in IEEE 802.3az-2010 table 45–1. |

4.2.10 MMD Address or Data Register

The bits in register 14 of the main register space are a window to the EEE registers as defined in IEEE 802.3az-2010 Clause 45.

Table 30 • MMD Address or Data Register, Address 14 (0x0E)

| Bit | Name | Access | Description |
|------|-----------------------|--------|--|
| 15:0 | Register Address/Data | R/W | When register 13.15:14 = 2'b00, address of register of the device that is specified by 13.4:0. Otherwise, the data to be written to or read from the register. |

4.2.11 100BASE-TX Status Extension

Register 16 in the main registers page space provides additional information about the status of the 100BASE-TX operation.

Table 31 • 100BASE-TX Status Extension, Address 16 (0x10)

| Bit | Name | Access | Description | Default |
|-----|--------------------------------|--------|--|---------|
| 15 | 100BASE-TX Descrambler | RO | 1: Descrambler locked. | 0 |
| 14 | 100BASE-TX lock error | RO | Self-clearing bit. 1: Lock error detected. | 0 |
| 13 | 100BASE-TX disconnect state | RO | Self-clearing bit. 1: PHY 100BASE-TX link disconnect detected. | 0 |
| 12 | 100BASE-TX current link status | RO | 1: PHY 100BASE-TX link active. | 0 |
| 11 | 100BASE-TX receive error | RO | Self-clearing bit. 1: Receive error detected. | 0 |
| 10 | 100BASE-TX transmit error | RO | Self-clearing bit. 1: Transmit error detected. | 0 |
| 9 | 100BASE-TX SSD error | RO | Self-clearing bit. 1: Start-of-stream delimiter error detected. | 0 |
| 8 | 100BASE-TX ESD error | RO | Self-clearing bit. 1: End-of-stream delimiter error detected. | 0 |
| 7:0 | Reserved | RO | Reserved. | |

4.2.12 Bypass Control

The bits in this register control aspects of functionality in effect when the device is disabled for the purpose of traffic bypass. The following table shows the settings available.

Table 32 • Bypass Control, Address 18 (0x12)

| Bit | Name | Access | Description | Default |
|-----|--|--------|--|---------|
| 15 | Transmit disable | R/W | 1: PHY transmitter disabled. | 0 |
| 14 | 4B5B encoder/decoder | R/W | 1: Bypass 4B/5B encoder/decoder. | 0 |
| 13 | Scrambler | R/W | 1: Bypass scrambler. | 0 |
| 12 | Descrambler | R/W | 1: Bypass descrambler. | 0 |
| 11 | PCS receive | R/W | 1: Bypass PCS receiver. | 0 |
| 10 | PCS transmit | R/W | 1: Bypass PCS transmit. | 0 |
| 9 | LFI timer | R/W | 1: Bypass Link Fail Inhibit (LFI) timer. | 0 |
| 8 | Reserved | RO | Reserved. | |
| 7 | HP Auto-MDIX at forced 10/100 | R/W | Sticky bit. 1: Disable HP Auto-MDIX at forced 10/100 speeds. | 1 |
| 6 | Reserved | R/W | Reserved. | 0 |
| 5 | Disable pair swap correction (HP Auto-MDIX when autonegotiation enabled) | R/W | Sticky bit. 1: Disable the automatic pair swap correction. | 0 |
| 4 | Disable polarity correction | R/W | Sticky bit. 1: Disable polarity inversion correction on each subchannel. | 0 |
| 3 | Parallel detect control | R/W | Sticky bit. 1: Do not ignore advertised ability. 0: Ignore advertised ability. | 1 |
| 2:0 | Reserved | RO | Reserved. | |

4.2.13 Error Counter 1

The bits in register 19 provide an error counter. The following table shows the settings available.

Table 33 • Extended Control and Status, Address 19 (0x13)

| Bit | Name | Access | Description | Default |
|------|-----------------------|--------|---|---------|
| 15:8 | Reserved | RO | Reserved. | |
| 7:0 | Receive error counter | RO | 8-bit counter that saturates when it reaches 255. These bits are self-clearing when read. | 0x00 |

4.2.14 Error Counter 2

The bits in register 20 provide an error counter. The following table shows the settings available.

Table 34 • Extended Control and Status, Address 20 (0x14)

| Bit | Name | Access | Description | Default |
|------|-----------------------|--------|---|---------|
| 15:8 | Reserved | RO | Reserved. | |
| 7:0 | False carrier counter | RO | 8-bit counter that saturates when it reaches 255. These bits are self-clearing when read. | 0x00 |

4.2.15 Error Counter 3

The bits in register 21 provide an error counter. The following table shows the settings available.

Table 35 • Extended Control and Status, Address 21 (0x15)

| Bit | Name | Access | Description | Default |
|------|--------------------------------------|--------|---|---------|
| 15:8 | Reserved | RO | Reserved. | |
| 7:0 | Copper media link disconnect counter | RO | 8-bit counter that saturates when it reaches 255. These bits are self-clearing when read. | 0x00 |

4.2.16 Extended Control and Status

The bits in register 22 provide additional device control and readouts. The following table shows the settings available.

Table 36 • Extended Control and Status, Address 22 (0x16)

| Bit | Name | Access | Description | Default |
|-------|---------------------------|--------|--|---------|
| 15 | Force 10BASE-T link high | R/W | Sticky bit. 1: Bypass link integrity test. 0: Enable link integrity test. | 0 |
| 14 | Jabber detect disable | R/W | Sticky bit. 1: Disable jabber detect. | 0 |
| 13 | Disable 10BASE-T echo | R/W | Sticky bit. 1: Disable 10BASE-T echo. | 1 |
| 12 | Disable SQE mode | R/W | Sticky bit. 1: Disable SQE mode. | 1 |
| 11:10 | 10BASE-T squelch control | R/W | Sticky bit. 00: Normal squelch. 01: Low squelch. 10: High squelch. 11: Reserved. | 00 |
| 9 | Sticky reset enable | R/W | Super-sticky bit. 1: Enabled. | 1 |
| 8 | EOF Error | RO | This bit is self-clearing. 1: EOF error detected. | 0 |
| 7 | 10BASE-T disconnect state | RO | This bit is self-clearing. 1: 10BASE-T link disconnect detected. | 0 |
| 6 | 10BASE-T link status | RO | 1: 10BASE-T link active. | 0 |
| 5:1 | Reserved | RO | Reserved. | |
| 0 | SMI broadcast write | R/W | Sticky bit. 1: Enabled. | 0 |

The following information applies to the extended control and status bits:

- When bit 22.15 is set, the link integrity state machine is bypassed and the PHY is forced into a link pass status.
- When bits 22.11:10 are set to 00, the squelch threshold levels are based on the IEEE standard for 10BASE-T. When set to 01, the squelch level is decreased, which can improve the bit error rate performance on long loops. When set to 10, the squelch level is increased and can improve the bit error rate in high-noise environments.

- When bit 22.9 is set, all sticky register bits retain their values during a software reset. Clearing this bit causes all sticky register bits to change to their default values upon software reset. Super-sticky bits retain their values upon software reset regardless of the setting of bit 22.9.
- When bit 22.0 is set, if a write to any PHY register (registers 0–31, including extended registers), the same write is broadcast to all PHYs. For example, if bit 22.0 is set to 1 and a write to PHY0 is executed (register 0 is set to 0x1040), all PHYs' register 0s are set to 0x1040. Disabling this bit restores normal PHY write operation. Reads are still possible when this bit is set, but the value that is read corresponds only to the particular PHY being addressed.

4.2.17 Extended PHY Control 1

The following table shows the settings available.

Table 37 • Extended PHY Control 1, Address 23 (0x17)

| Bit | Name | Access | Description | Default |
|-------|---------------------------|--------|--|---------|
| 15:14 | Reserved | RO | Reserved. | |
| 13 | MAC supplied clock enable | R/W | MAC interface RX_CLK synchronization. 0: Synchronize RX_CLK to recovered clock. 1: Synchronize RX_CLK to REFCLK. Note: This bit is not applicable to the RMII MAC interface selection. This bit may be changed during COMA mode or written prior to a soft-reset, after which it takes effect. | 0 |
| 12:11 | MAC interface selection | R/W | MAC interface mode. 00: MII. 01: RMII. 10: RGMII. 11: Reserved. Note: These bits may be changed during COMA mode or written prior to a soft-reset, after which it takes effect. | 10 |
| 10:4 | Reserved | RO | Reserved. | |
| 3 | Far-end loopback mode | R/W | 1: Enabled. | 0 |
| 2:0 | Reserved | RO | Reserved. | |

Note: After configuring bits 13:11 of the extended PHY control register set 1, a software reset (register 0, bit 15) must be written to change the device operating mode. On read, these bits only indicate the actual operating mode and not the pending operating mode setting before a software reset has taken place.

4.2.18 Extended PHY Control 2

The second set of extended controls is located in register 24 in the main register space for the device. The following table shows the settings and readouts available.

Table 38 • Extended PHY Control 2, Address 24 (0x18)

| Bit | Name | Access | Description | Default |
|-------|-------------------------------|--------|--|---------|
| 15:13 | 100BASE-TX edge rate control | R/W | Sticky bit. 011: +7 edge rate (slowest). 010: +6 edge rate. 001: +5 edge rate. 000: +4 edge rate. 111: +3 edge rate. 110: +2 edge rate. 101: +1 edge rate. 100: Fastest edge rate. | 000 |
| 12 | PICMG 2.16 reduced power mode | R/W | Sticky bit. 1: Enabled. | 0 |
| 11:6 | Reserved | RO | Reserved. | |
| 5:4 | Jumbo packet mode | R/W | Sticky bit. 00: Normal IEEE 1.5 kB packet length. 01: 9 kB jumbo packet length (12 kB with 60 ppm or better reference clock). 10: 12 kB jumbo packet length (16 kB with 70 ppm or better reference clock). 11: Reserved. | 00 |
| 3:1 | Reserved | RO | Reserved. | |
| 0 | Connector loopback | R/W | 1: Enabled. | 0 |

Note: When bits 5:4 are set to jumbo packet mode, the default maximum packet values are based on 100 ppm driven reference clock to the device. Controlling the ppm offset between the MAC and the PHY as specified in the bit description results in a higher jumbo packet length.

4.2.19 Interrupt Mask

These bits control the device interrupt mask. The following table shows the settings available.

Table 39 • Interrupt Mask, Address 25 (0x19)

| Bit | Name | Access | Description | Default |
|-----|---|--------|-------------------------|---------|
| 15 | MDINT interrupt status enable | R/W | Sticky bit. 1: Enabled. | 0 |
| 14 | Speed state change mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 13 | Link state change mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 12 | FDX state change mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 11 | Autonegotiation error mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 10 | Autonegotiation complete mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 9 | Inline-powered device (PoE) detect mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 8 | Symbol error interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 7 | Fast link failure interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 6 | Wake-on-LAN event interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 5 | Extended interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |

Table 39 • Interrupt Mask, Address 25 (0x19) (continued)

| Bit | Name | Access | Description | Default |
|-----|------------------------------|--------|-------------------------|---------|
| 4 | Reserved | R/W | Reserved. | 0 |
| 3 | False carrier interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 2 | Reserved | R/W | Reserved. | 0 |
| 1 | Reserved | R/W | Reserved. | 0 |
| 0 | RX_ER interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |

Note: When bit 25.15 is set, the MDINT pin is enabled. When enabled, the state of this pin reflects the state of bit 26.15. Clearing this bit only inhibits the MDINT pin from being asserted. Also, before enabling this bit, read register 26 to clear any previously inactive interrupts pending that will cause bit 25.15 to be set.

4.2.20 Interrupt Status

The status of interrupts already written to the device is available for reading from register 26 in the main registers space. The following table shows the expected readouts.

Table 40 • Interrupt Status, Address 26 (0x1A)

| Bit | Name | Access | Description | Default |
|-----|-------------------------------------|--------|--|---------|
| 15 | Interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 14 | Speed state change status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 13 | Link state change status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 12 | FDX state change status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 11 | Autonegotiation error status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 10 | Autonegotiation complete status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 9 | Inline powered device detect status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 8 | Symbol error status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 7 | Fast link failure detect status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 6 | Wake-on-LAN event status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 5 | Extended interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 4 | Reserved | RO | Reserved. | |
| 3 | False carrier interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 2 | Reserved | RO | Reserved. | |
| 1 | Reserved | RO | Reserved. | |
| 0 | RX_ER interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |

The following information applies to the interrupt status bits:

- All set bits in this register are cleared after being read (self-clearing). If bit 26.15 is set, the cause of the interrupt can be read by reading bits 26.14:0.
- For bits 26.14 and 26.12, bit 0.12 must be set for this interrupt to assert.
- For bit 26.0, this interrupt will not occur when RX_ER is used for carrier-extension decoding of a link partner's data transmission.
- If bit 5 is set, register 29E2 must be read to determine the source of the interrupt.

4.2.21 Device Auxiliary Control and Status

Register 28 provides control and status information for several device functions not controlled or monitored by other device registers. The following table shows the settings available and the expected readouts.

Table 41 • Auxiliary Control and Status, Address 28 (0x1C)

| Bit | Name | Access | Description | Default |
|-----|--|--------|--|---------|
| 15 | Autonegotiation complete | RO | Duplicate of bit 1.5 when auto-negotiation is enabled, otherwise this is the current link status. | 0 |
| 14 | Autonegotiation disabled | RO | Inverted duplicate of bit 0.12. | 0 |
| 13 | HP Auto-MDIX crossover indication | RO | 1: HP Auto-MDIX crossover performed internally. | 0 |
| 12 | Reserved | RO | Reserved. | |
| 11 | A polarity inversion | RO | 1: Polarity swap on pair A. | 0 |
| 10 | B polarity inversion | RO | 1: Polarity swap on pair B. | 0 |
| 9:8 | Reserved | RO | Reserved. | |
| 7 | ActiPHY link status time-out control [1] | R/W | Sticky bit. Bits 7 and 2 are part of the ActiPHY Link Status time-out control. Bit 7 is the MSB. 00: 2.3 seconds. 01: 3.3 seconds. 10: 4.3 seconds. 11: 5.3 seconds. | 0 |
| 6 | ActiPHY mode enable | R/W | Sticky bit. 1: Enabled. | 0 |
| 5 | FDX status | RO | 1: Full-duplex. 0: Half-duplex. | 0 |
| 4:3 | Speed status | RO | 00: Speed is 10BASE-T. 01: Speed is 100BASE-TX. 10: Reserved. 11: Reserved. | 00 |
| 2 | ActiPHY link status time-out control [0] | R/W | Sticky bit. Bits 7 and 2 are part of the ActiPHY Link Status time-out control. Bit 7 is the MSB. 00: 2.3 seconds. 01: 3.3 seconds. 10: 4.3 seconds. 11: 5.3 seconds. | 1 |
| 1:0 | Media mode status | RO | 00: No media selected. 01: Copper media selected. 10: Reserved. 11: Reserved. | 00 |

4.2.22 LED Mode Select

The device LED outputs are controlled using the bits in register 29 of the main register space. The following table shows the information needed to access the functionality of each of the outputs. For more

information about LED modes, see [Table 14](#), page 20. For information about enabling the extended LED mode bits in Register 19E1 bits 13 to 12, see [Table 16](#), page 21.

Table 42 • LED Mode Select, Address 29 (0x1D)

| Bit | Name | Access | Description | Default |
|------|------------------|--------|---|---------|
| 15 | Reserved | RO | Reserved. | |
| 14:8 | Reserved | R/W | Reserved. | 0x00 |
| 7:4 | LED1 mode select | R/W | Sticky bit. Select from LED modes 0–15. | 0010 |
| 3:0 | LED0 mode select | R/W | Sticky bit. Select from LED modes 0–15. | 0001 |

4.2.23 LED Behavior

The bits in register 30 control and enable you to read the status of the pulse or blink rate of the device LEDs. The following table shows the settings you can write to the register or read from the register.

Table 43 • LED Behavior, Address 30 (0x1E)

| Bit | Name | Access | Description | Default |
|-------|---------------------------------|--------|---|---------|
| 15:13 | Reserved | RO | Reserved. | |
| 12 | LED pulsing enable | R/W | Sticky bit. 0: Normal operation. 1: LEDs pulse with a 5 kHz, programmable duty cycle when active. | 0 |
| 11:10 | LED blink/pulse-stretch rate | R/W | Sticky bit. 00: 2.5 Hz blink rate/400 ms pulse-stretch. 01: 5 Hz blink rate/200 ms pulse-stretch. 10: 10 Hz blink rate/100 ms pulse-stretch. 11: 20 Hz blink rate/50 ms pulse-stretch. The blink rate selection sets the rate used for all LED pins. | 01 |
| 9:7 | Reserved | RO | Reserved. | |
| 6 | LED1 pulse-stretch/blink select | R/W | Sticky bit. 1: Pulse-stretch. 0: Blink. | 0 |
| 5 | LED0 pulse-stretch/blink select | R/W | Sticky bit. 1: Pulse-stretch. 0: Blink. | 0 |
| 4:2 | Reserved | RO | Reserved. | |
| 1 | LED1 combine feature disable | R/W | Sticky bit. 0: Combine enabled (link/activity, duplex/collision). 1: Disable combination (link only, duplex only). | 0 |
| 0 | LED0 combine feature disable | R/W | Sticky bit. 0: Combine enabled (link/activity, duplex/collision). 1: Disable combination (link only, duplex only). | 0 |

Note: Bits 30.11:10 are active only in port 0 and affect the behavior of LEDs for all the ports.

4.2.24 Extended Page Access

To provide functionality beyond the IEEE 802.3-specified registers and main device registers, an extended set of registers provide an additional 15 register spaces.

The register at address 31 controls access to the extended registers. Accessing the GPIO page register space is similar to accessing the extended page registers. The following table shows the settings available.

Table 44 • Extended/GPIO Register Page Access, Address 31 (0x1F)

| Bit | Name | Access | Description | Default |
|------|------------------------------------|--------|---|---------|
| 15:0 | Extended/GPIO page register access | R/W | 0x0000: Register 16–30 accesses main register space. Writing 0x0000 to register 31 restores the main register access. 0x0001: Registers 16–30 access extended register space 1. 0x0002: Registers 16–30 access extended register space 2. 0x0010: Registers 0–30 access GPIO register space. | 0x0000 |

4.3 Extended Page 1 Registers

To access the extended page 1 registers (17E1–30E1), enable extended register access by writing 0x0001 to register 31. Writing 0x0000 to register 31 restores the main register access.

When extended page 1 register access is enabled, reads and writes to registers 16–30 affect the extended registers 17E1–30E1 instead of those same registers in the IEEE-specified register space. Registers 0–15 are not affected by the state of the extended page register access.

Table 45 • Extended Registers Page 1 Space

| Address | Name |
|-----------|--|
| 17E1 | Reserved |
| 18E1 | Cu Media CRC Good Counter |
| 19E1 | Extended Mode Control |
| 20E1 | Extended PHY Control 3 (ActiPHY) |
| 21E1–22E1 | Reserved |
| 23E1 | Extended PHY Control 4 (PoE and CRC Error Counter) |
| 27E1–28E1 | Reserved |
| 29E1 | Ethernet Packet Generator (EPG) 1 |
| 30E1 | EPG 2 |

4.3.1 Cu Media CRC Good Counter

Register 18E1 makes it possible to read the contents of the CRC good counter for packets that are received on the Cu media interface: the number of CRC routines that have executed successfully. The following table shows the expected readouts.

Table 46 • Cu Media CRC Good Counter, Address 18E1 (0x12)

| Bit | Name | Access | Description | Default |
|------|------------------------------------|--------|--|---------|
| 15 | Packet since last read | RO | Self-clearing bit. 1: Packet received since last read. | 0 |
| 14 | Reserved | RO | Reserved. | |
| 13:0 | Cu Media CRC good counter contents | RO | Self-clearing bit. Counter containing the number of packets with valid CRCs modulo 10,000; this counter does not saturate and will roll over to zero on the next good packet received after 9,999. | 0x0000 |

4.3.2 Extended Mode Control

Register 19E1 controls the extended LED and other chip modes. The following table shows the settings available.

Table 47 • Extended Mode Control, Address 19E1 (0x13)

| Bit | Name | Access | Description | Default |
|-------|--------------------------|--------|---|---------|
| 15:14 | Reserved | R/W | Reserved. | 00 |
| 13 | LED1 Extended Mode | R/W | Sticky bit. 1: See Basic Serial LED Mode , page 20. | 0 |
| 12 | LED0 Extended Mode | R/W | Sticky bit. 1: See Basic Serial LED Mode , page 20. | 0 |
| 11 | LED Reset Blink Suppress | R/W | Sticky bit. 1: Blink LEDs after COMA_MODE is de-asserted. 0: Suppress LED blink after COMA_MODE is de-asserted. | 0 |
| 10:5 | Reserved | RO | Reserved. | |
| 4 | Fast link failure | R/W | Sticky bit. Enable fast link failure pin. 1: Enabled. 0: Disabled. | 1 |
| 3:2 | Force MDI crossover | R/W | Sticky bit. 00: Normal HP Auto-MDIX operation. 01: Reserved. 10: Copper media forced to MDI. 11: Copper media forced MDI-X. | 00 |
| 1 | Reserved | RO | Reserved. | |
| 0 | Reserved | R/W | Reserved. | 0 |

4.3.3 ActiPHY Control

Register 20E1 controls the device ActiPHY sleep timer and its wake-up timer. The following table shows the settings available.

Table 48 • Extended PHY Control 3, Address 20E1 (0x14)

| Bit | Name | Access | Description | Default |
|-------|-----------------------|--------|--|---------|
| 15 | Reserved | RO | Reserved. | |
| 14:13 | ActiPHY sleep timer | R/W | Sticky bit. 00: 1 second. 01: 2 seconds. 10: 3 seconds. 11: 4 seconds. | 01 |
| 12:11 | ActiPHY wake-up timer | R/W | Sticky bit. 00: 160 ms. 01: 400 ms. 10: 800 ms. 11: 2 seconds. | 00 |

Table 48 • Extended PHY Control 3, Address 20E1 (0x14) (continued)

| Bit | Name | Access | Description | Default |
|-----|----------------------------------|--------|--|---------|
| 10 | Slow MDC | R/W | Sticky bit. 1: Indicates that MDC runs at less than 1 MHz (use of this bit is optional and indicated when MDC runs at less than 1 MHz). | 0 |
| 9:8 | Reserved | RO | Reserved. | |
| 7:6 | Media mode status | RO | 00: No media selected. 01: Copper media selected. 10: Reserved. 11: Reserved. | 00 |
| 5 | Enable 10BASE-T no preamble mode | R/W | Sticky bit. 1: 10BASE-T will assert RX_DV indication when data is presented to the receiver even without a preamble preceding it. | 0 |
| 4:0 | Reserved | RO | Reserved. | |

4.3.4 PoE and Miscellaneous Functionality

The register at address 23E1 controls various aspects of inline-powering and the CRC error counter in the VSC8540-04 device.

Table 49 • Extended PHY Control 4, Address 23E1 (0x17)

| Bit | Name | Access | Description | Default |
|-------|--|--------|---|---------|
| 15:11 | PHY address | RO | Internal PHY address: 0–31. | |
| 10 | Inline powered device detection | R/W | Sticky bit. 1: Enabled. | 0 |
| 9:8 | Inline powered device detection status | RO | Only valid when bit 10 is set. 00: Searching for devices. 01: Device found; requires inline-power. 10: Device found; does not require inline-power. 11: Reserved. | 00 |
| 7:0 | Cu Media CRC error counter | RO | Self-clearing 8-bit error count register. | |

4.3.5 Ethernet Packet Generator (EPG) Control 1

The EPG control register provides access to and control of various aspects of the EPG testing feature. There are two separate EPG control registers. The following table shows the settings available in the first register.

Table 50 • EPG Control Register 1, Address 29E1 (0x1D)

| Bit | Name | Access | Description | Default |
|-----|-------------------------|--------|--|---------|
| 15 | EPG enable ¹ | R/W | 1: Enable EPG. | 0 |
| 14 | EPG run or stop | R/W | 1: Run EPG. | 0 |
| 13 | Transmission duration | R/W | 1: Continuous (sends in 10,000-packet increments). 0: Send 30,000,000 packets and stop. | 0 |

Table 50 • EPG Control Register 1, Address 29E1 (0x1D) (continued)

| Bit | Name | Access | Description | Default |
|-------|---|--------|--|---------|
| 12:11 | Packet length | R/W | 00: 125 bytes. 01: 64 bytes. 10: 1518 bytes. 11: 10,000 bytes (jumbo packet). | 00 |
| 10 | Interpacket gap | R/W | 1: 8,192 ns. 0: 96 ns. | 0 |
| 9:6 | Destination address | R/W | Lowest nibble of the 6-byte destination address. | 0001 |
| 5:2 | Source address | R/W | Lowest nibble of the 6-byte destination address. | 0000 |
| 1 | Payload type | R/W | 1: Randomly generated payload pattern. 0: Fixed based on payload pattern. | 0 |
| 0 | Bad frame check sequence (FCS) generation | R/W | 1: Generate packets with bad FCS. 0: Generate packets with good FCS. | 0 |

- To end forced transmission of EEE LPIs from the PHY, clear the force EEE LPI bit (17E2.4) first before clearing the EPG enable bit (29E1.15).

The following information applies to the EPG control number 1:

- Do not run the EPG when the VSC8540-04 device is connected to a live network.
- Bit 29E1.13 (continuous EPG mode control): when enabled, this mode causes the device to send continuous packets. When disabled, the device continues to send packets only until it reaches the next 10,000-packet increment mark. It then ceases to send packets.
- The 6-byte destination address in bits 9:6 is assigned one of 16 addresses in the range of 0xFF FF FF FF F0 through 0xFF FF FF FF FF.
- The 6-byte source address in bits 5:2 is assigned one of 16 addresses in the range of 0xFF FF FF FF F0 through 0xFF FF FF FF FF.
- If any of bits 13:0 are changed while the EPG is running (bit 14 is set to 1), bit 14 must be cleared and then set back to 1 for the change to take effect and to restart the EPG.

4.3.6 Ethernet Packet Generator Control 2

Register 30E1 consists of the second set of bits that provide access to and control over the various aspects of the EPG testing feature. The following table shows the settings available.

Table 51 • EPG Control Register 2, Address 30E1 (0x1E)

| Bit | Name | Access | Description | Default |
|------|--------------------|--------|--|---------|
| 15:0 | EPG packet payload | R/W | Data pattern repeated in the payload of packets generated by the EPG | 0x0000 |

Note: If any of bits 15:0 in this register are changed while the EPG is running (bit 14 of register 29E1 is set to 1), that bit (29E1.14) must first be cleared and then set back to 1 for the change to take effect and to restart the EPG.

4.4 Extended Page 2 Registers

To access the extended page 2 registers (16E2–30E2), enable extended register access by writing 0x0002 to register 31. For more information, see [Table 44](#), page 41.

When extended page 2 register access is enabled, reads and writes to registers 16–30 affect the extended registers 16E2–30E2 instead of those same registers in the IEEE-specified register space. Registers 0–15 are not affected by the state of the extended page register access.

Writing 0x0000 to register 31 restores the main register access.

The following table lists the addresses and register names in the extended register page 2 space. These registers are accessible only when the device register 31 is set to 0x0002.

Table 52 • Extended Registers Page 2 Space

| Address | Name |
|-----------|---------------------------------------|
| 16E2 | Cu PMD Transmit Control |
| 17E2 | EEE Control |
| 18E2–19E2 | Reserved |
| 20E2 | RGMII Control |
| 21E2 | Wake-on-LAN MAC Address [15:0] |
| 22E2 | Wake-on-LAN MAC Address [31:16] |
| 23E2 | Wake-on-LAN MAC Address [47:32] |
| 24E2 | Secure-On Password [15:0] |
| 25E2 | Secure-On Password [31:16] |
| 26E2 | Secure-On Password [47:32] |
| 27E2 | Wake-on-LAN and MAC Interface Control |
| 28E2 | Extended Interrupt Mask |
| 29E2 | Extended Interrupt Status |
| 30E2 | Reserved |

4.4.1 Cu PMD Transmit Control

The register at address 16E2 consists of the bits that provide control over the amplitude settings for the transmit side Cu PMD interface. These bits provide the ability to make small adjustments in the signal amplitude to compensate for minor variations in the magnetics from different vendors. Extreme caution must be exercised when changing these settings from the default values as they have a direct impact on the signal quality. Changing these settings also affects the linearity and harmonic distortion of the transmitted signals. For help with changing these values, contact your Microsemi representative.

Table 53 • Cu PMD Transmit Control, Address 16E2 (0x10)

| Bit | Name | Access | Description | Default |
|-------|----------|--------|-------------|---------|
| 15:12 | Reserved | RO | Reserved | |

Table 53 • Cu PMD Transmit Control, Address 16E2 (0x10) (continued)

| Bit | Name | Access | Description | Default |
|------|---|--------|--|---------|
| 11:8 | 100BASE-TX signal amplitude trim ¹ | R/W | Sticky bit. 100BASE-TX signal amplitude 0000: 1.8% 0001: 2.7% 0010: 3.6% 0011: 4.5% 0100: 5.4% 0101: 6.3% 0110: 7.2% 0111 8.1% 1000: -8% 1001: -6.2% 1010: -4.4% 1011: -2.7% 1100: -1.8% 1101: -0.9% 1110: 0% 1111: 0.9% | 0010 |
| 7:4 | 10BASE-T signal amplitude trim ² | R/W | Sticky bit. 10BASE-T signal amplitude 0000: 0% 0001: 0.9% 0010: 1.8% 0011: 2.7% 0100: 3.6% 0101: 4.5% 0110: 5.4% 0111: 6.1% 1000: -7.2% 1001: -6.3% 1010: -5.4% 1011: -4.5% 1100: -3.6% 1101: -2.7% 1110: -1.8% 1111: -0.9% | 1000 |

Table 53 • Cu PMD Transmit Control, Address 16E2 (0x10) (continued)

| Bit | Name | Access | Description | Default |
|-----|---------------------------------|--------|---|---------|
| 3:0 | 10BASE-Te signal amplitude trim | R/W | Sticky bit. 10BASE-Te signal amplitude 0000: 0% 0001: 0.65% 0010: 1.3% 0011: 1.95% 0100: 2.6% 0101: 3.25% 0110: 3.9% 0111: 4.55% 1000: -5.2% 1001: -4.55% 1010: -3.9% 1011: -3.25% 1100: -2.6% 1101: -1.95% 1110: -1.3% 1111: -0.65% | 1110 |

1. Adjust 100BASE-TX to specific magnetics.
2. Amplitude is limited by V_{CC} (2.5 V).

4.4.2 EEE Control

The register at address 17E2 consists of the bits that provide additional control over the chip behavior in energy-efficient Ethernet (IEEE 802.3az-2010) mode for debug.

Table 54 • EEE Control, Address 17E2 (0x11)

| Bit | Name | Access | Description | Default |
|-------|---------------------------------|--------|--|---------|
| 15 | Enable 10BASE-Te | R/W | Sticky bit. Enable energy efficient (IEEE 802.3az-2010) 10BASE-Te operating mode. | 0 |
| 14:12 | Reserved | RO | Reserved. | |
| 11:10 | Invert LED polarity | R/W | Sticky bit. Invert polarity of LED signals. Default is to drive an active low signal on the LED pins. For more information, see Extended LED Modes , page 21. | 00 |
| 9 | Reserved | RO | Reserved. | |
| 8 | Link status | RO | 1: Link is up. | 0 |
| 7 | Reserved | RO | Reserved. | |
| 6 | 100BASE-TX EEE enable | RO | 1: EEE is enabled for 100BASE-TX. | 0 |
| 5 | Reserved | RO | Reserved. | |
| 4 | Force transmit LPI ¹ | R/W | Sticky bit. 1: Enable the EPG to transmit LPI on the MDI, ignore data from the MAC interface. 0: Transmit idles being received from the MAC. | 0 |

Table 54 • EEE Control, Address 17E2 (0x11) (continued)

| Bit | Name | Access | Description | Default |
|-----|-------------------------------------|--------|---|---------|
| 3 | Inhibit 100BASE-TX transmit EEE LPI | R/W | Sticky bit. 1: Disable transmission of EEE LPI on transmit path MDI in 100BASE-TX mode when receiving LPI from MAC. | 0 |
| 2 | Inhibit 100BASE-TX receive EEE LPI | R/W | Sticky bit. 1: Disable transmission of EEE LPI on receive path MAC interface in 100BASE-TX mode when receiving LPI from the MDI. | 0 |
| 1:0 | Reserved | RO | Reserved. | |

1. 17E2 bits 4:0 are for debugging purposes only, not for operational use.

4.4.3 RGMII Control

The following table shows the register settings for the RGMII controls at address 20E2.

Table 55 • RGMII Control, Address 20E2 (0x14)

| Bit | Name | Access | Description | Default |
|-------|----------------------------|--------|---|---------|
| 15 | FLF2 enable | R/W | Fast Link Failure 2 indication enable. 0: Disabled. 1: Enabled. | 0 |
| 14:12 | Reserved | RO | Reserved. | |
| 11:8 | Reserved | RO | Reserved. | |
| 7 | RGMII/MII RXD bit reversal | R/W | Sticky bit. When set to 1, makes the following reversed mapping internally: RXD3 maps to RXD0 RXD2 maps to RXD1 RXD1 maps to RXD2 RXD0 maps to RXD3 | 0 |
| 6:4 | RX_CLK delay | R/W | Sticky bit. 000: 0.2 ns delay. 001: 0.8 ns delay. 010: 1.1 ns delay. 011: 1.7 ns delay. 100: 2.0 ns delay. 101: 2.3 ns delay. 110: 2.6 ns delay. 111: 3.4 ns delay. | 000 |
| 3 | RGMII/MII TXD bit reversal | R/W | Sticky bit. When set to 1, makes the following reversed mapping internally: TXD3 maps to TXD0 TXD2 maps to TXD1 TXD1 maps to TXD2 TXD0 maps to TXD3 | 0 |

Table 55 • RGMII Control, Address 20E2 (0x14) (continued)

| Bit | Name | Access | Description | Default |
|-----|--------------|--------|---|---------|
| 2:0 | TX_CLK delay | R/W | Sticky bit. 000: 0.2 ns delay. 001: 0.8 ns delay. 010: 1.1 ns delay. 011: 1.7 ns delay. 100: 2.0 ns delay. 101: 2.3 ns delay. 110: 2.6 ns delay. 111: 3.4 ns delay. | 000 |

4.4.4 Wake-on-LAN MAC Address [15:0]

The following table shows the register settings for the Wake-on-LAN MAC address at 21E2.

Table 56 • Wake-on-LAN MAC Address, 21E2 (0x15)

| Bit | Name | Access | Description | Default |
|------|------------------------|--------|---|---------|
| 15:0 | WoL MAC address [15:0] | R/W | Sticky bit. WoL MAC address lower two bytes. | 0x0000 |

4.4.5 Wake-on-LAN MAC Address [31:16]

The following table shows the register settings for the Wake-on-LAN MAC address at 22E2.

Table 57 • Wake-on-LAN MAC Address, 22E2 (0x16)

| Bit | Name | Access | Description | Default |
|------|-------------------------|--------|--|---------|
| 15:0 | WoL MAC address [31:16] | R/W | Sticky bit. WoL MAC address middle two bytes. | 0x0000 |

4.4.6 Wake-on-LAN MAC Address [47:32]

The following table shows the register settings for the Wake-on-LAN MAC address at 23E2.

Table 58 • Wake-on-LAN MAC Address, 23E2 (0x17)

| Bit | Name | Access | Description | Default |
|------|-------------------------|--------|---|---------|
| 15:0 | WoL MAC address [47:32] | R/W | Sticky bit. WoL MAC address upper two bytes. | 0x0000 |

4.4.7 Secure-On Password [15:0]

The following table shows the register settings for the Secure-On password used for WoL at 24E2.

Table 59 • Secure-On Password, 24E2 (0x18)

| Bit | Name | Access | Description | Default |
|------|---------------------------|--------|--|---------|
| 15:0 | Secure-On password [15:0] | R/W | Sticky bit. Secure-On password for WoL lower two bytes. | 0x0000 |

4.4.8 Secure-On Password [31:16]

The following table shows the register settings for the Secure-On password used for WoL at 25E2.

Table 60 • Secure-On Password, 25E2 (0x19)

| Bit | Name | Access | Description | Default |
|------|----------------------------|--------|---|---------|
| 15:0 | Secure-On password [31:16] | R/W | Sticky bit. Secure-On password for WoL middle two bytes. | 0x0000 |

4.4.9 Secure-On Password [47:32]

The following table shows the register settings for the Secure-On password used for WoL at 26E2.

Table 61 • Secure-On Password, 26E2 (0x1A)

| Bit | Name | Access | Description | Default |
|------|----------------------------|--------|--|---------|
| 15:0 | Secure-On password [47:32] | R/W | Sticky bit. Secure-On password for WoL upper two bytes. | 0x0000 |

4.4.10 Wake-on-LAN and MAC Interface Control

The following table shows the register settings for the Wake-on-LAN and MAC interface control at address 27E2.

Table 62 • WoL and MAC Interface Control, Address 27E2 (0x1B)

| Bit | Name | Access | Description | Default |
|-------|--|--------|--|---------|
| 15 | Secure-On enable | R/W | Sticky bit. 0: Disabled. 1: Enabled. | 0 |
| 14 | Secure-On password length | R/W | Sticky bit. 0: 6 byte password. 1: 4 byte password. | 0 |
| 13:12 | Reserved | RO | Reserved. | |
| 11:8 | Address repetition count in Magic packet | R/W | Sticky bit. Count value: 0000: 1 0001: 2 0010: 3 0011: 4 0100: 5 0101: 6 0110: 7 0111: 8 1000: 9 1001: 10 1010: 11 1011: 12 1100: 13 1101: 14 1110: 15 1111: 16 | 1111 |

Table 62 • WoL and MAC Interface Control, Address 27E2 (0x1B) (continued)

| Bit | Name | Access | Description | Default |
|-----|-----------------------|--------|--|---------|
| 7:5 | Pad edge rate control | R/W | Sticky bit. MAC interface edge rate control. 000: Slowest edge rate 001: +1 pad edge rate 010: +2 pad edge rate 011: +3 pad edge rate 100: +4 pad edge rate 101: +5 pad edge rate 110: +6 pad edge rate 111: +7 pad edge rate (fastest) | 111 |
| 4 | RMII CLKOUT enable | R/W | Sticky bit. 0: RMII CLKOUT disabled. 1: RMII CLKOUT enabled. | 1 |
| 3:1 | Reserved | RO | Reserved. | |
| 0 | MDINT CMOS drive | R/W | Sticky bit. 0: Disabled. 1: Enabled. | 0 |

4.4.11 Extended Interrupt Mask

The following table shows the register settings for the extended interrupt mask at address 28E2.

Table 63 • Extended Interrupt Mask, Address 28E2 (0x1C)

| Bit | Name | Access | Description | Default |
|-------|---|--------|-------------------------|---------|
| 15:14 | Reserved interrupt mask | R/W | Reserved. | 00 |
| 13 | Rx FIFO overflow/underflow interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 12 | Tx FIFO overflow/underflow interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 11:4 | Reserved interrupt mask | R/W | Reserved. | 0x00 |
| 3 | EEE link fail interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 2 | EEE Rx TQ timer interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 1 | EEE wait quiet/Rx TS timer interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |
| 0 | EEE wake error interrupt mask | R/W | Sticky bit. 1: Enabled. | 0 |

4.4.12 Extended Interrupt Status

The following table shows the register settings for the extended interrupt status at address 29E2.

Table 64 • Extended Interrupt Status, Address 29E2 (0x1D)

| Bit | Name | Access | Description | Default |
|-------|---|--------|---|---------|
| 15:14 | Reserved | RO | Reserved. | |
| 13 | Rx FIFO overflow/underflow interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 12 | Tx FIFO overflow/underflow interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 11:4 | Reserved | RO | Reserved. | |

Table 64 • Extended Interrupt Status, Address 29E2 (0x1D) (continued)

| Bit | Name | Access | Description | Default |
|-----|---|--------|---|---------|
| 3 | EEE link fail interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 2 | EEE Rx TQ timer interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 1 | EEE wait quiet/Rx TS timer interrupt status | RO | Self-clearing bit. 1: Interrupt pending. | 0 |
| 0 | EEE wake error interrupt mask | RO | Self-clearing bit. 1: Interrupt pending. | 0 |

4.5 General Purpose Registers

Accessing the general purpose register space is similar to accessing the extended page registers. Set register 31 to 0x0010. This sets all 32 registers to the general purpose register space.

To restore main register page access, write 0x0000 to register 31. All general purpose register bits are super-sticky.

Table 65 • General Purpose Registers Space

| Address | Name |
|---------|-------------------------|
| 0G–12G | Reserved |
| 13G | CLKOUT Control |
| 14G | GPIO Control 2 |
| 15G–18G | Reserved |
| 19G | Fast Link Register |
| 20G–22G | Reserved |
| 23G | Recovered Clock Control |
| 24G | Reserved |
| 25G | Enhanced LED Control |
| 26G–30G | Reserved |

4.5.1 CLKOUT Control

The CLKOUT control register configures the functionality of the CLKOUT output pin.

Table 66 • CLKOUT Control, Address 13G (0x0D)

| Bit | Name | Access | Description | Default |
|-------|-------------------------|--------|---|---------|
| 15 | CLKOUT enable | R/W | 1: CLKOUT enabled. 0: CLKOUT disabled. | 0 |
| 14:13 | CLKOUT frequency select | R/W | 00: 25 MHz. 01: 50 MHz. 10: 125 MHz. 11: Reserved. | 00 |
| 12:0 | Reserved | R/W | Reserved. | 0x0000 |

4.5.2 GPIO Control 2

The GPIO control 2 register configures the functionality of the COMA_MODE and LED pins.

Table 67 • GPIO Control 2, Address 14G (0x0E)

| Bit | Name | Access | Description | Default |
|-------|--------------------------------------|--------|--|---------|
| 15:14 | Reserved | R/W | Reserved. | 00 |
| 13 | COMA_MODE output enable (active low) | R/W | 1: COMA_MODE pin is an input. 0: COMA_MODE pin is an output. | 1 |
| 12 | COMA_MODE output data | R/W | Value to output on the COMA_MODE pin when it is configured as an output. | 0 |
| 11 | COMA_MODE input data | RO | Data read from the COMA_MODE pin. | |
| 10 | Reserved | RO | Reserved. | |
| 9 | Tri-state enable for LEDs | R/W | 1: Tri-state LED output signals instead of driving them high. This allows the signals to be pulled above V_{DDIO} using an external pull-up resistor. 0: Drive LED bus output signals to high and low values. | 1 |
| 8:0 | Reserved | RO | Reserved. | |

4.5.3 Fast Link Configuration

Register 19G in the GPIO register space controls the selection of the source PHY for the fast link failure indication. The following table shows the settings available for the FASTLINK_FAIL pin.

Table 68 • MAC Configuration and Fast Link Register, Address 19G (0x13)

| Bit | Name | Access | Description | Default |
|------|---------------------------|--------|--|---------|
| 15:4 | Reserved | RO | Reserved. | |
| 3:0 | Fast link failure setting | R/W | 0000: Fast link failure pin enabled. 0001–1110: Reserved. 1111: Output disabled. | 0000 |

4.5.4 Recovered Clock Control

Register 23G in the extended register space controls the functionality of the recovered clock output signal.

Table 69 • Recovered Clock Control, Address 23G (0x17)

| Bit | Name | Access | Description | Default |
|-------|------------------------|--------|---|---------|
| 15 | Enable RCVRD_CLK | R/W | 1: Enable recovered clock output. 0: Disable recovered clock output. | 0 |
| 14:11 | Reserved | RO | Reserved. | |
| 10:8 | Clock frequency select | R/W | Select output clock frequency. 000: 25 MHz output clock. 001: 125 MHz output clock. 010: 31.25 MHz output clock. 011–111: Reserved. | 000 |
| 7:6 | Reserved | RO | Reserved. | |

Table 69 • Recovered Clock Control, Address 23G (0x17) (continued)

| Bit | Name | Access | Description | Default |
|-----|---------------------|--------|---|---------|
| 5:4 | Clock squelch level | R/W | Select clock squelch level. 00: Automatically squelch clock to low when the link is not up, is unstable, is up in a mode that does not support the generation of a recovered clock (10BASE-T), or is up in EEE mode (100BASE-TX). 01: Same as 00 except that the clock is also generated in 10BASE-T link-up mode. This mode also generates a recovered clock output in EEE mode during reception of LP_IDLE. 10: Squelch only when the link is not up. 11: Disable clock squelch. Note: A clock from the Cu PHY will be output on the recovered clock output in this mode when the link is down. When the CLK_SQUELCH_IN pin is set high, it squelches the recovered clocks regardless of bit settings. | 00 |
| 3 | Reserved | RO | Reserved. | |
| 2:0 | Clock selection | R/W | 000: Reserved. 001: Copper PHY recovered clock. 010–111: Reserved. | 000 |

4.5.5 Enhanced LED Control

Register 25G in the extended register space controls the advanced functionality of the parallel LED signals.

Table 70 • Enhanced LED Control, Address 25G (0x19)

| Bit | Name | Access | Description | Default |
|------|--------------------------------|--------|--|---------|
| 15:8 | LED pulsing duty cycle control | R/W | Programmable control for LED pulsing duty cycle when bit 30.12 is set to 1. Valid settings are between 0 and 198. A setting of 0 corresponds to a 0.5% duty cycle and 198 corresponds to a 99.5% duty cycle. Intermediate values change the duty cycle in 0.5% increments. | 0x00 |
| 7:0 | Reserved | RO | Reserved. | |

4.6 Clause 45 Registers to Support Energy-Efficient Ethernet and 802.3bf

This section describes the Clause 45 registers that are required to support energy-efficient Ethernet. Access to these registers is through the IEEE standard registers 13 and 14 (MMD access control and MMD data or address registers).

The following table lists the addresses and register names in the Clause 45 register page space. When the link is down, 0 is the value returned for the x.180x addresses.

Table 71 • Clause 45 Registers Page Space

| Address | Name |
|---------|---------------------------|
| 1.1 | PMA/PMD status 1 |
| 1.1800 | PMA/PMD time sync capable |

Table 71 • Clause 45 Registers Page Space (continued)

| Address | Name |
|---------|--------------------------------|
| 1.1801 | PMA/PMD delay Tx max. |
| 1.1803 | PMA/PMD delay Tx min. |
| 1.1805 | PMA/PMD delay Rx max. |
| 1.1807 | PMA/PMD delay Rx min. |
| 3.1 | PCS status 1 |
| 3.20 | EEE capability |
| 3.22 | EEE wake error counter |
| 7.60 | EEE advertisement |
| 7.61 | EEE link partner advertisement |

4.6.1 PMA/PMD Status 1

The following table shows the bit descriptions for the PMA/PMD Status 1 register.

Table 72 • PMA/PMD Status 1

| Bit | Name | Access | Description |
|------|-----------------------------|--------|--|
| 15:3 | Reserved | RO | Reserved. |
| 2 | PMD/PMA receive link status | RO/LL | 1: PMA/PMD receive link up. 0: PMA/PMD receive link down. |
| 1:0 | Reserved | RO | Reserved. |

4.6.2 PCS Status 1

The bits in the PCS Status 1 register provide a status of the EEE operation from the PCS for the link that is currently active.

Table 73 • PCS Status 1, Address 3.1

| Bit | Name | Access | Description |
|-------|-------------------------|--------|---|
| 15:12 | Reserved | RO | Reserved. |
| 11 | Tx LPI received | RO/LH | 1: Tx PCS has received LPI. 0: LPI not received. |
| 10 | Rx LPI received | RO/LH | 1: Rx PCS has received LPI. 0: LPI not received. |
| 9 | Tx LPI indication | RO | 1: Tx PCS is currently receiving LPI. 0: PCS is not currently receiving LPI. |
| 8 | Rx LPI indication | RO | 1: Rx PCS is currently receiving LPI. 0: PCS is not currently receiving LPI. |
| 7:3 | Reserved | RO | Reserved. |
| 2 | PCS receive link status | RO/LL | 1: PCS receive link up. 0: PCS receive link down. |
| 1:0 | Reserved | RO | Reserved. |

4.6.3 EEE Capability

This register is used to indicate the capability of the PCS to support EEE functions for each PHY type. The following table shows the bit assignments for the EEE capability register.

Table 74 • EEE Capability, Address 3.20

| Bit | Name | Access | Description |
|------|----------------|--------|--|
| 15:2 | Reserved | RO | Reserved. |
| 1 | 100BASE-TX EEE | RO | 1: EEE is supported for 100BASE-TX. 0: EEE is not supported for 100BASE-TX. |
| 0 | Reserved | RO | Reserved. |

4.6.4 EEE Wake Error Counter

This register is used by PHY types that support EEE to count wake time faults where the PHY fails to complete its normal wake sequence within the time required for the specific PHY type. The definition of the fault event to be counted is defined for each PHY and can occur during a refresh or a wakeup as defined by the PHY. This 16-bit counter is reset to all zeros when the EEE wake error counter is read or when the PHY undergoes hardware or software reset.

Table 75 • EEE Wake Error Counter, Address 3.22

| Bit | Name | Access | Description |
|------|--------------------|--------|-------------------------------------|
| 15:0 | Wake error counter | RO | Count of wake time faults for a PHY |

4.6.5 EEE Advertisement

This register defines the EEE advertisement that is sent in the unformatted next page following a EEE technology message code. The following table shows the bit assignments for the EEE advertisement register.

Table 76 • EEE Advertisement, Address 7.60

| Bit | Name | Access | Description | Default |
|------|----------------|--------|---|---------|
| 15:2 | Reserved | RO | Reserved. | |
| 1 | 100BASE-TX EEE | R/W | 1: Advertise that the 100BASE-TX has EEE capability. 0: Do not advertise that the 100BASE-TX has EEE capability. | 0 |
| 0 | Reserved | RO | Reserved. | |

4.6.6 EEE Link Partner Advertisement

All the bits in the EEE LP advertisement register are read only. A write to the EEE LP advertisement register has no effect. When the AN process has been completed, this register will reflect the contents of the link partner's EEE advertisement register. The following table shows the bit assignments for the EEE advertisement register.

Table 77 • EEE Advertisement, Address 7.61

| Bit | Name | Access | Description |
|------|----------------|--------|--|
| 15:2 | Reserved | RO | Reserved. |
| 1 | 100BASE-TX EEE | RO | 1: Link partner is advertising EEE capability for 100BASE-TX. 0: Link partner is not advertising EEE capability for 100BASE-TX. |
| 0 | Reserved | RO | Reserved. |

4.6.7 802.3bf Registers

The following table shows the bit assignments for the 802.3bf registers. When the link is down, 0 is the value returned. 1.1801 would be device address of 1 and register address of 1801.

Table 78 • 802.3bf Registers

| Register | Name | Function |
|----------|---------------------------|--|
| 1.1800 | PMA/PMD Time Sync capable | 1: PMA/PMD Time Sync Tx capable. 0: PMA/PMD Time Sync Rx capable. |
| 1.1801 | PMA/PMD delay Tx max | Tx maximum delay through PHY (PMA/PMD/PCS). |
| 1.1803 | PMA/PMD delay Tx min | Tx minimum delay through PHY (PMA/PMD/PCS). |
| 1.1805 | PMA/PMD delay Rx max | Rx maximum delay through PHY (PMA/PMD/PCS). |
| 1.1807 | PMA/PMD delay Rx min | Rx minimum delay through PHY (PMA/PMD/PCS). |

5 Electrical Specifications

This section provides the DC characteristics, AC characteristics, recommended operating conditions, and stress ratings for the VSC8540-04 device.

5.1 DC Characteristics

This section contains the DC specifications for the VSC8540-04 device.

5.1.1 VDDMAC, VDDIO, and VDDMDIO (2.5 V)

The following table shows the DC specifications for the pins referenced to VDDMAC, VDDIO, and VDDMDIO when it is set to 2.5 V. The specifications listed in the following table are valid only when VDD1 = 1.0 V, VDD1A = 1.0 V, and VDD25A = 2.5 V.

Table 79 • VDDMAC, VDDIO, and VDDMDIO (2.5 V) DC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|------------------------|-------------|---------|---------|---------|---------|----------------------------|
| Output high voltage | V_{OH} | 2.0 | | | V | $I_{OH} = -1.0$ mA |
| Output low voltage | V_{OL} | | | 0.4 | V | $I_{OL} = 1.0$ mA |
| Input high voltage | V_{IH} | 1.85 | | 3.6 | V | |
| Input high voltage | V_{IH} | 1.85 | | 3.1 | V | SMI pins (MDC, MDIO) |
| Input high voltage | V_{IH} | 1.85 | | 2.75 | V | VDDMAC-referenced pins |
| Input low voltage | V_{IL} | -0.3 | | 0.7 | V | |
| Input leakage current | I_{ILEAK} | -85 | | 85 | μ A | Internal resistor included |
| Output leakage current | I_{OLEAK} | -85 | | 85 | μ A | Internal resistor included |

5.1.2 VDDMAC, VDDIO, and VDDMDIO (3.3 V)

The following table shows the DC specifications for the pins referenced to VDDMAC, VDDIO, and VDDMDIO when it is set to 3.3 V. The specifications listed in the following table are valid only when VDD1 = 1.0 V, VDD1A = 1.0 V, and VDD25A = 2.5 V.

Table 80 • VDDMAC, VDDIO, and VDDMDIO (3.3 V) DC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|------------------------|-------------|---------|---------|---------|---------|----------------------------|
| Output high voltage | V_{OH} | 2.6 | | | V | $I_{OH} = -1.0$ mA |
| Output low voltage | V_{OL} | | | 0.4 | V | $I_{OL} = 1.0$ mA |
| Input high voltage | V_{IH} | 2.25 | | 3.6 | V | |
| Input low voltage | V_{IL} | -0.3 | | 0.8 | V | |
| Input leakage current | I_{ILEAK} | -135 | | 135 | μ A | Internal resistor included |
| Output leakage current | I_{OLEAK} | -135 | | 135 | μ A | Internal resistor included |

5.1.3 VDDMAC and VDDMDIO (1.5 V)

The following table shows the DC specifications for the pins referenced to VDDMAC and VDDMDIO when it is set to 1.5 V. The specifications listed in the following table are valid only when VDD1 = 1.0 V, VDD1A = 1.0 V, VDD25A = 2.5 V, and VDDIO = 2.5 V or 3.3 V.

Table 81 • VDDMAC and VDDMDIO DC Characteristics (1.5 V)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|------------------------|-------------|---------|---------|---------|---------|----------------------------|
| Output high voltage | V_{OH} | 1.2 | | | V | $I_{OH} = -1$ mA |
| Output low voltage | V_{OL} | | | 0.25 | V | $I_{OL} = 1$ mA |
| Input high voltage | V_{IH} | 1.13 | | 1.87 | V | VDDMDIO-referenced pins |
| Input high voltage | V_{IH} | 1.13 | | 1.65 | V | VDDMAC-referenced pins |
| Input low voltage | V_{IL} | -0.375 | | 0.45 | V | |
| Input leakage current | I_{ILEAK} | -40 | | 40 | μ A | Internal resistor included |
| Output leakage current | I_{OLEAK} | -40 | | 40 | μ A | Internal resistor included |

5.1.4 VDDMAC and VDDMDIO (1.8 V)

The following table shows the DC specifications for the pins references to VDDMAC and VDDMDIO when it is set to 1.8 V. The specifications listed in the following table are valid only when VDD1 = 1.0 V, VDD1A = 1.0 V, VDD25A = 2.5 V, and VDDIO = 2.5 V or 3.3 V.

Table 82 • VDDMAC and VDDMDIO DC Characteristics (1.8 V)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|------------------------|-------------|---------|---------|---------|---------|----------------------------|
| Output high voltage | V_{OH} | 1.43 | | | V | $I_{OH} = -1$ mA |
| Output low voltage | V_{OL} | | | 0.3 | V | $I_{OL} = 1$ mA |
| Input high voltage | V_{IH} | 1.35 | | 2.25 | V | VDDMDIO-referenced pins |
| Input high voltage | V_{IH} | 1.35 | | 1.98 | V | VDDMAC-referenced pins |
| Input low voltage | V_{IL} | -0.45 | | 0.54 | V | |
| Input leakage current | I_{ILEAK} | -48 | | 48 | μ A | Internal resistor included |
| Output leakage current | I_{OLEAK} | -48 | | 48 | μ A | Internal resistor included |

5.1.5 VDDMDIO (1.2 V)

The following table shows the DC specifications for the pins referenced to VDDMDIO when it is set to 1.2 V. The specifications listed in the following table are valid only when VDD1 = 1.0 V, VDD1A = 1.0 V, and VDD25A = 2.5 V.

Table 83 • VDDMDIO DC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|---------------------|----------|---------|---------|---------|------|------------------|
| Output high voltage | V_{OH} | 0.95 | | | V | $I_{OH} = -1$ mA |
| Output low voltage | V_{OL} | | | 0.2 | V | $I_{OL} = 1$ mA |
| Input high voltage | V_{IH} | 0.9 | | 1.5 | V | |
| Input low voltage | V_{IL} | -0.3 | | 0.36 | V | |

Table 83 • VDDMDIO DC Characteristics (continued)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|------------------------|-------------|---------|---------|---------|---------------|----------------------------|
| Input leakage current | I_{ILEAK} | -32 | | 32 | μA | Internal resistor included |
| Output leakage current | I_{OLEAK} | -32 | | 32 | μA | Internal resistor included |

5.1.6 XTAL1

The following table shows the DC specifications for the XTAL1 pin referenced to VDD25A. The specifications listed in the following table are valid only when VDD1 = 1.0 V, VDD1A = 1.0 V, and the on-chip oscillator is turned off.

Table 84 • XTAL1 DC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|------------------------|-------------|---------|---------|---------|---------------|
| Input high voltage | V_{IH} | 1.85 | | 2.75 | V |
| Input low voltage | V_{IL} | -0.3 | | 0.7 | V |
| Input leakage current | I_{ILEAK} | -85 | | 85 | μA |
| Output leakage current | I_{OLEAK} | -85 | | 85 | μA |

5.1.7 LED

The following table shows the DC specifications for the LED pins.

Table 85 • LED DC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|------------------------------------|----------|---------|---------|---------|------|
| Output high current drive strength | I_{OH} | | | -24 | mA |
| Output low current drive strength | I_{OL} | 24 | | | mA |

5.1.8 Internal Pull-Up or Pull-Down Resistors

Internal pull-up or pull-down resistors are specified in the following table. All internal pull-up resistors are connected to their respective I/O supply.

Table 86 • Internal Pull-Up or Pull-Down Resistors (MII/RGMII/RMII Interface)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|-----------------------------|----------|---------|---------|---------|-----------|-----------|
| Internal pull-down resistor | R_{PD} | 31 | 46 | 72 | $k\Omega$ | 3.3 V |
| Internal pull-down resistor | R_{PD} | 38 | 59 | 96 | $k\Omega$ | 2.5 V |
| Internal pull-down resistor | R_{PD} | 57 | 91 | 155 | $k\Omega$ | 1.8 V |
| Internal pull-down resistor | R_{PD} | 78 | 125 | 220 | $k\Omega$ | 1.5 V |

Table 87 • Internal Pull-Up or Pull-Down Resistors (Other I/Os)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|-----------------------------|----------|---------|---------|---------|-----------|-----------|
| Internal pull-up resistor | R_{PU} | 26 | 39 | 64 | $k\Omega$ | 3.3 V |
| Internal pull-down resistor | R_{PD} | 26 | 45 | 79 | $k\Omega$ | 3.3 V |
| Internal pull-up resistor | R_{PU} | 33 | 53 | 93 | $k\Omega$ | 2.5 V |
| Internal pull-down resistor | R_{PD} | 34 | 58 | 108 | $k\Omega$ | 2.5 V |

5.1.9 Current Consumption

The following table shows the measured current consumption values for each mode of operation. Add values from table for VDDMAC current consumption to calculate total typical current for each power supply. Add significant margin above the values for sizing power supplies.

Note: VDDMAC currents at 1.5 V and 1.8 V are measured with an edge rate setting of 111. Currents at 2.5 V and 3.3 V are measured with an edge rate setting of 100.

Table 88 • Current Consumption

| Mode | Typical (mA) | | | |
|----------------|--------------|-------|--------|---------------|
| | VDD1 | VDD1A | VDD25A | VDDIO/VDDMDIO |
| Reset | 15 | 5 | 5 | 5 |
| Power Down | 20 | 20 | 15 | 5 |
| ActiPHY | 20 | 20 | 20 | 5 |
| No Link | 30 | 20 | 55 | 5 |
| 100BASE-TX | 35 | 20 | 100 | 5 |
| 10BASE-T | 20 | 20 | 65 | 5 |
| 100BASE-TX EEE | 25 | 20 | 60 | 5 |
| 10BASE-Te | 20 | 20 | 60 | 5 |

Table 89 • Current Consumption (VDDMAC)

| Mode | Typical (mA) | | | |
|--------------------|--------------|-------|-------|-------|
| | 1.5 V | 1.8 V | 2.5 V | 3.3 V |
| Reset | 5 | 5 | 5 | 5 |
| Power Down | 10 | 10 | 15 | 20 |
| ActiPHY | 10 | 10 | 15 | 20 |
| No Link | 10 | 10 | 15 | 20 |
| MII (100BASE-TX) | 10 | 10 | 15 | 15 |
| MII (10BASE-T/Te) | 5 | 5 | 5 | 5 |
| RGMI (100BASE-TX) | 5 | 10 | 10 | 15 |
| RGMI (10BASE-T/Te) | 5 | 5 | 5 | 5 |
| RMII (100BASE-TX) | 10 | 15 | 15 | 20 |
| RMII (10BASE-T/Te) | 10 | 10 | 15 | 15 |

Table 90 • Power Consumption

| Parameter | Symbol | Typical | Maximum | Unit |
|------------------------------|--------|---------|---------|------|
| Worst-case power consumption | P_D | | 580 | mW |

5.1.10 Thermal Diode

The device includes an on-die diode and internal circuitry for monitoring die temperature (junction temperature). The operation and accuracy of the diode is not guaranteed and should only be used as a reference.

The on-die thermal diode requires an external thermal sensor, located on the board or in a stand-alone measurement kit. Temperature measurement using a thermal diode is very sensitive to noise. The following illustration shows a generic application design.

Figure 22 • Thermal Diode

Note: Microsemi does not support or recommend operation of the thermal diode under reverse bias.

The following table provides the diode parameter and interface specifications with the pins connected internally to VSS in the device.

Table 91 • Thermal Diode Parameters

| Parameter | Symbol | Typical | Maximum | Unit |
|-----------------------|----------|-----------------------|---------|------|
| Forward bias current | I_{FW} | See note ¹ | 1 | mA |
| Diode ideality factor | n | 1.008 | | |

1. Typical value is device dependent.

The ideality factor, n , represents the deviation from ideal diode behavior as exemplified by the diode equation:

$$I_{FW} = I_S (e^{(qV_D)/(nkT)} - 1)$$

where, I_S = saturation current, q = electronic charge, V_D = voltage across the diode, k = Boltzmann constant, and T = absolute temperature (Kelvin).

5.2 AC Characteristics

This section provides the AC specifications for the VSC8540-04 device.

5.2.1 Reference Clock

The following table lists the AC specifications for the REFCLK reference clock.

Table 92 • RefClk

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|---------------------------------------|------------|----------|---------|---------|------------|---------------------------------|
| REFCLK frequency, REFCLK_SEL[1:0]= 11 | f | -100 ppm | 125 | 100 ppm | MHz | |
| REFCLK frequency, REFCLK_SEL[1:0]= 10 | f | -100 ppm | 50 | 100 ppm | MHz | |
| REFCLK frequency, REFCLK_SEL[1:0]= 01 | f | -100 ppm | 25 | 100 ppm | MHz | |
| Rise time and fall time | t_R, t_F | | | 1.5 | ns | 20% to 80%, 5.1 pF load |
| Duty cycle | | 45 | | 55 | % | |
| Phase jitter—Gaussian | | | | 4 | ps_{RMS} | Bandwidth from 10 kHz to 10 MHz |

Table 92 • RefClk (continued)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|----------------------------|--------|---------|---------|---------|------------------|--------------|
| Total jitter, peak-to-peak | | | | 200 | ps _{pp} | 10K samples. |

5.2.1.1 XTAL Reference Clock

When using the 25 MHz crystal clock input option (REFCLK_SEL[1:0] = 00), the additional specifications listed in the following table are required.

Table 93 • XTAL RefClk

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|-----------------|--------|---------|---------|---------|------|
| CL ¹ | | 8 | | | pF |
| Crystal ESR | | | | 60 | Ω |

$$1. \quad C_L = \frac{C1_{EXT} \times C2_{EXT}}{C1_{EXT} + C2_{EXT}}$$

where

$$C1_{EXT} = C1 + CIN_{EXT}$$

$$C2_{EXT} = C2 + COU_{EXT}$$

CIN_{EXT} represents input (XTAL1) I/O, bond pad, package pin, and routing parasitic capacitance

and COU_{EXT} represents output (XTAL2) I/O, bond pad, package pin, and routing parasitic capacitance.

For a reference tank circuit, see [Figure 10](#), page 13.

5.2.2 Recovered Clock

This section provides the AC characteristics for the recovered clock output signal. The following table shows the AC specifications for the RCVRD_CLK output.

Table 94 • Recovered Clock AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|---|-----------------------|---------|---------|---------|------|--------------|
| Recovered clock frequency | f | | 125 | | MHz | |
| Recovered clock frequency | f | | 31.25 | | MHz | |
| Recovered clock frequency | f | | 25 | | MHz | |
| Recovered clock cycle time | t_{RCYC} | | 8 | | ns | |
| Recovered clock cycle time | t_{RCYC} | | 32 | | ns | |
| Recovered clock cycle time | t_{RCYC} | | 40 | | ns | |
| Frequency stability | $f_{STABILITY}$ | | | 50 | ppm | |
| Duty cycle | DC | 40 | 50 | 60 | % | |
| Clock rise time and fall time | t_R, t_F | | | 1.2 | ns | 20% to 80% |
| Peak-to-peak jitter, copper media interface | JPP _{CLK_Cu} | | | 400 | ps | 10k samples. |

The following illustration shows the test circuit for the CLKOUT, RCVRD_CLK, and RMII_CLKOUT outputs.

Figure 23 • Test Circuit for Recovered Clock Outputs Signal

5.2.3 CLKOUT

This section provides the AC characteristics for the CLKOUT signal.

The following table shows the AC specifications for the CLKOUT output.

Table 95 • CLKOUT AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|-------------------------------|------------------------------|---------|---------|---------|------|-------------------------------------|
| CLKOUT frequency | f | | 125 | | MHz | |
| CLKOUT frequency | f | | 50 | | MHz | |
| CLKOUT frequency | f | | 25 | | MHz | |
| CLKOUT cycle time | t_{COCYC} | | 8 | | ns | |
| CLKOUT cycle time | t_{COCYC} | | 20 | | ns | |
| CLKOUT cycle time | t_{COCYC} | | 40 | | ns | |
| Frequency stability | $f_{\text{STABILITY}}$ | | | 5 | ppm | Relative to device REFCLK frequency |
| Duty cycle | DC | 40 | 50 | 60 | % | CLKOUT at 25 MHz and 125 MHz |
| Duty cycle | DC | 35 | 50 | 75 | % | CLKOUT at 50 MHz |
| Clock rise time and fall time | $t_{\text{R}}, t_{\text{F}}$ | | | 1.5 | ns | 20% to 80% |
| Peak-to-peak jitter | $\text{JPP}_{\text{CLKOUT}}$ | | | 700 | ps | 10 k samples |

5.2.4 RMII_CLKOUT

This section provides the AC characteristics for the RMII_CLKOUT signal.

Note: The RMII_CLKOUT signal is provided on the RX_CLK pin (see Table 3, page 6) when the device is operating in RMII mode.

The following table shows the AC specifications for RMII_CLKOUT.

Table 96 • RMII_CLKOUT AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|------------------------|----------------|---------|---------|---------|------|
| RMII_CLKOUT frequency | f | | 50 | | MHz |
| RMII_CLKOUT duty cycle | DC | 35 | | 65 | % |
| RMII_CLKOUT rise time | t_{R} | | | 1 | ns |
| RMII_CLKOUT fall time | t_{F} | | | 1 | ns |

5.2.5 Basic Serial LEDs

This section contains the AC specifications for the basic serial LEDs.

Table 97 • Basic Serial LEDs AC Characteristics

| Parameter | Symbol | Typical | Unit |
|----------------------------------|-------------------|-----------|------|
| LED_CLK cycle time | t_{CYC} | 1024 | ns |
| Pause between LED port sequences | t_{PAUSE_PORT} | 3072 | ns |
| Pause between LED bit sequences | t_{PAUSE_BIT} | 25.541632 | ms |
| LED_CLK to LED_DATA | t_{CO} | 1 | ns |

Figure 24 • Basic Serial LED Timing

5.2.6 RMII AC Characteristics

The following table lists the characteristics when using the device in RMII mode.

Table 98 • RMII AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|--|------------|---------|---------|---------|------|
| TXD[1:0], TX_EN, RXD[1:0], CRS_DV, RX_ER data setup to RMII_CLKIN rising edge | T_{SU} | 4 | | | ns |
| TXD[1:0], TX_EN, RXD[1:0], CRS_DV, RX_ER data hold from RMII_CLKIN rising edge | T_{HOLD} | 2 | | | ns |

5.2.7 MII Transmit

The following table lists the characteristics when using the device in MII transmit mode. For information about the MII transmit timing, see [Figure 25](#), page 66.

Table 99 • MII Transmit AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|---|-------------|---------|---------|---------|------|
| MII_TXCLK to TXD[3:0], TX_EN, TX_ER delay | t_{DELAY} | 0 | | 25 | ns |
| MII_TXCLK duty cycle | DC | 35 | | 65 | % |

Figure 25 • MII Transmit Timing

5.2.8 MII Receive

The following table lists the characteristics when using the device in MII receive mode. For information about the MII receive timing, see [Figure 26](#), page 66.

Table 100 • MII Receive AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|-------------------------|----------|---------|---------|---------|------|--|
| Setup to RX_CLK rising | t_{SU} | 10 | | | ns | |
| Hold from RX_CLK rising | t_H | 10 | | | ns | Measured from 0.8 V to 2.0 V, VDDMAC = 2.5 V and 3.3 V |

Figure 26 • MII Receive Timing

5.2.9 Uncompensated RGMII

The following table lists the characteristics when using the device in RGMII uncompensated mode. For more information about the RGMII uncompensated timing, see [Figure 27](#), page 67.

Table 101 • Uncompensated RGMII AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|---|-------------|---------|-----------|---------|------|--|
| Clock frequency | f_{CLK} | | 25 2.5 | | MHz | 100BASE-TX operation 10BASE-T operation |
| Duty cycle | DC | 40 | 50 | 60 | % | |
| Data to clock output skew (at Transmitter) ¹ | t_{SKEWT} | -500 | | 500 | ps | |
| Data to clock output skew (at Receiver) ¹ | t_{SKEWR} | 1 | 1.8 | 2.6 | ns | |

Table 101 • Uncompensated RGMII AC Characteristics (continued)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|---------------------------------------|--------------|---------|---------|---------|------|--|
| TX_CLK switching threshold | V_{THRESH} | 0.75 | | | V | $VDDMAC = 1.5\text{ V}$ |
| | | 0.90 | | | | $VDDMAC = 1.8\text{ V}$ |
| | | 1.25 | | | | $VDDMAC = 2.5\text{ V}$ |
| | | 1.65 | | | | $VDDMAC = 3.3\text{ V}$ |
| Clock/data output rise and fall times | t_R, t_F | | | 0.75 | ns | $VDDMAC = 1.5\text{ V},$ $27E2.7:5 = 111$ |
| | | | | | | $VDDMAC = 1.8\text{ V},$ $27E2.7:5 = 111$ |
| | | | | | | $VDDMAC = 2.5\text{ V},$ $27E2.7:5 = 100$ |
| | | | | | | $VDDMAC = 3.3\text{ V},$ $27E2.7:5 = 100$ |

- When operating in uncompensated mode, the PC board design requires a clock to be routed such that an additional trace delay of greater than 1.5 ns is added to the associated clock signal.

Figure 27 • Uncompensated RGMII Timing

5.2.10 Compensated RGMII

The following table lists the characteristics when using the device in RGMII compensated mode.

Table 102 • PHY Input (GTX_CLK Delay When Register 20E2.[2:0]=011'b)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|--|----------------------|---------|---------|---------|------|
| Data to clock setup (TX_CLK delay = 011'b) | t_{SETUP_T} | -1.0 | | | ns |
| Clock to data hold (TX_CLK delay = 011'b) | t_{HOLD_T} | 2.8 | | | ns |

Figure 28 • Compensated Input RGMII Timing

Table 103 • PHY Output (RX_CLK Delay When Register 20E2.[6:4]=100'b)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|--|----------------------|---------|---------|---------|------|
| Data to clock setup (RX_CLK delay = 100'b) | t_{SETUP_R} | 1.4 | 2.0 | | ns |
| Clock to data hold (RX_CLK delay = 100'b) | t_{HOLD_R} | 1.5 | 2.0 | | ns |

Figure 29 • Compensated Output RGMII Timing

5.2.11 Serial Management Interface

This section contains the AC specifications for the serial management interface (SMI).

Table 104 • Serial Management Interface AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|----------------------------|------------------|---------|---------|---------|------|-----------|
| MDC frequency ¹ | f_{CLK} | | 2.5 | 12.5 | MHz | |
| MDC cycle time | t_{CYC} | 80 | 400 | | ns | |

Table 104 • Serial Management Interface AC Characteristics (continued)

| Parameter | Symbol | Minimum | Typical | Maximum | Unit | Condition |
|----------------------|----------|---------|---------|--------------------------------|------|--|
| MDC time high | t_{WH} | 20 | 50 | | ns | |
| MDC time low | t_{WL} | 20 | 50 | | ns | |
| Setup to MDC rising | t_{SU} | 10 | | | ns | |
| Hold from MDC rising | t_H | 14 | | | ns | |
| MDC rise time | t_R | | | 100 $t_{CYC} \times 10\%^1$ | ns | $f_{CLK} < 1$ MHz f_{CLK} from 1 MHz to 12.5 MHz |
| MDC fall time | t_F | | | 100 $t_{CYC} \times 10\%^1$ | ns | $f_{CLK} < 1$ MHz f_{CLK} from 1 MHz to 12.5 MHz |
| MDC to MDIO valid | t_{CO} | | 10 | 300 | ns | Time-dependent on the value of the external pull-up resistor on the MDIO pin |

1. For f_{CLK} above 1 MHz, the maximum rise time and fall time is in relation to the frequency of the MDC clock period. For example, if f_{CLK} is 2 MHz, the maximum clock rise time and fall time is 50 ns.

Figure 30 • Serial Management Interface Timing

5.2.12 Reset Timing

This section contains the AC specifications that apply to device reset functionality. The signal applied to the NRESET input must comply with the specifications listed in the following table.

Table 105 • Reset Timing AC Characteristics

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|--|-------------|---------|---------|---------|------|
| NRESET assertion time after power supplies and clock stabilize | t_W | 2 | | | ms |
| Recovery time from reset inactive to device fully active | t_{REC} | | 15 | | ms |
| NRESET pulse width | $t_{W(RL)}$ | 100 | | | ns |
| Wait time between NRESET de-assert and access of the SMI interface | t_{WAIT} | 15 | | | ms |

5.3 Operating Conditions

The following table shows the recommended operating conditions for the VSC8540-04 device.

Table 106 • Recommended Operating Conditions

| Parameter | Symbol | Minimum | Typical | Maximum | Unit |
|---|-------------|---------|---------|---------|------|
| Power supply voltage for core supply | V_{DD1} | 0.95 | 1.00 | 1.05 | V |
| Power supply voltage for analog circuits | V_{DD1A} | 0.95 | 1.00 | 1.05 | V |
| 2.5 V power supply voltage for analog circuits | V_{DD25A} | 2.38 | 2.5 | 2.62 | V |
| 2.5 V power supply voltage for VDDMAC, VDDIO, and VDDMDIO | V_{25} | 2.38 | 2.5 | 2.62 | V |
| 3.3 V power supply voltage for VDDMAC, VDDIO, and VDDMDIO | V_{33} | 3.135 | 3.3 | 3.465 | V |
| 1.8 V power supply voltage for VDDMAC and VDDMDIO | V_{18} | 1.71 | 1.8 | 1.89 | V |
| 1.5 V power supply voltage for VDDMAC and VDDMDIO | V_{15} | 1.425 | 1.5 | 1.575 | V |
| 1.2 V power supply voltage for VDDMDIO | V_{12} | 1.14 | 1.2 | 1.26 | V |
| VSC8540-04 operating temperature ¹ | T | -40 | | 125 | °C |

1. Minimum specification is ambient temperature, and the maximum is junction temperature.

5.4 Stress Ratings

This section contains the stress ratings for the VSC8540-04 device.

Warning Stresses listed in the following table may be applied to devices one at a time without causing permanent damage. Functionality at or exceeding the values listed is not implied. Exposure to these values for extended periods may affect device reliability.

Table 107 • Stress Ratings

| Parameter | Symbol | Minimum | Maximum | Unit |
|---|---|-----------------------|---------|------|
| Power supply voltage for core supply | V_{DD1} | -0.3 | 1.10 | V |
| Power supply voltage for analog circuits | V_{DD1A} | -0.3 | 1.10 | V |
| Power supply voltage for analog circuits | V_{DD25A} | -0.3 | 2.75 | V |
| Power supply voltage for digital I/O | V_{DDMAC} , V_{DDIO} , V_{DDMDIO} | -0.3 | 3.6 | V |
| Input voltage for digital I/O (3.3 V) | | | 3.6 | V |
| Input voltage for digital I/O (2.5 V) | | | 3.3 | V |
| Storage temperature | T_S | -55 | 125 | °C |
| Electrostatic discharge voltage, charged device model | V_{ESD_CDM} | -1000 | 1000 | V |
| Electrostatic discharge voltage, human body model | V_{ESD_HBM} | See note ¹ | | V |

1. This device has completed all required testing as specified in the JEDEC standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*, and complies with a Class 2 rating. The definition of Class 2 is any part that passes an ESD pulse of 2000 V, but fails an ESD pulse of 4000 V.

Warning This device can be damaged by electrostatic discharge (ESD) voltage. Microsemi recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures may adversely affect reliability of the device.

6 Pin Descriptions

The VSC8540-04 device has 68 pins, which are described in this section.

The pin information is also provided as an attached Microsoft Excel file so that you can copy it electronically. In Acrobat, double-click the attachment icon.

6.1 Pin Identifications

This section contains the pin descriptions for the VSC8540-04 device. The following table provides notations for definitions of the various pin types.

Table 108 • Pin Type Symbol Definitions

| Symbol | Pin Type | Description |
|--------|---------------------|--|
| A | Analog | Analog. |
| ADIFF | Analog differential | Analog differential signal pair. |
| I | Input | Input without on-chip pull-up or pull-down resistor. |
| I/O | Bidirectional | Bidirectional input or output signal. |
| O | Output | Output signal. |
| P | Power | Power. |
| PD | Pull-down | On-chip pull-down resistor present. |
| PU | Pull-up | On-chip pull-up resistor present. |

| Functional Group | Name | Number | Type | I/O Domain | Description |
|------------------|------------|--------|---------|------------|--|
| Cu PHY Media | P0_D0N | 12 | ADIFF | VDD25A | Tx/Rx channel A negative signal |
| Cu PHY Media | P0_D0P | 13 | ADIFF | VDD25A | Tx/Rx channel A positive signal |
| Cu PHY Media | P0_D1N | 9 | ADIFF | VDD25A | Tx/Rx channel B negative signal |
| Cu PHY Media | P0_D1P | 10 | ADIFF | VDD25A | Tx/Rx channel B positive signal |
| Miscellaneous | REF_FILT | 67 | A | VDD25A | Reference filter connects to an external 0.01 uF (20%) capacitor to analog ground |
| Miscellaneous | REF_REXT | 1 | A | VDD25A | Reference connects to an external 2k Ω (1%) resistor to analog ground |
| Miscellaneous | RESERVED_0 | 66 | | VDD25A | Reserved signal, leave unconnected |
| Miscellaneous | RESERVED_1 | 65 | | VDD25A | Reserved signal, leave unconnected |
| Miscellaneous | RESERVED_2 | 7 | ADIFF | VDD25A | Internal test signal. Connect a 100 Ω (5%) resistor across this pin and pin 6. |
| Miscellaneous | RESERVED_3 | 6 | ADIFF | VDD25A | Internal test signal. Connect a 100 Ω (5%) resistor across this pin and pin 7. |
| Miscellaneous | RESERVED_4 | 4 | ADIFF | VDD25A | Internal test signal. Connect a 100 Ω (5%) resistor across this pin and pin 3. |
| Miscellaneous | RESERVED_5 | 3 | ADIFF | VDD25A | Internal test signal. Connect a 100 Ω (5%) resistor across this pin and pin 4. |
| Miscellaneous | RESERVED_6 | 47 | I, PD | VDDMAC | Reserved signal, leave unconnected |
| Miscellaneous | RESERVED_7 | 46 | I, PD | VDDMAC | Reserved signal, leave unconnected |
| Miscellaneous | RESERVED_8 | 45 | I, PD | VDDMAC | Reserved signal, leave unconnected |
| Miscellaneous | RESERVED_9 | 43 | I, PD | VDDMAC | Reserved signal, leave unconnected |
| Miscellaneous | RXD4 | 24 | I/O, PD | VDDMAC | The logic state on this pin is latched on the rising edge of NRESET to configure the device. See Hardware Mode Strapping and PHY Addressing for details. Does not perform any GMII function for this device. |
| Miscellaneous | RXD5 | 23 | I/O, PD | VDDMAC | The logic state on this pin is latched on the rising edge of NRESET to configure the device. See Hardware Mode Strapping and PHY Addressing for details. Does not perform any GMII function for this device. |
| Miscellaneous | RXD6 | 21 | I/O, PD | VDDMAC | The logic state on this pin is latched on the rising edge of NRESET to configure the device. See Hardware Mode Strapping and PHY Addressing for details. Does not perform any GMII function for this device. |
| Miscellaneous | RXD7 | 20 | I/O, PD | VDDMAC | The logic state on this pin is latched on the rising edge of NRESET to configure the device. See Hardware Mode Strapping and PHY Addressing for details. Does not perform any GMII function for this device. |

| | | | | | |
|-------------------|----------------|----|---------|--------|---|
| Miscellaneous | THERMDA | 15 | A | VDD25A | Thermal Diode Anode |
| Miscellaneous | THERMDC_VSS | 16 | A | VDD25A | Thermal Diode Cathode connected to device ground. Temperature sensor must be chosen accordingly. |
| PHY Configuration | CLK_SQUELCH_IN | 57 | I, PD | VDDIO | Input control to squelch recovered clock |
| PHY Configuration | CLKOUT | 54 | I/O, PD | VDDIO | Clock output, can be enabled or disabled. Output a clock based on the local reference clock with programmable frequency. This pin is not active when NRESET is asserted and is disabled by default. When disabled, the pin is held low. The logic state on this pin is latched on the rising edge of NRESET to configure CLKOUT output. See "Hardware Mode Strapping and PHY Addressing" for details. |
| PHY Configuration | COMA_MODE | 56 | I/O, PU | VDDIO | When this pin is asserted high, PHY is held in a powered down state. When de-asserted low, PHY is powered up and resumes normal operation. This signal is also used to synchronize the operation of multiple chips on the same PCB to provide visual synchronization for LEDs driven by separate chips. |
| PHY Configuration | FASTLINK_FAIL | 52 | O | VDDIO | Fast link failure indication signal |
| PHY Configuration | LED0 | 60 | O | VDDIO | LED direct drive outputs. All LED pins are active low. LED_DATA output in serial LED mode. |
| PHY Configuration | LED1 | 59 | O | VDDIO | LED direct drive outputs. All LED pins are active low. LED_CLK output in serial LED mode. |
| PHY Configuration | NRESET | 53 | I, PD | VDDIO | Device reset. Active low input that powers down the device and sets all register bits to their default state. |
| PHY Configuration | RCVRD_CLK | 55 | O | VDDIO | Recovered clock output, can be enabled or disabled. Output a clock based on the selected active media with programmable frequency. This pin is not active when NRESET is asserted. When disabled, the pin is held low. |
| PHY Configuration | REFCLK_SEL_0 | 62 | I, PU | VDDIO | Reference clock mode/frequency select signal |
| PHY Configuration | REFCLK_SEL_1 | 61 | I, PU | VDDIO | Reference clock mode/frequency select signal |
| PHY Configuration | XTAL1 | 63 | I | VDD25A | Crystal/single ended reference clock input |
| PHY Configuration | XTAL2 | 64 | O | VDD25A | Crystal output, leave unconnected when using single ended reference clock |

| | | | | |
|--------|-----------|----|----------------|--|
| Power | VDD1 | 17 | P | 1.0 V digital core power |
| Power | VDD1 | 34 | P | 1.0 V digital core power |
| Power | VDD1A | 5 | P | 1.0 V analog power requiring additional PCB power supply filtering |
| Power | VDD1A | 14 | P | 1.0 V analog power requiring additional PCB power supply filtering |
| Power | VDD1A | 68 | P | 1.0 V analog power requiring additional PCB power supply filtering |
| Power | VDD25A | 2 | P | 2.5 V analog power requiring additional PCB power supply filtering |
| Power | VDD25A | 8 | P | 2.5 V analog power requiring additional PCB power supply filtering |
| Power | VDD25A | 11 | P | 2.5 V analog power requiring additional PCB power supply filtering |
| Power | VDDIO | 58 | P | 2.5 V or 3.3 V general I/O power |
| Power | VDDMAC | 22 | P | 1.5 V, 1.8 V, 2.5 V, or 3.3 V RGMII/MII/RMII MAC power |
| Power | VDDMAC | 28 | P | 1.5 V, 1.8 V, 2.5 V, or 3.3 V RGMII/MII/RMII MAC power |
| Power | VDDMAC | 39 | P | 1.5 V, 1.8 V, 2.5 V, or 3.3 V RGMII/MII/RMII MAC power |
| Power | VDDMAC | 44 | P | 1.5 V, 1.8 V, 2.5 V, or 3.3 V RGMII/MII/RMII MAC power |
| Power | VDDMDIO | 49 | P | 1.2 V, 1.5 V, 1.8 V, 2.5 V, or 3.3 V power for SMI pins |
| R/GMII | COL | 18 | I/O, PD VDDMAC | MII collision output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | CRS | 19 | I/O, PD VDDMAC | MII carrier sense output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | MII_TXCLK | 36 | I/O, PD VDDMAC | MII transmit clock output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | RX_CLK | 32 | I/O, PD VDDMAC | RGMII/MII receive clock output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |

| | | | | | |
|--------|--------------|----|---------|---------|--|
| R/GMII | RX_DV/RX_CTL | 30 | I/O, PD | VDDMAC | MII receive data valid output / RGMII receive control output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | RX_ER | 31 | I/O, PD | VDDMAC | MII receive data error output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | RXD0 | 29 | I/O, PD | VDDMAC | RGMII/MII data output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | RXD1 | 27 | I/O, PD | VDDMAC | RGMII/MII data output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | RXD2 | 26 | I/O, PD | VDDMAC | RGMII/MII data output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | RXD3 | 25 | I/O, PD | VDDMAC | RGMII/MII data output. The logic state on this pin is latched on the rising edge of NRESET to configure the device. See "Hardware Mode Strapping and PHY Addressing" for details. |
| R/GMII | TX_CLK | 37 | I, PD | VDDMAC | RGMII transmit clock input |
| R/GMII | TX_EN/TX_CTL | 33 | I, PD | VDDMAC | MII transmit data enable input/RGMII transmit data control input |
| R/GMII | TX_ER | 35 | I, PD | VDDMAC | MII transmit data error input |
| R/GMII | TXD0 | 38 | I, PD | VDDMAC | RGMII/MII data input |
| R/GMII | TXD1 | 40 | I, PD | VDDMAC | RGMII/MII data input |
| R/GMII | TXD2 | 41 | I, PD | VDDMAC | RGMII/MII data input |
| R/GMII | TXD3 | 42 | I, PD | VDDMAC | RGMII/MII data input |
| SMI | MDC | 48 | I | VDDMDIO | Management data clock. A 0 MHz to 12.5 MHz reference input is used to clock serial MDIO data into and out of the PHY. |
| SMI | MDINT | 51 | O, OD | VDDMDIO | Management interrupt signal. These pins can be tied together in a wired-OR configuration with only a single pull-up resistor. |

| | | | | | |
|-----|------|----|-----|---------|--|
| SMI | MDIO | 50 | I/O | VDDMDIO | Management data input/output pin. Serial data is written or read from this pin bi-directionally between the PHY and station manager synchronously on the positive edge of MDC. One external pull-up resistor is required at the station manager. |
|-----|------|----|-----|---------|--|

7 Package Information

The VSC8540XMV-04 package is a lead-free (Pb-free), 68-pin, plastic quad flat no-lead (QFN) package with an exposed pad, 8 mm × 8 mm body size, 0.4 mm pin pitch, and 0.9 mm maximum height.

Lead-free products from Microsemi comply with the temperatures and profiles defined in the joint IPC and JEDEC standard IPC/JEDEC J-STD-020. For more information, see the IPC and JEDEC standard.

This section provides the package drawing, thermal specifications, and moisture sensitivity rating for the VSC8540-04 device.

7.1 Package Drawing

The following illustration shows the package drawing for the VSC8540-04 device. The drawing contains the top view, bottom view, side view, dimensions, tolerances, and notes.

Figure 32 • Package Drawing

Notes

1. All dimensions and tolerances are in millimeters (mm).
2. Dimension b applies to the metallized terminal and is measured between 0.15 mm and 0.30 mm from the terminal tip.
3. Maximum package warpage is 0.08 mm.

Dimensions and Tolerances

| Reference | Minimum | Nominal | Maximum |
|-----------|---------|-----------|---------|
| A | 0.80 | 0.85 | 0.90 |
| A1 | 0.00 | 0.02 | 0.05 |
| A3 | | 0.203 Ref | |
| D | | 8.00 BSC | |
| D1 | 5.10 | 5.20 | 5.30 |
| E | | 8.00 BSC | |
| E1 | 5.10 | 5.20 | 5.30 |
| K | | 1.00 Ref | |
| e | | 0.40 BSC | |
| L | 0.30 | 0.40 | 0.50 |
| b | 0.15 | 0.20 | 0.25 |

7.2 Thermal Specifications

Thermal specifications for this device are based on the JEDEC JESD51 family of documents. These documents are available on the JEDEC website at www.jedec.org. The thermal specifications are modeled using a four-layer test board with two signal layers, a power plane, and a ground plane (2s2p

PCB). For more information about the thermal measurement method used for this device, see the JESD51-1 standard.

Table 109 • Thermal Resistances

| Symbol | °C/W | Parameter |
|-------------------------|------|--|
| $\theta_{J\text{Ctop}}$ | 19.3 | Die junction to package case top |
| θ_{JB} | 6.6 | Die junction to printed circuit board |
| θ_{JA} | 26.6 | Die junction to ambient |
| θ_{JMA} at 1 m/s | 20.0 | Die junction to moving air measured at an air speed of 1 m/s |
| θ_{JMA} at 2 m/s | 19.0 | Die junction to moving air measured at an air speed of 2 m/s |

To achieve results similar to the modeled thermal measurements, the guidelines for board design described in the JESD51 family of publications must be applied. For information about applications using QFN packages, see the following:

- JESD51-2A, *Integrated Circuits Thermal Test Method Environmental Conditions, Natural Convection (Still Air)*
- JESD51-6, *Integrated Circuit Thermal Test Method Environmental Conditions, Forced Convection (Moving Air)*
- JESD51-8, *Integrated Circuit Thermal Test Method Environmental Conditions, Junction-to-Board*
- JESD51-7, *High Effective Thermal Conductivity Test Board for Leaded Surface Mount Packages*
- JESD51-5, *Extension of Thermal Test Board Standards for Packages with Direct Thermal Attachment Mechanisms*

7.3 Moisture Sensitivity

This device is rated moisture sensitivity level 3 or better as specified in the joint IPC and JEDEC standard IPC/JEDEC J-STD-020. For more information, see the IPC and JEDEC standard.

8 Design Considerations

This section provides information about design considerations for the VSC8540-04 device.

8.1 Link status LED remains on while COMA_MODE pin is asserted high

When the COMA_MODE is asserted high, the link status LED may not deactivate unless the media cable is disconnected from the device.

While using COMA_MODE, link status should be verified using status registers rather than LED indicators.

8.2 10BASE-T signal amplitude

10BASE-T signal amplitude can be lower than the minimum specified in IEEE 802.3 paragraph 14.3.1.2.1 (2.2 V) at low supply voltages. Additionally, associated templates may be marginal or have failures.

This issue is not estimated to present any system-level impact. Performance is not impaired with cables up to 130 m with various link partners.

8.3 Receive error counter only clears when NRESET applied in RMII mode

When operating in RMII MAC interface mode, the receive error counter of register 19 ([Table 33](#), page 34) does not clear upon read-back or software reset of the device. The only way to clear this register while in RMII mode is to assert the NRESET pin of the device.

The receive error counter at register address 19 operates normally in MAC interface modes other than RMII.

8.4 Anomalous PCS error indications in Energy Efficient Ethernet mode

When a port is processing traffic with EEE enabled on the link, certain PCS errors (such as false carriers, spurious start-of-stream detection, and idle errors) and EEE wake errors may occur. There is no effect on traffic bit error rate for cable lengths up to 75 meters, and minor packet loss may occur on links longer than 75 meters.

Regardless of cable length, some error indications should not be used while EEE is enabled. These error indications include false carrier interrupts ([Interrupt Status](#), page 38, bit 3), receive error interrupts ([Interrupt Status](#), page 38, bit 0), and EEE wake error interrupts.

Contact Microsemi for a script that needs to be applied during system initialization if EEE will be enabled.

8.5 10BASE-T half-duplex linkup after initial reset from power up

After initial power up, register 0 (Mode Control) may contain all zeros and thus operate in forced 10BASE-T half-duplex mode.

For applications with register access to the device, the workaround is to perform a software reset using register 0, bit 15 to restore the power-on default values. For more information, see [Mode Control](#), page 29.

For unmanaged applications without register access to the device, see the reset step in [Configuration](#), page 25.

8.6 RGMII interface may not generate even count of preamble nibbles at 10 Mbps

When operating in 10 Mbps mode, the PHY may generate either an even or an odd number of preamble nibbles. Certain third-party RGMII MAC hosts cannot process odd numbers of preamble nibbles, and will drop those odd-count frames. The nibble count output from the PHY is random, depending on input copper signal characteristics.

There is no workaround for those MAC hosts that lack odd-or-even alignment capability for RGMII data streams received at their input pins.

8.7 Default LED0 mode is a non-applicable Gigabit value

The default power-on reset value of register 29 bits 3:0 is 0x1, which is a Link1000/Activity value not applicable to Fast Ethernet devices.

In order to use LED0 on these devices, register 29 must be reprogrammed to applicable Link100/Link10 values.

One such workaround for this issue is to program register 29 bits 3:0 to value 0x2 (LED0 Link 100/Activity), and program bits 7:4 to value 0x3 (LED1 Link 10/Activity).

8.8 Long link up times while in forced 100BASE-TX mode

While in forced 100BASE-TX operation mode and attempting to link up, the device may experience abnormally long link-up times.

The workaround for this issue is to clear all speed advertisements in the autonegotiation advertisement registers (register 4, bits 9:5 and register 9, bits 9:8), then toggle the auto-negotiation enable bit of the mode control register (register 0, bit 12) for a port upon detecting repeated 100BASE-TX link-up attempts. Any advertisements temporarily cleared can then be restored once register 0, bit 12 is cleared.

Please contact Microsemi for the latest software to address this issue.

8.9 Long link up times for 100BASE-TX parallel detection

While parallel-detecting 100BASE-TX link partners and attempting to link up, the device may experience abnormally long link-up times.

The workaround for this issue is to restart media interface auto-negotiation using register 0, bit 9 for a port upon detecting repeated 100BASE-TX link-up attempts.

Please contact Microsemi for the latest software to address this issue.

9 Ordering Information

The VSC8540XMV-04 package is a lead-free (Pb-free), 68-pin, plastic quad flat no-lead (QFN) package with an exposed pad, 8 mm × 8 mm body size, 0.4 mm pin pitch, and 0.9 mm maximum height.

Lead-free products from Microsemi comply with the temperatures and profiles defined in the joint IPC and JEDEC standard IPC/JEDEC J-STD-020. For more information, see the IPC and JEDEC standard.

The following table lists the ordering information for the VSC8540-04 device.

Table 110 • Ordering Information

| Part Order Number | Description |
|-------------------|---|
| VSC8540XMV-04 | Lead-free, 68-pin, plastic QFN package with an exposed pad, 8 mm × 8 mm body size, 0.4 mm pin pitch, and 0.9 mm maximum height. |
