

# H-Bridge 6 Click

PID: MIKROE-4289

H-Bridge 6 Click is a compact add-on board that contains a DC motor driver for automotive applications. This board features the VNHD7008AY, an H-bridge motor driver for automotive DC motor driving from STMicroelectronics. The VNHD7008AY, an I2C configurable motor driver, features an undervoltage shutdown, load current limitation, overload active power limitation, overtemperature shutdown, and more. This Click board™ also contains the PCA9538A, a low-voltage 8-bit GPIO expander for communication between MCU and motor driver. H-Bridge 6 Click is suitable for automotive motor control applications like automotive brushed DC motor, or in applications such as body control module (BCM), car-seat control, and others.

H-Bridge 6 Click is supported by a mikroSDK compliant library, which includes functions that simplify software development. This Click board™ comes as a fully tested product, ready to be used on a system equipped with the mikroBUS™ socket.

## How does it work?

H-Bridge 6 Click is based on the VNHD7008AY, a DC motor driver for automotive applications that integrates a full protected dual high-side driver and protection for the external power MOSFETs from STMicroelectronics. This Click board™ can interface the MCU to select the motor direction and the brake conditions via input signals on INA and INB pins, but also possesses a MultiSense pin for a motor-current monitor. Two selection pins (SEL0 and SEL1) are available to address to the MCU the information available on the MultiSense pin. It operates from a single power supply input labeled as VBATT in a range from 4V to 28V which can be directly connected to a DC voltage supply. Also, this device is fully protected against supply under-voltage, output overcurrent, and device overtemperature events.

Mikroe produces entire development toolchains for all major microcontroller architectures.

Committed to excellency, we are dedicated to helping engineers bring the project development up to speed and achieve outstanding results.

ISO 27001: 2013 certification of informational security management system.  
ISO 14001: 2015 certification of environmental management system.  
OHSAS 18001: 2008 certification of occupational health and safety management system.

ISO 9001: 2015 certification of quality management system (QMS).

**NOTE: To Power-On the VNHD7008AY from Stand-By Mode, it is recommended to toggle INA or INB or SEL0 or SEL1 pins from 0 to 1 state to come out from Stand-By Mode. Also, toggle the PWM pin from 0 to 1 state with a delay of 20µs to avoids any overstress on the device in case of an existing short-to-battery situation.**

H-Bridge 6 Click communicates with MCU through a well-known 8bit I/O expander the [PCA9538A](#) from [NXP Semiconductor](#) using the standard I2C 2-Wire interface with a maximum frequency of 400kHz. The VNHD7008AY also allows the choice of the least significant bit (LSB) of its I2C slave address by positioning SMD jumpers labeled as ADDR SEL to an appropriate position marked as 0 and 1. In addition to this feature, this Click board™ also contains additional functionalities routed to the PWM, AN, and RST pins on the mikroBUS™ socket. The PWM pin, up to 20 kHz, allows to control of the speed of the motor in all possible conditions, while the AN pin labeled as MS allows monitoring the motor current, provides a voltage proportional to the battery value, and the information on the temperature of the VNHD7008AY. The RST pin has retained its reset function by default.

This Click board™ is designed to be operated with both 3.3V and 5V logic voltage levels that can be selected via VCC SEL jumper. This allows for both 3.3V and 5V capable MCUs to use the I2C communication lines properly. However, the Click board™ comes equipped with a library that contains easy to use functions and an example code that can be used as a reference for further development.

## Specifications

|                  |                                                                                                                                                                                                                          |

## Software Support

We provide a library for the H-Bridge 6 Click on our [LibStock](#) page, as well as a demo application (example), developed using MikroElektronika [compilers](#). The demo can run on all the main MikroElektronika [development boards](#).

## Library Description

The library covers all the necessary functions to control the H-Bridge 6 Click board™. A library performs communication with the device via the I2C interface. Using the PWM function, we can adjust the engine speed and direction.

Key functions:

- void hbridge6\_generic\_write ( uint8\_t reg, uint8\_t tx\_data ) - Generic write function.
- uint8\_t hbridge6\_generic\_read ( uint8\_t reg ) - Generic read function.
- void hbridge6\_set\_direction ( uint8\_t direction ) - Set the direction function.

## Examples description

The application is composed of three sections :

- System Initialization - Initializes I2C and start to write log.
  - Application Initialization - Initialization driver enables - I2C, reset the device and set default configuration, initialization and configure the PWM, also write log.
  - Application Task - (code snippet) This is an example that demonstrates the use of H-Bridge 6 Click board™. It shows moving in the clockwise direction of rotation and moving in the counterclockwise direction of rotation from slow to fast speed. All data logs write on USB uart changes.
- 
- uint32\_t hbridge6\_pwm\_init ( uint16\_t freq ) - Initializes the Timer module in PWM mode.
  - void hbridge6\_pwm\_set\_duty ( uint16\_t duty ) - The function changes PWM duty ratio.
  - void hbridge6\_pwm\_start( ) - Starts appropriate PWM module.
  - void hbridge6\_pwm\_stop( ) - Stops appropriate PWM module.

The full application code, and ready to use projects can be found on our [LibStock](#) page.

Other mikroE Libraries used in the example:

- I2C
- PWM
- UART

## Additional notes and informations

Depending on the development board you are using, you may need [USB UART click](#), [USB UART 2 click](#) or [RS232 click](#) to connect to your PC, for development systems with no UART to USB interface available on the board. The terminal available in all MikroElektronika [compilers](#), or any other terminal application of your choice, can be used to read the message.

## mikroSDK

This Click board™ is supported with [mikroSDK](#) - MikroElektronika Software Development Kit. To ensure proper operation of mikroSDK compliant Click board™ demo applications, mikroSDK should be downloaded from the [LibStock](#) and installed for the compiler you are using.

For more information about mikroSDK, visit the [official page](#).
