
Trusted Platform Module – SPI Interface

SUMMARY DATASHEET

Features

- Compliant to the Trusted Computing Group (TCG) Trusted Platform Module (TPM) Version 1.2 Specification
- Compliant with TCG PC Client-Specific TPM Interface Specification (TIS) Version 1.3
- Single-chip, Turnkey Solution
- Hardware Asymmetric Crypto Engine
- Atmel® AVR® RISC Microprocessor
- Internal EEPROM Storage for RSA Keys
- Serial Peripheral Interface (SPI) Protocol Up to 45MHz*
(*Typical PC Operating Range is 24MHz to 33MHz)
- Secure Hardware and Firmware Design and Chip Layout
- FIPS-140-2 Module Certified Including the High-quality Random Number Generator (RNG), HMAC, AES, SHA, and RSA Engines
- NV Storage Space for 2066 bytes of User Defined Data
- 3.3V Supply Voltage
- 28-lead Thin TSSOP and 32-pad QFN Package
- Offered in Both Commercial (0°C to 70°C) and Industrial (-40°C to +85°C) Temperature Ranges

Description

The Atmel AT97SC3205 is a fully integrated security module designed to be integrated into personal computers and other embedded systems. It implements version 1.2 of the Trusted Computing Group (TCG) specification for Trusted Platform Modules (TPM).

**This is a summary document.
The complete document is
available under NDA. For more
information, please contact
your local Atmel sales office.**

1. Pin Configurations and Pinouts

Table 1-1. Pin Configurations

Pin Name	Function
V _{CC}	3.3V Supply Voltage
GND	Ground
GPIO Express-00	GPIO assigned to TPM_NV_INDEX_GPIO_00
PP/GPIO	Hardware Physical Presence or GPIO pin.
GPIO	General Purpose Input/Output Pin
MISO	SPI Slave Data Output
MOSI	SPI Slave Data Input
PIRQ#	SPI Interrupt Requests
SPI_CLK	SPI Clock Input
SPI_CS#	SPI Chip Select
SPI_RST#	SPI Reset Pin
TestI	TestI Manufacturing Test Input (Disabled)
TestBI	TestBI Manufacturing Test Input (Disabled)
XTamper	Indicate External Tamper Event
NC	No Connect

Figure 1-1. Pinouts

2. Block Diagram

The TPM includes hardware Random Number Generator (RNG), including a FIPS certified Pseudo Random Number Generator that is used for key generation and TCG protocol functions. The RNG is also available to the system to generate random numbers that may be needed during normal operation.

The chip uses a dynamic internal memory management scheme to store multiple RSA keys. Other than the standard TCG commands (TPM_FlushSpecific, TPM_Loadkey2), no system intervention is required to manage this internal key cache.

The TPM is offered to OEM and ODM manufacturers as a turnkey solution, including the firmware integrated on the chip. In addition, Atmel provides the necessary device driver software for integration into certain operating systems, along with BIOS drivers. Atmel will also provide manufacturing support software for use by OEMs and ODMs during initialization and verification of the TPM during board assembly.

Full documentation for TCG primitives can be found in the TCG TPM Main Specification, Parts 1 to 3, on the TCG web site located at <https://www.trustedcomputinggroup.org>. TPM features specific to PC client platforms are specified in the TCG PC Client Specific TPM Interface Specification, version 1.3, also available on the TCG web site. Implementation guidance for PC platforms is outlined in the TCG PC Client Specific Implementation Specification for Conventional Bios, version 1.2, also available on the TCG web site.

3. Pin Description

Table 3-1. Pin Descriptions

Pin	Description
V _{CC}	Power Supply, 3.3V. Care should be taken to prevent excessive noise. Effective decoupling of the V _{CC} inputs to the Atmel TPM is critical to assure consistently reliable operation over the lifetime of the system. The Atmel recommendation is for a decoupling bypass capacitor within the range of 2200pF to 4700pF, to be placed as close as possible, < 5mm, to each of the V _{CC} pins, located between each V _{CC} pin and the immediately adjacent GND pin. A 0.1μF decoupling bypass capacitor should be placed at the node in which these V _{CC} traces join, which should be as close as possible, < 10mm, to the TPM. In all cases, this bypass capacitor should be closer than the next closest component. All capacitors should be of high quality, with dielectric ratings of X5R or X7R. A low-power state is automatically entered when the chip is idle. No further action is required by the system to enter low-power mode.
GND	System Ground.
GPIO Express-00	General Purpose Input/Output. Internal pull-up resistor. This pin is mapped to NV Index TPM_NV_INDEX_GPIO_00. Default TPM configuration: GPIO Input. GPIO-Express-00 also serves as the XOR chain Output during I/O test mode. Since GPIO-Express-00 has an internal pull-up, it should be left floating if unused.
PP/GPIO	General Purpose Input/Output. Internal pull-down resistor. This pin is an indicator for hardware physical presence; active high. Default TPM configuration: GPIO input. Since PP/GPIO has an internal pull-down, it should be left floating if unused.
GPIO	General Purpose Input/Output. If unused, this pin can be tied to GND or V _{CC} at the customers discretion.
MISO	Master In Slave Out. SPI Slave Data Output. This pin serves as the SPI Data output from the TPM.
MOSI	Master Out Slave In. SPI Slave Data Input. This pin serves as the SPI Data Input to the TPM.
PIRQ#	SPI Interrupt Pin, Active-low. This pin is used by the TPM to assert interrupts. If unused, this pin should be tied to ground directly or through a 4.7kΩ resistor.
SPI_CLK	Clock used to drive the SPI bus. This pin should be asserted high for power savings when the TPM is not in use.
SPI_CS#	SPI_CS# Chip Select, Active-low. The TPM chip select.
SPI_RST#	SPI Reset Pin, Active-low. Pulsing this signal low resets the internal state of the TPM, and is equivalent to removal/restoration of power to the chip. The required minimum reset pulse width is 2μs. On power-up, it is critical that reset be kept active-low until V _{CC} , and SPI_CLK stabilize. To be compliant with TCG requirements, this pin needs to be tied to system reset. TPM_Init is indicated by asserting this pin.
TestI	TestI Manufacturing Test Input. Disabled after manufacturing. Tie TestI to ground directly or through a 4.7kΩ resistor.
TestBI/GPIO/ XTamper	TestBI Manufacturing Test Input. The Atmel TPM does not support legacy addressing via the optional BADD implementation of this pin. The TestBI pin also serves as the XTamper pin or an additional GPIO pin, active high. (See the application note, "Atmel Specific TPM Commands Reference Guide" for details on XTamper implementation). If unused, this pin should be tied to ground directly or through a 4.7kΩ resistor.
NC	No Connect Pins (TSSOP). The AT97SC3205 TSSOP package has additional pins which are no connects and can be tied to GND, V _{CC} , or left floating at the customers discretion: NC – TSSOP Pin 5 NC – TSSOP Pin 12 NC – TSSOP Pin 13 NC – TSSOP Pin 14 NC – TSSOP Pin 15 NC – TSSOP Pin 27 NC – TSSOP Pin 28

Table 3-1. Pin Descriptions (Continued)

Pin	Description
NC	No Connect Pins (QFN). The AT97SC3205 QFN package has additional pins which are no connects and can be tied to GND, V_{CC}, or left floating at the customers discretion: - NC – QFN Pin 7 - NC – QFN Pin 10 - NC – QFN Pin 11 - NC – QFN Pin 13 - NC – QFN Pin 14 - NC – QFN Pin 15 - NC – QFN Pin 16 - NC – QFN Pin 25 - NC – QFN Pin 26 - NC – QFN Pin 27 - NC – QFN Pin 28 - NC – QFN Pin 31

Note: 1. The substrate center pad for the 32-pin QFN is directly tied to GND internally; therefore, this pad can either be left floating or tied to GND.

4. Ordering Information

Atmel Ordering Code	Package		Operating Range
AT97SC3205 ⁽¹⁾	28X1 (28-pin thin TSSOP)	Lead-free, RoHS	Commercial (0°C to 70°C) Industrial (-40°C to 85°C)
	32M3 (32-pin very thin QFN)		

Note: 1. Please see the AT97SC3205 datasheet addendum for the complete catalog number ordering code.

Package Type	
28X1	28-lead, 4.4mm body width, Plastic Thin Shrink Small Outline (thin TSSOP)
32M3	32-pad, 4.0 x 4.0 x 0.9mm body, 0.4mm lead pitch, Very Thin Quad Flat No-Lead (QFN)

5. Package Drawings

5.1 28X1 — 28-lead Thin TSSOP

5.2 32M3 — 32-pad QFN

6. Revision History
