## Low Offset Voltage Operational Amplifier

OP07

### General Description

The OP07 is a precision operational amplifier with very low input offset voltage ( $10\mu\text{V}$  typ.,  $25\mu\text{V}$  max. for the OP07A), input offset drift of  $0.2\mu\text{V}/^\circ\text{C}$  and low input bias current of  $0.7\text{nA}$ . The wide input common mode range of  $\pm 14\text{V}$  combined with high CMRR of  $110\text{dB}$  minimum (OP07A), plus high input impedance and high open-loop gain make these devices particularly useful for high-gain instrumentation applications.

The excellent linearity and gain accuracy are maintained at high open-loop gains, over both time and temperature. The OP07 has become an industry standard and Maxim's reliability and quality are added advantages.
