ISO CAN FD ISO 11898-1:2015

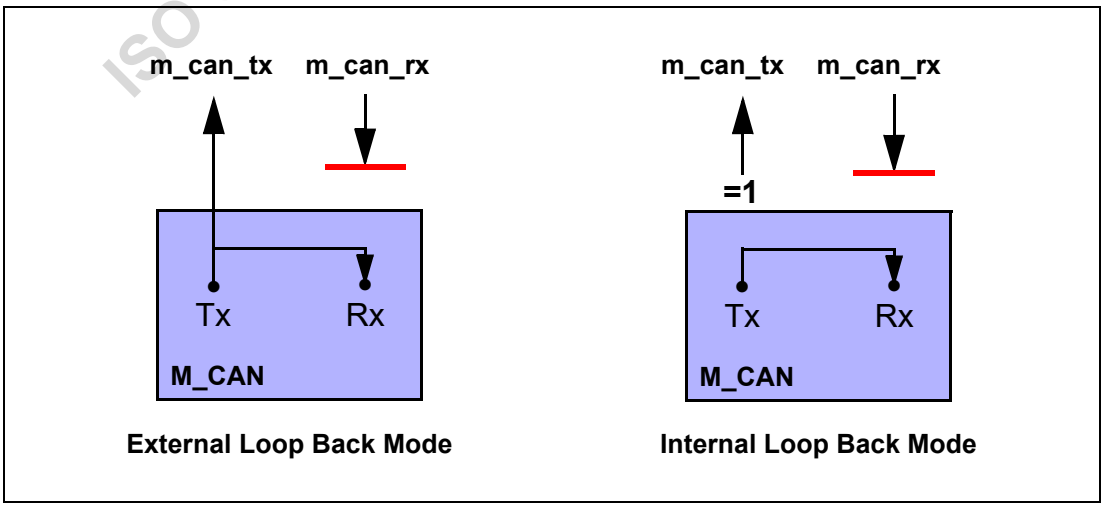

Figure 19.7 Pin Control in Loop Back Modes

### 19.5.3.2 Timestamp Generation

For timestamp generation the M_CAN supplies a 16-bit wrap-around counter. A prescaler MCANnTSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 to 16). The counter is readable via MCANnTSCV.TSC. A write access to register MCANnTSCV resets the counter to zero. When the timestamp counter wraps around interrupt flag MCANnIR.TSW is set.

On start of frame reception / transmission the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MCANnTSCC.TSS an external 16-bit timestamp can be used.

### 19.5.3.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO the M_CAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by MCANnTSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via register MCANnTOCC. The actual counter value can be read from MCANnTOCV.TOC. The Timeout Counter can only be started while MCANnCCCR.INIT = '0'. It is stopped when MCANnCCCR.INIT = '1', e.g. when the M_CAN enters Bus_Off state.

The operation mode is selected by MCANnTOCC.TOS. When operating in Continuous Mode, the counter starts when MCANnCCCR.INIT is reset. A write to MCANnTOCV presets the counter to the value configured by MCANnTOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MCANnTOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MCANnTOCV has no effect.

When the counter reaches zero, interrupt flag MCANnIR.TOO is set. In Continuous Mode, the counter is immediately restarted at MCANnTOCC.TOP.

**NOTE**

The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the bit rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

ISO CANFD ISO 11898-1:2015

### 19.5.3.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### (1) Acceptance Filtering

The M_CAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration MCANnGFC
- Standard ID Filter Configuration MCANnSIDFC
- Extended ID Filter Configuration MCANnXIDFC
- Extended ID AND Mask MCANnXIDAM

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag MCANnIR.HPM
- Set High Priority Message interrupt flag MCANnIR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected Rx Buffer or Rx FIFO:

ISO CAN FD ISO 11898-1:2015

**Rx Buffer**

New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see MCANnPSR.LEC respectively MCANnPSR.DLEC.

**Rx FIFO**

Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see MCANnPSR.LEC respectively MCANnPSR.DLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in **(b) Rx FIFO Overwrite Mode** have to be considered.

**NOTE**

When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

(a) Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

EFT: “00”: The Message ID of received frames is ANDed with the Extended ID AND Mask (MCANnXIDAM) before the range filter is applied

EFT: “11”: The Extended ID AND Mask (MCANnXIDAM) is not used for range filtering

(b) Filter for specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

(c) Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

ISO CAN FD ISO 11898-1:2015

(d) Standard Message ID Filtering

**Figure 19.8, Standard Message ID Filter Path** below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in **(5) Standard Message ID Filter Element**.

Controlled by the Global Filter Configuration MCANnGFC and the Standard ID Filter Configuration MCANnSIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

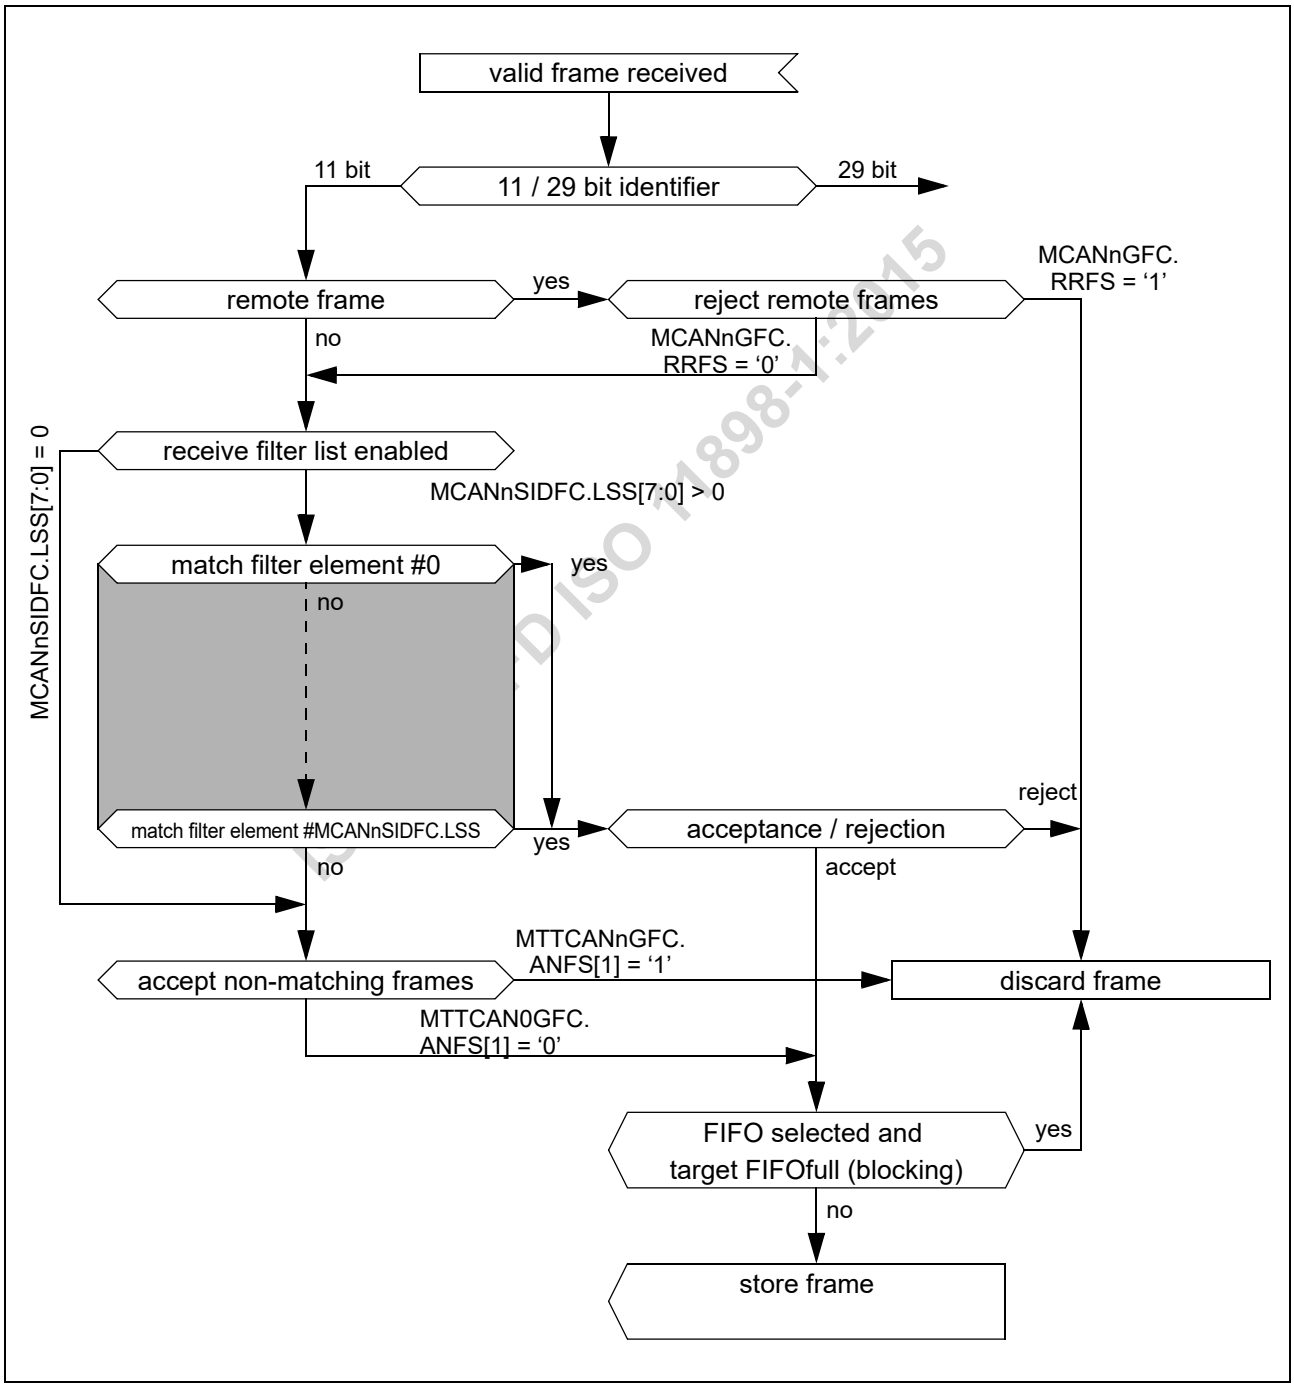

**Figure 19.8 Standard Message ID Filter Path**

(e) Extended Message ID Filtering

**Figure 19.9, Extended Message ID Filter Path** below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in **(6) Extended Message ID Filter Element**.

Controlled by the Global Filter Configuration MCANnGFC and the Extended ID Filter Configuration MCANnXIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask MCANnXIDAM is ANDed with the received identifier before the filter list is executed.

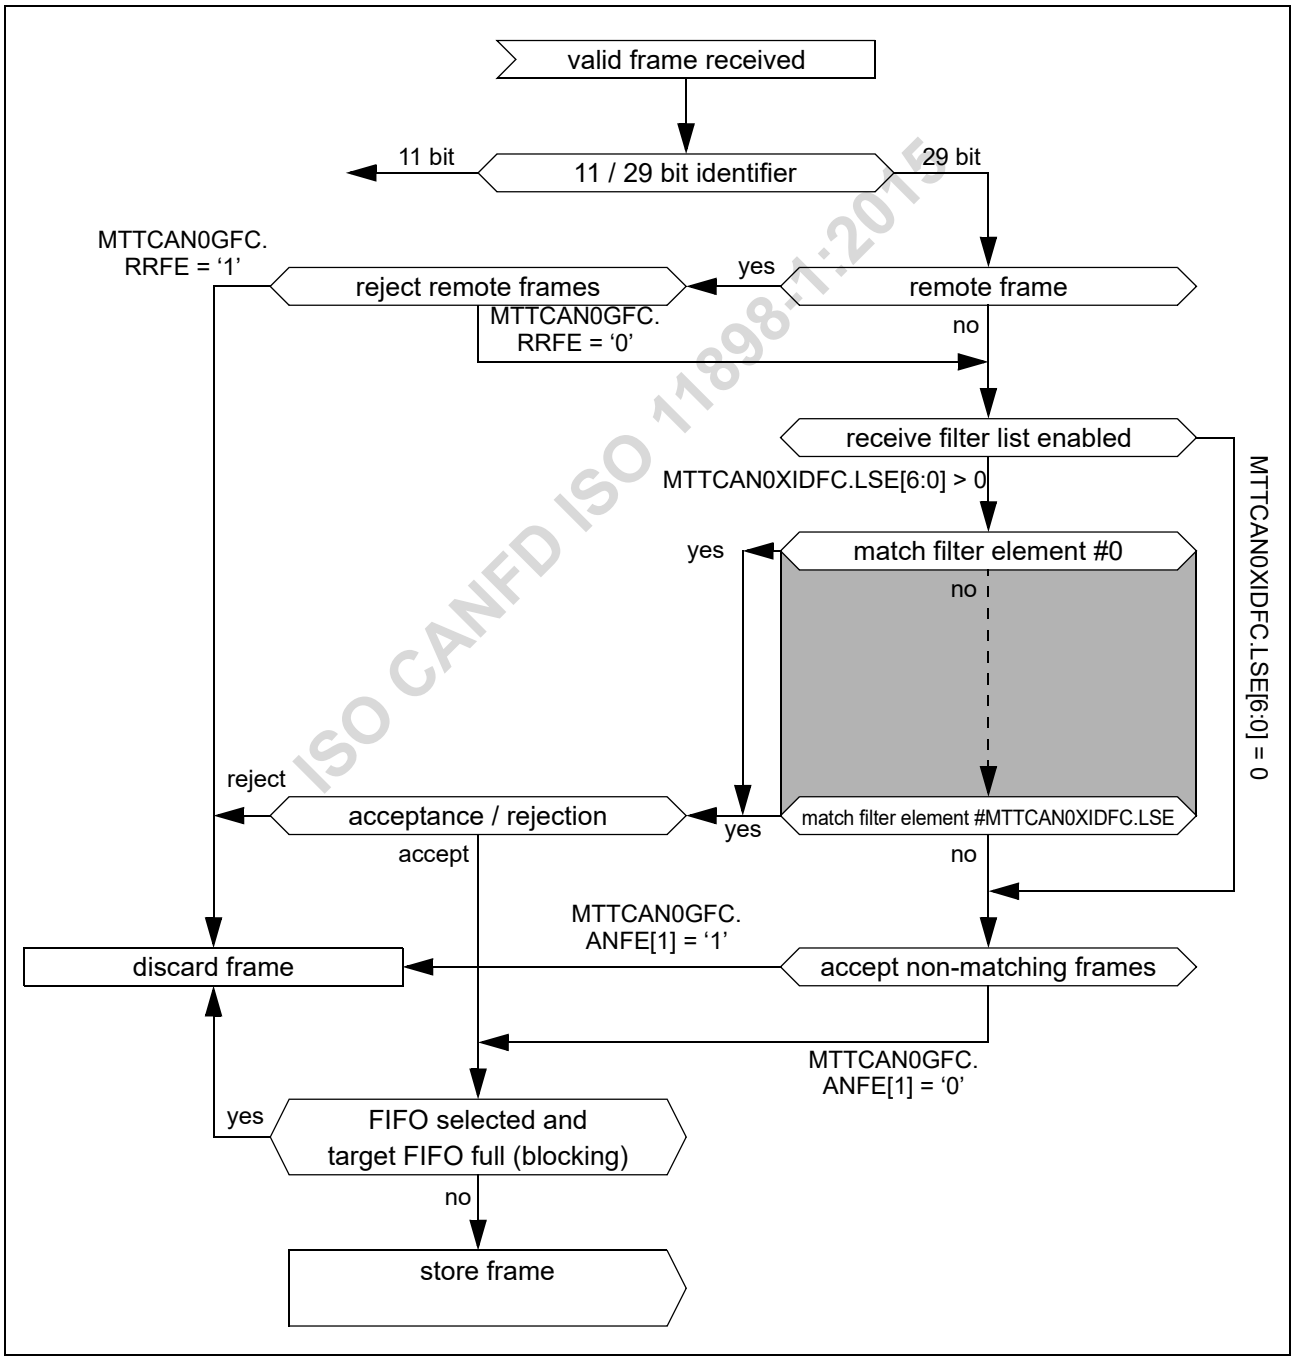

**Figure 19.9 Extended Message ID Filter Path**

### (2) Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers MCANnRXF0C and MCANnRXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1 see **(1) Acceptance Filtering**. The Rx FIFO element is described in **(2) Rx Buffer and FIFO Element**.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by RXFnC.FnWM, interrupt flag MCANnIR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signalled by RXFnS.FnF. In addition interrupt flag MCANnIR.RFnF is set.

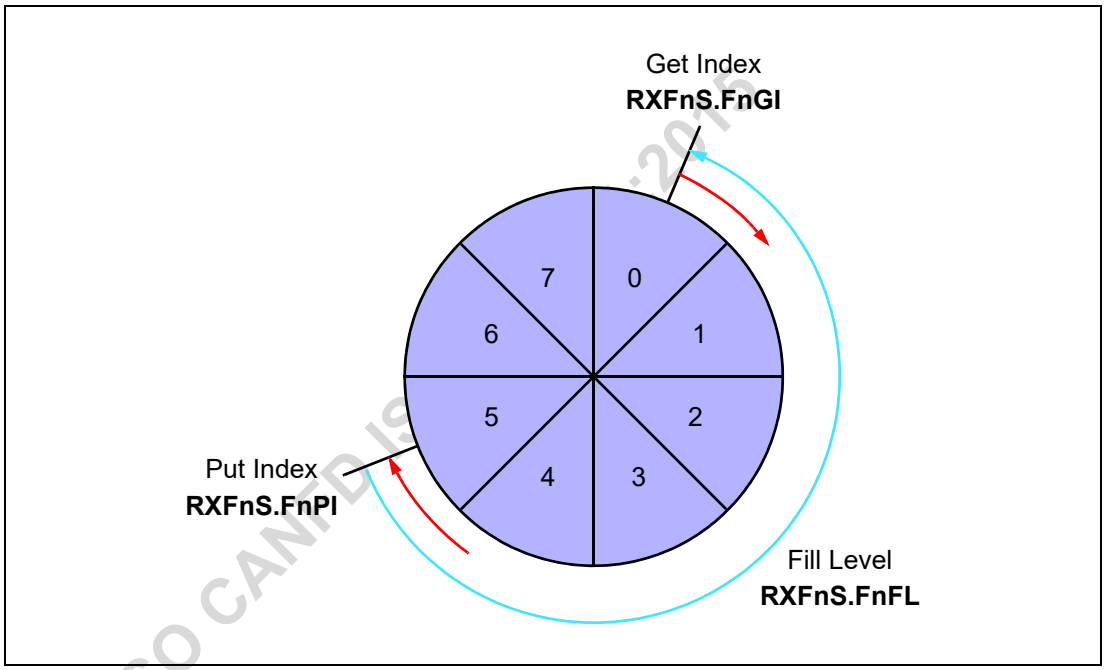

Figure 19.10 Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index RXFnS.FnGI • FIFO Element Size has to be added to the corresponding Rx FIFO start address RXFnC.FnSA.

Table 19.66 Rx Buffer / FIFO Element Size

| MCANnRXESC.RBDS[2:0]<br>MCANnRXESC.FnDS[2:0] | Data Field<br>[bytes] | FIFO Element Size<br>[RAM words] |
|---|---|---|
| 000 | 8 | 4 |
| 001 | 12 | 5 |
| 010 | 16 | 6 |
| 011 | 20 | 7 |
| 100 | 24 | 8 |
| 101 | 32 | 10 |
| 110 | 48 | 14 |
| 111 | 64 | 18 |

(a) Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = '0'. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by RXFnS.FnF = '1'. In addition interrupt flag MCANnIR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by RXFnS.RFnL = '1'. In addition interrupt flag MCANnIR.RFnL is set.

(b) Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = '1'.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signalled by RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. **Figure 19.11, Rx FIFO Overflow Handling** shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

ISO CANFD ISO 11898-1:2015

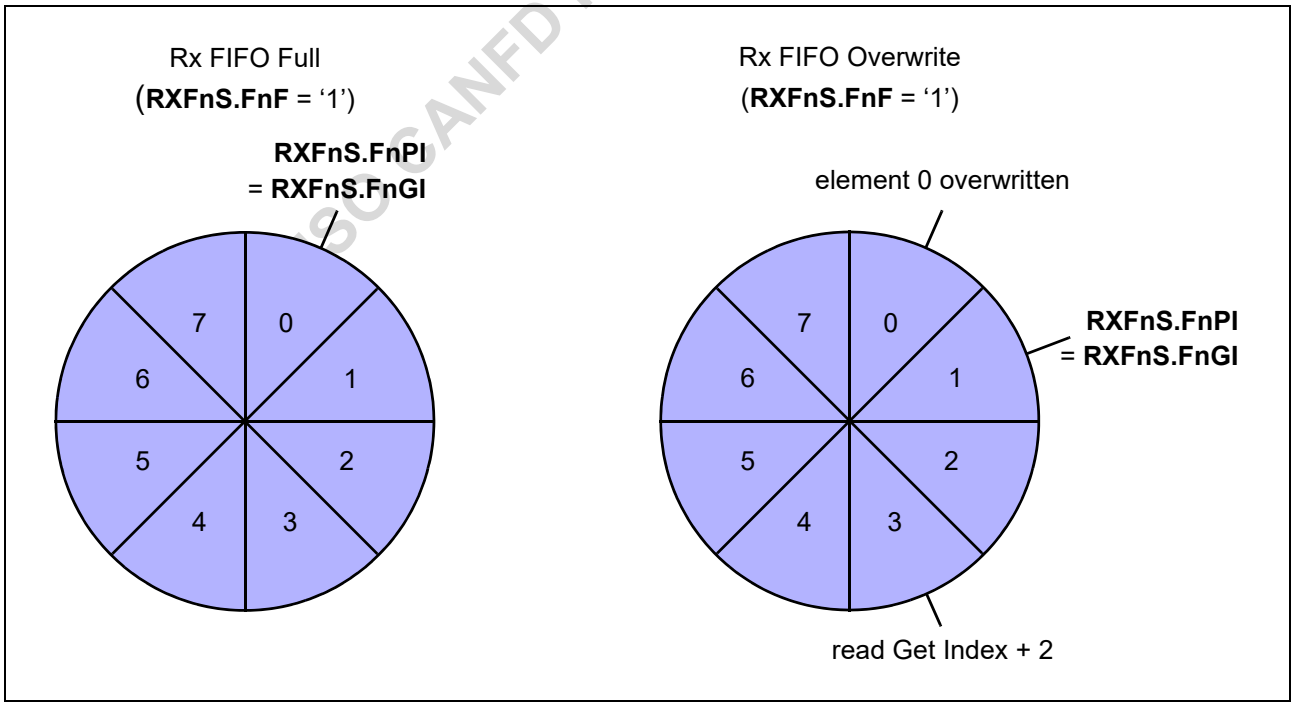

Figure 19.11 Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = '0').

### (3) Dedicated Rx Buffers

The M_CAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MCANnRXBC.RBSA.

For each Rx Buffer a Standard or Extended Message ID Filter Element with SFEC / EFEC = “111” and SFID2 / EFID2[10:9] = “00” has to be configured (see **(5) Standard Message ID Filter Element** and **(6) Extended Message ID Filter Element**).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag MCANnIR.DRX (Message stored in Dedicated Rx Buffer) in the interrupt register is set.

**Table 19.67 Example Filter Configuration for Rx Buffers**

| Filter Element | SFID1[10:0] EFID1[28:0] | SFID2[10:9] EFID2[10:9] | SFID2[5:0] EFID2[5:0] |
|---|---|---|---|
| 0 | ID message 1 | 00 | 00 0000 |
| 1 | ID message 2 | 00 | 00 0001 |
| 2 | ID message 3 | 00 | 00 0010 |

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MCANnNDAT1, 2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host by writing a ‘1’ to the respective bit position.

While an Rx Buffer’s New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

#### (a) Rx Buffer Handling

- Reset interrupt flag MCANnIR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

### (4) Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see M_CAN User’s Manual section 2.4.2).

Advantage: Fixed start address for the DMA transfers (relative to MCANnRXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = “111” have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_can_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the M_CAN while m_can_dma_req is activated. The behaviour is similar to that of an Rx Buffers with its New Data flag set.

ISO CANFD ISO 11898-1:2015

After the DMA has completed the DMA unit sets m_ttcan_dma_ack. This resets m_can_dma_req. Now the M_TTCAN is prepared to receive the next set of debug messages.

### (a) Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to “111”. In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning (see Section 2.4.5 and Section 2.4.6). While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MCANnIR.DRX are set. The reception of debug messages can be monitored via MCANnRXF1S.DMS

**Table 19.68 Example Filter Configuration for Debug Message**

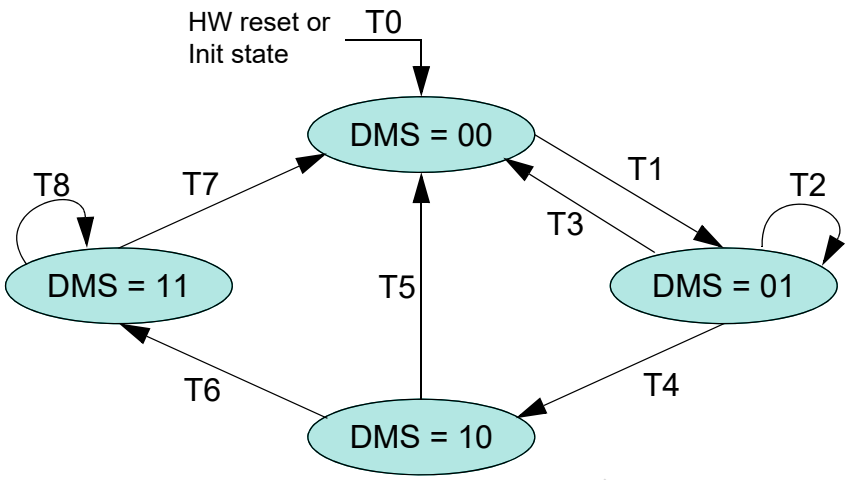
| Filter Element | SFID1[10:0] EFID1[28:0] | SFID2[10:9] EFID2[10:9] | SFID2[5:0] EFID2[5:0] |
|---|---|---|---|
| 0 | ID debug message A | 01 | 11 1101 |
| 1 | ID debug message B | 10 | 11 1110 |
| 2 | ID debug message C | 11 | 11 1111 |

### (b) Debug Message Handling

The debug message handling state machine assures that debug messages are stored to three consecutive Rx Buffers in correct order. In case of missing messages the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in correct order.

The status of the debug message handling state machine is signalled via RXF1S.DMS

ISO CANFD ISO 11898-1:201



T0: reset m_can_dma_req output, enable reception of debug messages A, B, and C
T1: reception of debug message A
T2: reception of debug message A
T3: reception of debug message C
T4: reception of debug message B
T5: reception of debug messages A, B
T6: reception of debug message C
T7: DMA transfer completed
T8: reception of debug message A,B,C (message rejected)

**Figure 19.12 Debug Message Handling State Machine**

ISO CANFD ISO 11898-1:2015

### 19.5.3.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices, and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in **(3) Tx Buffer Element**. **Table 19.69** below describes the possible configurations for frame transmission

**Table 19.69 Possible Configurations for Frame Transmission**

| CCCR | | Tx Buffer Element | | |
|---|---|---|---|---|
| BRSE | FDOE | FDF | BRS | Frame Transmission |
| ignored | 0 | ignored | ignored | Classic CAN |
| 0 | 1 | 0 | ignored | Classic CAN |
| 0 | 1 | 1 | ignored | FD without bit rate switching |
| 1 | 1 | 0 | ignored | Classic CAN |
| 1 | 1 | 1 | 0 | FD without bit rate switching |
| 1 | 1 | 1 | 1 | FD with bit rate switching |

**NOTE**

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register MCANnTXBRP is updated, or when a transmission has been started.

#### (1) Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MCANnCCCR.TXP. If the bit is set, the M_CAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MCANnCCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

ISO CANFD ISO 11898-1:2015

### (2) Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MCANnTXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.70, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

**Table 19.70 Tx Buffer / FIFO / Queue Element Size**

| MCANnTXESC.TBDS[2:0] | Data Field [bytes] | Element Size [RAM words] |
|---|---|---|
| 000 | 8 | 4 |
| 001 | 12 | 5 |
| 010 | 16 | 6 |
| 011 | 20 | 7 |
| 100 | 24 | 8 |
| 101 | 32 | 10 |
| 110 | 48 | 14 |
| 111 | 64 | 18 |

ISO CANFD ISO 11898-1:2015

### (3) Tx FIFO

Tx FIFO operation is configured by programming MCANnTXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MCANnTXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The M_CAN calculates the Tx FIFO Free Level MCANnTXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MCANnTXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MCANnTXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the MCANnTXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MCANnTXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see **Table 19.70, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MCANnTXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

ISO CAN FD ISO 11898-1:2015

### (4) Tx Queue

Tx Queue operation is configured by programming MCANnTXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MCANnTXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MCANnTXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MCANnTXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.70, Tx Buffer / FIFO / Queue Element Size**). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MCANnTXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MCANnTXBC.TBSA.

### (5) Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO. The number of Dedicated Tx Buffers is configured by MCANnTXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MCANnTXBC.TFQS. In case MCANnTXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

ISO CANFD ISO 11898-1:2015

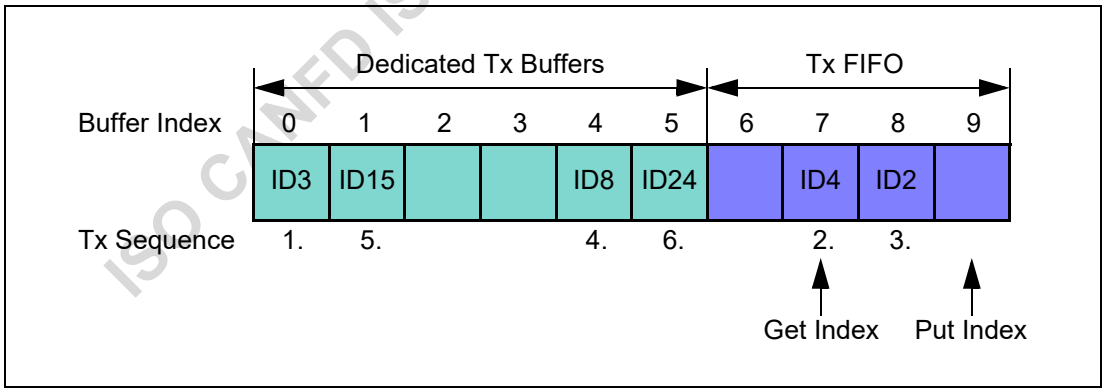


**Figure 19.13 Example of mixed Configuration Dedicated Tx Buffers / Tx FIFO**

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

### (6) Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue. The number of Dedicated Tx Buffers is configured by MCANnTXBC.NDTB. The number of Tx Queue Buffers is configured by MCANnTXBC.TFQS. In case MCANnTXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

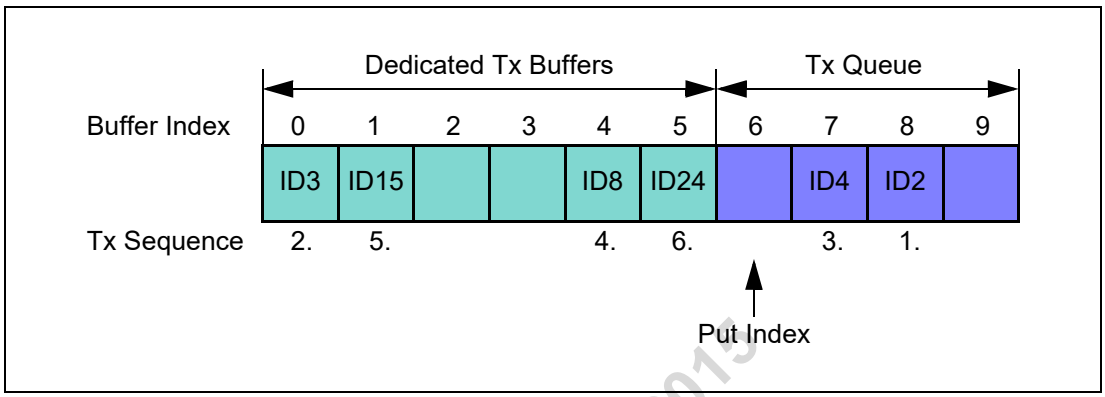

**Figure 19.14 Example of mixed Configuration Dedicated Tx Buffers / Tx Queue**

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

### (7) Transmit Cancellation

The M_CAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR based applications. To cancel a requested transmission from a dedicated Tx Buffer or a Tx Queue Buffer the Host has to write a '1' to the corresponding bit position (= number of Tx Buffer) of register MCANnTXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MCANnTXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding MCANnTXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MCANnTXBTO and MCANnTXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MCANnTXBCF bit is set.

**NOTE**

In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

ISO CAN FD ISO 11898-1:2015

### (8) Tx Event Handling

To support Tx event handling the M_CAN has implemented a Tx Event FIFO. After the M_CAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in **(4) Tx Event FIFO Element**.

The purpose of the Tx Event FIFO is to decouple handling transmit status information from transmit message handling i.e. a Tx Buffer holds only the message to be transmitted, while the transmit status is stored separately in the Tx Event FIFO. This has the advantage, especially when operating a dynamically managed transmit queue, that a Tx Buffer can be used for a new message immediately after successful transmission. There is no need to save transmit status information from a Tx Buffer before overwriting that Tx Buffer.

When a Tx Event FIFO full condition is signalled by MCANnIR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MCANnIR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MCANnTXEFC.EFWM, interrupt flag MCANnIR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MCANnTXEFS.EFGI has to be added to the Tx Event FIFO start address MCANnTXEFC.EFSA.

ISO CANFD ISO 11898-1:2015

#### 19.5.3.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see **(28) MCANnRXF0A — Rx FIFO 0 Acknowledge**, **(32) MCANnRXF1A — Rx FIFO 1 Acknowledge**, and **(46) MCANnTXEFA — Tx Event FIFO Acknowledge**). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus *one* and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the M_CAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**NOTE**

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The M_CAN does not check for erroneous values.

ISO CANFD ISO 11898-1:2015

# 19.6 M_TTCAN

## 19.6.1 Overview

The M_TTCAN module is the new TTCAN Communication Controller IP-module. The M_TTCAN performs communication according to ISO 11898-1:2015 and according to ISO 11898-4 (Time-triggered communication on CAN). The M_TTCAN provides all features of time-triggered communication specified in ISO 11898-4, including event synchronized time-triggered communication, global system time, and clock drift compensation. The CAN FD option can be used together with event-triggered and time-triggered CAN communication.

The message storage is intended to be a single-ported Message RAM outside of the module. It is connected to the M_TTCAN via the Generic Master Interface.

All functions concerning the handling of messages are implemented by the Rx Handler and the Tx Handler. The Rx Handler manages message acceptance filtering, the transfer of received messages from the CAN Core to the Message RAM as well as providing receive message status information. The Tx Handler is responsible for the transfer of transmit messages from the Message RAM to the CAN Core as well as providing transmit status information. It implements all functions concerning the time schedule and the global system time.

Acceptance filtering is implemented by a combination of up to 128 filter elements where each one can be configured as a range, as a bit mask, or as a dedicated ID filter.

The M_TTCAN's clock domain concept allows the separation between the high precision CAN clock and the Host clock, which may be generated by an FM-PLL.

ISO CANFD ISO 11898-1:2015

#### 19.6.1.1 Features

- Conform with ISO11898-1:2015 and ISO 11898-4
- CAN FD with up to 64 data bytes supported
- TTCAN protocol level 1 and level 2 completely in hardware
- Event synchronized time-triggered communication supported
- CAN Error Logging
- AUTOSAR optimized
- SAE J1939 optimized
- Improved acceptance filtering
- Two configurable Receive FIFOs
- Separate signalling on reception of High Priority Messages
- Up to 64 dedicated Receive Buffers
- Up to 32 dedicated Transmit Buffers
- Configurable Transmit FIFO
- Configurable Transmit Queue
- Configurable Transmit Event FIFO
- Direct Message RAM access for Host CPU
- Programmable loop-back test mode
- Maskable module interrupts
- 8/16/32 bit Generic Slave Interface for connection customer-specific Host CPUs
- Two clock domains (CAN clock and Host clock)
- Power-down support
- Debug on CAN support

ISO CANFD ISO 11898-1:2015

### 19.6.1.2 Block Diagram

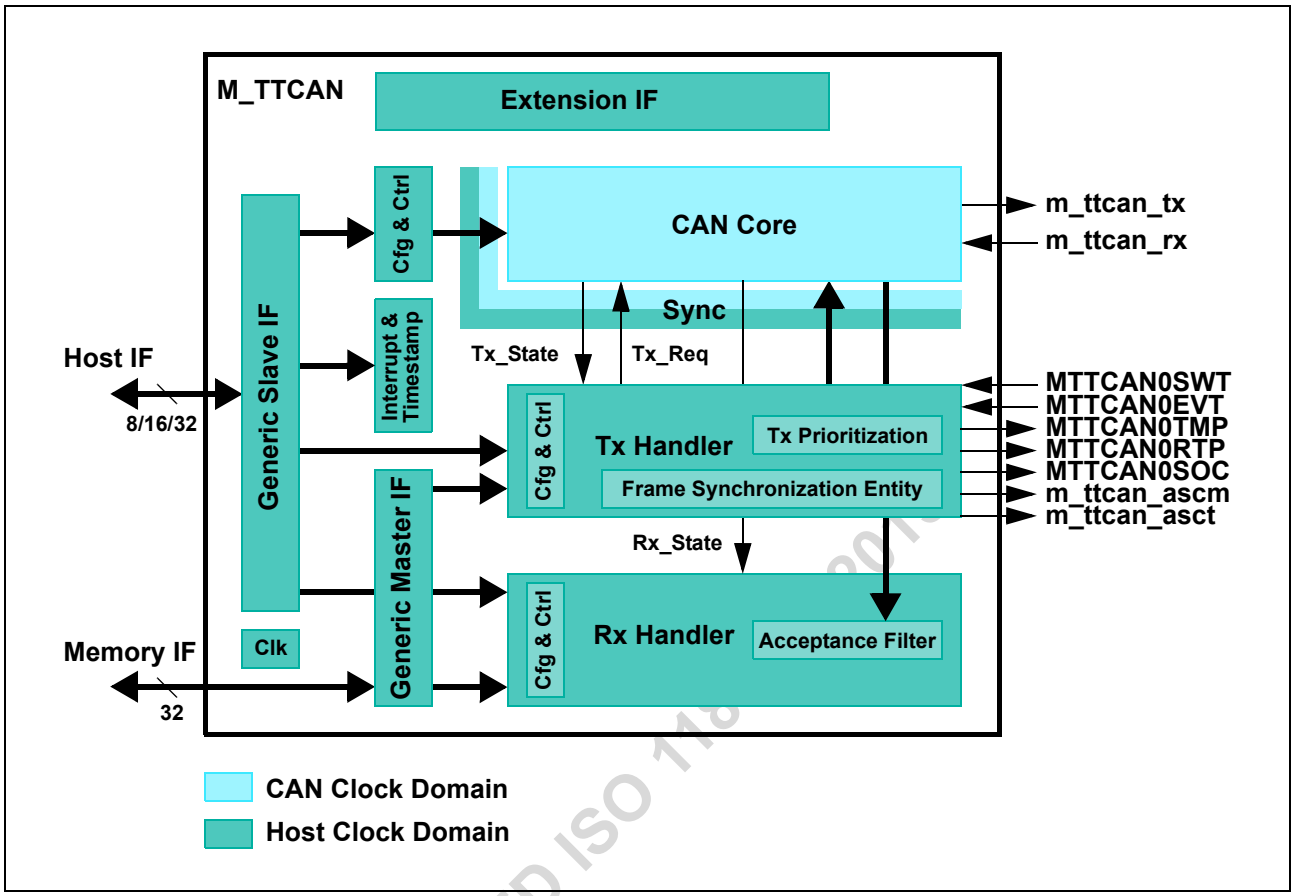

Figure 19.15 M_TTCAN Block Diagram

#### CAN Core

CAN Protocol Controller and Rx/Tx Shift Register. Handles all ISO 11898-1 protocol functions. Supports 11-bit and 29-bit identifiers.

#### Sync

Synchronizes signals from the Host clock domain to the CAN clock domain and vice versa.

#### Clk

Synchronizes reset signal to the Host clock domain and to the CAN clock domain.

#### Cfg & Ctrl

CAN Core related configuration and control bits.

#### Interrupt & Timestamp

Interrupt control and 16-bit CAN bit time counter for receive and transmit timestamp generation. An externally generated 16-bit vector may substitute the integrated 16-bit CAN bit time counter for receive and transmit timestamp generation.

ISO CANFD ISO 11898-1:2015

### Tx Handler

Controls the message transfer from the external Message RAM to the CAN Core. A maximum of 32 Tx Buffers can be configured for transmission. Tx buffers can be used as dedicated Tx Buffers, as Tx FIFO, part of a Tx Queue, or as a combination of them. A Tx Event FIFO stores Tx timestamps together with the corresponding Message ID. Transmit cancellation is also supported.

The Tx Handler also implements the Frame Synchronization Entity FSE which controls time-triggered communication according to ISO11898-4. It synchronizes itself to the reference messages on the CAN bus, controls cycle time and global time, and handles transmissions according to the predefined message schedule, the system matrix. It also handles the time marks of the system matrix that are linked to the messages in the Message RAM. Stop Watch Trigger, Event Trigger, and Time Mark Interrupt are synchronization interfaces.

### Rx Handler

Controls the transfer of received messages from the CAN Core to the external Message RAM. The Rx Handler supports two Receive FIFOs, each of configurable size, and up to 64 dedicated Rx Buffers for storage of all messages that have passed acceptance filtering. A dedicated Rx Buffer, in contrast to a Receive FIFO, is used to store only messages with a specific identifier. An Rx timestamp is stored together with each message. Up to 128 filters can be defined for 11-bit IDs and up to 64 filters for 29-bit IDs.

### Generic Slave Interface

Connects the M_TTCAN to a customer specific Host CPU. The Generic Slave Interface is capable to connect to an 8/16/32-bit bus to support a wide range of interconnection structures.

### Generic Master Interface

Connects the M_TTCAN to a local 32-bit Message RAM. The implemented Message RAM size is 2K • 32 bit.

### Extension Interface

All flags from the Interrupt Register MTTCAN0IR and TT Interrupt Register MTTCAN0TTIR as well as selected internal status and control signals are routed to this interface. The interface is intended for connection of the M_TTCAN to a module-external interrupt unit or to other module-external components. The connection of these signals is optional.

ISO CANFD ISO 11898-1:2015

#### 19.6.1.3 Dual Clock Sources

To improve the EMC behavior, a spread spectrum clock can be used for the Host clock domain m_ttcan_hclk (CLK_HSB). Due to the high precision clocking requirements of the CAN Core, a separate clock without any modulation has to be provided as m_ttcan_cclk (CLKP_H2).

Within the M_TTCAN module there is a synchronization mechanism implemented to ensure save data transfer between the two clock domains.

**NOTE**

In order to achieve a stable function of the M_TTCAN, the Host clock must always be faster than or equal to the CAN clock. Also the modulation depth of the spread spectrum clock has to be regarded.

#### 19.6.1.4 Dual Interrupt Lines

The module provides two interrupt lines. Interrupts can be routed either to m_ttcan_int0 (INTMTTCANI0) or to m_ttcan_int1(INTMTTCANI1). By default all interrupts are routed to interrupt line m_ttcan_int0 (INTMTTCANI0). By programming MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1 the interrupt lines can be enabled or disabled separately.

ISO CANFD ISO 11898-1:2015

## 19.6.2 Programmer's Model

### 19.6.2.1 Hardware Reset Description

After hardware reset, the registers of the M_TTCAN hold the reset values listed in **Table 19.71**. Additionally the Bus_Off state is reset and the output m_ttcan_tx is set to *recessive* (HIGH). The value $0001_H$ (MTTCAN0CCCR.INIT = '1') in the CC Control Register enables software initialization. The M_TTCAN does not influence the CAN bus until the CPU resets MTTCAN0CCCR.INIT to '0'.

### 19.6.2.2 Register Map

The M_TTCAN module allocates an address space of 512 bytes. All registers are organized as 32-bit registers. The M_TTCAN is accessible by the Host CPU via the Generic Slave Interface using a data width of 8 bit (byte access), 16 bit (half-word access), or 32 bit (word access). Write access by the Host CPU to registers/bits marked with "P = Protected Write" is possible only with MTTCAN0CCCR.CCE = '1' AND MTTCAN0CCCR.INIT = '1'. There is a delay from writing to a command register until the update of the related status register bits due to clock domain crossing.

ISO CANFD ISO 11898-1:2015

#### (1) Access to reserved Register Addresses

In case the application software wants to access one of the reserved addresses in the M_TTCAN register map (read or write access), interrupt flag MTTCAN0IR.ARA is set, and if enable the interrupt is signalled via the assigned interrupt line (m_ttcan_int0 or m_ttcan_int1).

### 19.6.2.3 Registers

#### (1) MTTCAN0CREL — Core Release Register

**Access:** This register can be read in 32-bit units.

ISO CANFD ISO 11898-1:2015

### (3) MTTCAN0DBTP — Data Bit Timing & Prescaler Register

This register is only writable if bits MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 49 time quanta. The CAN time quantum may be programmed in the range of 1 to 32 m_ttcan_cclk (CLKP_H2) periods. tq = (DBRP + 1) mtq.

DTSEG1 is the sum of Prop_Seg and Phase_Seg1. DTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [DTSEG1 + DTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $00C_H$

**Value after reset:** $0000\ 0A33_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.75 MTTCAN0DBTP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 23 | TDC | Transmitter Delay Compensation<br>0: Transmitter Delay Compensation disabled<br>1: Transmitter Delay Compensation enabled |
| 22, 21 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 20 to 16 | DBRP[4:0] | Data Bit Rate Prescaler<br>$00_H$ to $1F_H$<br>The value by which the oscillator frequency is divided for generating the bit time quanta. The bit time is built up from a multiple of this quanta. Valid values for the Bit Rate Prescaler are 0 to 31. When TDC = 1, the range is limited to 0, 1. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. |
| 15 to 13 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 12 to 8 | DTSEG1[4:0] | Data time segment before sample point<br>$00_H$ to $1F_H$<br>Valid values are 0 to 31. The actual interpretation by the hardware of this value is such that one more than the programmed value is used. |
| 7 to 4 | DTSEG2[3:0] | Data time segment after sample point<br>$0_H$ to $F_H$<br>Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the programmed value is used. |
| 3 to 0 | DSJW[3:0] | Data (Re) Synchronization Jump Width<br>$0_H$ to $F_H$<br>Valid values are 0 to 15. The actual interpretation by the hardware of this value is such that one more than the value programmed here is used. |

**NOTES**

1. With a CAN clock (m_ttcan_cclk: CLKP_H2) of 8 MHz, the reset value of 0000 0A33H configures the M_TTCAN for a data phase bit rate of 500 kBit/s.
2. The bit rate configured for the CAN FD data phase via MTTCAN0DBTP must be higher or equal to the bit rate configured for the arbitration phase via MTTCAN0NBTP.

ISO CANFD ISO 11898-1:2015

### (4) MTTCAN0TEST — Test Register

Write access to the Test Register has to be enabled by setting bit MTTCAN0CCCR.TEST to '1'. All Test Register functions are set to their reset values when bit MTTCAN0CCCR.TEST is reset.

Loop Back Mode and software control of pin m_ttcan_tx are hardware test modes. Programming of TX ≠ "00" may disturb the message transfer on the CAN bus.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

ISO CANFD 11898-1:2015

### (5) MTTCAN0RWD — RAM Watchdog

The RAM Watchdog monitors the READY output of the Message RAM (m_ttcan_aeim_ready). A Message RAM access via the M_TTCAN's Generic Master Interface (m_ttcan_aeim_sel active) starts the Message RAM Watchdog Counter with the value configured by MTTCAN0RWD.WDC. The counter is reloaded with MTTCAN0RWD.WDC when the Message RAM signals successful completion by activating its READY output. In case there is no response from the Message RAM until the counter has counted down to zero, the counter stops and interrupt flag MTTCAN0IR.WDI is set. The RAM Watchdog Counter is clocked by the Host clock (m_ttcan_hclk: CLK_HSB).

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $014_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.78 MTTCAN0CCCR Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 15 | NISO | Non ISO Operation<br>If this bit is set, the M_TTCAN uses the CAN FD frame format as specified by the Bosch CAN FD Specification V1.0.<br>0: CAN FD frame format according to ISO11898-1:2015<br>1: CAN FD frame format according to Bosch CAN FD Specification V1.0 |
| 14 | TXP | Transmit Pause<br>If this bit is set, the M_TTCAN pauses for two CAN bit times before starting the next transmission after itself has successfully transmitted a frame (see **(1) Transmit Pause**).<br>0: Transmit pause disabled<br>1: Transmit pause enabled |
| 13 | EFBI | Edge Filtering during Bus Integration<br>0: Edge filtering disabled.<br>1: Two consecutive dominant tq required to detect an edge for hard synchronization. |
| 12 | PXHD | Protocol Exception Handling Disable<br>0: Protocol exception handling enabled.<br>1: Protocol exception handling disabled.<br>**NOTE**<br>When protocol exception handling is disabled, the M_TTCAN will transmit an error frame when it detects a protocol exception condition. |
| 11, 10 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 9 | BRSE | Bit Rate Switch Enable<br>0: Bit rate switching for transmissions disabled.<br>1: Bit rate switching for transmissions enabled.<br>**NOTE**<br>When CAN FD operation is disabled FDOE = '0', BRSE is not evaluated. |
| 8 | FDOE | FD Operation Enable<br>0: FD operation disabled.<br>1: FD operation enabled. |

ISO CANFD IP Conformance 2015

**Table 19.78 MTTCAN0CCCR Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | TEST | Test Mode Enable<br>0: Normal operation, register MTTCAN0TEST holds reset values.<br>1: Test Mode, write access to register MTTCAN0TEST enabled. |
| 6 | DAR | Disable Automatic Retransmission<br>0: Automatic retransmission of messages not transmitted successfully enabled.<br>1: Automatic retransmission disabled |
| 5 | MON | Bus Monitoring Mode<br>Bit MON can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time.<br>0: Bus Monitoring Mode is disabled<br>1: Bus Monitoring Mode is enabled |
| 4 | CSR | Clock Stop Request<br>0: No clock stop is requested.<br>1: Clock stop requested. When clock stop is requested, first INIT and then CSA will be set after all pending transfer requests have been completed and the CAN bus reached idle. |
| 3 | CSA | Clock Stop Acknowledge<br>0: No clock stop acknowledged.<br>1: M_TTCAN may be set in power down by stopping m_ttcan_hclk (CLK_HSB) and m_ttcan_cclk (CLKP_H2). |
| 2 | ASM | Restricted Operation Mode<br>Bit ASM can only be set by the Host when both CCE and INIT are set to '1'. The bit can be reset by the Host at any time. For a description of the Restricted Operation Mode see **(5) Restricted Operation Mode**.<br>0: Normal CAN operation<br>1: Restricted Operation Mode active |
| 1 | CCE | Configuration Change Enable<br>0: The CPU has no write access to the protected configuration registers.<br>1: The CPU has write access to the protected configuration registers (while MTTCAN0CCCR.INIT = '1'). |
| 0 | INIT | Initialization<br>0: Normal Operation<br>1: Initialization is started. |

**NOTE**

Due to the synchronization mechanism between the two clock domains, there may be a delay until the value written to INIT can be read back. Therefore the programmer has to assure that the previous value written to INIT has been accepted by reading INIT before setting INIT to a new value.

NEO CANFD ISO 11898-1:2015

### (7) MTTCAN0NBTP — Nominal Bit Timing & Prescaler Register

This register is only writable if bits MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set. The CAN bit time may be programed in the range of 4 to 385 time quanta. The CAN time quantum may be programmed in the range of 1 to 512 m_ttcan_cclk (CLKP_H2) periods. tq = (NBRP + 1) mtq.

NTSEG1 is the sum of Prop_Seg and Phase_Seg1. NTSEG2 is Phase_Seg2.

Therefore the length of the bit time is (programmed values) [NTSEG1 + NTSEG2 + 3] tq
or (functional values) [Sync_Seg + Prop_Seg + Phase_Seg1 + Phase_Seg2] tq.

The Information Processing Time (IPT) is zero, meaning the data for the next bit is available at the first clock edge after the sample point.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $01C_H$

**Value after reset:** $0600\ 0A03_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.81 MTTCAN0TSCV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 15 to 0 | TSC[15:0] | Timestamp Counter<br>The internal/external Timestamp Counter value is captured on start of frame (both Rx and Tx). When MTTCAN0TSCC.TSS = “01”, the Timestamp Counter is incremented in multiples of CAN bit times [1 to 16] depending on the configuration of MTTCAN0TSCC.TCP. A wrap around sets interrupt flag MTTCAN0IR.TSW. Write access resets the counter to zero. When MTTCAN0TSCC.TSS = “10”, TSC reflects the external Timestamp Counter value. A write access has no impact. |

**NOTE**

A “wrap around” is a change of the Timestamp Counter value from non-zero to zero not caused by write access to MTTCAN0TSCV.

ISO CANFD ISO 11898-1:2015

### (10) MTTCAN0TOCC — Timeout Counter Configuration

For a description of the Timeout Counter see **Section 19.6.3.3, Timeout Counter**.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $028_H$

**Value after reset:** FFFF $0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.84 MTTCAN0ECR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. |
| 23 to 16 | CEL[7:0] | CAN Error Logging<br>The counter is incremented each time when a CAN protocol error causes the Transmit Error Counter or the Receive Error Counter to be incremented. It is reset by read access to CEL. The counter stops at $FF_H$; the next increment of TEC or REC sets interrupt flag MTTCAN0IR.ELO. |
| 15 | RP | Receive Error Passive<br>0: The Receive Error Counter is below the error passive level of 128<br>1: The Receive Error Counter has reached the error passive level of 128 |
| 14 to 8 | REC[6:0] | Receive Error Counter<br>Actual state of the Receive Error Counter, values between 0 and 127 |
| 7 to 0 | TEC[7:0] | Transmit Error Counter<br>Actual state of the Transmit Error Counter, values between 0 and 255 |

**NOTE**

When MTTCAN0CCCR.ASM is set, the CAN protocol controller does not increment TEC and REC when a CAN protocol error is detected, but CEL is still incremented. This enables monitoring of collisions between CAN frames and ASC frames.

ISO CANFD ISO 11898-1:2015

### (13) MTTCAN0PSR — Protocol Status Register

**Access:** This register can be read in 32-bit units.

**Address:** <MTTCAN0_base> + $044_H$

**Value after reset:** 0000 $0707_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 19.85 MTTCAN0PSR Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | These bits are always read as 0. |
| 22 to 16 | TDCV[6:0] | Transmitter Delay Compensation Value<br>$00_H$ to $7F_H$<br>Position of the secondary sample point, defined by the sum of the measured delay from m_ttcan_tx to m_ttcan_rx and MTTCAN0TDCR.TDCO. The SSP position is, in the data phase, the number of mtq between the start of the transmitted bit and the secondary sample point Valid values are 0 to 127 mtq. |
| 14 | PXE | Protocol Exception Event<br>0: No protocol exception event occurred since last read access.<br>1: Protocol exception event occurred. |
| 13 | RFDF | Received a CAN FD Message<br>This bit is set independent of acceptance filtering.<br>0: Since this bit was reset by the CPU, no CAN FD message has been received<br>1: Message in CAN FD format with FDF flag set has been received |
| 12 | RBRS | BRS flag of last received CAN FD Message<br>This bit is set together with RFDF, independent of acceptance filtering.<br>0: Last received CAN FD message did not have its BRS flag set<br>1: Last received CAN FD message had its BRS flag set |
| 11 | RESI | ESI flag of last received CAN FD Message<br>This bit is set together with RFDF, independent of acceptance filtering.<br>0: Last received CAN FD message did not have its ESI flag set<br>1: Last received CAN FD message had its ESI flag set |
| 10 to 8 | DLEC[2:0] | Data Phase Last Error Code<br>Type of last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. Coding is the same as for LEC. This field will be cleared to zero when a CAN FD format frame with its BRS flag set has been transferred (reception or transmission) without error. |
| 7 | BO | Bus_Off Status<br>0: The M_TTCAN is not Bus_Off<br>1: The M_TTCAN is in Bus_Off state |
| 6 | EW | Warning Status<br>0: Both error counters are below the Error_Warning limit of 96<br>1: At least one of error counter has reached the Error_Warning limit of 96 |

ISO CANFD ISO 11898-1:2015

**Table 19.85 MTTCAN0PSR Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 5 | EP | Error Passive<br>0: The M_TTCAN is in the Error_Active state. It normally takes part in bus communication and sends an active error flag when an error has been detected<br>1: The M_TTCAN is in the Error_Passive state |
| 4, 3 | ACT[1:0] | Activity<br>Monitors the module's CAN communication state.<br>00: Synchronizing - node is synchronizing on CAN communication<br>01: Idle - node is neither receiver nor transmitter<br>10: Receiver - node is operating as receiver<br>11: Transmitter - node is operating as transmitter<br>**NOTE**<br>ACT is set to "00" by a Protocol Exception Event. |
| 2 to 0 | LEC[2:0] | Last Error Code<br>The LEC indicates the type of the last error to occur on the CAN bus. This field will be cleared to '0' when a message has been transferred (reception or transmission) without error.<br>0: No Error: No error occurred since LEC has been reset by successful reception or transmission.<br>1: Stuff Error: More than 5 equal bits in a sequence have occurred in a part of a received message where this is not allowed.<br>2: Form Error: A fixed format part of a received frame has the wrong format.<br>3: AckError: The message transmitted by the M_TTCAN was not acknowledged by another node.<br>4: Bit1Error: During the transmission of a message (with the exception of the arbitration field), the device wanted to send a recessive level (bit of logical value '1'), but the monitored bus value was dominant.<br>5: Bit0Error: During the transmission of a message (or acknowledge bit, or active error flag, or overload flag), the device wanted to send a dominant level (data or identifier bit logical value '0'), but the monitored bus value was recessive. During Bus_Off recovery this status is set each time a sequence of 11 recessive bits has been monitored. This enables the CPU to monitor the proceeding of the Bus_Off recovery sequence (indicating the bus is not stuck at dominant or continuously disturbed).<br>6: CRCError: The CRC check sum of a received message was incorrect. The CRC of an incoming message does not match with the CRC calculated from the received data.<br>7: NoChange: Any read access to the Protocol Status Register re-initializes the LEC to '7'. When the LEC shows the value '7', no CAN bus event was detected since the last CPU read access to the Protocol Status Register. |

ISO CANFD 16.08.2015

**NOTES**

1. When a frame in CAN FD format has reached the data phase with BRS flag set, the next CAN event (error or valid frame) will be shown in DLEC instead of LEC. An error in a fixed stuff bit of a CAN FD CRC sequence will be shown as a Form Error, not Stuff Error.
2. The Bus_Off recovery sequence (see CAN Specification Rev. 2.0 or ISO11898-1:2015) cannot be shortened by setting or resetting MTTCAN0CCCR.INIT. If the device goes Bus_Off, it will set MTTCAN0CCCR.INIT of its own accord, stopping all bus activities. Once MTTCAN0CCCR.INIT has been cleared by the CPU, the device will then wait for 129 occurrences of Bus Idle (129 * 11 consecutive recessive bits) before resuming normal operation. At the end of the Bus_Off recovery sequence, the Error Management Counters will be reset. During the waiting time after the resetting of MTTCAN0CCCR.INIT, each time a sequence of 11 recessive bits has been monitored, a Bit0Error code is written to MTTCAN0PSR.LEC, enabling the CPU to readily check up whether the CAN bus is stuck at dominant or continuously disturbed and to monitor the Bus_Off recovery sequence. MTTCAN0ECR.REC is used to count these sequences.

### (14) MTTCAN0TDCR — Transmitter Delay Compensation Register

**Access:** This register can be read in 32-bit units.

**Address:** <MCANn_base> + $048_H$

**Value after reset:** $0000\ 0000_H$

**Table 19.86 MTTCAN0TDCR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 15 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 14 to 8 | TDCO[6:0] | Transmitter Delay Compensation Offset<br>$00_H$ to $7F_H$<br>Offset value defining the distance between the measured delay from m_ttcan_tx to m_ttcan_rx and the secondary sample point. Valid values are 0 to 127 mtq. |
| 7 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 6 to 0 | TDCF[6:0] | Transmitter Delay Compensation Filter Window Length<br>$00_H$ to $7F_H$<br>Defines the minimum value for the SSP position, dominant edges on m_ttcan_rx that would result in an earlier SSP position are ignored for transmitter delay measurement. The feature is enabled when TDCF is configured to a value greater than TDCO. Valid values are 0 to 127 mtq. |

ISO CANFD ISO 11898-1:2015

### (15) MTTCAN0IR — Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register. The configuration of MTTCAN0IE controls whether an interrupt is generated. The configuration of MTTCAN0ILS controls on which interrupt line an interrupt is signalled.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $050_H$

**Value after reset:** $0000\ 0000_H$

ISO CANFD ISO 11898-1:2015

### (17) MTTCAN0ILS — Interrupt Line Select

The Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1.

0: Interrupt assigned to interrupt line m_ttcan_int0 (INTMTTCANI0)

1: Interrupt assigned to interrupt line m_ttcan_int1 (INTMTTCANI1)

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $058_H$

**Value after reset:** $0000\ 0000_H$

| R/W | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP |

**Table 19.94 MTTCAN0XIDAM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 28 to 0 | EIDM[28:0] | Extended ID Mask<br>For acceptance filtering of extended frames the Extended ID AND Mask is ANDed with the Message ID of a received frame. Intended for masking of 29-bit IDs in SAE J1939. With the reset value of all bits set to one the mask is not active. |

ISO CANFD ISO 11898-1:2015

### (23) MTTCAN0HPMS — High Priority Message Status

This register is updated every time a Message ID filter element configured to generate a priority event matches. This can be used to monitor the status of incoming high priority messages and to enable fast access to these messages.

**Access:** This register can be read in 32-bit units.

**Address:** <MTTCAN0_base> + $094_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.104 MTTCAN0RXF1A Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 6 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 5 to 0 | F1AI[5:0] | Rx FIFO 1 Acknowledge Index<br>After the Host has read a message or a sequence of messages from Rx FIFO 1 it has to write the buffer index of the last element read from Rx FIFO 1 to F1AI. This will set the Rx FIFO 1 Get Index MTTCAN0RXF1S.F1GI to F1AI + 1 and update the FIFO 1 Fill Level MTTCAN0RXF1S.F1FL. |

ISO CANFD ISO 11898-1:2015

### (33) MTTCAN0RXESC — Rx Buffer / FIFO Element Size Configuration

Configures the number of data bytes belonging to an Rx Buffer / Rx FIFO element. Data field sizes >8 bytes are intended for CAN FD operation only.

**Access:** This register can be read in 32-bit units.

**Address:** <MTTCAN0_base> + $0BC_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.105 MTTCAN0RXESC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | These bits are always read as 0. |
| 10 to 8 | RBDS[2:0] | Rx Buffer Data Field Size<br>000: 8 byte data field<br>001: 12 byte data field<br>010: 16 byte data field<br>011: 20 byte data field<br>100: 24 byte data field<br>101: 32 byte data field<br>110: 48 byte data field<br>111: 64 byte data field |
| 7 | Reserved | This bit is always read as 0. |
| 6 to 4 | F1DS[2:0] | Rx FIFO 1 Data Field Size<br>000: 8 byte data field<br>001: 12 byte data field<br>010: 16 byte data field<br>011: 20 byte data field<br>100: 24 byte data field<br>101: 32 byte data field<br>110: 48 byte data field<br>111: 64 byte data field |
| 3 | Reserved | This bit is always read as 0. |
| 2 to 0 | F0DS[2:0] | Rx FIFO 0 Data Field Size<br>000: 8 byte data field<br>001: 12 byte data field<br>010: 16 byte data field<br>011: 20 byte data field<br>100: 24 byte data field<br>101: 32 byte data field<br>110: 48 byte data field<br>111: 64 byte data field |

**NOTE**

In case the data field size of an accepted CAN frame exceeds the data field size configured for the matching Rx Buffer or Rx FIFO, only the number of bytes as configured by MTTCAN0RXESC are stored to the Rx Buffer resp. Rx FIFO element. The rest of the frame's data field is ignored.

ISO CANFD ISO 11898-1:2015

### (34) MTTCAN0TXBC — Tx Buffer Configuration

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $0C0_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | RP | R | R |

**Table 19.106 MTTCAN0TXBC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | This bit is always read as 0. When written, write the initial value. |
| 30 | TFQM | Tx FIFO/Queue Mode<br>0: Tx FIFO operation<br>1: Tx Queue operation |
| 29 to 24 | TFQS[5:0] | Transmit FIFO/Queue Size<br>0: No Tx FIFO/Queue<br>1 to 32: Number of Tx Buffers used for Tx FIFO/Queue<br>>32: Values greater than 32 are interpreted as 32 |
| 23, 22 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 21 to 16 | NDTB[5:0] | Number of Dedicated Transmit Buffers<br>0: No Dedicated Tx Buffers<br>1 to 32: Number of Dedicated Tx Buffers<br>>32: Values greater than 32 are interpreted as 32 |
| 15 to 2 | TBSA[15:2] | Tx Buffers Start Address<br>Start address of Tx Buffers section in Message RAM (32-bit word address, see **Figure 19.4, Message RAM Configuration**). |
| 1, 0 | Reserved | These bits are always read as 0. When written, write the initial value. |

**NOTE**

Be aware that the sum of TFQS and NDTB may be not greater than 32. There is no check for erroneous configurations. The Tx Buffers section in the Message RAM starts with the dedicated Tx Buffers.

ISO CANFD 11898-1:2015

### (35) MTTCAN0TXFQS — Tx FIFO/Queue Status

The Tx FIFO/Queue status is related to the pending Tx requests listed in register MTTCAN0TXBRP. Therefore the effect of Add/Cancellation requests may be delayed due to a running Tx scan (MTTCAN0TXBRP not yet updated).

**Access:** This register can be read in 32-bit units.

**Address:** <MTTCAN0_base> + $0C4_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | TFQF | TFQPI[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | TFGI[4:0] | | | | | — | — | TFFL[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 19.107 MTTCAN0TXFQS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | These bits are always read as 0. |
| 21 | TFQF | Tx FIFO/Queue Full<br>0: Tx FIFO/Queue not full<br>1: Tx FIFO/Queue full |
| 20 to 16 | TFQPI[4:0] | Tx FIFO/Queue Put Index<br>Tx FIFO/Queue write index pointer, range 0 to 31. |
| 15 to 13 | Reserved | These bits are always read as 0. |
| 12 to 8 | TFGI[4:0] | Tx FIFO Get Index<br>Tx FIFO read index pointer, range 0 to 31. Read as zero when Tx Queue operation is configured (MTTCAN0TXBC.TFQM = '1'). |
| 7, 6 | Reserved | These bits are always read as 0. |
| 5 to 0 | TFFL[5:0] | Tx FIFO Free Level<br>Number of consecutive free Tx FIFO elements starting from TFGI, range 0 to 32. Read as zero when Tx Queue operation is configured (MTTCAN0TXBC.TFQM = '1') |

**NOTE**

In case of mixed configurations where dedicated Tx Buffers are combined with a Tx FIFO or a Tx Queue, the Put and Get Indices indicate the number of the Tx Buffer starting with the first dedicated Tx Buffers.
Example: For a configuration of 12 dedicated Tx Buffers and a Tx FIFO of 20 Buffers a Put Index of 15 points to the fourth buffer of the Tx FIFO.

ISO CANFD FDIS 11898-1:2015

### (36) MTTCAN0TXESC — Tx Buffer Element Size Configuration

Configures the number of data bytes belonging to a Tx Buffer element. Data field sizes > 8 bytes are intended for CAN FD operation only.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $0C8_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 19.109 MTTCAN0TXBRP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | TRP[31:0] | Transmission Request Pending<br>Each Tx Buffer has its own Transmission Request Pending bit. The bits are set via register MTTCAN0TXBAR. The bits are reset after a requested transmission has completed or has been cancelled via register MTTCAN0TXBCR. MTTCAN0TXBRP bits are set only for those Tx Buffers configured via MTTCAN0TXBC. After a MTTCAN0TXBRP bit has been set, a Tx scan (see **Section 19.5.3.5, Tx Handling**) is started to check for the pending Tx request with the highest priority (Tx Buffer with lowest Message ID).<br>A cancellation request resets the corresponding transmission request pending bit of register MTTCAN0TXBRP. In case a transmission has already been started when a cancellation is requested, this is done at the end of the transmission, regardless whether the transmission was successful or not. The cancellation request bits are reset directly after the corresponding MTTCAN0TXBRP bit has been reset.<br>After a cancellation has been requested, a finished cancellation is signalled via MTTCAN0TXBCF<br>• after successful transmission together with the corresponding MTTCAN0TXBTO bit<br>• when the transmission has not yet been started at the point of cancellation<br>• when the transmission has been aborted due to lost arbitration<br>• when an error occurred during frame transmission<br>In DAR mode all transmissions are automatically cancelled if they are not successful. The corresponding MTTCAN0TXBCF bit is set for all unsuccessful transmissions.<br>0: No transmission request pending<br>1: Transmission request pending<br>**NOTE**<br>MTTCAN0TXBRP bits which are set while a Tx scan is in progress are not considered during this particular Tx scan. In case a cancellation is requested for such a Tx Buffer, this Add Request is cancelled immediately, the corresponding MTTCAN0TXBRP bit is reset. |

ISO CANFD IP Module © 2015

### (38) MTTCAN0TXBAR — Tx Buffer Add Request

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $0D0_H$

**Value after reset:** $0000\ 0000_H$

**NOTE**

*ISO 11898-4, Section 5.2.1 requires,* that only the listed cycle count values are configured. Other values are possible but may lead to inconsistent matrix cycles.

ISO CANFD ISO 11898-1:2015

### (51) MTTCAN0TURCF — TUR Configuration

The length of the NTU is given by: NTU = CAN Clock Period • NC/DC

NC is an 18-bit value. Its high part, NCH[17:16] is hard wired to 0b01. Therefore the range of NC is $10000_H$ to $1FFFF_H$. The value configured by NCL is the initial value for MTTCAN0TURNA.NAV[15:0]. DC is set to $1000_H$ by hardware reset and it may not be written to $0000_H$.

Level 1: NC ≥ 4 • DC and NTU = CAN bit time
Level 0, 2: NC ≥ 8 • DC

The actual value of TUR may be changed by the clock drift compensation function of TTCAN Level 0 and Level 2 in order to adjust the node's local view of the NTU to the time master's view of the NTU. DC will not be changed by the automatic drift compensation, MTTCAN0TURNA.NAV may be adjusted around NC in the range of the Synchronization Deviation Limit given by MTTCAN0TTOCF.LDSDL. NC and DC should be programmed to the largest suitable values in order to allow the best computational accuracy for the drift compensation process.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $110_H$

**Value after reset:** $1000\ 0000_H$

| 8 | TTIE | Trigger Time Mark Interrupt Pulse Enable<br>External time mark events are configured by trigger memory element TMEX (see **(7) Trigger Memory Element**). A trigger time mark interrupt pulse is generated when the trigger memory element becomes active, and the M_TTCAN is in synchronization state In_Schedule or In_Gap.<br>0: Trigger Time Mark Interrupt output m_ttcan_tmp (MTTCAN0TMP) disabled<br>1: Trigger Time Mark Interrupt output m_ttcan_tmp (MTTCAN0TMP) enabled |

ISO CANFD IP Module - 2015

**Table 19.124 MTTCAN0TTOCN Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7, 6 | TMC[1:0] | Register Time Mark Compare<br>00: No Register Time Mark Interrupt generated<br>01: Register Time Mark Interrupt if Time Mark = cycle time<br>10: Register Time Mark Interrupt if Time Mark = local time<br>11: Register Time Mark Interrupt if Time Mark = global time<br>**NOTE**<br>When changing the time mark reference (cycle, local, global time), it is recommended to first write TMC = “00”, then reconfigure MTTCAN0TTTMK, and finally set TMC to the intended time reference. |
| 5 | RTIE | Register Time Mark Interrupt Pulse Enable<br>Register time mark interrupts are configured by register MTTCAN0TTTMK. A register time mark interrupt pulse with the length of one m_ttcan_clk period is generated when the time referenced by MTTCAN0TTOCN.TMC (cycle, local, or global) equals MTTCAN0TTTMK.TM, independent of the synchronization state.<br>0: Register Time Mark Interrupt output m_ttcan_rtp (MTTCAN0RTP) disabled<br>1: Register Time Mark Interrupt output m_ttcan_rtp (MTTCAN0RTP) enabled |
| 4, 3 | SWS[1:0] | Stop Watch Source<br>00: Stop Watch disabled<br>01: Actual value of cycle time is copied to MTTCAN0TTCPT.SWV<br>10: Actual value of local time is copied to MTTCAN0TTCPT.SWV<br>11: Actual value of global time is copied to MTTCAN0TTCPT.SWV |
| 2 | SWP | Stop Watch Polarity<br>0: Rising edge trigger<br>1: Falling edge trigger |
| 1 | ECS | External Clock Synchronization<br>Writing a ‘1’ to ECS sets MTTCAN0TTOST.WECS if the node is the actual Time Master. ECS is reset after one Host clock period. The external clock synchronization takes effect at the start of the next basic cycle. |
| 0 | SGT | Set Global time<br>Writing a ‘1’ to SGT sets MTTCAN0TTOST.WGDT if the node is the actual Time Master. SGT is reset after one Host clock period. The global time preset takes effect when the node transmits the next reference message with the Master_Ref_Mark modified by the preset value written to MTTCAN0TTGTP. |

ISO CANFD IC V1.0 Dec. 2015

### (53) MTTCAN0TTGTP — TT Global Time Preset

If MTTCAN0TTOST.WGDT is set, the next reference message will be transmitted with the Master_Ref_Mark modified by the preset value and with Disc_Bit = '1', presetting the global time in all nodes simultaneously.

TP is reset to $0000_H$ each time a reference message with Disc_Bit = '1' becomes valid or if the node is not the current Time Master. TP is locked while MTTCAN0TTOST.WGTD = '1' after setting MTTCAN0TTOCN.SGT until the reference message with Disc_Bit = '1' becomes valid or until the node is no longer the current Time Master.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $118_H$

**Value after reset:** $0000\ 0000_H$

### (54) MTTCAN0TTTMK — TT Time Mark

A time mark interrupt (MTTCAN0TTIR.RTMI = '1') is generated when the time base indicated by MTTCAN0TTOCN.TMC (cycle time, local time, or global time) has the same value as TM.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $11C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | TM[15:0] | Time Mark<br>$0000_H$ to $FFFF_H$: Time Mark |

**NOTE**

When using byte access to register MTTCAN0TTTMK it is recommended to first disable the time mark compare function (MTTCAN0TTOCN.TMC = "00") to avoid compares on inconsistent register values.

ISO CANFD 11898-1:2015

### (55) MTTCAN0TTIR — TT Interrupt Register

The flags are set when one of the listed conditions is detected (edge-sensitive). The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. A hard reset will clear the register.

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $120_H$

**Value after reset:** $0000\ 0000_H$

### (57) MTTCAN0TTILS — TT Interrupt Line Select

The TT Interrupt Line Select register assigns an interrupt generated by a specific interrupt flag from the TT Interrupt Register to one of the two module interrupt lines. For interrupt generation the respective interrupt line has to be enabled via MTTCAN0ILE.EINT0 and MTTCAN0ILE.EINT1.

0: TT interrupt assigned to interrupt line m_ttcan_int0 (INTMTTCANI0)

1: TT interrupt assigned to interrupt line m_ttcan_int1 (INTMTTCANI1)

**Access:** This register can be read/written in 32-bit units.

**Address:** <MTTCAN0_base> + $128_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

ISO CANFD CC 11898-1:2015

### (59) MTTCAN0TURNA — TUR Numerator Actual

There is no drift compensation in TTCAN Level 1 (NAV = NC). In TTCAN Level 0 and Level 2, the drift between the node's local clock and the time master's local clock is calculated. The drift is compensated when the Synchronization Deviation (difference between NC and the calculated NAV) is not more than 2 (MTTCAN0TTOCF.LDSDL + 5). With MTTCAN0TTOCF.LDSDL ≤ 7, this results in a maximum range for NAV of $(NC - 1000_H) \leq NAV \leq (NC + 1000_H)$.

**Access:** This register can be read in 32-bit units.

**Address:** <MTTCAN0_base> + $130_H$

**Value after reset:** $0001\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

ISO CANFD ISO 11898-1:2015

### 19.6.2.4 Message RAM

For storage of Rx/Tx messages and for storage of the filter configuration a single-ported Message RAM is connected to the M_TTCAN module.

#### (1) Message RAM Configuration

The Message RAM has a width of 32 bits. In case parity checking or ECC is used a respective number of bits has to be added to each word. The M_TTCAN module can be configured to allocate up to 4480 words in the Message RAM. It is not necessary to configure each of the sections listed in **Figure 19.16, Message RAM Configuration**, nor is there any restriction with respect to the sequence of the sections.

When operated in CAN FD mode the required Message RAM size strongly depends on the element size configured for Rx FIFO0, Rx FIFO1, Rx Buffers, and Tx Buffers via MTTCAN0RXESC.F0DS, MTTCAN0RXESC.F1DS, MTTCAN0RXESC.RBDS, and MTTCAN0TXESC.TBDS.

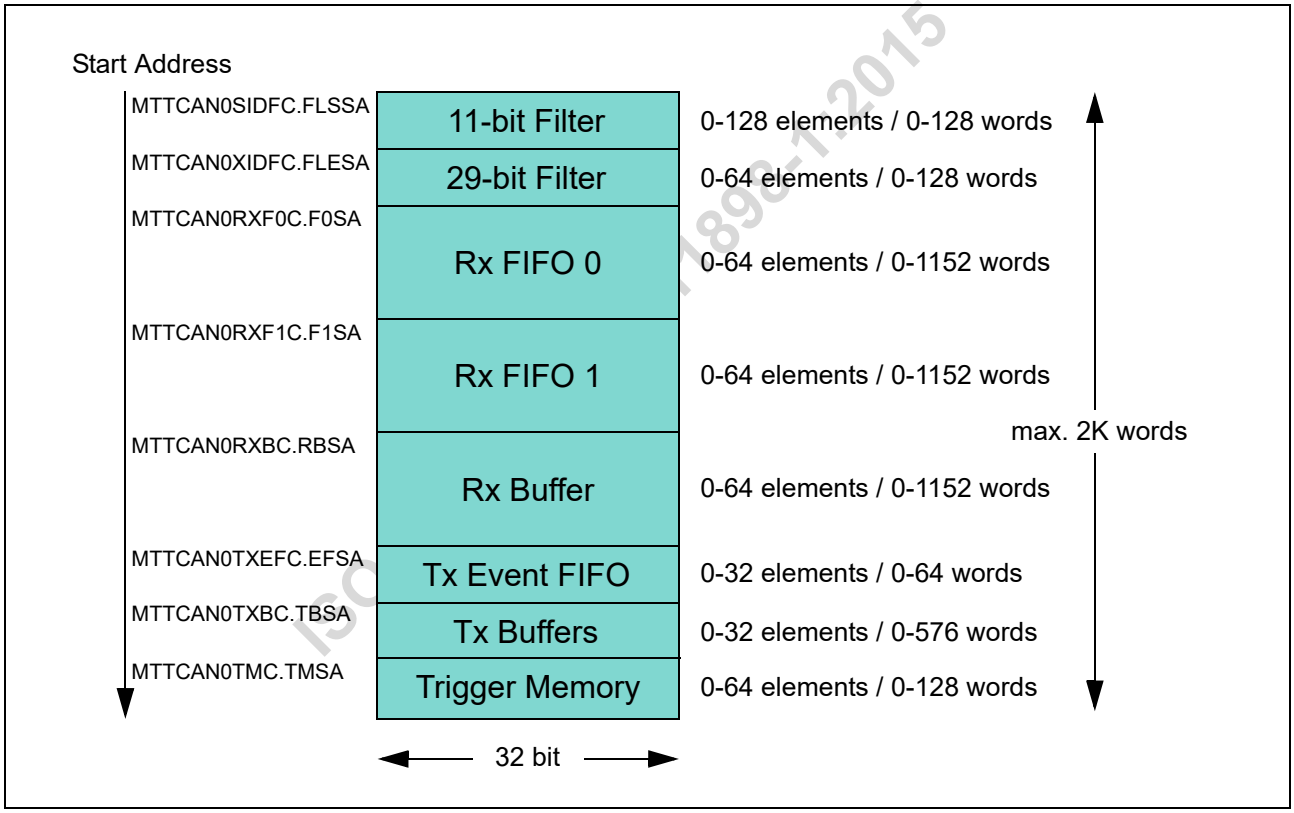

**Figure 19.16 Message RAM Configuration**

When the M_TTCAN addresses the Message RAM it addresses 32-bit words, not single bytes. The configurable start addresses are 32-bit word addresses i.e. only bits 15 to 2 are evaluated, the two least significant bits are ignored.

**NOTE**

The M_TTCAN does not check for erroneous configuration of the Message RAM. Especially the configuration of the start addresses of the different sections and the number of elements of each section has to be done carefully to avoid falsification or loss of data.

### (2) Rx Buffer and FIFO Element

Up to 64 Rx Buffers and two Rx FIFOs can be configured in the Message RAM. Each Rx FIFO section can be configured to store up to 64 received messages. The structure of a Rx Buffer / FIFO element is shown in **Table 19.136** below. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MTTCAN0RXESC.

**Table 19.136 Rx Buffer and FIFO Element**

| | 31 24 | 23 16 | 15 8 | 7 0 |
|---|---|---|---|---|
| R0 | ESI / XTD / RTR / ID[28:0] | | | |
| R1 | ANMF / FIDX[6:0] | res / FDF / BRS / DLC[3:0] | RXTS[15:0] | |
| R2 | DB3[7:0] | DB2[7:0] | DB1[7:0] | DB0[7:0] |
| R3 | DB7[7:0] | DB6[7:0] | DB5[7:0] | DB4[7:0] |
| ... | ... | ... | ... | ... |
| Rn | DBm[7:0] | DBm-1[7:0] | DBm-2[7:0] | DBm-3[7:0] |

**R0 Bit 31 ESI: Error State Indicator**

0: Transmitting node is error active
1: Transmitting node is error passive

**R0 Bit 30 XTD: Extended Identifier**

Signals to the Host whether the received frame has a standard or extended identifier.

0: 11-bit standard identifier
1: 29-bit extended identifier

**R0 Bit 29 RTR: Remote Transmission Request**

Signals to the Host whether the received frame is a data frame or a remote frame.

0:Received frame is a data frame

1:Received frame is a remote frame

**NOTE**

There are no remote frames in CAN FD format. In case a CAN FD frame (FDF = '1'), the dominant RRS (Remote Request Substitution) bit replaces bit RTR (Remote Transmission Request).

ISO CANFD ISO 11898-1:2015

**R0 Bits 28:0 ID[28:0]: Identifier**

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

**R1 Bit 31 ANMF: Accepted Non-matching Frame**

Acceptance of non-matching frames may be enabled via MTTCAN0GFC.ANFS and MTTCAN0GFC.ANFE.

0:Received frame matching filter index FIDX

1:Received frame did not match any Rx filter element

**R1 Bits 30:24 FIDX[6:0]:Filter Index**

0 to 127:Index of matching Rx acceptance filter element (invalid if ANMF = '1').
Range is 0 to MTTCAN0SIDFC.LSS - 1 resp. MTTCAN0XIDFC.LSE - 1.

**R1 Bit 21 FDF: FD Format**

0:Standard frame format

1:CAN FD frame format (new DLC-coding and CRC)

**R1 Bit 20 BRS: Bit Rate Switch**

0:Frame received without bit rate switching

1:Frame received with bit rate switching

**R1 Bits 19:16 DLC[3:0]: Data Length Code**

0 to 8: CAN + CAN FD: received frame has 0 to 8 data bytes

9 to 15: CAN: received frame has 8 data bytes

9 to 15: CAN FD: received frame has 12/16/20/24/32/48/64 data bytes

**R1 Bits 15:0 RXTS[15:0]:Rx Timestamp**

Timestamp Counter value captured on start of frame reception. Resolution depending on configuration of the Timestamp Counter Prescaler MTTCAN0TSCC.TCP.

ISO CANFD ISO 11898-1:2015

**R2 Bits 31:24 DB3[7:0]:Data Byte 3**

**R2 Bits 23:16 DB2[7:0]:Data Byte 2**

**R2 Bits 15:8 DB1[7:0]:Data Byte 1**

**R2 Bits 7:0 DB0[7:0]:Data Byte 0**

**R3 Bits 31:24 DB7[7:0]:Data Byte 7**

**R3 Bits 23:16 DB6[7:0]:Data Byte 6**

**R3 Bits 15:8 DB5[7:0]:Data Byte 5**

**R3 Bits 7:0 DB4[7:0]:Data Byte 4**

...

**Rn Bits 31:24 DBm[7:0]:Data Byte m**

**Rn Bits 23:16 DBm-1[7:0]:Data Byte m-1**

**Rn Bits 15:8 DBm-2[7:0]:Data Byte m-2**

**Rn Bits 7:0 DBm-3[7:0]:Data Byte m-3**

**NOTE**

Depending on the configuration of the element size (MCTTAN0RXESC), between two and sixteen 32-bit words (Rn = 3 to 17) are used for storage of a CAN message's data field.

ISO CAN FD ISO 11898-1:2015

### (3) Tx Buffer Element

The Tx Buffers section can be configured to hold dedicated Tx Buffers as well as a Tx FIFO / Tx Queue. In case that the Tx Buffers section is shared by dedicated Tx buffers and a Tx FIFO / Tx Queue, the dedicated Tx Buffers start at the beginning of the Tx Buffers section followed by the buffers assigned to the Tx FIFO or Tx Queue. The Tx Handler distinguishes between dedicated Tx Buffers and Tx FIFO / Tx Queue by evaluating the Tx Buffer configuration MTTCAN0TXBC.TFQS and MTTCAN0TXBC.NDTB. The element size can be configured for storage of CAN FD messages with up to 64 bytes data field via register MTTCAN0TXESC.

**Table 19.137 Tx Buffer Element**

| | 31 | 30 | 29 | 28 … 24 | 23 … 16 | 15 … 8 | 7 … 0 |
|---|---|---|---|---|---|---|---|
| T0 | ESI | XTD | RTR | ID[28:0] | | | |
| T1 | MM[7:0] | | | | EFC / res / FDF / BRS / DLC[3:0] | res | |
| T2 | DB3[7:0] | | | | DB2[7:0] | DB1[7:0] | DB0[7:0] |
| T3 | DB7[7:0] | | | | DB6[7:0] | DB5[7:0] | DB4[7:0] |
| ... | ... | | | | ... | ... | ... |
| Tn | DBm[7:0] | | | | DBm-1[7:0] | DBm-2[7:0] | DBm-3[7:0] |

**T0 Bit 31 ESI: Error State Indicator**

0: ESI bit in CAN FD format depends only on error passive flag

1: ESI bit in CAN FD format transmitted recessive

**NOTE**

The ESI bit of the transmit buffer is or'ed with the error passive flag to decide the value of the ESI bit in the transmitted FD frame. As required by the CAN FD protocol specification, an error active node may optionally transmit the ESI bit recessive, but an error passive node will always transmit the ESI bit recessive

**T0 Bit 30 XTD: Extended Identifier**

0: 11-bit standard identifier

1: 29-bit extended identifier

**T0 Bit 29 RTR: Remote Transmission Request**

0: Transmit data frame

1: Transmit remote frame

ISO CANFD ISO 11898-1:2015

**NOTE**

When RTR = 1, the M_TTCAN transmits a remote frame according to ISO11898-1:2015, even if MTTCAN0CCCR.FDOE enables the transmission in CAN FD format.

**T0 Bits 28:0 ID[28:0]: Identifier**

Standard or extended identifier depending on bit XTD. A standard identifier has to be written to ID[28:18].

**T1 Bits 31:24 MM[7:0]: Message Marker**

Written by CPU during Tx Buffer configuration. Copied into Tx Event FIFO element for identification of Tx message status.

**T1 Bit 23 EFC: Event FIFO Control**

0: Don't store Tx events

1: Store Tx events

**T1 Bit 21 FDF: FD Format**

0: Frame transmitted in Classic CAN format

1: Frame transmitted in CAN FD format

**T1 Bit 20 BRS: Bit Rat Switching**

0: CAN FD frames transmitted without bit rate switching

1: CAN FD frames transmitted with bit rate switching

**NOTE**

Bits ESI, FDF, and BRS are only evaluated when CAN FD operation is enabled MTTCAN0CCCR.FDOE = '1'. Bit BRS is only evaluated when in addition CCCR.BRSE = '1'.

**T1 Bits 19:16 DLC[3:0]: Data Length Code**

0 to 8: CAN + CAN FD: transmit frame has 0-8 data bytes

9 to 15: CAN: transmit frame has 8 data bytes

9 to 15: CAN FD: transmit frame has 12/16/20/24/32/48/64 data bytes

ISO CANFD ISO 11898-1:2015

**T2 Bits 31:24 DB3[7:0]:Data Byte 3**

**T2 Bits 23:16 DB2[7:0]: Data Byte 2**

**T2 Bits 15:8 DB1[7:0]: Data Byte 1**

**T2 Bits 7:0 DB0[7:0]: Data Byte 0**

**T3 Bits 31:24 DB7[7:0]: Data Byte 7**

**T3 Bits 23:16 DB6[7:0]: Data Byte 6**

**T3 Bits 15:8 DB5[7:0]: Data Byte 5**

**T3 Bits 7:0 DB4[7:0]: Data Byte 4**

**...**

**Tn Bits 31:24 DBm[7:0]: Data Byte m**

**Tn Bits 23:16 DBm-1[7:0]:Data Byte m-1**

**Tn Bits 15:8 DBm-2[7:0]:Data Byte m-2**

**Tn Bits 7:0 DBm-3[7:0]:Data Byte m-3**

**NOTE**

Depending on the configuration of the element size (MTTCAN0TXESC), between two and sixteen 32-bit words (Tn = 3 to 17) are used for storage of a CAN message's data field.

ISO CANFD ISO 11898-1:2015

### (4) Tx Event FIFO Element

Each element stores information about transmitted messages. By reading the Tx Event FIFO the Host CPU gets this information in the order the messages were transmitted. Status information about the Tx Event FIFO can be obtained from register MTTCAN0TXEFS.

**Table 19.138 Tx Event FIFO Element**

| | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| E0 | ESI | XTD | RTR | ID[28:0] | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| E1 | MM[7:0] | | | | | | | | ET[1:0] | | FDF | BRS | DLC[3:0] | | | | TXTS[15:0] | | | | | | | | | | | | | | | |

**E0 Bit 31 ESI: Error State Indicator**

0: Transmitting node is error active

1: Transmitting node is error passive

**E0 Bit 30 XTD: Extended Identifier**

0: 11-bit standard identifier

1: 29-bit extended identifier

**E0 Bit 29 RTR: Remote Transmission Request**

0: Data frame transmitted

1: Remote frame transmitted

**E0 Bits 28:0 ID[28:0]: Identifier**

Standard or extended identifier depending on bit XTD. A standard identifier is stored into ID[28:18].

**E1 Bits 31:24 MM[7:0]: Message Marker**

Copied from Tx Buffer into Tx Event FIFO element for identification of Tx message status.

**E1 Bit 23:22 ET[1:0]: Event Type**

00: Reserved

01: Tx event

10: Transmission in spite of cancellation (always set for transmissions in DAR mode)

11: Reserved

**E1 Bit 21 FDF: FD Format**

0: Standard frame format

1: CAN FD frame format (new DLC-coding and CRC)

**E1 Bit 20 BRS: Bit Rate Switch**

0: Frame transmitted without bit rate switching

1: Frame transmitted with bit rate switching

ISO CANFD ISO 11898-1:2015

**E1 Bits 19:16 DLC[3:0]: Data Length Code**

0 to 8: CAN + CAN FD: frame with 0-8 data bytes transmitted

9 to 15: CAN: frame with 8 data bytes transmitted

9 to 15: CAN FD: frame with 12/16/20/24/32/48/64 data bytes transmitted

**E1 Bits 15:0 TXTS[15:0]:Tx Timestamp**

Timestamp Counter value captured on start of frame transmission. Resolution depending on configuration of the Timestamp Counter Prescaler MTTCAN0TSCC.TCP.

ISO CANFD ISO 11898-1:2015

### (5) Standard Message ID Filter Element

Up to 128 filter elements can be configured for 11-bit standard IDs. When accessing a Standard Message ID Filter element, its address is the Filter List Standard Start Address MTTCAN0SIDFC.FLSSA plus the index of the filter element (0 to 127).

**Table 19.139 Standard Message ID Filter Element**

| 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| S0 | SFT[1:0] | | SFEC[2:0] | | SFID1[10:0] | | | | | | | | | | | res | | | | | | | | SFID2[10:0] | | | | | | | |

**Bits 31:30 SFT[1:0]: Standard Filter Type**

00: Range filter from SFID1 to SFID2 (SFID2 ≥ SFID1)

01: Dual ID filter for SFID1 or SFID2

10: Classic filter: SFID1 = filter, SFID2 = mask

11: Filter element disabled

**NOTE**

With SFT = “11” the filter element is disabled and the acceptance filtering continues (same behaviour as with SFEC = “000”).

**Bit 29:27 SFEC[2:0]:Standard Filter Element Configuration**

All enabled filter elements are used for acceptance filtering of standard frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If SFEC = “100”, “101”, or “110” a match sets interrupt flag MTTCAN0IR.HPM and, if enabled, an interrupt is generated. In this case register MTTCAN0HPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of SFT[1:0] ignored

**Bits 26:16 SFID1[10:0]:Standard Filter ID 1**

First ID of standard ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of a standard message to be stored. The received identifiers must match exactly, no masking mechanism is used.

ISO CANFD ISO 11898-1:2015

**Bits 10:0 SFID2[10:0]:Standard Filter ID 2**

This bit field has a different meaning depending on the configuration of SFEC:

1) SFEC = “001” to ”110” Second ID of standard ID filter element

2) SFEC = “111” Filter for Rx Buffers or for debug messages

**SFID2[10:9]**: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

**SFID2[8:6]**: These bits are used to control the filter event pins m_ttcan_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_ttcan_hclk (CLK_HSB) period in case the filter matches.

**SFID2[5:0]:** These bits define the offset to the Rx Buffer Start Address MTTCAN0RXBC.RBSA for storage of a matching message.

ISO CANFD ISO 11898-1:2015

### (6) Extended Message ID Filter Element

Up to 64 filter elements can be configured for 29-bit extended IDs. When accessing an Extended Message ID Filter element, its address is the Filter List Extended Start Address MTTCAN0XIDFC.FLESA plus two times the index of the filter element (0 to 63).

**Table 19.140 Extended Message ID Filter Element**

| | 31 | 24 | 23 | 16 | 15 | 8 | 7 | 0 |
|---|---|---|---|---|---|---|---|---|
| F0 | EFEC[2:0] | | EFID1[28:0] | | | | | |
| F1 | EFT[1:0] | res | EFID2[28:0] | | | | | |

#### F0 Bit 31:29 EFEC[2:0]:Extended Filter Element Configuration

All enabled filter elements are used for acceptance filtering of extended frames. Acceptance filtering stops at the first matching enabled filter element or when the end of the filter list is reached. If EFEC = “100”, “101”, or “110” a match sets interrupt flag MCANnIR.HPM and, if enabled, an interrupt is generated. In this case register MCANnHPMS is updated with the status of the priority match.

000: Disable filter element

001: Store in Rx FIFO 0 if filter matches

010: Store in Rx FIFO 1 if filter matches

011: Reject ID if filter matches

100: Set priority if filter matches

101: Set priority and store in FIFO 0 if filter matches

110: Set priority and store in FIFO 1 if filter matches

111: Store into Rx Buffer or as debug message, configuration of EFT[1:0] ignored

ISO CANFD ISO 11898-1:2015

#### F0 Bits 28:0 EFID1[28:0]:Extended Filter ID 1

First ID of extended ID filter element.

When filtering for Rx Buffers or for debug messages this field defines the ID of an extended message to be stored. The received identifiers must match exactly, only MTTCAN0XIDAM masking mechanism (see **Section (e), Extended Message ID Filtering**) is used.

#### F1 Bits 31:30 EFT[1:0]: Extended Filter Type

00: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1)

01: Dual ID filter for EFID1 or EFID2

10: Classic filter: EFID1 = filter, EFID2 = mask

11: Range filter from EFID1 to EFID2 (EFID2 ≥ EFID1), MTTCAN0XIDAM mask not applied

#### F1 Bits 28:0 EFID2[28:0]:Extended Filter ID 2

This bit field has a different meaning depending on the configuration of EFEC:

1) EFEC: “001” to ”110”Second ID of extended ID filter element

2) EFEC: “111”Filter for Rx Buffers or for debug messages

**EFID2[10:9]**: These bits decide whether the received message is stored into an Rx Buffer or treated as message A, B, or C of the debug message sequence.
00: Store message into an Rx Buffer
01: Debug Message A
10: Debug Message B
11: Debug Message C

**EFID2[8:6]**: These bits are used to control the filter event pins m_ttcan_fe[2:0] at the Extension Interface. A one at the respective bit position enables generation of a pulse at the related filter event pin with the duration of one m_ttcan_hclk (CLK_HSB) period in case the filter matches.

**EFID2[5:0]:** These bits define the offset to the Rx Buffer Start Address MCANnRXBC.RBSA for storage of a matching message.

ISO CANFD ISO 11898-1:2015

### (7) Trigger Memory Element

Up to 64 trigger memory elements can be configured. When accessing a Trigger Memory element, its address is the Trigger Memory Start Address MTTCAN0TTTMC.TMSA plus the index of the trigger memory element (0 to 63).

**Table 19.141 Trigger Memory Element**

| | 31 24 | 23 16 | 15 8 | 7 0 |
|---|---|---|---|---|
| T0 | TM[15:0] | | res CC[6:0] | ASC[1:0] TMIN TMEX TYPE[3:0] |
| T1 | res | FTYPE MNR[6:0] | res | MSC[2:0] |

#### T0 Bit 31:16 TM[15:0]:Time Mark

Cycle time for which the trigger becomes active.

#### T0 Bit 14:8 CC[6:0]:Cycle Code

Cycle count for which the trigger is valid. Ignored for trigger types Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, End_of_List.

$000000x_B$ valid for all cycles

$000001c_B$ valid every 2nd cycle at cycle count mod2 = c

$00001cc_B$ valid every 4th cycle at cycle count mod4 = cc

$0001ccc_B$ valid every 8th cycle at cycle count mod8 = ccc

$001cccc_B$ valid every 16th cycle at cycle count mod16 = cccc

$01ccccc_B$ valid every 32nd cycle at cycle count mod32 = ccccc

$1cccccc_B$ valid every 64th cycle at cycle count mod64 = cccccc

#### T0 Bit 7:6 ASC[1:0]:Asynchronous Serial Communication

00: No ASC operation

01: Reserved, do not use

10: Node is ASC receiver

11: Node is ASC transmitter

#### T0 Bit 5 TMIN:Time Mark Event Internal

0: No action

1: MTTCAN0TTIR.TTMI is set when trigger memory element becomes active

#### T0 Bit 4 TMEX:Time Mark Event External

0: No action

1: Pulse at output m_ttcan_tmp (MTTCAN0TMP) with the length of one m_ttcan_cclk (CLKP_H2) period is generated when the time mark of the trigger memory element becomes active and MTTCAN0TTOCN.TTMIE = '1'

ISO CANFD ISO 11898-1:2015

**T0 Bit 3:0 TYPE[3:0]:Trigger Type**

| | |
|---|---|
| 0000 | Tx_Ref_Trigger - valid when not in Gap |
| 0001 | Tx_Ref_Trigger_Gap - valid when in Gap |
| 0010 | Tx_Trigger_Single - starts a single transmission in an exclusive time window |
| 0011 | Tx_Trigger_Continuous - starts continuous transmission in an exclusive time window |
| 0100 | Tx_Trigger_Arbitration - starts a transmission in an arbitrating time window |
| 0101 | Tx_Trigger_Merged - starts a merged arbitration window |
| 0110 | Watch_Trigger - valid when not in Gap |
| 0111 | Watch_Trigger_Gap - valid when in Gap |
| 1000 | Rx_Trigger - check for reception |
| 1001 | Time_Base_Trigger - only control TMIN, TMEX, and ASC |
| 1010 to 1111 | End_of_List - illegal type, causes config error |

**NOTE**

For ASC operation (ASC = “10”, “11”) only trigger types Rx_Trigger and Time_Base_Trigger should be used.

**T1 Bit 23 FTYPE:Filter Type**

*0*= 11-bit standard message ID
*1*= 29-bit extended message ID

**T1 Bit 22:16 MNR[6:0]:Message Number**

Transmission: Trigger is valid for configured Tx Buffer number. Valid values are 0 to 31.
Reception: Trigger is valid for standard / extended message ID filter element number. Valid values are 0 to 63 resp. 0 to 127.

**T1 Bits 2:0 MSC[2:0]:Message Status Count**

Counts scheduling errors for periodic messages in exclusive time windows. It has no function for arbitrating messages and in event-driven CAN communication (ISO11898-1:2015).

0-7: Actual status

**NOTES**

1. The trigger memory elements have to be written when the M_TTCAN is in INIT state. Write access to the trigger memory elements outside INIT state is not allowed.
2. There is an exception for TMIN and TMEX when they are defined as part of a trigger memory element of TYPE Tx_Ref_Trigger. In this case they become active at the time mark modified by the actual Reference Trigger Offset (MTTCAN0TTOST.RTO).

ISO CANFD ISO 11898-1:2015

## 19.6.3 Functional Description

### 19.6.3.1 Operating Modes

#### (1) Software Initialization

Software initialization is started by setting bit MTTCAN0CCCR.INIT, either by software or by a hardware reset, when an uncorrected bit error was detected in the Message RAM, or by going Bus_Off. While MTTCAN0CCCR.INIT is set, message transfer from and to the CAN bus is stopped, the status of the CAN bus output m_ttcan_tx is recessive (HIGH). The counters of the Error Management Logic EML are unchanged. Setting MTTCAN0CCCR.INIT does not change any configuration register. Resetting MTTCAN0CCCR.INIT finishes the software initialization. Afterwards the Bit Stream Processor BSP synchronizes itself to the data transfer on the CAN bus by waiting for the occurrence of a sequence of 11 consecutive recessive bits (≡ Bus_Idle) before it can take part in bus activities and start the message transfer.

Access to the M_TTCAN configuration registers is only enabled when both bits MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are set (protected write).

MTTCAN0CCCR.CCE can only be set/reset while MTTCAN0CCCR.INIT = '1'. MTTCAN0CCCR.CCE is automatically reset when MTTCAN0CCCR.INIT is reset.

The following registers are reset when MTTCAN0CCCR.CCE is set

- MTTCAN0HPMS - High Priority Message Status
- MTTCAN0RXF0S - Rx FIFO 0 Status
- MTTCAN0RXF1S - Rx FIFO 1 Status
- MTTCAN0TXFQS - Tx FIFO/Queue Status
- MTTCAN0TXBRP - Tx Buffer Request Pending
- MTTCAN0TXBTO - Tx Buffer Transmission Occurred
- MTTCAN0TXBCF - Tx Buffer Cancellation Finished
- MTTCAN0TXEFS - Tx Event FIFO Status
- MTTCAN0TTOST - TT Operation Status
- MTTCAN0TTLGT - TT Local & Global Time, only Global Time MTTCAN0TTLGT.GT is reset
- MTTCAN0TTCTC - TT Cycle Time & Count
- MTTCAN0TTCSM - TT Cycle Sync Mark

The Timeout Counter value MTTCAN0TOCV.TOC is preset to the value configured by MTTCAN0TOCC.TOP when MTTCAN0CCCR.CCE is set.

In addition the state machines of the Tx Handler and Rx Handler are held in idle state while MTTCAN0CCCR.CCE = '1'.

The following registers are only writable while MTTCAN0CCCR.CCE = '0'

- MTTCAN0TXBAR - Tx Buffer Add Request
- MTTCAN0TXBCR - Tx Buffer Cancellation Request

MTTCAN0CCCR.TEST and MTTCAN0CCCR.MON can only be set by the Host while MTTCAN0CCCR.INIT = '1' and MTTCAN0CCCR.CCE = '1'. Both bits may be reset at any time. MTTCAN0CCCR.DAR can only be set/reset while MTTCAN0CCCR.INIT = '1' and MTTCAN0CCCR.CCE = '1'.

ISO CANFD ISO 11898-1:2015

### (2) Normal Operation

The M_TTCAN's default operating mode after hardware reset is event-driven CAN communication without time triggers (MTTCAN0TTOCF.OM = "00"). It is required that both MTTCAN0CCCR.INIT and MTTCAN0CCCR.CCE are set before the TT Operation Mode can be changed.

Once the M_TTCAN is initialized and MTTCAN0CCCR.INIT is reset to zero, the M_TTCAN synchronizes itself to the CAN bus and is ready for communication.

After passing the acceptance filtering, received messages including Message ID and DLC are stored into a dedicated Rx Buffer or into Rx FIFO 0 or Rx FIFO 1.

For messages to be transmitted dedicated Tx Buffers and/or a Tx FIFO or a Tx Queue can be initialized or updated. Automated transmission on reception of remote frames is not implemented.

### (3) CAN FD Operation

There are two variants in the CAN FD frame transmission, first the CAN FD frame without bit rate switching . The second variant is the CAN FD frame where control field, data field, and CRC field are transmitted with a higher bit rate than the beginning and the end of the frame.

The previously reserved bit in CAN frames with 11-bit identifiers and the first previously reserved bit in CAN frames with 29-bit identifiers will now be decoded as FDF bit. FDF = recessive signifies a CAN FD frame, FDF = dominant signifies a Classic CAN frame. In a CAN FD frame, the two bits following FDF, res and BRS, decide whether the bit rate inside of this CAN FD frame is switched. A CAN FD bit rate switch is signified by res = dominant and BRS = recessive. The coding of res = recessive is reserved for future expansion of the protocol. In case the M_TTCAN receives a frame with FDF = recessive and res = recessive, it will signal a Protocol Exception Event by setting bit PSR.PXE. When Protocol Exception Handling is enabled (MTTCAN0CCCR.PXHD = '0'), this causes the operation state to change from Receiver (MTTCAN0PSR.ACT = "10") to Integrating (MTTCAN0PSR.ACT = "00") at the next sample point. In case Protocol Exception Handling is disabled (MTTCAN0CCCR.PXHD = '1'), the M_TTCAN will treat a recessive res bit as an form error and will respond with an error frame.

ISO CAN FD ISO 11898-1:2015

CAN FD operation is enabled by programming MTTCAN0CCCR.FDOE. In case MTTCAN0CCCR.FDOE = '1', transmission and reception of CAN FD frames is enabled. Transmission and reception of Classic CAN frames is always possible. Whether a CAN FD frame or a Classic CAN frame is transmitted can be configured via bit FDF in the respective Tx Buffer element. With MTTCAN0CCCR.FDOE = '0', received frames are interpreted as Classic CAN frames, which leads to the transmission of an error frame when receiving a CAN FD frame. When CAN FD operation is disabled, no CAN FD frames are transmitted even if bit FDF of a Tx Buffer element is set. MTTCAN0CCCR.FDOE and MTTCAN0CCCR.BRSE can only be changed while MTTCAN0CCCR.INIT and CCCR.CCE are both set.

With MTTCAN0CCCR.FDOE = '0', the setting of bits FDF and BRS is ignored and frames are transmitted in Classic CAN format. With MTTCAN0CCCR.FDOE = '1' and MTTCAN0CCCR.BRSE = '0', only bit FDF of a Tx Buffer element is evaluated. With MTTCAN0CCCR.FDOE = '1' and MTTCAN0CCCR.BRSE = '1', transmission of CAN FD frames with bit rate switching is enabled. All Tx Buffer elements with bits FDF and BRS set are transmitted in CAN FD format with bit rate switching.

A mode change during CAN operation is only recommended under the following conditions:

- The failure rate in the CAN FD data phase is significant higher than in the CAN FD arbitration phase. In this case disable the CAN FD bit rate switching option for transmissions.
- During system startup all nodes are transmitting Classic CAN messages until it is verified that

they are able to communicate in CAN FD format. If this is true, all nodes switch to CAN FD operation.

- Wake-up messages in CAN Partial Networking have to be transmitted in Classic CAN format.
- End-of-line programming in case not all nodes are CAN FD capable. Non CAN FD nodes are held in Silent mode until programming has completed. Then all nodes switch back to Classic CAN communication.

In the CAN FD format, the coding of the DLC differs from the standard CAN format. The DLC codes 0 to 8 have the same coding as in standard CAN, the codes 9 to 15, which in standard CAN all code a data field of 8 bytes, are coded according to **Table 19.142** below.

**Table 19.142 Coding of DLC in CAN FD**

| DLC | 9 | 10 | 11 | 12 | 13 | 14 | 15 |
|---|---|---|---|---|---|---|---|
| Number of Data Bytes | 12 | 16 | 20 | 24 | 32 | 48 | 64 |

In CAN FD frames, the bit timing will be switched inside the frame, after the BRS (Bit Rate Switch) bit, if this bit is recessive. Before the BRS bit, in the CAN FD arbitration phase, the nominal CAN bit timing is used as defined by the Nominal Bit Timing & Prescaler Register MTTCAN0NBTP. In the following CAN FD data phase, the data phase bit timing is used as defined by the Data Bit Timing & Prescaler Register MTTCAN0DBTP. The bit timing is switched back from the data phase timing at the CRC delimiter or when an error is detected, whichever occurs first.

The maximum configurable bit rate in the CAN FD data phase depends on the CAN clock frequency (m_ttcan_cclk: CLKP_H2). Example: with a CAN clock frequency of 20MHz and the shortest configurable bit time of 4 tq, the bit rate in the data phase is 5 Mbit/s.

In both data frame formats, CAN FD and CAN FD with bit rate switching, the value of the bit ESI (Error Status Indicator) is determined by the transmitter's error state at the start of the transmission. If the transmitter is error passive, ESI is transmitted recessive, else it is transmitted dominant.

ISO CANFD ISO 11898-1:2015

### (4) Transmitter Delay Compensation

During the data phase of a CAN FD transmission only one node is transmitting, all others are receivers. The length of the bus line has no impact. When transmitting via pin m_ttcan_tx the protocol controller receives the transmitted data from its local CAN transceiver via pin m_ttcan_rx. The received data is delayed by the CAN transceiver's loop delay. In case this delay is greater than TSEG1 (time segment before sample point), a bit error is detected. In order to enable a data phase bit time that is even shorter than the transceiver loop delay, the delay compensation is introduced. Without transmitter delay compensation, the bit rate in the data phase of a CAN FD frame is limited by the transceivers loop delay.

(a) Description

The CAN FD protocol unit has implemented a delay compensation mechanism to compensate the CAN transceiver's loop delay, thereby enabling transmission with higher bit rates during the CAN FD data phase independent of the delay of a specific CAN transceiver.

To check for bit errors during the data phase of transmitting nodes, the delayed transmit data is compared against the received data at the Secondary Sample Point SSP. If a bit error is detected, the transmitter will react on this bit error at the next following regular sample point. During arbitration phase the delay compensation is always disabled.

The transmitter delay compensation enables configurations where the data bit time is shorter than the transmitter delay, it is described in detail in the ISO11898-1:2015. It is enabled by setting bit MTTCAN0DBTP.TDC.

The received bit is compared against the transmitted bit at the SSP. The SSP position is defined as the sum of the measured delay from the M_TTCAN's transmit output m_ttcan_tx through the transceiver to the receive input m_ttcan_rx plus the transmitter delay compensation offset as configured by MTTCAN0TDCR.TDCO. The transmitter delay compensation offset is used to adjust the position of the SSP inside the received bit (e.g. half of the bit time in the data phase). The position of the secondary sample point is rounded down to the next integer number of mtq.

MTTCAN0PSR.TDCV shows the actual transmitter delay compensation value. MTTCAN0PSR.TDCV is cleared when MTTCAN0CCCR.INIT is set and is updated at each transmission of an FD frame while MTTCAN0DBTP.TDC is set.

The following boundary conditions have to be considered for the transmitter delay compensation implemented in the M_TTCAN:

- The sum of the measured delay from m_ttcan_tx to m_ttcan_rx and the configured transmitter delay compensation offset MTTCAN0TDCR.TDCO has to be less than 6 bit times in the data phase.
- The sum of the measured delay from m_ttcan_tx to m_ttcan_rx and the configured transmitter delay compensation offset MTTCAN0TDCR.TDCO has to be less or equal 127 mtq. In case this sum exceeds 127 mtq, the maximum value of 127 mtq is used for transmitter delay compensation.
- The data phase ends at the sample point of the CRC delimiter, that stops checking of receive bits at the SSPs

ISO CANFD ISO 11898-1:2015

(b) Transmitter Delay Compensation Measurement

If transmitter delay compensation is enabled by programming MTTCAN0DBTP.TDC = '1', the measurement is started within each transmitted CAN FD frame at the falling edge of bit FDF to bit res. The measurement is stopped when this edge is seen at the receive input m_ttcan_rx of the transmitter. The resolution of this measurement is one mtq.

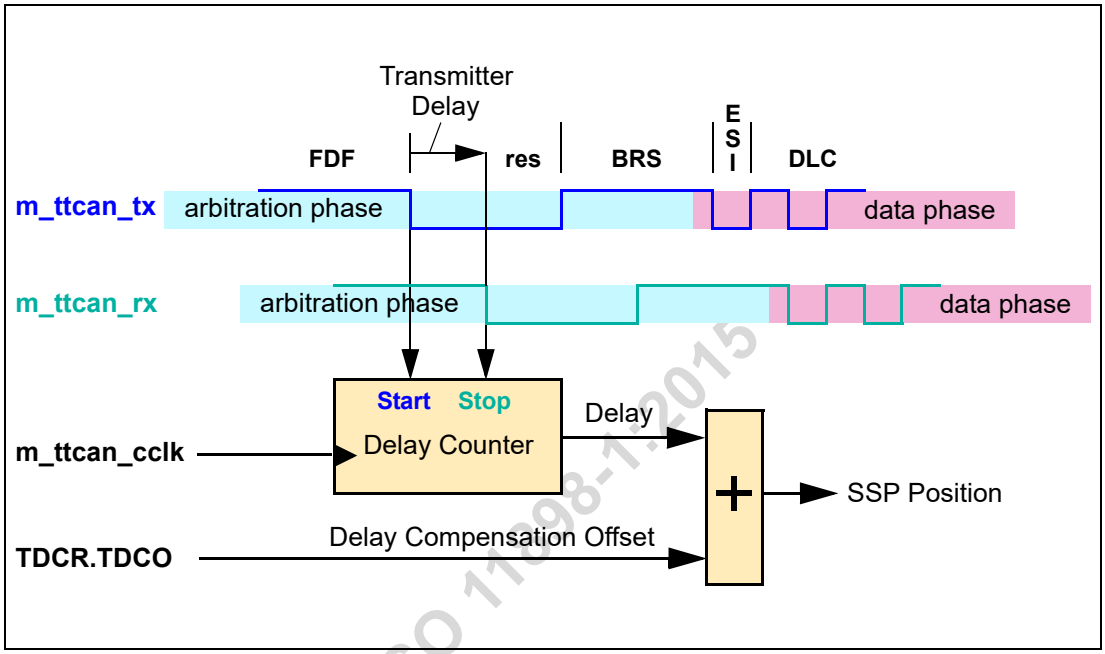

Figure 19.17 Transmitter delay measurement

ISO CANFD ISO 11898-1:2015

To avoid that a dominant glitch inside the received FDF bit ends the delay compensation measurement before the falling edge of the received res bit, resulting in a to early SSP position, the use of a transmitter delay compensation filter window can be enabled by programming MTTCAN0TDCR.TDCF. This defines a minimum value for the SSP position. Dominant edges on m_ttcan_rx, that would result in an earlier SSP position are ignored for transmitter delay measurement. The measurement is stopped when the SSP position is at least MTTCAN0TDCR.TDCF AND m_ttcan_rx is low.

### (5) Restricted Operation Mode

In Restricted Operation Mode the node is able to receive data and remote frames and to give acknowledge to valid frames, but it does not send data frames, remote frames, active error frames, or overload frames. In case of an error condition or overload condition, it does not send dominant bits, instead it waits for the occurrence of bus idle condition to resynchronize itself to the CAN communication. The error counters (ECR.REC, ECR.TEC) are frozen while Error Logging (ECR.CEL) is active. The Host can set the M_TTCAN into Restricted Operation mode by setting bit MTTCAN0CCCR.ASM. The bit can only be set by the Host when both MTTCAN0CCCR.CCE and MTTCAN0CCCR.INIT are set to '1'. The bit can be reset by the Host at any time.

Restricted Operation Mode is automatically entered when the Tx Handler was not able to read data from the Message RAM in time. To leave Restricted Operation Mode, the Host CPU has to reset MTTCAN0CCCR.ASM.

The Restricted Operation Mode can be used in applications that adapt themselves to different CAN bit rates. In this case the application tests different bit rates and leaves the Restricted Operation Mode after it has received a valid frame.

When the M_TTCAN is configured for Asynchronous Serial Communication, the Host has to set MTTCAN0CCCR.ASM during initialization to start with an ASC window. The bit is reset at the end of the first ASC window after the M_TTCAN has finished initializing. During time-triggered operation MTTCAN0CCCR.ASM is set by the M_TTCAN at the beginning of an ASC window (trigger memory element with T0.ASC = "10", "11"). It is reset by each trigger memory element with T0.ASC = "00".

If the M_TTCAN is connected to a Clock Calibration on CAN unit, MTTCAN0CCCR.ASM is controlled by input m_ttcan_cok. In case m_ttcan_cok switches to '0', bit MTTCAN0CCCR.ASM is set. When m_ttcan_cok switches back to '1', bit MTTCAN0CCCR.ASM returns to the previously written value. When there is no Clock Calibration on CAN unit connected input m_ttcan_cok is hardwired to '1'.

**NOTE**

The Restricted Operation Mode must not be combined with the Loop Back Mode (internal or external).

ISO CANFD ISO 11898-1:2015

### (6) Bus Monitoring Mode

The M_TTCAN is set in Bus Monitoring Mode by programming MTTCAN0CCCR.MON to one or when error level S3 (MTTCAN0TTOST.EL = “11”) is entered. In Bus Monitoring Mode (see ISO11898-1:2015, 10.12 Bus monitoring), the M_TTCAN is able to receive valid data frames and valid remote frames, but cannot start a transmission. In this mode, it sends only recessive bits on the CAN bus, if the M_TTCAN is required to send a dominant bit (ACK bit, overload flag, active error flag), the bit is rerouted internally so that the M_TTCAN monitors this dominant bit, although the CAN bus may remain in recessive state. In Bus Monitoring Mode register MTTCAN0TXBRP is held in reset state.

The Bus Monitoring Mode can be used to analyze the traffic on a CAN bus without affecting it by the transmission of dominant bits. **Figure 19.18** shows the connection of signals m_ttcan_tx and m_ttcan_rx to the M_TTCAN in Bus Monitoring Mode.

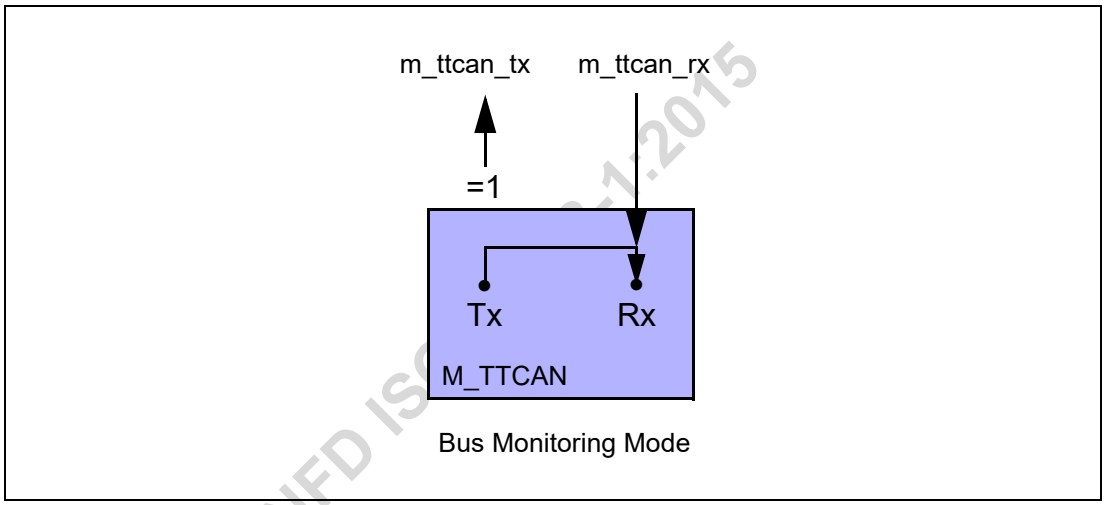

**Figure 19.18 Pin Control in Bus Monitoring Mode**

### (7) Disabled Automatic Retransmission

According to the CAN Specification (see ISO11898-1:2015, 6.3.3 Recovery Management), the M_TTCAN provides means for automatic retransmission of frames that have lost arbitration or that have been disturbed by errors during transmission. By default automatic retransmission is enabled. To support time-triggered communication as described in ISO 11898-1, chapter 9.2, the automatic retransmission may be disabled via MTTCAN0CCCR.DAR.

#### (a) Frame Transmission in DAR Mode

In DAR mode all transmissions are automatically cancelled after they started on the CAN bus. A Tx Buffer’s Tx Request Pending bit MTTCAN0TXBRP.TRPx is reset after successful transmission, when a transmission has not yet been started at the point of cancellation, has been aborted due to lost arbitration, or when an error occurred during frame transmission.

- Successful transmission:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx not set
- Successful transmission in spite of cancellation:
  Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx set
  Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx set
- Arbitration lost or frame transmission disturbed:

ISO CANFD ISO11898-1:2015

Corresponding Tx Buffer Transmission Occurred bit MTTCAN0TXBTO.TOx not set
Corresponding Tx Buffer Cancellation Finished bit MTTCAN0TXBCF.CFx set

In case of a successful frame transmission, and if storage of Tx events is enabled, a Tx Event FIFO element is written with Event Type ET = “10” (transmission in spite of cancellation).

### (8) Power Down (Sleep Mode)

The M_TTCAN can be set into power down mode by using CC Control Register MTTCAN0CCCR.CSR. When all pending transmission requests have completed, the M_TTCAN waits until bus idle state is detected. Then the M_TTCAN sets then MTTCAN0CCCR.INIT to one to prevent any further CAN transfers. Now the M_TTCAN acknowledges that it is ready for power down by MTTCAN0CCCR.CSA to one. In this state, before the clocks are switched off, further register accesses can be made. A write access to MTTCAN0CCCR.INIT will have no effect. Now the module clock inputs m_ttcan_hclk (CLK_HSB) and m_ttcan_cclk (CLKP_H2) may be switched off.

To leave power down mode, the application has to turn on the module clocks before resetting CC Control Register flag MTTCAN0CCCR.CSR. The M_TTCAN will acknowledge this by resetting MTTCAN0CCCR.CSA. Afterwards, the application can restart CAN communication by resetting bit MTTCAN0CCCR.INIT.

### (9) Test Modes

To enable write access to register MTTCAN0TEST (see **(4) MCANnTEST — Test Register**), bit MTTCAN0CCCR.TEST has to be set to one. This allows the configuration of the test modes and test functions.

Four output functions are available for the CAN transmit pin m_ttcan_tx by programming MTTCAN0TEST.TX. Additionally to its default function – the serial data output – it can drive the CAN Sample Point signal to monitor the M_TTCAN’s bit timing and it can drive constant dominant or recessive values. The actual value at pin m_ttcan_rx can be read from MTTCAN0TEST.RX. Both functions can be used to check the CAN bus’ physical layer.

Due to the synchronization mechanism between CAN clock and Host clock domain, there may be a delay of several Host clock periods between writing to MTTCAN0TEST.TX until the new configuration is visible at output pin m_ttcan_tx. This applies also when reading input pin m_ttcan_rx via MTTCAN0TEST.RX.

ISO CAN FD ISO 11898-1:2015

**NOTE**

Test modes should be used for production tests or self test only. The software control for pin m_ttcan_tx interferes with all CAN protocol functions. It is not recommended to use test modes for application.

#### (a) External Loop Back Mode

The M_TTCAN can be set in External Loop Back Mode by programming MTTCAN0TEST.LBCK to one. In Loop Back Mode, the M_TTCAN treats its own transmitted messages as received messages and stores them (if they pass acceptance filtering) into an Rx Buffer or an Rx FIFO. **Figure 19.19** shows the connection of signals m_ttcan_tx and m_ttcan_rx to the M_TTCAN in External Loop Back Mode.

This mode is provided for hardware self-test. To be independent from external stimulation, the M_TTCAN ignores acknowledge errors (recessive bit sampled in the acknowledge slot of a data/remote frame) in Loop Back Mode. In this mode the M_TTCAN performs an internal feedback from its Tx output to its Rx input. The actual value of the m_ttcan_rx input pin is disregarded by the M_TTCAN. The transmitted messages can be monitored at the m_ttcan_tx pin.

(b) Internal Loop Back Mode

Internal Loop Back Mode is entered by programming bits MTTCAN0TEST.LBCK and MTTCAN0CCCR.MON to one. This mode can be used for a “Hot Selftest”, meaning the M_TTCAN can be tested without affecting a running CAN system connected to the pins m_ttcan_tx and m_ttcan_rx. In this mode pin m_ttcan_rx is disconnected from the M_TTCAN and pin m_ttcan_tx is held recessive. **Figure 19.19** shows the connection of m_ttcan_tx and m_ttcan_rx to the M_TTCAN in case of Internal Loop Back Mode.

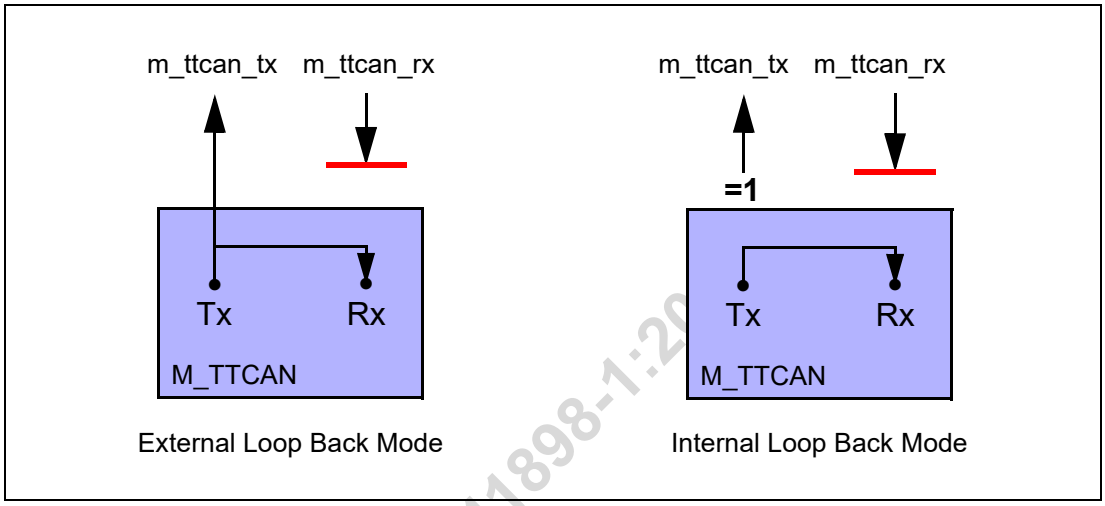

**Figure 19.19 Pin Control in Loop Back Modes**

ISO CAN FD ISO 11898-1:20

### (10) Application Watchdog

The application watchdog is served by reading register MTTCAN0TTOST. When the application watchdog is not served in time, bit MTTCAN0TTOST.AWE is set, all TTCAN communication is stopped, and the M_TTCAN is set into Bus Monitoring Mode.

The TT Application Watchdog can be disabled by programming the Application Watchdog Limit MTTCAN0TTOCF.AWL to $00_H$. The TT Application Watchdog should not be disabled in a TTCAN application program.

### 19.6.3.2 Timestamp Generation

For timestamp generation the M_TTCAN supplies a 16-bit wrap-around counter. A prescaler MTTCAN0TSCC.TCP can be configured to clock the counter in multiples of CAN bit times (1 to 16). The counter is readable via MTTCAN0TSCV.TCV. A write access to register MTTCAN0TSCV resets the counter to zero. When the timestamp counter wraps around interrupt flag MTTCAN0IR.TSW is set.

On start of frame reception / transmission the counter value is captured and stored into the timestamp section of an Rx Buffer / Rx FIFO (RXTS[15:0]) or Tx Event FIFO (TXTS[15:0]) element.

By programming bit MTTCAN0TSCC.TSS an external 16-bit timestamp can be used.

### 19.6.3.3 Timeout Counter

To signal timeout conditions for Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO the M_TTCAN supplies a 16-bit Timeout Counter. It operates as down-counter and uses the same prescaler controlled by MTTCAN0TSCC.TCP as the Timestamp Counter. The Timeout Counter is configured via register MTTCAN0TOCC. The actual counter value can be read from MTTCAN0TOCV.TOC.

The Timeout Counter can only be started while MTTCAN0CCCR.INIT = '0'. It is stopped when MTTCAN0CCCR.INIT = '1', e.g. when the M_TTCAN enters Bus_Off state.

The operation mode is selected by MTTCAN0TOCC.TOS. When operating in Continuous Mode, the counter starts when MTTCAN0CCCR.INIT is reset. A write to MTTCAN0TOCV presets the counter to the value configured by MTTCAN0TOCC.TOP and continues down-counting.

When the Timeout Counter is controlled by one of the FIFOs, an empty FIFO presets the counter to the value configured by MTTCAN0TOCC.TOP. Down-counting is started when the first FIFO element is stored. Writing to MTTCAN0TOCV has no effect.

When the counter reaches zero, interrupt flag MTTCAN0IR.TOO is set. In Continuous Mode, the counter is immediately restarted at MTTCAN0TOCC.TOP.

**NOTE**

The clock signal for the Timeout Counter is derived from the CAN Core's sample point signal. Therefore the point in time where the Timeout Counter is decremented may vary due to the synchronization / re-synchronization mechanism of the CAN Core. If the baud rate switch feature in CAN FD is used, the timeout counter is clocked differently in arbitration and data field.

ISO CAN FD ISO 11898-1:2015

### 19.6.3.4 Rx Handling

The Rx Handler controls the acceptance filtering, the transfer of received messages to the Rx Buffers or to one of the two Rx FIFOs, as well as the Rx FIFO's Put and Get Indices.

#### (1) Acceptance Filtering

The M_TTCAN offers the possibility to configure two sets of acceptance filters, one for standard identifiers and one for extended identifiers. These filters can be assigned to an Rx Buffer or to Rx FIFO 0,1. For acceptance filtering each list of filters is executed from element #0 until the first matching element. Acceptance filtering stops at the first matching element. The following filter elements are not evaluated for this message.

The main features are:

- Each filter element can be configured as
  - range filter (from - to)
  - filter for one or two dedicated IDs
  - classic bit mask filter
- Each filter element is configurable for acceptance or rejection filtering
- Each filter element can be enabled / disabled individually
- Filters are checked sequentially, execution stops with the first matching filter element

Related configuration registers are:

- Global Filter Configuration MTTCAN0GFC
- Standard ID Filter Configuration MTTCAN0SIDFC
- Extended ID Filter Configuration MTTCAN0XIDFC
- Extended ID AND Mask MTTCAN0XIDAM

Depending on the configuration of the filter element (SFEC/EFEC) a match triggers one of the following actions:

- Store received frame in FIFO 0 or FIFO 1
- Store received frame in Rx Buffer
- Store received frame in Rx Buffer and generate pulse at filter event pin
- Reject received frame
- Set High Priority Message interrupt flag MTTCAN0IR.HPM
- Set High Priority Message interrupt flag MTTCAN0IR.HPM and store received frame in FIFO 0 or FIFO 1

Acceptance filtering is started after the complete identifier has been received. After acceptance filtering has completed, and if a matching Rx Buffer or Rx FIFO has been found, the Message Handler starts writing the received message data in portions of 32 bit to the matching Rx Buffer or Rx FIFO. If the CAN protocol controller has detected an error condition (e.g. CRC error), this message is discarded with the following impact on the affected Rx Buffer or Rx FIFO:

ISO CAN FD ISO 11898-1:2015

### Rx Buffer

New Data flag of matching Rx Buffer is not set, but Rx Buffer (partly) overwritten with received data. For error type see MTTCAN0PSR.LEC respectively MTTCAN0PSR.DLEC.

### Rx FIFO

Put index of matching Rx FIFO is not updated, but related Rx FIFO element (partly) overwritten with received data. For error type see MTTCAN0PSR.LEC respectively MTTCAN0PSR.DLEC. In case the matching Rx FIFO is operated in overwrite mode, the boundary conditions described in **(b) Rx FIFO Overwrite Mode** have to be considered.

**NOTE**

When an accepted message is written to one of the two Rx FIFOs, or into an Rx Buffer, the unmodified received identifier is stored independent of the filter(s) used. The result of the acceptance filter process is strongly depending on the sequence of configured filter elements.

(a) Range Filter

The filter matches for all received frames with Message IDs in the range defined by SF1ID/SF2ID resp. EF1ID/EF2ID.

There are two possibilities when range filtering is used together with extended frames:

EFT: “00”: The Message ID of received frames is ANDed with the Extended ID AND Mask (MTTCAN0XIDAM) before the range filter is applied

EFT: “11”: The Extended ID AND Mask (MTTCAN0XIDAM) is not used for range filtering

(b) Filter for specific IDs

A filter element can be configured to filter for one or two specific Message IDs. To filter for one specific Message ID, the filter element has to be configured with SF1ID = SF2ID resp. EF1ID = EF2ID.

(c) Classic Bit Mask Filter

Classic bit mask filtering is intended to filter groups of Message IDs by masking single bits of a received Message ID. With classic bit mask filtering SF1ID/EF1ID is used as Message ID filter, while SF2ID/EF2ID is used as filter mask.

A zero bit at the filter mask will mask out the corresponding bit position of the configured ID filter, e.g. the value of the received Message ID at that bit position is not relevant for acceptance filtering. Only those bits of the received Message ID where the corresponding mask bits are one are relevant for acceptance filtering.

In case all mask bits are one, a match occurs only when the received Message ID and the Message ID filter are identical. If all mask bits are zero, all Message IDs match.

ISO CAN FD ISO 11898-1:2015

(d) Standard Message ID Filtering

**Figure 19.20** below shows the flow for standard Message ID (11-bit Identifier) filtering. The Standard Message ID Filter element is described in **(5) Standard Message ID Filter Element**.

Controlled by the Global Filter Configuration MTTCAN0GFC and the Standard ID Filter Configuration MTTCAN0SIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

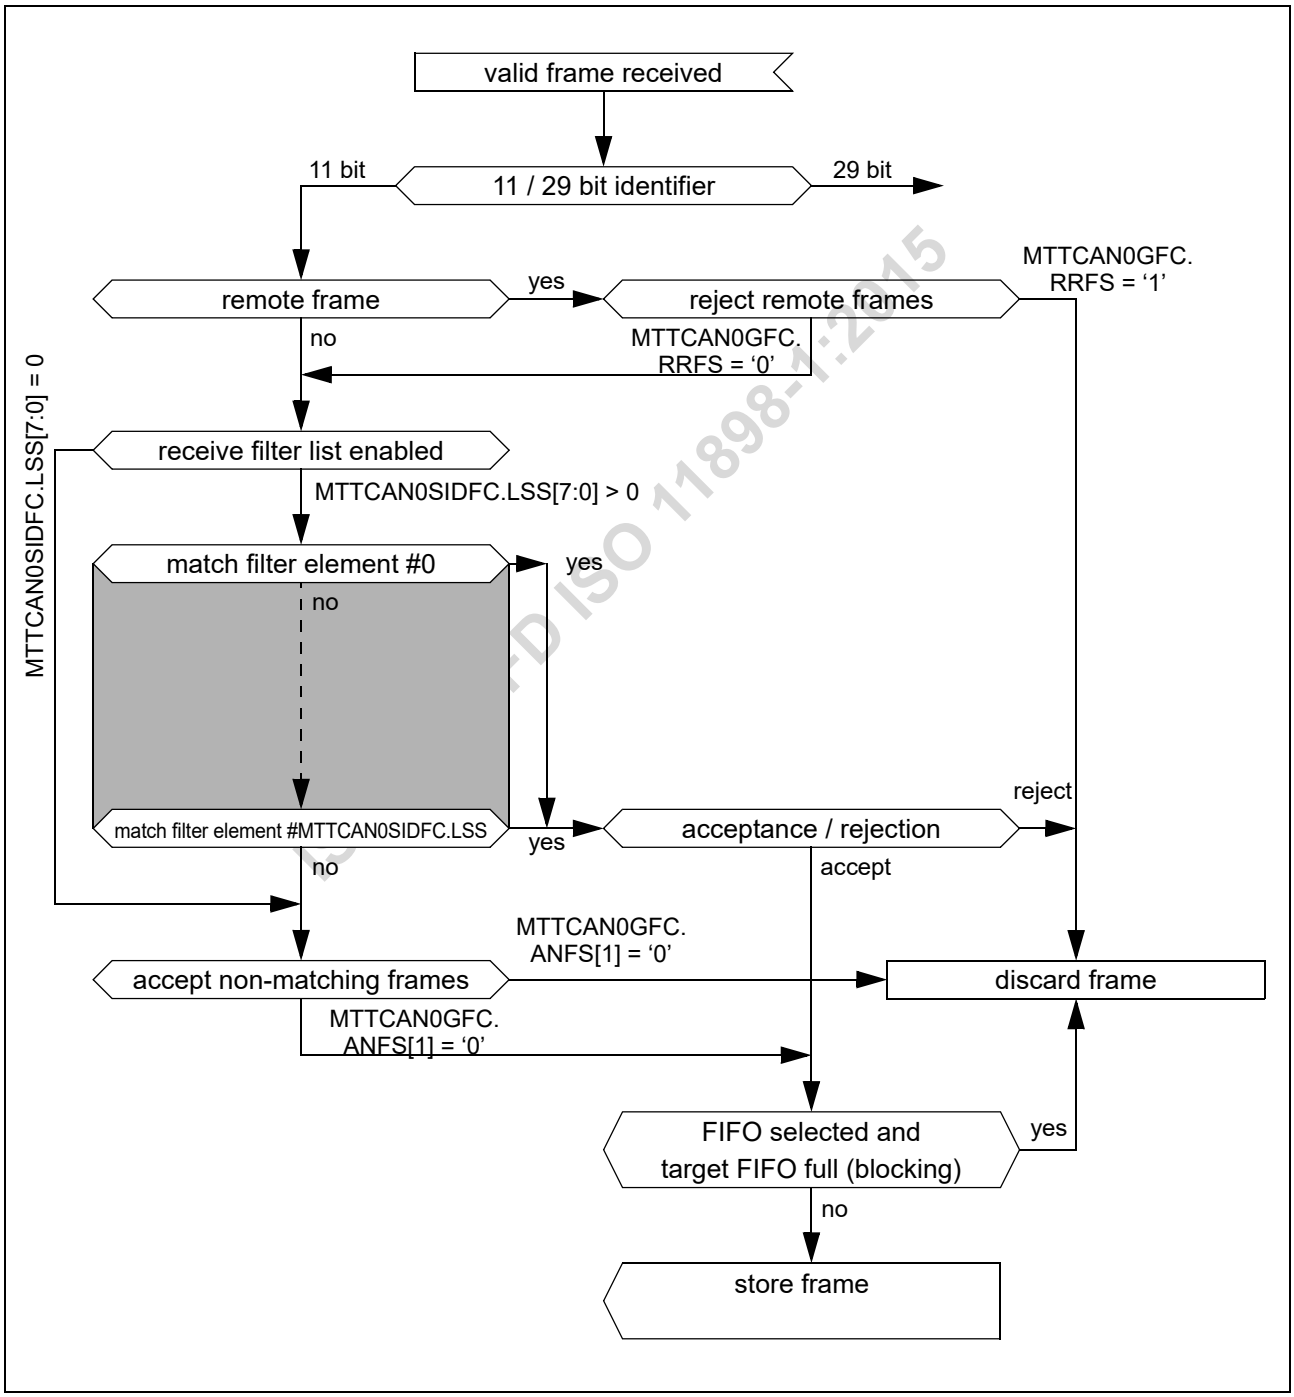

**Figure 19.20 Standard Message ID Filter Path**

(e) Extended Message ID Filtering

**Figure 19.21** below shows the flow for extended Message ID (29-bit Identifier) filtering. The Extended Message ID Filter element is described in **(6) Extended Message ID Filter Element**.

Controlled by the Global Filter Configuration MTTCAN0GFC and the Extended ID Filter Configuration MTTCAN0XIDFC Message ID, Remote Transmission Request bit (RTR), and the Identifier Extension bit (IDE) of received frames are compared against the list of configured filter elements.

The Extended ID AND Mask MTTCAN0XIDAM is ANDed with the received identifier before the filter list is executed.

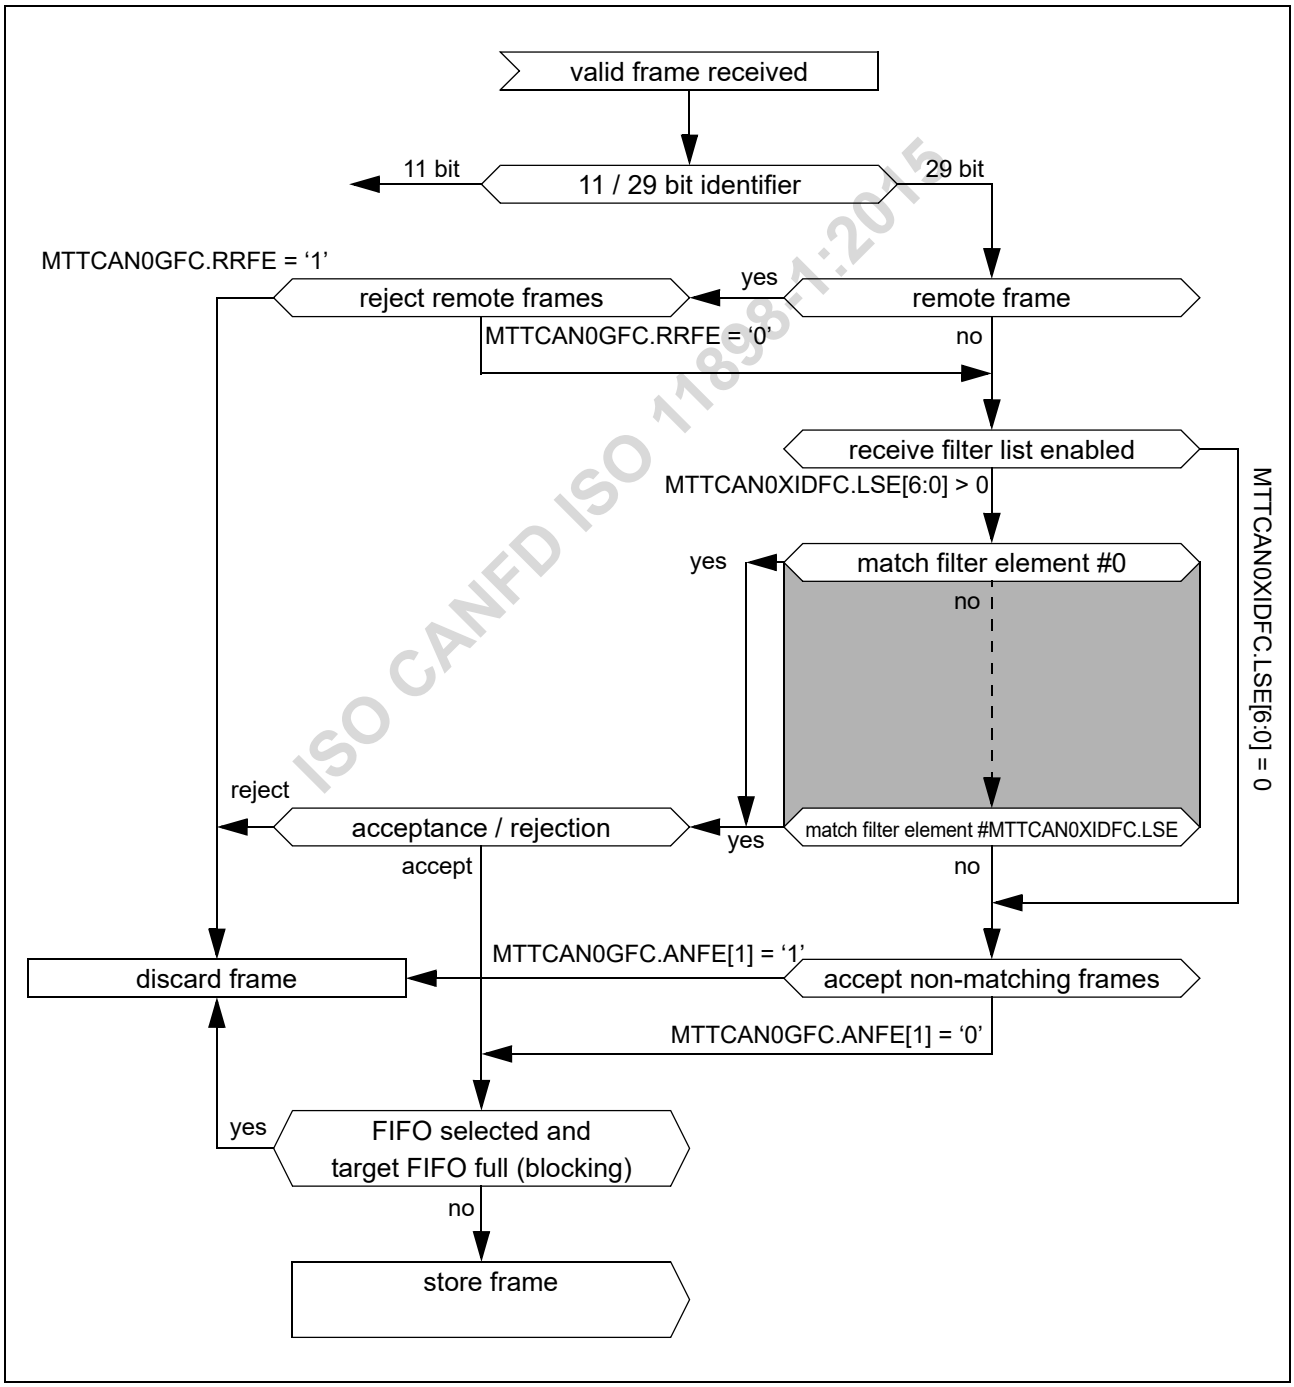

**Figure 19.21 Extended Message ID Filter Path**

### (2) Rx FIFOs

Rx FIFO 0 and Rx FIFO 1 can be configured to hold up to 64 elements each. Configuration of the two Rx FIFOs is done via registers MTTCAN0RXF0C and MTTCAN0RXF1C.

Received messages that passed acceptance filtering are transferred to the Rx FIFO as configured by the matching filter element. For a description of the filter mechanisms available for Rx FIFO 0 and Rx FIFO 1 see **(1) Acceptance Filtering**. The Rx FIFO element is described in **(2) Rx Buffer and FIFO Element**.

To avoid an Rx FIFO overflow, the Rx FIFO watermark can be used. When the Rx FIFO fill level reaches the Rx FIFO watermark configured by RXFnC.FnWM, interrupt flag MTTCAN0IR.RFnW is set. When the Rx FIFO Put Index reaches the Rx FIFO Get Index an Rx FIFO Full condition is signalled by RXFnS.FnF. In addition interrupt flag MTTCAN0IR.RFnF is set.

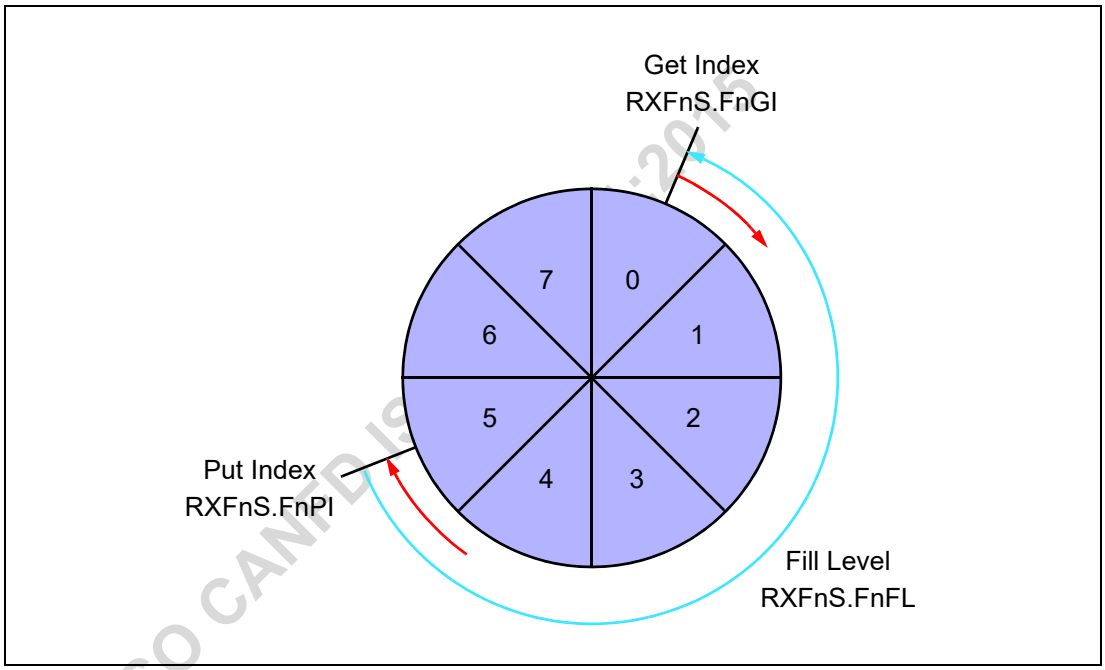

Figure 19.22 Rx FIFO Status

When reading from an Rx FIFO, Rx FIFO Get Index RXFnS.FnGI • FIFO Element Size has to be added to the corresponding Rx FIFO start address RXFnC.FnSA.

Table 19.143 Rx Buffer / FIFO Element Size

| MTTCAN0RXESC.RBDS[2:0]<br>MTTCAN0RXESC.FnDS[2:0] | Data Field<br>[bytes] | FIFO Element Size<br>[RAM words] |
|---|---|---|
| 000 | 8 | 4 |
| 001 | 12 | 5 |
| 010 | 16 | 6 |
| 011 | 20 | 7 |
| 100 | 24 | 8 |
| 101 | 32 | 10 |
| 110 | 48 | 14 |
| 111 | 64 | 18 |

(a) Rx FIFO Blocking Mode

The Rx FIFO blocking mode is configured by RXFnC.FnOM = '0'. This is the default operation mode for the Rx FIFOs.

When an Rx FIFO full condition is reached (RXFnS.FnPI = RXFnS.FnGI), no further messages are written to the corresponding Rx FIFO until at least one message has been read out and the Rx FIFO Get Index has been incremented. An Rx FIFO full condition is signalled by RXFnS.FnF = '1'. In addition interrupt flag MTTCAN0IR.RFnF is set.

In case a message is received while the corresponding Rx FIFO is full, this message is discarded and the message lost condition is signalled by RXFnS.RFnL = '1'. In addition interrupt flag MTTCAN0IR.RFnL is set.

(b) Rx FIFO Overwrite Mode

The Rx FIFO overwrite mode is configured by RXFnC.FnOM = '1'.

When an Rx FIFO full condition (RXFnS.FnPI = RXFnS.FnGI) is signalled by RXFnS.FnF = '1', the next message accepted for the FIFO will overwrite the oldest FIFO message. Put and get index are both incremented by one.

When an Rx FIFO is operated in overwrite mode and an Rx FIFO full condition is signalled, reading of the Rx FIFO elements should start at least at get index + 1. The reason for that is, that it might happen, that a received message is written to the Message RAM (put index) while the CPU is reading from the Message RAM (get index). In this case inconsistent data may be read from the respective Rx FIFO element. Adding an offset to the get index when reading from the Rx FIFO avoids this problem. The offset depends on how fast the CPU accesses the Rx FIFO. **Figure 19.23** shows an offset of two with respect to the get index when reading the Rx FIFO. In this case the two messages stored in element 1 and 2 are lost.

ISO CANFD ISO 11898-1:2015

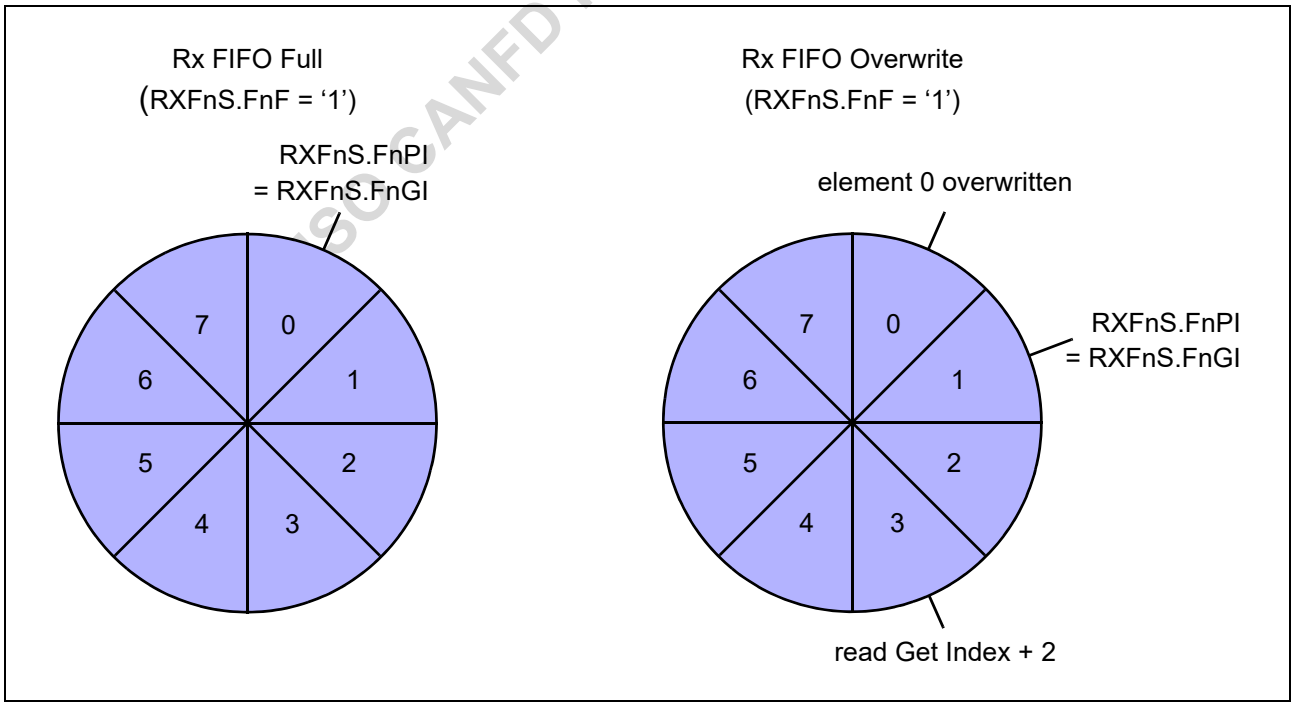

Figure 19.23 Rx FIFO Overflow Handling

After reading from the Rx FIFO, the number of the last element read has to be written to the Rx FIFO Acknowledge Index RXFnA.FnA. This increments the get index to that element number. In case the put index has not been incremented to this Rx FIFO element, the Rx FIFO full condition is reset (RXFnS.FnF = '0').

### (3) Dedicated Rx Buffers

The M_TTCAN supports up to 64 dedicated Rx Buffers. The start address of the dedicated Rx Buffer section is configured via MTTCAN0RXBC.RBSA.

For each Rx Buffer a Standard or Extended Message ID Filter Element with SFEC / EFEC = “111” and SFID2 / EFID2[10:9] = “00” has to be configured (see **(5) Standard Message ID Filter Element** and **(6) Extended Message ID Filter Element**).

After a received message has been accepted by a filter element, the message is stored into the Rx Buffer in the Message RAM referenced by the filter element. The format is the same as for an Rx FIFO element. In addition the flag MTTCAN0IR.DRX (Message stored in Dedicated Rx Buffer) in the interrupt register is set.

**Table 19.144 Example Filter Configuration for Rx Buffers**

| Filter Element | SFID1[10:0] EFID1[28:0] | SFID2[10:9] EFID2[10:9] | SFID2[5:0] EFID2[5:0] |
|---|---|---|---|
| 0 | ID message 1 | 00 | 00 0000 |
| 1 | ID message 2 | 00 | 00 0001 |
| 2 | ID message 3 | 00 | 00 0010 |

After the last word of a matching received message has been written to the Message RAM, the respective New Data flag in register MTTCAN0NDAT1,2 is set. As long as the New Data flag is set, the respective Rx Buffer is locked against updates from received matching frames. The New Data flags have to be reset by the Host by writing a ‘1’ to the respective bit position.

While an Rx Buffer’s New Data flag is set, a Message ID Filter Element referencing this specific Rx Buffer will not match, causing the acceptance filtering to continue. Following Message ID Filter Elements may cause the received message to be stored into another Rx Buffer, or into an Rx FIFO, or the message may be rejected, depending on filter configuration.

(a) Rx Buffer Handling

- Reset interrupt flag MTTCAN0IR.DRX
- Read New Data registers
- Read messages from Message RAM
- Reset New Data flags of processed messages

### (4) Debug on CAN Support

Debug messages are stored into Rx Buffers. For debug handling three consecutive Rx buffers (e.g. #61, #62, #63) have to be used for storage of debug messages A, B, and C. The format is the same as for an Rx Buffer or an Rx FIFO element (see M_TTCAN User’s Manual section 2.4.2).

Advantage: Fixed start address for the DMA transfers (relative to MTTCAN0RXBC.RBSA), no additional configuration required.

For filtering of debug messages Standard / Extended Filter Elements with SFEC / EFEC = “111” have to be set up. Messages matching these filter elements are stored into the Rx Buffers addressed by SFID2 / EFID2[5:0].

After message C has been stored, the DMA request output m_ttcan_dma_req is activated and the three messages can be read from the Message RAM under DMA control. The RAM words holding the debug messages will not be changed by the M_TTCAN while m_ttcan_dma_req is activated. The behaviour is similar to that of an Rx Buffers with its New Data flag set.

ISO CANFD ISO 11898-1:2015

After the DMA has completed the DMA unit sets m_ttcan_dma_ack. This resets m_ttcan_dma_req. Now the M_TTCAN is prepared to receive the next set of debug messages.

### (a) Filtering for Debug Messages

Filtering for debug messages is done by configuring one Standard / Extended Message ID Filter Element for each of the three debug messages. To enable a filter element to filter for debug messages SFEC / EFEC has to be programmed to “111”. In this case fields SFID1 / SFID2 and EFID1 / EFID2 have a different meaning (see Section 2.4.5 and Section 2.4.6). While SFID2 / EFID2[10:9] controls the debug message handling state machine, SFID2 / EFID2[5:0] controls the location for storage of a received debug message.

When a debug message is stored, neither the respective New Data flag nor MTTCAN0IR.DRX are set. The reception of debug messages can be monitored via MTTCAN0RXF1S.DMS

**Table 19.145 Example Filter Configuration for Debug Message**

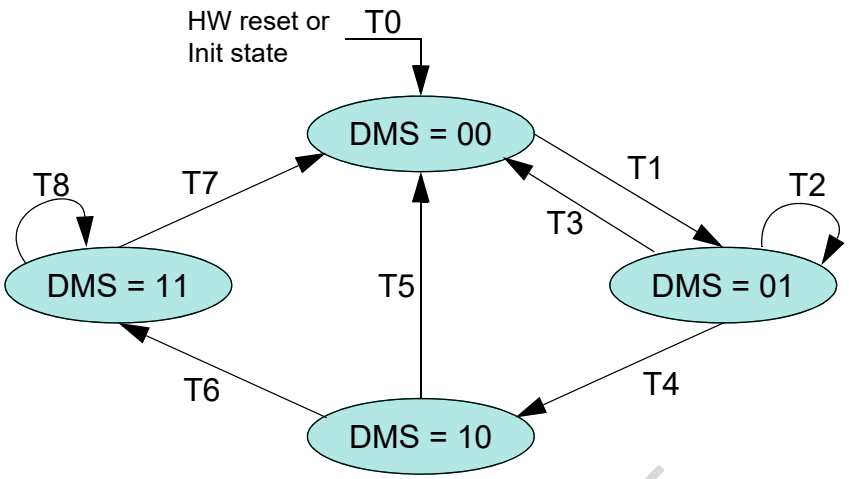
| Filter Element | SFID1[10:0] EFID1[28:0] | SFID2[10:9] EFID2[10:9] | SFID2[5:0] EFID2[5:0] |
|---|---|---|---|
| 0 | ID debug message A | 01 | 11 1101 |
| 1 | ID debug message B | 10 | 11 1110 |
| 2 | ID debug message C | 11 | 11 1111 |

### (b) Debug Message Handling

The debug message handling state machine assures that debug messages are stored to three consecutive Rx Buffers in correct order. In case of missing messages the process is restarted. The DMA request is activated only when all three debug messages A, B, C have been received in correct order.

The status of the debug message handling state machine is signalled via RXF1S.DMS

ISO CANFD ISO 11898-1:201



T0: reset m_ttcan_dma_req output, enable reception of debug messages A, B, and C
T1: reception of debug message A
T2: reception of debug message A
T3: reception of debug message C
T4: reception of debug message B
T5: reception of debug messages A, B
T6: reception of debug message C
T7: DMA transfer completed
T8: reception of debug message A,B,C (message rejected)

ISO CANFD ISO 11898-1:2015

**Figure 19.24 Debug Message Handling State Machine**

### 19.6.3.5 Tx Handling

The Tx Handler handles transmission requests for the dedicated Tx Buffers, the Tx FIFO, and the Tx Queue. It controls the transfer of transmit messages to the CAN Core, the Put and Get Indices,and the Tx Event FIFO. Up to 32 Tx Buffers can be set up for message transmission. The CAN mode for transmission (Classic CAN or CAN FD) can be configured separately for each Tx Buffer element. The Tx Buffer element is described in **(3) Tx Buffer Element**. **Table 19.146** below describes the possible configurations for frame transmission

**Table 19.146 Possible Configurations for Frame Transmission**

| CCCR | | Tx Buffer Element | | |
|---|---|---|---|---|
| BRSE | FDOE | FDF | BRS | Frame Transmission |
| ignored | 0 | ignored | ignored | Classic CAN |
| 0 | 1 | 0 | ignored | Classic CAN |
| 0 | 1 | 1 | ignored | FD without bit rate switching |
| 1 | 1 | 0 | ignored | Classic CAN |
| 1 | 1 | 1 | 0 | FD without bit rate switching |
| 1 | 1 | 1 | 1 | FD with bit rate switching |

**NOTE**

AUTOSAR requires at least three Tx Queue Buffers and support of transmit cancellation

The Tx Handler starts a Tx scan to check for the highest priority pending Tx request (Tx Buffer with lowest Message ID) when the Tx Buffer Request Pending register MTTCAN0TXBRP is updated, or when a transmission has been started.

#### (1) Transmit Pause

The transmit pause feature is intended for use in CAN systems where the CAN message identifiers are (permanently) specified to specific values and cannot easily be changed. These message identifiers may have a higher CAN arbitration priority than other defined messages, while in a specific application their relative arbitration priority should be inverse. This may lead to a case where one ECU sends a burst of CAN messages that cause another ECU's CAN messages to be delayed because that other messages have a lower CAN arbitration priority.

If e.g. CAN ECU-1 has the transmit pause feature enabled and is requested by its application software to transmit four messages, it will, after the first successful message transmission, wait for two CAN bit times of bus idle before it is allowed to start the next requested message. If there are other ECUs with pending messages, those messages are started in the idle time, they would not need to arbitrate with the next message of ECU-1. After having received a message, ECU-1 is allowed to start its next transmission as soon as the received message releases the CAN bus.

The transmit pause feature is controlled by bit MTTCAN0CCCR.TXP. If the bit is set, the M_TTCAN will, each time it has successfully transmitted a message, pause for two CAN bit times before starting the next transmission. This enables other CAN nodes in the network to transmit messages even if their messages have lower prior identifiers. Default is transmit pause disabled (MTTCAN0CCCR.TXP = '0').

This feature looses up burst transmissions coming from a single node and it protects against "babbling idiot" scenarios where the application program erroneously requests too many transmissions.

ISO CANFD ISO 11898-1:2015

### (2) Dedicated Tx Buffers

Dedicated Tx Buffers are intended for message transmission under complete control of the Host CPU. Each Dedicated Tx Buffer is configured with a specific Message ID. In case that multiple Tx Buffers are configured with the same Message ID, the Tx Buffer with the lowest buffer number is transmitted first.

If the data section has been updated, a transmission is requested by an Add Request via MTTCAN0TXBAR.ARn. The requested messages arbitrate internally with messages from an optional Tx FIFO or Tx Queue and externally with messages on the CAN bus, and are sent out according to their Message ID.

A Dedicated Tx Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.147**). Therefore the start address of a dedicated Tx Buffer in the Message RAM is calculated by adding transmit buffer index (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

**Table 19.147 Tx Buffer / FIFO / Queue Element Size**

| MTTCAN0TXESC.TBDS[2:0] | Data Field [bytes] | Element Size [RAM words] |
|---|---|---|
| 000 | 8 | 4 |
| 001 | 12 | 5 |
| 010 | 16 | 6 |
| 011 | 20 | 7 |
| 100 | 24 | 8 |
| 101 | 32 | 10 |
| 110 | 48 | 14 |
| 111 | 64 | 18 |

ISO CANFD ISO 11898-1:20

### (3) Tx FIFO

Tx FIFO operation is configured by programming MTTCAN0TXBC.TFQM to '0'. Messages stored in the Tx FIFO are transmitted starting with the message referenced by the Get Index MTTCAN0TXFQS.TFGI. After each transmission the Get Index is incremented cyclically until the Tx FIFO is empty. The Tx FIFO enables transmission of messages with the same Message ID from different Tx Buffers in the order these messages have been written to the Tx FIFO. The M_TTCAN calculates the Tx FIFO Free Level MTTCAN0TXFQS.TFFL as difference between Get and Put Index. It indicates the number of available (free) Tx FIFO elements.

New transmit messages have to be written to the Tx FIFO starting with the Tx Buffer referenced by the Put Index MTTCAN0TXFQS.TFQPI. An Add Request increments the Put Index to the next free Tx FIFO element. When the Put Index reaches the Get Index, Tx FIFO Full (MTTCAN0TXFQS.TFQF = '1') is signalled. In this case no further messages should be written to the Tx FIFO until the next message has been transmitted and the Get Index has been incremented.

When a single message is added to the Tx FIFO, the transmission is requested by writing a '1' to the MTTCAN0TXBAR bit related to the Tx Buffer referenced by the Tx FIFO's Put Index.

When multiple (n) messages are added to the Tx FIFO, they are written to n consecutive Tx Buffers starting with the Put Index. The transmissions are then requested via MTTCAN0TXBAR. The Put Index is then cyclically incremented by n. The number of requested Tx buffers should not exceed the number of free Tx Buffers as indicated by the Tx FIFO Free Level.

When a transmission request for the Tx Buffer referenced by the Get Index is cancelled, the Get Index is incremented to the next Tx Buffer with pending transmission request and the Tx FIFO Free Level is recalculated. When transmission cancellation is applied to any other Tx Buffer, the Get Index and the FIFO Free Level remain unchanged.

A Tx FIFO element allocates Element Size 32-bit words in the Message RAM (see **Table 19.147**). Therefore the start address of the next available (free) Tx FIFO Buffer is calculated by adding Tx FIFO/Queue Put Index MTTCAN0TXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

ISO CANFD ISO 11898-1:2015

### (4) Tx Queue

Tx Queue operation is configured by programming MTTCAN0TXBC.TFQM to '1'. Messages stored in the Tx Queue are transmitted starting with the message with the lowest Message ID (highest priority). In case that multiple Queue Buffers are configured with the same Message ID, the Queue Buffer with the lowest buffer number is transmitted first.

New messages have to be written to the Tx Buffer referenced by the Put Index MTTCAN0TXFQS.TFQPI. An Add Request cyclically increments the Put Index to the next free Tx Buffer. In case that the Tx Queue is full (MTTCAN0TXFQS.TFQF = '1'), the Put Index is not valid and no further message should be written to the Tx Queue until at least one of the requested messages has been sent out or a pending transmission request has been cancelled.

The application may use register MTTCAN0TXBRP instead of the Put Index and may place messages to any Tx Buffer without pending transmission request.

A Tx Queue Buffer allocates Element Size 32-bit words in the Message RAM (see **Table 19.147**). Therefore the start address of the next available (free) Tx Queue Buffer is calculated by adding Tx FIFO/Queue Put Index MTTCAN0TXFQS.TFQPI (0 to 31) • Element Size to the Tx Buffer Start Address MTTCAN0TXBC.TBSA.

### (5) Mixed Dedicated Tx Buffers / Tx FIFO

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx FIFO. The number of Dedicated Tx Buffers is configured by MTTCAN0TXBC.NDTB. The number of Tx Buffers assigned to the Tx FIFO is configured by MTTCAN0TXBC.TFQS. In case MTTCAN0TXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

ISO CANFD ISO 11898-1:2015

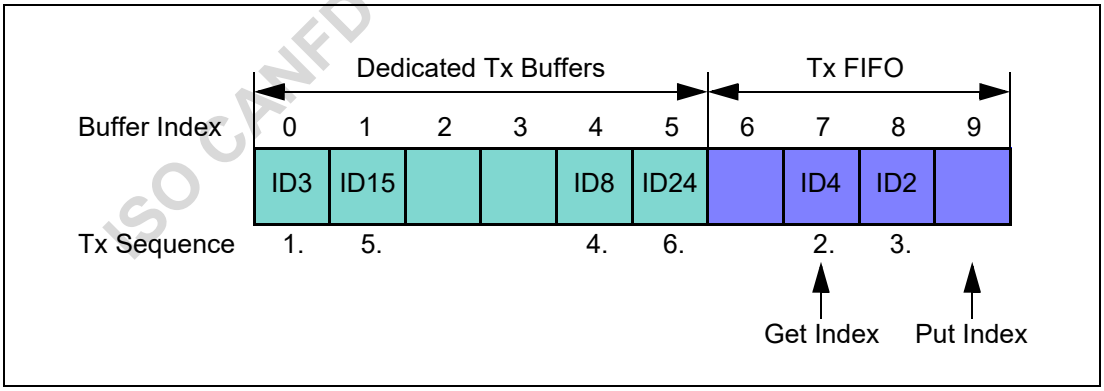


**Figure 19.25 Example of mixed Configuration Dedicated Tx Buffers / Tx FIFO**

Tx prioritization:

- Scan Dedicated Tx Buffers and oldest pending Tx FIFO Buffer (referenced by TXFS.TFGI)
- Buffer with lowest Message ID gets highest priority and is transmitted next

### (6) Mixed Dedicated Tx Buffers / Tx Queue

In this case the Tx Buffers section in the Message RAM is subdivided into a set of Dedicated Tx Buffers and a Tx Queue. The number of Dedicated Tx Buffers is configured by MTTCAN0TXBC.NDTB. The number of Tx Queue Buffers is configured by MTTCAN0TXBC.TFQS. In case MTTCAN0TXBC.TFQS is programmed to zero, only Dedicated Tx Buffers are used.

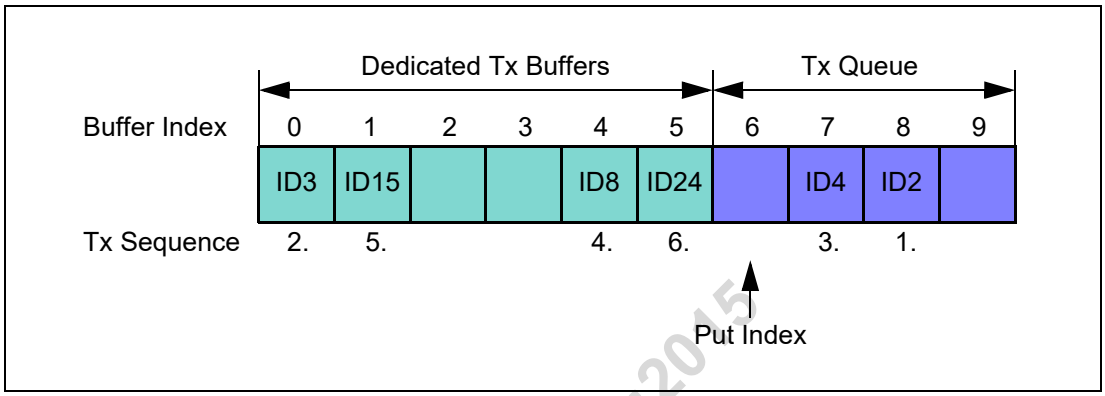

**Figure 19.26 Example of mixed Configuration Dedicated Tx Buffers / Tx Queue**

Tx prioritization:

- Scan all Tx Buffers with activated transmission request
- Tx Buffer with lowest Message ID gets highest priority and is transmitted next

### (7) Transmit Cancellation

The M_TTCAN supports transmit cancellation. This feature is especially intended for gateway applications and AUTOSAR based applications. To cancel a requested transmission from a Dedicated Tx Buffer or a Tx Queue Buffer the Host has to write a '1' to the corresponding bit position (=number of Tx Buffer) of register MTTCAN0TXBCR. Transmit cancellation is not intended for Tx FIFO operation.

Successful cancellation is signalled by setting the corresponding bit of register MTTCAN0TXBCF to '1'.

In case a transmit cancellation is requested while a transmission from a Tx Buffer is already ongoing, the corresponding MTTCAN0TXBRP bit remains set as long as the transmission is in progress. If the transmission was successful, the corresponding MTTCAN0TXBTO and MTTCAN0TXBCF bits are set. If the transmission was not successful, it is not repeated and only the corresponding MTTCAN0TXBCF bit is set.

**NOTE**

In case a pending transmission is cancelled immediately before this transmission could have been started, there follows a short time window where no transmission is started even if another message is also pending in this node. This may enable another node to transmit a message which may have a lower priority than the second message in this node.

ISO CAN FD ISO 11898-1:2015

### (8) Tx Event Handling

To support Tx event handling the M_TTCAN has implemented a Tx Event FIFO. After the M_TTCAN has transmitted a message on the CAN bus, Message ID and timestamp are stored in a Tx Event FIFO element. To link a Tx event to a Tx Event FIFO element, the Message Marker from the transmitted Tx Buffer is copied into the Tx Event FIFO element.

The Tx Event FIFO can be configured to a maximum of 32 elements. The Tx Event FIFO element is described in **(4) Tx Event FIFO Element**.

The purpose of the Tx Event FIFO is to decouple handling transmit status information from transmit message handling i.e. a Tx Buffer holds only the message to be transmitted, while the transmit status is stored separately in the Tx Event FIFO. This has the advantage, especially when operating a dynamically managed transmit queue, that a Tx Buffer can be used for a new message immediately after successful transmission. There is no need to save transmit status information from a Tx Buffer before overwriting that Tx Buffer.

When a Tx Event FIFO full condition is signalled by MTTCAN0IR.TEFF, no further elements are written to the Tx Event FIFO until at least one element has been read out and the Tx Event FIFO Get Index has been incremented. In case a Tx event occurs while the Tx Event FIFO is full, this event is discarded and interrupt flag MTTCAN0IR.TEFL is set.

To avoid a Tx Event FIFO overflow, the Tx Event FIFO watermark can be used. When the Tx Event FIFO fill level reaches the Tx Event FIFO watermark configured by MTTCAN0TXEFC.EFWM, interrupt flag MTTCAN0IR.TEFW is set.

When reading from the Tx Event FIFO, two times the Tx Event FIFO Get Index MTTCAN0TXEFS.EFGI has to be added to the Tx Event FIFO start address MTTCAN0TXEFC.EFSA.

ISO CANFD ISO 11898-1:2015

#### 19.6.3.6 FIFO Acknowledge Handling

The Get Indices of Rx FIFO 0, Rx FIFO 1, and the Tx Event FIFO are controlled by writing to the corresponding FIFO Acknowledge Index (see **(28) MTTCAN0RXF0A — Rx FIFO 0 Acknowledge**, **(32) MTTCAN0RXF1A — Rx FIFO 1 Acknowledge**, and **(46) MTTCAN0TXEFA — Tx Event FIFO Acknowledge**). Writing to the FIFO Acknowledge Index will set the FIFO Get Index to the FIFO Acknowledge Index plus one and thereby updates the FIFO Fill Level. There are two use cases:

When only a single element has been read from the FIFO (the one being pointed to by the Get Index), this Get Index value is written to the FIFO Acknowledge Index.

When a sequence of elements has been read from the FIFO, it is sufficient to write the FIFO Acknowledge Index only once at the end of that read sequence (value: Index of the last element read), to update the FIFO's Get Index.

Due to the fact that the CPU has free access to the M_TTCAN's Message RAM, special care has to be taken when reading FIFO elements in an arbitrary order (Get Index not considered). This might be useful when reading a High Priority Message from one of the two Rx FIFOs. In this case the FIFO's Acknowledge Index should not be written because this would set the Get Index to a wrong position and also alters the FIFO's Fill Level. In this case some of the older FIFO elements would be lost.

**NOTE**

The application has to ensure that a valid value is written to the FIFO Acknowledge Index. The M_TTCAN does not check for erroneous values.

ISO CANFD ISO 11898-1:2015

## 19.6.4 TTCAN Operation

### 19.6.4.1 Reference Message

A reference message is a data frame characterized by a specific CAN identifier. It is received and accepted by all nodes except the Time Master (sender of the reference message).

For Level 1 the data length must be at least one; for Level 0,2 the data length must be at least four; otherwise, the message is not accepted as reference message. The reference message may be extended by other data up to the sum of eight CAN data bytes. All bits of the identifier except the three LSBs characterize the message as a reference message. The last three bits specify the priorities of up to 8 potential time masters. Reserved bits are transmitted as logical 0 and are ignored by the receivers. The reference message is configured via register MTTCAN0TTRMC.

The time master transmits the reference message. If the reference message is disturbed by an error, it is retransmitted immediately. In case of a retransmission, the transmitted Master_Ref_Mark is updated. The reference message is sent periodically, but is allowed to stop the periodic transmission (Next_is_Gap bit) and to initiate transmission event-synchronized at the start of the next basic cycle by the current time master or by one of the other potential time masters.

The node transmitting the reference message is the current time master. The time master is allowed to transmit other messages. If the current time master fails, its function is replicated by the potential time master with the highest priority. Nodes that are neither time master nor potential time master are time-receiving nodes.

ISO CAN FD ISO 11898-1:2015

#### (1) Level 1

Level 1 operation is configured via MTTCAN0TTOCF.OM = “01” and MTTCAN0TTOCF.GEN. External clock synchronization is not available in Level 1.

The information related to the reference message is stored in the first data byte as shown in **Table 19.148** below. Cycle_Count is optional.

**Table 19.148 First byte of Level 1 reference message**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| First Byte | Next_is_Gap | res | Cycle_Count[5:0] | | | | | |

### (2) Level 2

Level 2 operation is configured via MTTCAN0TTOCF.OM = “10” and MTTCAN0TTOCF.GEN.

The information related to the reference message is stored in the first four data bytes as shown in **Table 19.149** below. Cycle_Count and the lower four bits of NTU_Res are optional. The M_TTCAN does not evaluate NTU_Res[3:0] from received reference messages, it always transmits these bits as zero.

**Table 19.149 First four bytes of Level 2 reference message**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| First Byte | Next_is_Gap | res | Cycle_Count[5:0] | | | | | |
| Second Byte | NTU_Res[6:4] | | | NTU_Res[3:0] | | | | Disc_Bit |
| Third Byte | Master_Ref_Mark[7:0] | | | | | | | |
| Fourth Byte | Master_Ref_Mark[15:8] | | | | | | | |

### (3) Level 0

Level 0 operation is configured via MTTCAN0TTOCF.OM = “11”. External event-synchronized time-triggered operation is not available in Level 0.

The information related to the reference message is stored in the first four data bytes as shown in **Table 19.150** below. In Level 0 Next_is_Gap is always zero. Cycle_Count and the lower four bits of NTU_Res are optional. The M_TTCAN does not evaluate NTU_Res[3:0] from received reference messages, it always transmits these bits as zero.

**Table 19.150 First four bytes of Level 0 reference message**

| Bits | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| First Byte | Next_is_Gap | res | Cycle_Count[5:0] | | | | | |
| Second Byte | NTU_Res[6:4] | | | NTU_Res[3:0] | | | | Disc_Bit |
| Third Byte | Master_Ref_Mark[7:0] | | | | | | | |
| Fourth Byte | Master_Ref_Mark[15:8] | | | | | | | |

ISO CANFD ISO 11898-1:2015

### 19.6.4.2 TTCAN Configuration

#### (1) TTCAN Timing

The Network Time Unit NTU is the unit in which all times are measured. The NTU is a constant of the whole network and is defined a priori by the network system designer. In TTCAN Level 1 the NTU is the nominal CAN bit time. In TTCAN Level 0 and Level 2 the NTU is a fraction of the physical second.

The NTU is the time base for the local time. The integer part of the local time (16-bit value) is incremented once each NTU. Cycle time and global time are both derived from local time. The fractional part (3-bit value) of local time, cycle time, and global time is not readable.

In TTCAN Level 0 and Level 2 the length of the NTU is defined by the Time Unit Ratio TUR. The TUR is in principle a non-integer number and given by the formula TUR = MTTCAN0TURNA.NAV/ MTTCAN0TURCF.DC. The length of the NTU is given by the formula NTU = CAN Clock Period • TUR.

The TUR Numerator Configuration NC is an 18-bit number, MTTCAN0TURCF.NCL[15:0] can be programmed in the range $0000_H$ to $FFFF_H$. MTTCAN0TURCF.NCH[17:16] is hard wired to 0b01. When the number $nnnn_H$ is written to MTTCAN0TURCF.NCL[15:0], MTTCAN0TURNA.NAV starts with the value $10000_H + 0nnnn_H = 1nnnn_H$. The TUR Denominator Configuration MTTCAN0TURCF.DC is a 14-bit number. MTTCAN0TURCF.DC may be programmed in the range $0001_H$ to $3FFF_H$, $0000_H$ is an illegal value.

In Level 1, NC must be ≥ 4 • MTTCAN0TURCF.DC. In Level 0,2 NC must be ≥ 8 • MTTCAN0TURCF.DC to allow the 3-bit resolution for the internal fractional part of the NTU.

A hardware reset presets MTTCAN0TURCF.DC to $1000_H$ and MTTCAN0TURCF.NCL to $10000_H$, resulting in an NTU consisting of 16 CAN clock periods. Local time and application watchdog are not started before either the MTTCAN0CCCR.INIT is reset, or MTTCAN0TURCF.ELT is set. MTTCAN0TURCF.ELT may not be set before the NTU is configured. Setting MTTCAN0TURCF.ELT to '1' also locks the write access to register MTTCAN0TURCF.

At startup MTTCAN0TURNA.NAV is updated from NC (= MTTCAN0TURCF.NCL + $10000_H$) when MTTCAN0TURCF.ELT is set. In TTCAN Level 1 there is no drift compensation. MTTCAN0TURNA.NAV does not change during operation, it always equals NC.

In TTCAN Level 0 and Level 2 there are two possibilities for MTTCAN0TURNA.NAV to change. When operating as time slave or backup time master, and when MTTCAN0TTOCF.ECC is set, MTTCAN0TURNA.NAV is updated automatically to the value calculated from the monitored global time speed, as long as the M_TTCAN is in synchronization state In_Schedule or In_Gap. When it loses synchronization it returns to NC. When operating as the actual time master, and when MTTCAN0TTOCF.EECS is set, the Host may update MTTCAN0TURCF.NCL. When the Host sets MTTCAN0TTOCN.ECS, MTTCAN0TURNA.NAV will be updated from the new value of NC at the next reference message. The status flag MTTCAN0TTOST.WECS as is set when MTTCAN0TTOCN.ECS is set and is cleared when MTTCAN0TURNA.NAV is updated. MTTCAN0TURCF.NCL is write locked while MTTCAN0TTOST.WECS is set.

In TTCAN Level 0 and Level 2 the clock calibration process adapts MTTCAN0TURNA.NAV in the range of the Synchronization Deviation Limit SDL of NC ± $2^{(MTTCAN0TTOCF.LDSDL+5)}$. MTTCAN0TURCF.NCL should be programmed to the largest applicable numerical value in order to achieve the best accuracy in the calculation of MTTCAN0TURNA.NAV.

The synchronization deviation SD is the difference between NC and MTTCAN0TURNA.NAV (SD = |NC - MTTCAN0TURNA.NAV|). It is limited by the Synchronization Deviation Limit SDL,

ISO CANFD ISO 11898-1:2015

which is configured by its dual logarithm MTTCAN0TTOCF.LDSDL (SDL = $2^{(MTTCAN0TTOCF.LDSDL+5)}$) and should not exceed the clock tolerance given by the CAN bit timing configuration. SD is calculated at each new Basic Cycle. When the calculated MTTCAN0TURNA.NAV deviates by more than SDL from NC, or if the Disc_Bit in the reference message is set, the drift compensation is suspended and MTTCAN0TTIR.GTE is set and TTOSC.QCS is reset, or in case of the Disc_Bit = '1', MTTCAN0TTIR.GTD is set.

TUR configuration examples are shown in **Table 19.151** below.

**Table 19.151 TUR Configuration Examples**

| TUR | 8 | 10 | 24 | 50 | 510 | 125000 | 32.5 | 100/12 | 529/17 |
|---|---|---|---|---|---|---|---|---|---|
| NC | $1FFF8_H$ | $1FFFE_H$ | $1FFF8_H$ | $1FFEA_H$ | $1FFFE_H$ | $1E848_H$ | $1FFE0_H$ | $19000_H$ | $10880_H$ |
| MTTCAN0TURCF.DC | $3FFF_H$ | $3333_H$ | $1555_H$ | $0A3D_H$ | $0101_H$ | $0001_H$ | $0FC0_H$ | $3000_H$ | $0880_H$ |

MTTCAN0TTOCN.ECS schedules NC for activation by the next reference message. MTTCAN0TTOCN.SGT schedules MTTCAN0TTGTP.TP for activation by the next reference message. Setting of MTTCAN0TTOCN.ECS and MTTCAN0TTOCN.SGT requires MTTCAN0TTOCF.EECS to be set (external clock synchronization enabled) while the M_TTCAN is actual time master.

The M_TTCAN module provides an application watchdog to verity the function of the application program. The Host has to serve this watchdog regularly, else all CAN bus activity is stopped. The Application Watchdog Limit MTTCAN0TTOCF.AWL specifies the number of NTUs between two times the watchdog has to be served. The maximum number of NTUs is 256. The Application Watchdog is served by reading register MTTCAN0TTOST. MTTCAN0TTOST.AWE indicates whether the watchdog has been served in time. In case the application failed to serve the application watchdog, interrupt flag MTTCAN0TTIR.AW is set. For software development, the application watchdog may be disabled by programming MTTCAN0TTOCF.AWL to $00_H$ (see also **(10) Application Watchdog**).

ISO CAN FD ISO 11898-1:2015

(a) Timing of Interface Signals

The timing events which cause a pulse at output m_ttcan_tmp (MTTCAN0TMP) and m_ttcan_rtp (MTTCAN0RTP) are generated in the CAN clock domain. There is a clock domain crossing delay to be considered before the same event is visible in the Host clock domain (MTTCAN0TTIR.TTMI resp. MTTCAN0TTIR.RTMI set). The signals can be connected e.g. to the timing input(s) of another TTCAN node (m_ttcan_swt:MTTCAN0SWT / m_ttcan_evt: MTTCAN0EVT), in order to automatically synchronize two TTCAN networks.

Output m_ttcan_soc (MTTCAN0SOC) gets active whenever a reference message is completed (either transmitted or received). The output is controlled in the Host clock domain.

**(2) Message Scheduling**

MTTCAN0TTOCF.TM controls whether the M_TTCAN operates as a potential time master or as a time slave. If it is a potential time master, the three LSBs of the reference message's identifier MTTCAN0TTRMC.RID define the master priority, 0 giving the highest and 7 giving the lowest priority. There may not be two nodes in the network using the same master priority. MTTCAN0TTRMC.RID is used for recognition of reference messages. MTTCAN0TTRMC.RMPS is not relevant for time slaves.

The Initial Reference Trigger Offset MTTCAN0TTOCF.IRTO is a 7-bit-value that defines (in NTUs) how long a backup time master waits before it starts the transmission of a reference message when a reference message is expected but the bus remains idle. The recommended value for

MTTCAN0TTOCF.IRTO is the master priority multiplied with a factor depending on the expected clock drift between the potential time masters in the network. The sequential order of the backup time masters, when one of them starts the reference message in case the current time master fails, should correspond to their master priority, even with maximum clock drift.

MTTCAN0TTOCF.OM decides whether the node operates in TTCAN Level 0, Level 1, or Level 2. In one network, all potential time masters have to operate on the same level. Time slaves may operate on Level 1 in a Level 2 network, but not vice versa. The configuration of the TTCAN operation mode via MTTCAN0TTOCF.OM is the last step in the setup. With MTTCAN0TTOCF.OM = “00” (event-driven CAN communication), the M_TTCAN operates according to ISO 11898-1, without time triggers. With MTTCAN0TTOCF.OM = “01” (Level 1), the M_TTCAN operates according to ISO 11898-4, but without the possibility to synchronize the basic cycles to external events, the Next_is_Gap bit in the reference message is ignored. With MTTCAN0TTOCF.OM = “10” (Level 2), the M_TTCAN operates according to ISO 11898-4, including the event-synchronized start of a basic cycle. With MTTCAN0TTOCF.OM = “11” (Level 0), the M_TTCAN operates as event-driven CAN but maintains a calibrated global time base as in Level 2.

MTTCAN0TTOCF.EECS enables the external clock synchronization, allowing the application program of the current time master to update the TUR configuration during time-triggered operation, to adapt the clock speed and (in Level 0,2 only) the global clock phase to an external reference.

MTTCAN0TTMLM.ENTT in the TT Matrix Limits register specifies the number of expected Tx_Triggers in the system matrix. This is the sum of Tx_Triggers for exclusive, single arbitrating and merged arbitrating windows, excluding the Tx_Ref_Triggers. Note that this is usually not the number of Tx_Trigger memory elements; the number of basic cycles in the system matrix and the trigger’s repeat factors have to be taken into account. An inaccurate configuration of MTTCAN0TTMLM.ENTT will result in either a Tx Count Underflow (MTTCAN0TTIR.TXU = ‘1’ and MTTCAN0TTOST.EL = “01”, severity 1) or in a Tx Count Overflow (MTTCAN0TTIR.TXO = ‘1’ and MTTCAN0TTOST.EL = “10”, severity 2).

**NOTE**

In case the first reference message seen by a node does not have Cycle_Count zero, this node may finish its first matrix cycle with its Tx count resulting in a Tx Count Underflow condition. As long as a node is in state Synchronizing its Tx_Triggers will not lead to transmissions.

MTTCAN0TTMLM.CCM specifies the number of the last basic cycle in the system matrix. The counting of basic cycles starts at 0. In a system matrix consisting of 8 basic cycles MTTCAN0TTMLM.CCM would be 7. MTTCAN0TTMLM.CCM is ignored by time slaves, a receiver of a reference message considers the received cycle count as the valid cycle count for the actual basic cycle.

MTTCAN0TTMLM.TXEW specifies the length of the Tx enable window in NTUs. The Tx enable window is that period of time at the beginning of a time window where a transmission may be started. If the sample point of the first bit of a transmit message is not inside the Tx enable window because of e.g. a slight overlap from the previous time window’s message, the transmission cannot be started in that time window at all. MTTCAN0TTMLM.TXEW has to be chosen with respect to the network’s synchronization quality and with respect to the relation between the length of the time windows and the length of the messages.

ISO CAN FD ISO 11898-1:2015

### (3) Trigger Memory

The trigger memory is part of the external Message RAM to which the M_TTCAN is connected via its Generic Master Interface (see **Figure 19.16, Message RAM Configuration**). It stores up to 64 trigger elements. A trigger memory element consists of Time Mark TM, Cycle Code CC, Trigger Type TYPE, Filter Type FTYPE, Message Number MNR, Message Status Count MSC, Time Mark Event Internal TMIN, Time Mark Event External TMEX, and Asynchronous Serial Communication ASC (see **(7) Trigger Memory Element**).

The time mark defines at which cycle time a trigger becomes active. The triggers in the trigger memory have to be sorted by their time marks. The trigger element with the lowest time mark is written to the first trigger memory word. Message number and cycle code are ignored for triggers of type Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, Watch_Trigger_Gap, and End_of_List.

When the cycle time reaches the time mark of the actual trigger, the FSE switches to the next trigger and starts to read the following trigger from the trigger memory. In case of a transmit trigger, the Tx Handler starts to read the message from the Message RAM as soon as the FSE switches to its trigger. The RAM access speed defines the minimum time step between a transmit trigger and its preceding trigger, the Tx Handler has to be able to prepare the transmission before the transmit trigger's time mark is reached. The RAM access speed also limits the number of non-matching (with regard to their cycle code) triggers between two matching triggers, the next matching trigger must be read before its time mark is reached. If the reference message is n NTU long, a trigger with a time mark< n will never become active and will be treated as a configuration error.

Starting point of the cycle time is the sample point of the reference message's start of frame bit. The next reference message is requested when cycle time reaches the Tx_Ref_Trigger's time mark. The M_TTCAN reacts on the transmission request at the next sample point. A new Sync_Mark is captured at the start of frame bit, but the cycle time is incremented until the reference message is successfully transmitted (or received) and the Sync_Mark is taken as the new Ref_Mark. At that point in time, cycle time is restarted. As a consequence, cycle time can never (with the exception of initialisation) be seen at a value< n, with n being the length of the reference message measured in NTU.

Length of a basic cycle: Tx_Ref_Trigger's time mark+1 NTU+1 CAN bit time

The trigger list will be different for all nodes in the TTCAN network. Each node knows only the Tx_Triggers for its own transmit messages, the Rx_Triggers for those receive messages that are processed by this node, and the triggers concerning the reference messages.

#### (a) Trigger Types

Tx_Ref_Trigger (TYPE = "0000") and Tx_Ref_Trigger_Gap (TYPE = "0001") cause the transmission of a reference message by a time master. A configuration error (MTTCAN0TTOST.EL = "11", severity 3) is detected when a time slave encounters a Tx_Ref_Trigger(_Gap) in its trigger memory. Tx_Ref_Trigger_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, Tx_Ref_Trigger is ignored when the M_TTCAN synchronization state is In_Gap (MTTCAN0TTOST.SYS = "10").

Tx_Trigger_Single (TYPE = "0010"), Tx_Trigger_Continuous (TYPE = "0011"), Tx_Trigger_Arbitration (TYPE = "0100"), and Tx_Trigger_Merged (TYPE = "0101") cause the start of a transmission. They define the start of a time window.

Tx_Trigger_Single starts a single transmission in an exclusive time window when the message buffer's Transmission Request Pending bit is set. After successful transmission the Transmission Request Pending bit is reset.

ISO CANFD ISO 11898-1:2015

Tx_Trigger_Continuous starts a transmission in an exclusive time window when the message buffer's Transmission Request Pending bit is set. After successful transmission the Transmission Request Pending bit remains set, and the message buffer is transmitted again in the next matching time window.

Tx_Trigger_Arbitration starts an arbitrating time window, Tx_Trigger_Merged a merged arbitrating time window. The last Tx_Trigger of a merged arbitrating time window must be of type Tx_Trigger_Arbitration. A Configuration Error (MTTCAN0TTOST.EL = "11", severity 3) is detected when a trigger of type Tx_Trigger_Merged is followed by any other Tx_Trigger than one of type Tx_Trigger_Merged or Tx_Trigger_Arbitration. Several Tx_Triggers may be defined for the same Tx message buffer. Depending on their cycle code, they may be ignored in some basic cycles. The cycle code has to be considered when the expected number of Tx_Triggers (MTTCAN0TTMLM.ENTT) is calculated.

Watch_Trigger (TYPE = "0110") and Watch_Trigger_Gap (TYPE = "0111") check for missing reference messages. They are used by both time masters and time slaves. Watch_Trigger_Gap is only used in external event-synchronized time-triggered operation mode. In that mode, a Watch_Trigger is ignored when the M_TTCAN synchronization state is In_Gap (MTTCAN0TTOST.SYS = "10").

Rx_Trigger (TYPE = "1000") is used to check for the reception of periodic messages in exclusive time windows. Rx_Triggers are not active until state In_Schedule or In_Gap is reached. The time mark of an Rx_Trigger shall be placed after the end of that message's transmission, independent of time window boundaries. Depending on their cycle code, Rx_Triggers may be ignored in some basic cycles. At the time mark of the Rx_Trigger, it is checked whether the last received message before this time mark and after start of cycle or previous Rx_Trigger had matched the acceptance filter element referenced by MNR. Accepted messages are stored in one of the two receive FIFOs, according to the acceptance filtering, independent of the Rx_Trigger. Acceptance filter elements which are referenced by Rx_Triggers should be placed at the beginning of the filter list to ensure that the filtering is finished before the Rx_Trigger's time mark is reached.

Time_Base_Trigger (TYPE = "1001") are used to generate internal/external events depending on the configuration of ASC, TMIN, and TMEX.

End_of_List (TYPE = "1010 to 1111") is an illegal trigger type, a configuration error (MTTCAN0TTOST.EL = "11", severity 3) is detected when an End_of_List trigger is encountered in the trigger memory before the Watch_Trigger or Watch_Trigger_Gap.

ISO CANFD ISO 11898-1:2015

(b) Restrictions for the Node's Trigger List

There may not be two triggers that are active at the same cycle time and cycle count, but triggers that are active in different basic cycles (different cycle code) may share the same time mark.

Rx_Triggers and Time_Base_Triggers may not be placed inside the Tx enable windows of Tx_Trigger_Single/Continuous/Arbitration, but they may be placed after Tx_Trigger_Merged.

Triggers that are placed after the Watch_Trigger (or the Watch_Trigger_Gap when MTTCAN0TTOST.SYS = "10") will never become active. The watch triggers themselves will not become active when the reference messages are transmitted on time.

All unused trigger memory words (after the Watch_Trigger or after the Watch_Trigger_Gap when MTTCAN0TTOST.SYS = "10") must be set to trigger type End_of_List.

A typical trigger list for a potential time master will begin with a number of Tx_Triggers and Rx_Triggers followed by the Tx_Ref_Trigger and the Watch_Trigger. For networks with external event- synchronized time-triggered communication, this is followed by the Tx_Ref_Trigger_Gap and the Watch_Trigger_Gap. The trigger list for a time slave will be the same but without the Tx_Ref_Trigger and the Tx_Ref_Trigger_Gap.

At the beginning of each basic cycle, that is at each reception or transmission of a reference message, the trigger list is processed starting with the first trigger memory element. The FSE looks for the first trigger with a cycle code that matches the current cycle count. The FSE waits until cycle time reaches the trigger's time mark and activates the trigger. Afterwards the FSE looks for the next trigger in the list with a cycle code that matches the current cycle count.

Special consideration is needed for the time around Tx_Ref_Trigger and Tx_Ref_Trigger_Gap. In a time master competing for master ship, the effective time mark of a Tx_Ref_Trigger may be decremented in order to be the first node to start a reference message. In backup time masters the effective time mark of a Tx_Ref_Trigger or Tx_Ref_Trigger_Gap is the sum of its configured time mark and the Reference Trigger Offset MTTCAN0TTOCF.IRTO. In case error level 2 is reached (MTTCAN0TTOST.EL = "10"), the effective time mark is the sum of its time mark and $127_H$. No other trigger elements should be placed in this range otherwise it may happen, that the time marks appear out of order and are flagged as a configuration error. Trigger elements which are coming after Tx_Ref_Trigger may never become active as long as the reference messages come in time.

There are interdependencies between the following parameters:

- Host clock frequency
- Speed and waiting time for Trigger RAM accesses
- Length of the acceptance filter list
- Number of trigger elements
- Complexity of cycle code filtering in the trigger elements
- Offset between time marks of the trigger elements

### (c) Example for Trigger Handling

The example below shows how the trigger list is derived from a node's system matrix. Assumed node A is first time master and has knowledge of the section of the system matrix shown in **Table 19.152** below.

ISO CANFD ISO 11898-1:2015

**Table 19.152 System Matrix Node A**

| Cycle Count | Time Mark1 | Time Mark2 | Time Mark3 | Time Mark4 | Time Mark5 | Time Mark6 | Time Mark7 |
|---|---|---|---|---|---|---|---|
| 0 | Tx7 | | | | | TxRef | Error |
| 1 | Rx3 | | | Tx2, Tx4 | | TxRef | Error |
| 2 | | | | | | TxRef | Error |
| 3 | Tx7 | | Rx5 | | | TxRef | Error |
| 4 | Tx7 | | | Rx6 | | TxRef | Error |

The cycle count starts with 0 and runs until 0, 1, 3, 7, 15, 31, 63 (the number of basic cycles in the system matrix is 1, 2, 4, 8, 16, 32, 64). The maximum cycle count is configured by MTTCAN0TTMLM.CCM. The Cycle Code CC is composed of repeat factor (= value of most significant '1') and the number of the first basic cycle in the system matrix (= bit field after most significant '1').

Example:with a cycle code of 0b0010011 (repeat factor: 16, first basic cycle: 3) and a maximum cycle count of MTTCAN0TTMLM.CCM = "$3F_H$"matches occur at cycle counts 3, 19, 35, 51

A trigger element consists of Time Mark TM, Cycle Code CC, Trigger Type TYPE, and Message Number MNR. For transmission MNR references the Tx Buffer number (0 to 31). For reception MNR references the number of the filter element (0 to 127) that matched during acceptance filtering.

Depending on the configuration of the Filter Type FTYPE, the 11-bit or 29-bit message ID filter list is referenced.

In addition a trigger element can be configured for Asynchronous Serial Communication ASC, generation of Time Mark Event Internal TMIN, and Time Mark Event External TMEX. The Message Status Count MSC holds the counter value (0 to 7) for scheduling errors for periodic messages in exclusive time windows at the point in time when the time mark of the trigger element became active.

**Table 19.153 Trigger List Node A**

| Trigger | Time Mark TM[15:0] | Cycle Code CC[6:0] | Trigger Type TYPE[3:0] | Mess. No. MNR[6:0] |
|---|---|---|---|---|
| 0 | Mark1 | $0000100_B$ | Tx_Trigger_Single | 7 |
| 1 | Mark1 | $1000000_B$ | Rx_Trigger | 3 |
| 2 | Mark1 | $1000011_B$ | Tx_Trigger_Single | 7 |
| 3 | Mark3 | $1000001_B$ | Tx_Trigger_Merged | 2 |
| 4 | Mark3 | $1000011_B$ | Rx_Trigger | 5 |
| 5 | Mark4 | $1000001_B$ | Tx_Trigger_Arbitration | 4 |
| 6 | Mark4 | $1000100_B$ | Rx_Trigger | 6 |
| 7 | Mark6 | n.a. | Tx_Ref_Trigger | 0 (Ref) |
| 8 | Mark7 | n.a. | Watch_Trigger | n.a. |
| 9 | n.a. | n.a. | End_of_List | n.a. |

Tx_Trigger_Single, Tx_Trigger_Continuous, Tx_Trigger_Merged, Tx_Trigger_Arbitration, Rx_Trigger, and Time_Base_Trigger are only valid for the specified cycle code. For all other trigger types the cycle code is ignored.

The FSE starts the basic cycle with scanning the trigger list starting from zero until a trigger with time mark > cycle time and with its Cycle Code CC matching the actual cycle count is reached, or a trigger of type Tx_Ref_Trigger, Tx_Ref_Trigger_Gap, Watch_Trigger, or Watch_Trigger_Gap is encountered.

When the cycle time reached the Time Mark TM, the action defined by Trigger Type TYPE and Message Number MNR is started. There is an error in the configuration when End_of_List is reached.

At Mark6 the reference message (always TxRef) is transmitted. After transmission of the reference message the FSE returns to the beginning of the trigger list. When the Watch Trigger at Mark7 is reached, the node was not able to transmit the reference message; error treatment is started.

ISO CAN FD ISO 11898-1:2015

### (d) Detection of Configuration Errors

A configuration error is signalled via MTTCAN0TTOST.EL = “11” (severity 3) when:

The FSE comes to a trigger in the list with a cycle code that matches the current cycle count but with a time mark that is less than the cycle time.

The previous active trigger was a Tx_Trigger_Merged and the FSE comes to a trigger in the list with a cycle code that matches the current cycle count but that is neither a Tx_Trigger_Merged nor a Tx_Trigger_Arbitration nor a Time_Base_Trigger nor an Rx_Trigger.

The FSE of a node with MTTCAN0TTOCF.TM=‘0’ (time slave) encounters a Tx_Ref_Trigger or a Tx_Ref_Trigger_Gap.

Any time mark placed inside the Tx enable window (defined by MTTCAN0TTMLM.TXEW) of a Tx_Trigger with a matching cycle code.

A time mark is placed near the time mark of a Tx_Ref_Trigger and the Reference Trigger Offset MTTCAN0TTOST.RTO causes a reversal of their sequential order measured in cycle time.

### (4) TTCAN Schedule Initialization

The synchronization to the M_TTCAN's message schedule starts when MTTCAN0CCCR.INIT is reset. The M_TTCAN can operate strictly time-triggered (MTTCAN0TTOCF.GEN = '0') or external event-synchronized time-triggered (MTTCAN0TTOCF.GEN = '1'). All nodes start with cycle time zero at the beginning of their trigger list with MTTCAN0TTOST.SYS = "00" (out of synchronization), no transmission is enabled with the exception of the reference message. Nodes in external event-synchronized time-triggered operation mode will ignore Tx_Ref_Trigger and Watch_Trigger and will use instead Tx_Ref_Trigger_Gap and Watch_Trigger_Gap until the first reference message decides whether a Gap is active.

#### (a) Time Slaves

After configuration, a time slave will ignore its Watch_Trigger and Watch_Trigger_Gap when it did not receive any message before reaching the Watch_Triggers. When it reaches Init_Watch_Trigger, interrupt flag MTTCAN0TTIR.IWT is set, the FSE is frozen, and the cycle time will become invalid, but the node will still be able to take part in CAN bus communication (to give acknowledge or to send error flags). The first received reference message will restart the FSE and the cycle time.

**NOTE**

Init_Watch_Trigger is not part of the trigger list. It is implemented as an internal counter which counts up to $FFFF_H$ = maximum cycle time.

When a time slave has received any message but the reference message before reaching the Watch_Triggers, it will assume a fatal error (MTTCAN0TTOST.EL = "11", severity 3), set interrupt flag MTTCAN0TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (MTTCAN0CCCR.MON set to '1'). In the bus monitoring mode it is still able to receive messages, but it cannot send any dominant bits and therefore cannot give acknowledge.

**NOTE**

To leave the fatal error state, the Host has to set MTTCAN0CCCR.INIT = '1'. After reset of MTTCAN0CCCR.INIT, the node restarts TTCAN communication.

When no error is encountered during synchronization, the first reference message sets MTTCAN0TTOST.SYS = "01" (Synchronizing), the second sets the TTCAN synchronization state (depending on its Next_is_Gap bit) to MTTCAN0TTOST.SYS = "11" (In_Schedule) or MTTCAN0TTOST.SYS = "10" (In_Gap), enabling all Tx_Triggers and Rx_Triggers.

#### (b) Potential Time Masters

After configuration, a potential time master will start the transmission of a reference message when it reaches its Tx_Ref_Trigger (or its Tx_Ref_Trigger_Gap when in external event-synchronized time-triggered operation). It will ignore its Watch_Trigger and Watch_Trigger_Gap when it did not receive any message or transmit the reference message successfully before reaching the Watch_Triggers (assumed reason: all other nodes still in reset or configuration, giving no acknowledge). When it reaches Init_Watch_Trigger, the attempted transmission is aborted, interrupt flag MTTCAN0TTIR.IWT is set, the FSE is frozen, and the cycle time will become invalid, but the node will still be able to take part in CAN bus communication (to give acknowledge or to send error flags). Resetting MTTCAN0TTIR.IWT will re-enable the transmission of reference messages until next time the Init_Watch_Trigger condition is met, or another CAN message is received. The FSE will be restarted by the reception of a reference message.

ISO Draft NFD ISO 11898-1:2015

When a potential time master reaches the Watch_Triggers after it has received any message but the reference message, it will assume a fatal error (MTTCAN0TTOST.EL = “11”, severity 3), set interrupt flag MTTCAN0TTIR.WT, switch off its CAN bus output, and enter the bus monitoring mode (MTTCAN0CCCR.MON set to ‘1’). In bus monitoring mode, it is still able to receive messages, but it cannot send any dominant bits and therefore cannot give acknowledge.

When no error is detected during initialization, the first reference message sets MTTCAN0TTOST.SYS = “01” (synchronizing), the second sets the TTCAN synchronization state (depending on its Next_is_Gap bit) to MTTCAN0TTOST.SYS = “11” (In_Schedule) or MTTCAN0TTOST.SYS = “10” (In_Gap), enabling all Tx_Triggers and Rx_Triggers.

A potential time master is current time master (MTTCAN0TTOST.MS = “11”) when it was the transmitter of the last reference message, else it is backup time master (MTTCAN0TTOST.MS = “10”).

When all potential time masters have finished configuration, the node with the highest time master priority in the network will become the current time master.

### 19.6.4.3 TTCAN Gap Control

All functions related to Gap control apply only when the M_TTCAN is operated in external event-synchronized time-triggered mode (MTTCAN0TTOCF.GEN = ‘1’). In this operation mode the TTCAN message schedule may be interrupted by inserting Gaps between the basic cycles of the system matrix. All nodes connected to the CAN network have to be configured for external event-synchronized time-triggered operation.

During a Gap, all transmissions are stopped and the CAN bus remains idle. A Gap is finished when the next reference message starts a new basic cycle. A Gap starts at the end of a basic cycle that itself was started by a reference message with bit Next_is_Gap = ‘1’ e.g. Gaps are initiated by the current time master.

The current time master has two options to initiate a Gap. A Gap can be initiated under software control when the application program writes MTTCAN0TTOCN.NIG = ‘1’. The Next_is_Gap bit will be transmitted as ‘1’ with the next reference message. A Gap can also be initiated under hardware control when the application program enables the event trigger input pin m_ttcan_evt (MTTCAN0EVT) by writing MTTCAN0TTOCN.GCS = ‘1’. When a reference message is started and MTTCAN0TTOCN.GCS is set, a HIGH level at pin m_ttcan_evt (MTTCAN0EVT) will set Next_is_Gap = ‘1’.

As soon as that reference message is completed, the MTTCAN0TTOST.WFE bit will announce the Gap to the time master as well as to the time slaves. The current basic cycle will continue until its last time window. The time after the last time window is the Gap time.

For the actual time master and the potential time masters, MTTCAN0TTOST.GSI will be set when the last basic cycle has finished and the Gap time starts. In nodes that are time slaves, bit MTTCAN0TTOST.GSI will remain at ‘0’.

When a potential time master is in synchronization state In_Gap (MTTCAN0TTOST.SYS = “10”), it has four options to intentionally finish a Gap:

Under software control by writing MTTCAN0TTOCN.FGP = ‘1’.

Under hardware control (MTTCAN0TTOCN.GCS = ‘1’) an edge from HIGH to LOW at the event-trigger input pin m_ttcan_evt (MTTCAN0EVT) sets MTTCAN0TTOCN.FGP and restarts the schedule.

ISO 11898-1:2015

The third option is a time-triggered restart. When MTTCAN0TTOCN.TMG = '1', the next register time mark interrupt (MTTCAN0TTIR.RTMI = '1') will set MTTCAN0TTOCN.FGP and start the reference message.

Finally any potential time master will finish a Gap when it reaches its Tx_Ref_Trigger_Gap, assuming that the event to synchronize on did not occur in time.

Neither of these options can cause a basic cycle to be interrupted with a reference message.

Setting of MTTCAN0TTOCN.FGP after the Gap time has started will start the transmission of a reference message immediately and will thereby synchronize the message schedule. When MTTCAN0TTOCN.FGP is set before the Gap time has started (while the basic cycle is still in progress), the next reference message is started at the end of the basic cycle, at the Tx_Ref_Trigger – there will be no Gap time in the message schedule.

In strictly time-triggered operation, bit Next_is_Gap = '1' in the reference message will be ignored, as well as the event-trigger input pin m_ttcan_evt (MTTCAN0EVT) and the bits MTTCAN0TTOCN.NIG, MTTCAN0TTOCN.FGP, and MTTCAN0TTOCN.TMG.

#### 19.6.4.4 Stop Watch

The stop watch function enables capturing of M_TTCAN internal time values (local time, cycle time, or global time) triggered by an external event.

To enable the stop watch function, the application program first has to define local time, cycle time, or global time as stop watch source via MTTCAN0TTOCN.SWS. When MTTCAN0TTOCN.SWS is ≠ "00" and TT Interrupt Register flag MTTCAN0TTIR.SWE is '0', the actual value of the time selected by MTTCAN0TTOCN.SWS will be copied into MTTCAN0TTCPT.SWV on the next rising/falling edge (as configured via MTTCAN0TTOCN.SWP) on pin m_ttcan_swt (MTTCAN0SWT). This will set interrupt flag MTTCAN0TTIR.SWE. After the application program has read MTTCAN0TTCPT.SWV, it may enable the next stop watch event by resetting MTTCAN0TTIR.SWE to '0'.

#### 19.6.4.5 Local Time, Cycle Time, Global Time, and External Clock Synchronization

There are two possible levels in time-triggered CAN: Level 1 and Level 2. Level 1 only provides time-triggered operation using cycle time. Level 2 additionally provides increased synchronization quality, global time and external clock synchronization. In both levels, all timing features are based on a local time base - the local time.

The local time is a 16-bit cyclic counter, it is incremented once each NTU. Internally the NTU is represented by a 3-bit counter which can be regarded as a fractional part (three binary digits) of the local time. Generally, the 3-bit NTU counter is incremented 8 times each NTU. If the length of the NTU is shorter than 8 CAN clock periods (as may be configured in Level 1, or as a result of clock calibration in Level 2), the length of the NTU fraction is adapted, and the NTU counter is incremented only 4 times each NTU.

**Figure 19.27** describes the synchronization of the cycle time and global time, performed in the same manner by all TTCAN nodes, including the time master. Any message received or transmitted invokes a capture of the local time taken at the message's frame synchronization event. This frame synchronization event occurs at the sample point of each Start of Frame (SoF) bit and causes the local time to be stored as Sync_Mark. Sync_Marks and Ref_Marks are captured including the 3-bit fractional part.

Whenever a valid reference message is transmitted or received, the internal Ref_Mark is updated from the Sync_Mark. The difference between Ref_Mark and Sync_Mark is the Cycle Sync Mark

ISO CANFD ISO 11898-1:2015

(Cycle Sync Mark = Sync_Mark - Ref_Mark) stored in register MTTCAN0TTCSM. The most significant 16 bits of the difference between Ref_Mark and the actual value of the local time is the cycle time (Cycle Time = Local Time - Ref_Mark).

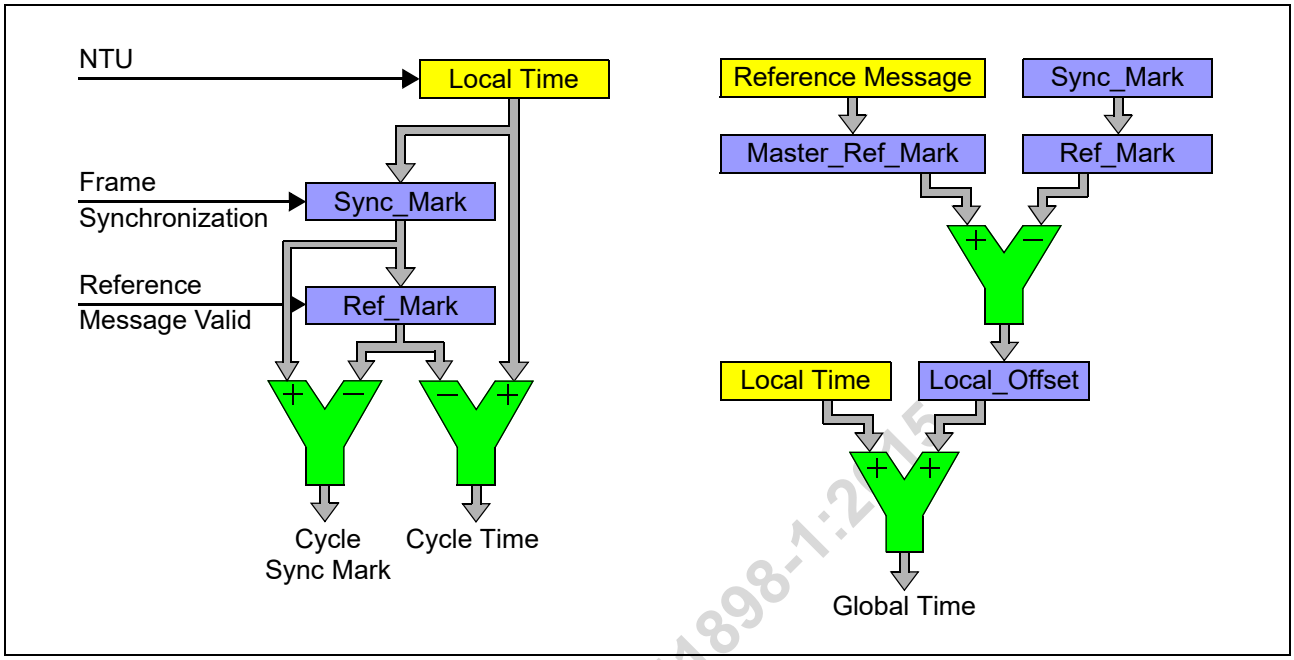

**Figure 19.27 Cycle Time and Global Time Synchronization**

ISO CAN FD ISO 11898-1:2015

The cycle time that can be read from MTTCAN0TTCTC.CT is the difference of the node's local time and Ref_Mark, both synchronized into the Host clock domain and truncated to 16 bit.

The global time exists for TTCAN Level 0 and Level 2 only, in Level 1 it is invalid. The node's view of the global time is the local image of the global time in (local) NTUs. After configuration, a potential time master will use its own local time as global time. The time master establishes its own local time as global time by transmitting its own Ref_Marks as Master_Ref_Marks in the reference message (bytes 3,4). The global time that can be read from MTTCAN0TTLGT.GT is the sum of the node's local time and its local offset, both synchronized into the Host clock domain and truncated to 16 bit. The fractional part is used for clock synchronization only.

A node that receives a reference message calculates its local offset to the global time by comparing its local Ref_Mark with the received Master_Ref_Mark (see **Figure 19.27**). The node's view of the global time is local time + local offset. In a potential time master that has never received another time master's reference message, Local_Offset will be zero. When a node becomes the current time master after first having received other reference messages, Local_Offset will be frozen at its last value. In the time receiving nodes, Local_Offset may be subject to small adjustments, due to clock drift, when another node becomes time master, or when there is a global time discontinuity, signalled by Disc_Bit in the reference message. With the exception of global time discontinuity, the global time provided to the application program by register MTTCAN0TTLGT is smoothed by a low-pass filtering to have a continuous monotonic value.

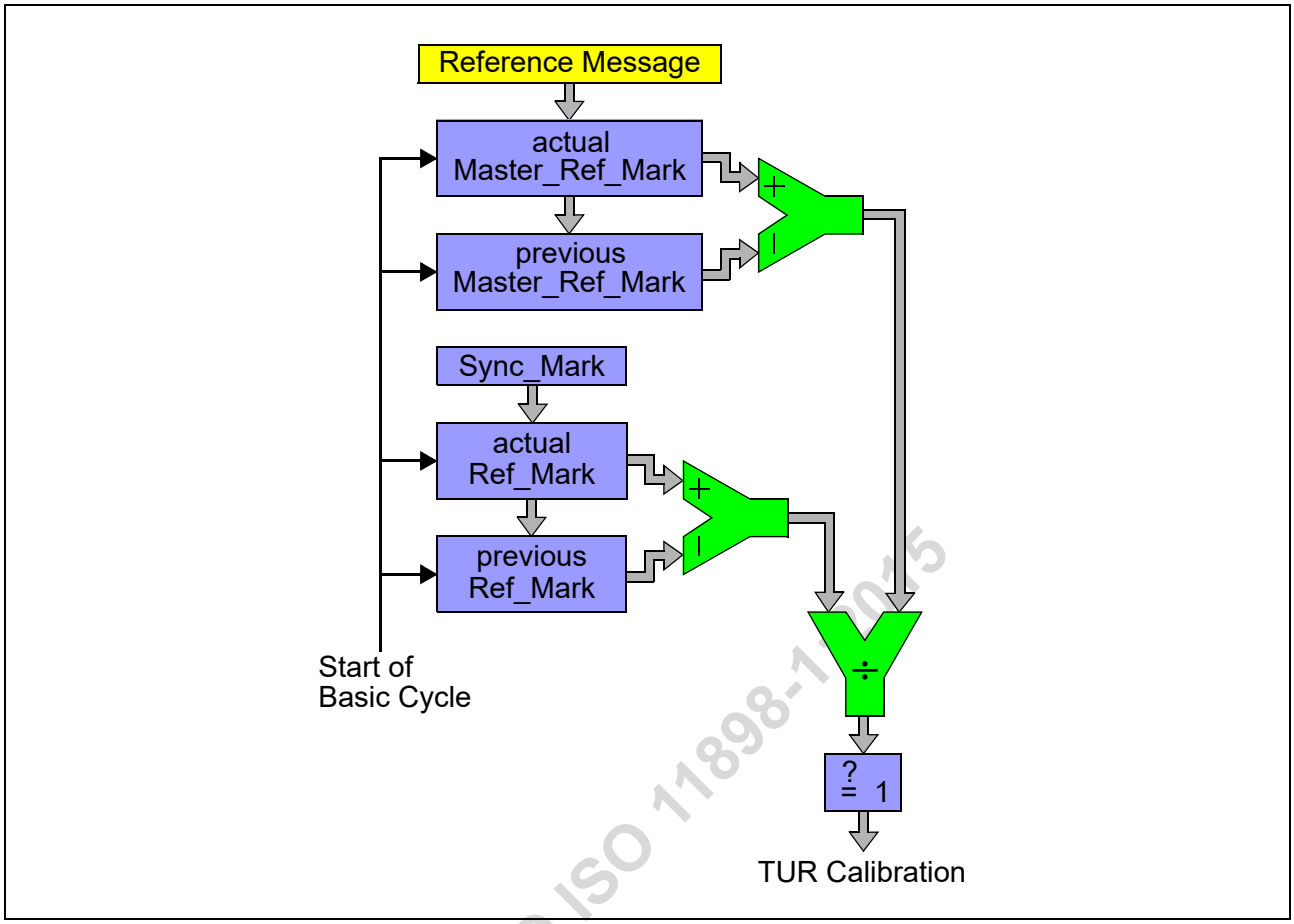

Figure 19.28 TTCAN Level 0 and Level 2 Drift Compensation

**Figure 19.28** describes how in TTCAN Level 0,2 each time receiving node compensates the drift between its own local clock and the time master's clock by comparing the length of a basic cycle in local time and in global time. If there is a difference between the two values and the Disc_Bit in the reference message is not set, a new value for MTTCAN0TURNA.NAV is calculated. If the Synchronization Deviation SD = |NC - MTTCAN0TURNA.NAV| ≤ SDL (Synchronization Deviation Limit), the new value for MTTCAN0TURNA.NAV takes effect. Else the automatic drift compensation is suspended.

In TTCAN Level 0 and Level 2, MTTCAN0TTOST.QCS indicates whether the automatic drift compensation is active or suspended. In TTCAN Level 1, MTTCAN0TTOST.QCS is always '1'.

The current time master may synchronize its local clock speed and the global time phase to an external clock source. This is enabled by bit MTTCAN0TTOCF.EECS.

The stop watch function (see **Section 19.6.4.4, Stop Watch**) may be used to measure the difference in clock speed between the local clock and the external clock. The local clock speed is adjusted by first writing the newly calculated Numerator Configuration Low to MTTCAN0TURCF.NCL (MTTCAN0TURCF.DC cannot be updated during operation). The new value takes effect by writing MTTCAN0TTOCN.ECS to '1'.

The global time phase is adjusted by first writing the phase offset into the TT Global Time Preset register MTTCAN0TTGTP. The new value takes effect by writing MTTCAN0TTOCN.SGT to '1'. The first reference message transmitted after the global time phase adjustment will have the Disc_Bit set to '1'.

ISO CANFD ISO 11898-1:2015

MTTCAN0TTOST.QGTP shows whether the node's global time is in phase with the time master's global time. MTTCAN0TTOST.QGTP is permanently '0' in TTCAN Level 1 and when the Synchronization Deviation Limit is exceeded in TTCAN Level 0,2 (MTTCAN0TTOST.QCS = '0'). It is temporarily '0' while the global time is low-pass filtered to supply the application with a continuous monotonic value. There is no low-pass filtering when the last reference message contained a Disc_Bit = '1' or when MTTCAN0TTOST.QCS = '0'.

### 19.6.4.6 TTCAN Error Level

The ISO 11898-4 specifies four levels of error severity:

#### S0 - No Error

#### S1 - Warning

Only notification of application, reaction application-specific.

#### S2 Error

Notification of application. All transmissions in exclusive or arbitrating time windows are disabled (i.e. no data or remote frames may be started). Potential time masters still transmit reference messages with the Reference Trigger Offset MTTCAN0TTOST.RTO set to the maximum value of 127.

#### S3 - Severe Error

Notification of application. All CAN bus operations are stopped, i.e. transmission of dominant bits is not allowed, and MTTCAN0CCCR.MON is set. The S3 error condition remains active until the application updates the configuration (set MTTCAN0CCCR.CCE).

If several errors are detected at the same time, the highest severity prevails. When an error is detected, the application is notified by MTTCAN0TTIR.ELC. The error level is monitored by MTTCAN0TTOST.EL.

The M_TTCAN signals the following error conditions as required by ISO 11898-4:

#### Config_Error (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when a merged arbitrating time window is not properly closed or when there is a Tx_Trigger with a time mark beyond the Tx_Ref_Trigger.

#### Watch_Trigger_Reached (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when a watch trigger was reached because the reference message is missing.

#### Application_Watchdog (S3)

Sets Error Level MTTCAN0TTOST.EL to "11" when the application failed to serve the application watchdog. The application watchdog is configured via MTTCAN0TTOCF.AWL. It is served by reading register MTTCAN0TTOST. When the watchdog is not served in time, bit MTTCAN0TTOST.AWE and interrupt flag MTTCAN0TTIR.AW are set, all TTCAN communication is stopped, and the M_TTCAN is set into bus monitoring mode (MTTCAN0CCCR.MON set to '1').

ISO CAN FD ISO 11898-1:2015

#### CAN_Bus_Off (S3)

Entering CAN_Bus_Off state sets error level MTTCAN0TTOST.EL to “11”. CAN_Bus_Off state is signalled by MTTCAN0PSR.BO = ‘1’ and MTTCAN0CCCR.INIT = ‘1’.

#### Scheduling_Error_2 (S2)

Sets Error Level MTTCAN0TTOST.EL to “10” if the MSC of one Tx_Trigger has reached 7. In addition interrupt flag MTTCAN0TTIR.SE2 is set. The Error Level MTTCAN0TTOST.EL is reset to “00” at the beginning of a matrix cycle when no Tx_Trigger has an MSC of 7 in the preceding matrix cycle.

#### Tx_Overflow (S2)

Sets Error Level MTTCAN0TTOST.EL to “10” when the Tx count is equal or higher than the expected number of Tx_Triggers MTTCAN0TTMLM.ENTT and a Tx_Trigger event occurs. In addition interrupt flag MTTCAN0TTIR.TXO is set. The Error Level MTTCAN0TTOST.EL is reset to “00” when the Tx count is no more than MTTCAN0TTMLM.ENTT at the start of a new matrix cycle.

#### Scheduling_Error_1 (S1)

Sets Error Level MTTCAN0TTOST.EL to “01” if within one matrix cycle the difference between the maximum MSC and the minimum MSC for all trigger memory elements (of exclusive time windows) is larger than 2, or if one of the MSCs of an exclusive Rx_Trigger has reached 7. In addition interrupt flag MTTCAN0TTIR.SE1 is set. If within one matrix cycle none of these conditions is valid, the Error Level MTTCAN0TTOST.EL is reset to “00”.

#### Tx_Underflow (S1)

Sets Error Level MTTCAN0TTOST.EL to “01” when the Tx count is less than the expected number of Tx_Triggers MTTCAN0TTMLM.ENTT at the start of a new matrix cycle. In addition interrupt flag MTTCAN0TTIR.TXU is set. The Error Level MTTCAN0TTOST.EL is reset to “00” when the Tx count is at least MTTCAN0TTMLM.ENTT at the start of a new matrix cycle.

ISO CANFD ISO 11898-1:2015

### 19.6.4.7 TTCAN Message Handling

#### (1) Reference Message

For potential time masters the identifier of the reference message is configured via MTTCAN0TTRMC.RID. No dedicated Tx Buffer is required for transmission of the reference message. When a reference message is transmitted, the first data byte (TTCAN Level 1) resp. the first four data bytes (TTCAN Level 0 and Level 2) will be provided by the FSE.

In case the reference message Payload Select MTTCAN0TTRMC.RMPS is set, the rest of the reference message's payload (Level 1: bytes 2-8, Level 0,2: bytes 5-6) is taken from Tx Buffer 0. In this case the data length DLC code from message buffer 0 is used.

**Table 19.154 Number of Data Bytes transmitted with a reference messages**

| MTTCAN0TTRMC. RMPS | MTTCAN0TXBRP. TRP0 | Level 0 | Level 1 | Level 2 |
|---|---|---|---|---|
| 0 | 0 | 4 | 1 | 4 |
| 0 | 1 | 4 | 1 | 4 |
| 1 | 0 | 4 | 1 | 4 |
| 1 | 1 | 4 + MB0 | 1 + MB0 | 4 + MB0 |

To send additional payload with the reference message in Level 1 a DLC > 1 has to be configured, for Level 0,2 a DLC > 4 is required. In addition the transmission request pending bit MTTCAN0TXBRP.TRP0 of message buffer 0 must be set (see **Table 19.154**). In case bit MTTCAN0TXBRP.TRP0 is not set when a reference message is started, the reference message is transmitted with the data bytes supplied by the FSE only.

For acceptance filtering of reference messages the Reference Identifier MTTCAN0TTRMC.RID is used.

#### (2) Message Reception

Message reception is done via the two Rx FIFOs in the same way as for event-driven CAN communication (see **Section 19.6.3.4, Rx Handling**).

The Message Status Count MSC is part of the corresponding trigger memory element and has to be initialized to zero during configuration. It is updated while the M_TTCAN is in synchronization states In_Gap or In_Schedule. The update happens at the message's Rx_Trigger. At this point in time it is checked at which acceptance filter element the latest message received in this basic cycle had matched. The matching filter number is stored as the acceptance filter result. If this is the same the filter number as defined in this trigger memory element, the MSC is decremented by one. If the acceptance filter result is not the same filter number as defined for this filter element, or if the acceptance filter result is cleared, the MSC is incremented by one. At each Rx_Trigger and at each start of cycle, the last acceptance filter result is cleared.

The time mark of an Rx_Trigger should be set to a value where it is ensured that reception and acceptance filtering for the targeted message has completed. This has to take into consideration the RAM access time and the order of the filter list. It is recommended, that filters which are used for Rx_Triggers are placed at the beginning of the filter list. It is not recommended to use an Rx_Trigger for the reference message.

ISO CANFD ISO 11898-1:2015

### (3) Message Transmission

For time-triggered message transmission the M_TTCAN supplies 32 dedicated Tx buffers (see **Section (2), Dedicated Tx Buffers**). A Tx FIFO or Tx queue is not available when the M_TTCAN is configured for time-triggered operation (MTTCAN0TTOCF.OM = “01” or “10”).

Each Tx_Trigger in the trigger memory points to a particular Tx buffer containing a specific message. There may be more than one Tx_Trigger for a given Tx buffer if that Tx buffer contains a message that is to be transmitted more than once in a basic cycle or matrix cycle.

The application program has to update the data regularly and on time, synchronized to the cycle time. The Host CPU is responsible that no partially updated messages are transmitted. To assure this the Host has to proceed in the following way:

Tx_Trigger_Single / Tx_Trigger_Merged / Tx_Trigger_Arbitration

- Check whether the previous transmission has completed by reading MTTCAN0TXBTO
- Update the Tx buffer’s configuration and/or payload
- Issue an Add Request to set the Tx Buffer Request Pending bit

Tx_Trigger_Continuous

- Issue a Cancellation Request to reset the Tx Buffer Request Pending bit
- Check whether the cancellation has finished by reading MTTCAN0TXBCF
- Update Tx buffer’s configuration and/or payload
- Issue an Add Request to set the Tx Buffer Request Pending bit

The message’s MSC stored with the corresponding Tx_Trigger provides information on the success of the transmission.

The MSC is incremented by one when the transmission could not be started because the CAN bus was not idle within the corresponding transmit enable window or when the message was started and could not be completed successfully. The MSC is decremented by one when the message was transmitted successfully or when the message could have been started within its transmit enable window but was not started because transmission was disabled (M_TTCAN in Error Level S2 or Host has disabled this particular message).

The Tx buffers may be managed dynamically, i.e. several messages with different identifiers may share the same Tx buffer element. In this case the Host has to assure that no transmission request is pending for the Tx buffer element to be reconfigured by checking MTTCAN0TXBRP.

If a Tx buffer with pending transmission request should be updated, the Host first has to issue a cancellation request and check whether the cancellation has completed by reading MTTCAN0TXBCF before it starts updating.

The Tx Handler will transfer a message from the Message RAM to its intermediate output buffer at the trigger element which becomes active immediately before the Tx_Trigger element which defines the beginning of the transmit window. During and after the transfer time the transmit message may not be updated and its MTTCAN0TXBRP bit may not be changed. To control this transfer time, an additional trigger element may be placed before the Tx_Trigger. This may be e.g. a Time_Base_Trigger which need not cause any other action. The difference in time marks between the Tx_Trigger and the preceding trigger has to be large enough to guarantee that the Tx Handler can read four words from the Message RAM even at high RAM access load from other modules.

ISO CANFD ISO 11898-1:2015

(a) Transmission in Exclusive Time Windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx_Trigger_Single or Tx_Trigger_Continuous. There is no arbitration on the bus with messages from other nodes. The MSC is updated according the result of the transmission attempt. After successful transmission started by a Tx_Trigger_Single the respective Tx Buffer Request Pending bit is reset. After successful transmission started by a Tx_Trigger_Continuous the respective Tx Buffer Request Pending remains set. When the transmission was not successful due to disturbances, it will be repeated next time (one of) its Tx_Trigger(s) become(s) active.

(b) Transmission in Arbitrating Time Windows

A transmission is started time-triggered when the cycle time reaches the time mark of a Tx_Trigger_Arbitration. Several nodes may start to transmit at the same time. In this case the message has to arbitrate with the messages from other nodes. The MSC is not updated. When the transmission was not successful (lost arbitration or disturbance), it will be repeated next time (one of) its Tx_Trigger(s) become(s) active.

(c) Transmission in Merged Arbitrating Time Windows

The purpose of a merged arbitrating time window is to enable multiple nodes to send a limited number of frames which are transmitted in immediate sequence, the order given by CAN arbitration. It is not intended for burst transmission by a single node. Since the node does not have exclusive access within this time window, it may happen that not all requested transmissions are successful.

Messages which have lost arbitration or were disturbed by an error, may be re-transmitted inside the same merged arbitrating time window. The re-transmission will not be started if the corresponding Transmission Request Pending flag was reset by a successful Tx cancellation.

In single transmit windows, the Tx Handler transmits the message indicated by the message number of the trigger element. In merged arbitrating time windows, it can handle up to three message numbers from the trigger list. Their transmissions will be attempted in the sequence defined by the trigger list. If the time mark of a fourth message is read before the first is transmitted (or cancelled by the Host), the fourth request will be ignored.

The transmission inside a merged arbitrating time window is not time-triggered. The transmission of a message may start before its time mark, or after the time mark if the bus was not idle.

The messages transmitted by a specific node inside a merged arbitrating time window will be started in the order of their Tx_Triggers, so a message with low CAN priority may prevent the successful transmission of a following message with higher priority, if there is competing bus traffic. This has to be considered for the configuration of the trigger list. Time_Base_Triggers may be placed between consecutive Tx_Triggers to define the time until the data of the corresponding Tx Buffer needs to be updated.

ISO CAN FD ISO 11898-1:2015

#### 19.6.4.8 TTCAN Interrupt and Error Handling

The TT Interrupt Register MTTCAN0TTIR consists of four segments. Each interrupt can be enabled separately by the corresponding bit in the TT Interrupt Enable register MTTCAN0TTIE. The flags remain set until the Host clears them. A flag is cleared by writing a '1' to the corresponding bit position.

The first segment consists of flags CER, AW, WT, and IWT. Each flag indicates a fatal error condition where the CAN communication is stopped. With the exception of IWT, these error conditions require a re-configuration of the M_TTCAN module before the communication can be restarted.

The second segment consists of flags ELC, SE1, SE2, TXO, TXU, and GTE. Each flag indicates an error condition where the CAN communication is disturbed. If they are caused by a transient failure, e.g. by disturbances on the CAN bus, they will be handled by the TTCAN protocol's failure handling and do not require intervention by the application program.

The third segment consists of flags GTD, GTW, SWE, TTMI, and RTMI. The first two flags are controlled by global time events (Level 0, 2 only) that require a reaction by the application program. With a Stop Watch Event triggered by a rising/falling edge on pin m_ttcan_swt (MTTCAN0SWT) internal time values are captured. The Trigger Time Mark Interrupt notifies the application that a specific Time_Base_Trigger is reached. The Register Time Mark Interrupt signals that the time referenced by MTTCAN0TTOCN.TMC (Cycle, Local, or Global) equals time mark MTTCAN0TTTMK.TM. It can also be used to finish a Gap.

The fourth segment consists of flags SOG, CSM, SMC, and SBC. These flags provide a means to synchronize the application program to the communication schedule.

ISO CANFD ISO 11898-1:2015

#### 19.6.4.9 Level 0

TTCAN Level 0 is not part of ISO11898-4. This operation mode makes the hardware, that in TTCAN Level 2 maintains the calibrated global time base, also available for event-driven CAN according to ISO11898-1:2015.

Level 0 operation is configured via MTTCAN0TTOCF.OM = “11”. In this mode the M_TTCAN operates in event-driven CAN communication, there is no fixed schedule, the configuration of MTTCAN0TTOCF.GEN is ignored. External event-synchronized operation is not available in Level 0. A synchronized time base is maintained by transmission of reference messages.

In Level 0 the trigger memory is not active and therefore needs not to be configured. The time mark interrupt flag (MTTCAN0TTIR.TTMI) is set when the cycle time has reached MTTCAN0TTOCF.IRTO • $200_H$, it reminds the Host to set a transmission request for message buffer 0. The Watch_Trigger interrupt flag (MTTCAN0TTIR.WT) is set when the cycle time has reached $FF00_H$. These values were chosen to have enough margin for a stable clock calibration. There are no further TT-error-checks.

Register time mark interrupts (MTTCAN0TTIR.RTMI) are also possible.

The reference message is configured as for Level 2 operation. Received reference messages are recognized by the identifier configured in register MTTCAN0TTRMC. For the transmission of reference messages only message buffer 0 may be used. The node transmits reference messages any time the Host sets a transmission request for message buffer 0, there is no reference trigger offset.

Level 0 operation is configured via:

- MTTCAN0TTRMC
- MTTCAN0TTOCF except EVTP, AWL, GEN
- MTTCAN0TTMLM except ENTT, TXEW
- MTTCAN0TURCF

Level 0 operation is controlled via:

- MTTCAN0TTOCN except NIG, TMG, FGP, GCS, TTMIE
- MTTCAN0TTGTP
- MTTCAN0TTTMK
- MTTCAN0TTIR excluding bits CER, AW, IWT SE2, SE1, TXO, TXU, SOG (no function)
- MTTCAN0TTIR the following bits have changed function
  - TTMI not defined by trigger memory - activated at cycle time MTTCAN0TTOCF.IRTO • $200_H$
  - WT not defined by trigger memory - activated at cycle time $FF00_H$

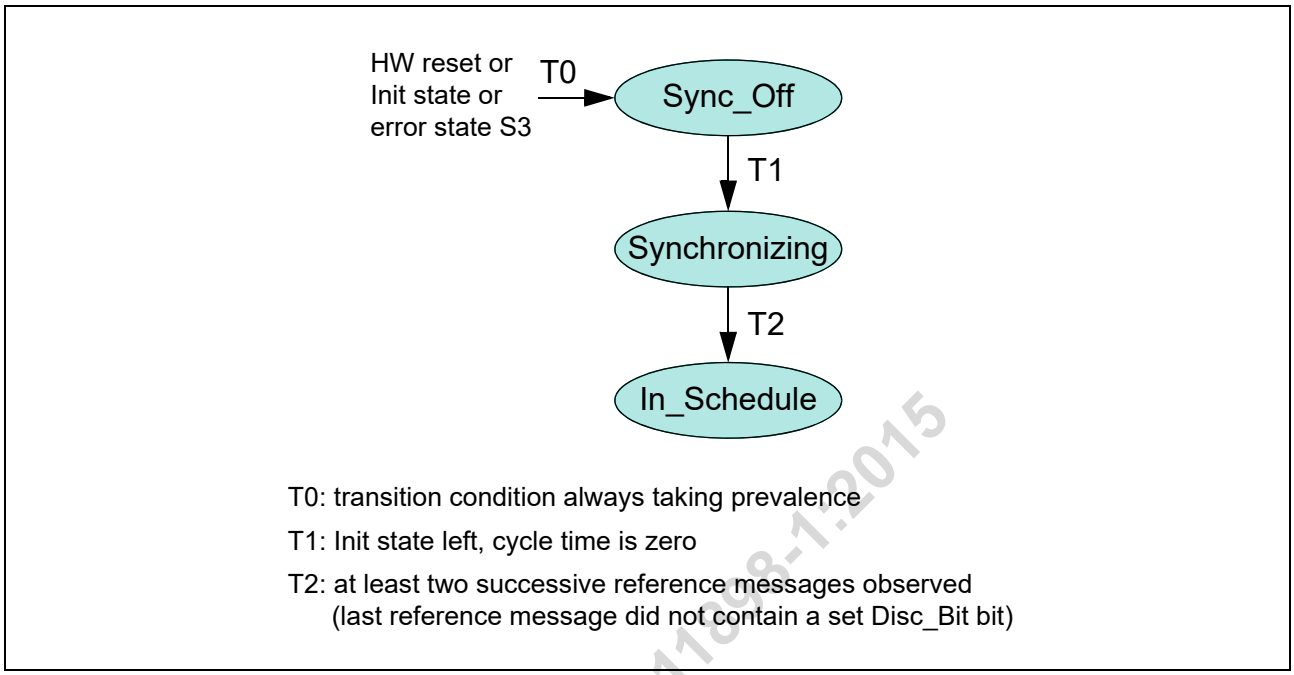
Level 0 operation is signalled via:

- MTTCAN0TTOST excluding bits AWE, WFE, GSI, GFI, RTO (no function)

ISO CANFD ISO 11898-1:2015

### (1) Synchronizing

**Figure 19.29** below describes the states and state transitions in TTCAN Level 0 operation. Level 0 has no In_Gap state.



ISO CANFD ISO 11898-1:2015

**Figure 19.29 Level 0 schedule synchronization state machine**

### (2) Handling of Error Levels

During Level 0 operation only the following error conditions may occur:

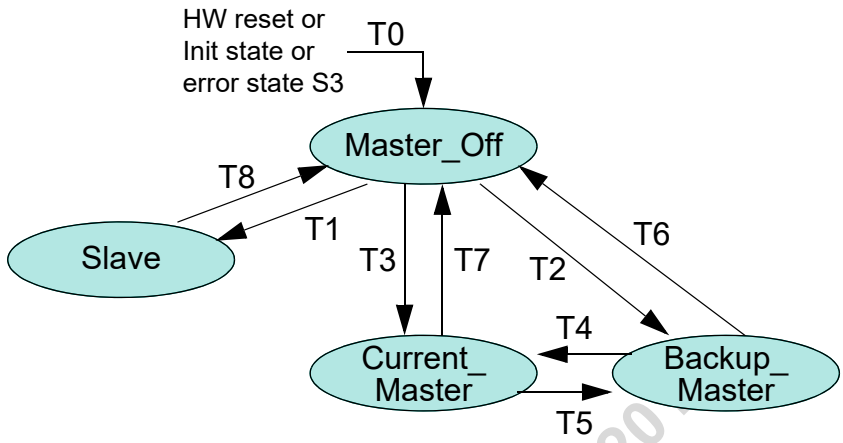
- Watch_Trigger_Reached (S3), reached cycle time $FF00_H$
- CAN_Bus_Off (S3)

Since no S1 and S2 error are possible, the error level can only switch between S0 (No Error) and S3 (Severe Error). In TTCAN Level 0 an S3 error is handled differently. When error level S3 is reached, both MTTCAN0TTOST.SYS and MTTCAN0TTOST.MS are reset, and interrupt flags MTTCAN0TTIR.GTE and MTTCAN0TTIR.GTD are set.

When error level S3 (MTTCAN0TTOST.EL = “11”) is entered, bus monitoring mode is, contrary to TTCAN Level 1 and Level 2, not entered. S3 error level is left automatically after transmission (time master) or reception (time slave) of the next reference message.

### (3) Master Slave Relation

**Figure 19.30** below describes the master slave relation in TTCAN Level 0. In case of an S3 error the M_TTCAN returns to state Master_Off.



T0: transition condition always taking prevalence

T1: reference message observed when not potential time master

T2: reference message observed with master priority ≠ own master priority, error state ≠ S3

T3: reference message observed with master priority = own master priority, error state ≠ S3

T4: reference message observed with own master priority

T5: reference message observed with master priority higher than own master priority

T6: error state S3

T7: error state S3

T8: error state S3

ISO CANFD ISO 11898-1:20

**Figure 19.30 Level 0 master to slave relation**

## 19.6.4.10 Asynchronous Serial Communication

When configured for TTCAN Level 1 or Level 2 operation, the M_TTCAN time base can be used to switch access to the CAN bus for predefined time windows between M_TTCAN and an ASC module (see **Figure 19.31**).

When an exclusive time window is assigned to the ASC module, the multiplexer connects the ASC module to the CAN transceiver. ASC transmission is free of CAN requirements for arbitration and fault confinement and therefore higher bit rates and effective payloads are possible

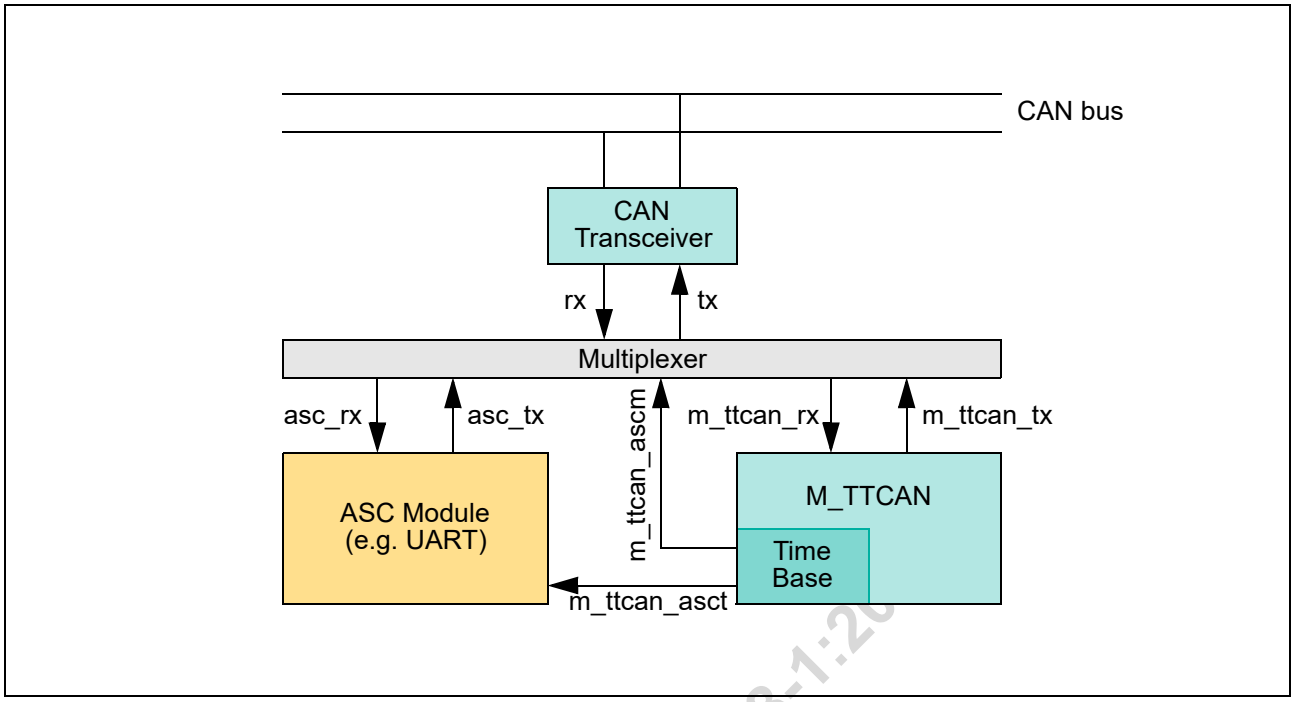


**Figure 19.31 Asynchronous Serial Communication at CAN**

Asynchronous serial operation is configured for each trigger element separately via T0.ASC. The M_TTCAN's time base controls access to the CAN transceiver for M_TTCAN or ASC module via output signal m_ttcan_ascm. Output signal m_ttcan_asct controls whether the ASC module is transmitter or receiver. For ASC transmission only one node in the network must be configured as transmitter while all other nodes are receivers.

With T0.ASC = "00" the ASC module is disconnected from the CAN bus (m_ttcan_ascm = '0', m_ttcan_asct = '0'). When T0.ASC = "01" the ASC module is receiver (m_ttcan_ascm = '1', m_ttcan_asct = '0'). When T0.ASC = "10" the ASC module is transmitter (m_ttcan_ascm = '1', m_ttcan_asct = '1')

ISO CANFD ISO 11898-1:20

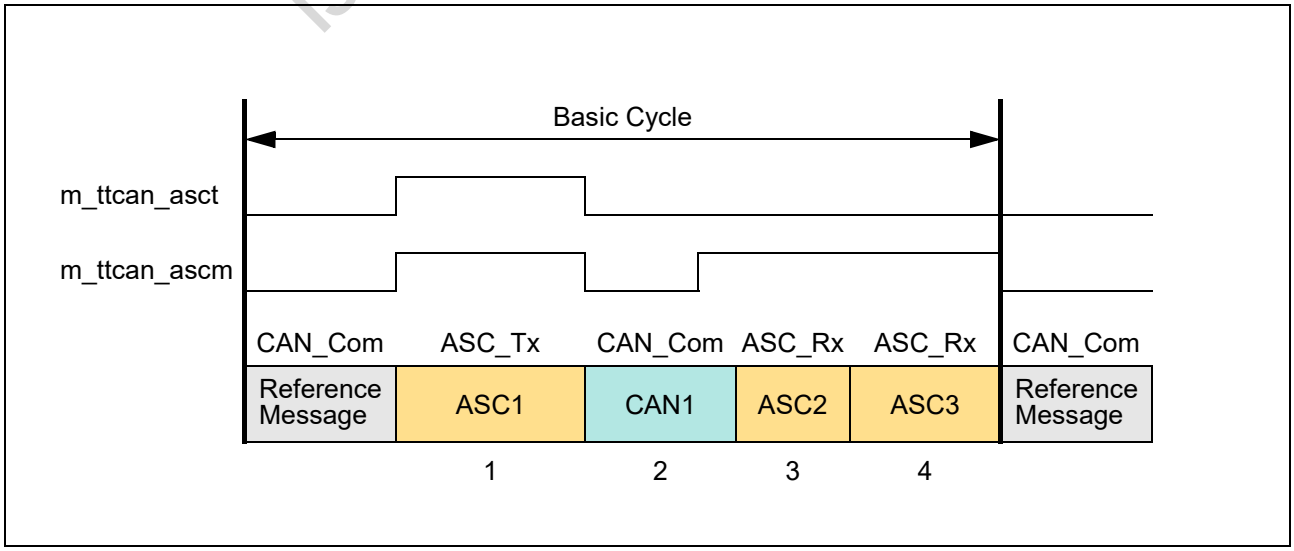

**Figure 19.32 ASC@CAN operation**

There are separate time windows for ASC transmission and reception. For each ASC time window there is one predefined transmitter, all other nodes are configured as receivers.

To start with an ASC window, the Host has to set CCCR.ASM during initialization. The bit is reset at the end of the first ASC window after the M_TTCAN has finished initializing. During time-triggered operation CCCR.ASM is set by the M_TTCAN at the beginning of an ASC window (trigger memory element with T0.ASC = “10”, “11”). It is reset by each trigger memory element with T0.ASC = “00”.

When CCCR.ASM is set, the CAN protocol controller

- sends no error/overload frames
- does not increment ECR.REC and ECR.TEC
- waits for Bus_Idle (11 recessive bits) after it has detected an error or overload condition
- acknowledges valid frames
- may start the transmission of a frame after it has detected Bus_Idle (11 recessive bits)

ASC mode operation is only entered when the M_TTCAN is synchronization state In_Schedule or In_Gap (m_ttcan_ascm = ’0’ and m_ttcan_asct = ’0’ when not synchronized).

### 19.6.4.11 Synchronization to external Time Schedule

This feature can be used to synchronize the phase of the M_TTCAN’s schedule to an external schedule (e.g. that of a second TTCAN network or FlexRay network). It is applicable only when the M_TTCAN is current time master (MTTCAN0TTOST.MS = “11”).

External synchronization is controlled by event trigger input pin m_ttcan_evt (MTTCAN0EVT) . If bit MTTCAN0TTOCN.ESCN is set, a rising edge at pin m_ttcan_evt (MTTCAN0EVT) the M_TTCAN compares its actual cycle time with the target phase value configured by MTTCAN0TTGTP.CTP.

Before setting MTTCAN0TTOCN.ESCN the Host has to adapt the phases of the two time schedules e.g. by using the TTCAN gap control (see **Section 19.6.4.3, TTCAN Gap Control**). When the Host sets MTTCAN0TTOCN.ESCN, MTTCAN0TTOST.SPL is set.

If the difference between the cycle time and the target phase value MTTCAN0TTGTP.CTP at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is greater than 9 NTU, the phase lock bit MTTCAN0TTOST.SPL is reset, and interrupt flag MTTCAN0TTIR.CSM is set. MTTCAN0TTOST.SPL is also reset (and MTTCAN0TTIR.CSM is set), when another node becomes time master.

If both MTTCAN0TTOST.SPL and MTTCAN0TTOCN.ESCN are set, and if the difference between the cycle time and the target phase value MTTCAN0TTGTP.CTP at the rising edge at pin m_ttcan_evt (MTTCAN0EVT) is less or equal 9 NTU, the phase lock bit MTTCAN0TTOST.SPL remains set, and the measured difference is used as reference trigger offset value to adjust the phase at the next transmitted reference message.

**NOTE**

The rising edge detection at pin m_ttcan_evt (MTTCAN0EVT) is enabled with the start of each basic cycle. The first rising edge triggers the compare of the actual cycle time with MTTCAN0TTGTP.CTP. All further edges until the beginning of the next basic cycle are ignored.

ISO CANFD ISO 11898-1:2015

## 19.7 Usage Notes

### 19.7.1 Port sharing between M_CAN IP and RLIN

By port sharing, ASC@CAN functionality can be achieved by sharing the M_TTCAN/M_CAN with the RLIN3.

All MTTCAN channel 0 pins will be shared with RLIN30.

One pair of MCAN channel 0 pins will be shared with RLIN30.

See the **Section 2, Pin Functions** and the **Section 18, LIN/UART Interface (RLIN3)** for details.

## 19.8 CAUTION

| No. | Outline |
|---|---|
| ID1 | M(TT)CAN - Edge filtering causes mis-synchronization when falling edge at Rx input pin coincides with end of integration phase.<br>(Direction of use) |
| ID2 | M(TT)CAN - Retransmission in DAR mode due to lost arbitration at the first two identifier bits.<br>(Direction of use) |

ISO CANFD ISO 11898-1:2015

| | | |
|---|---|---|
| ID1 | | M(TT)CAN - Edge filtering causes mis-synchronization when falling edge at Rx input pin coincides with end of integration phase. |
| | Description | When edge filtering is enabled (M(TT)CANnCCCR.EFBI = '1') and when the end of the integration phase coincides with a falling edge at the Rx input pin it may happen, that the M(TT)CAN synchronizes itself wrongly and does not correctly receive the first bit of the frame. In this case the CRC will detect that the first bit was received incorrectly, it will rate the received FD frame as faulty and an error frame will be send.<br><br>The issue only occurs, when there is a falling edge at the Rx input pin (m(tt)can_rx) within the last time quantum (tq) before the end of the integration phase. The last time quantum of the integration phase is at the sample point of the 11th recessive bit of the integration phase. When the edge filtering is enabled, the bit timing logic of the M(TT)CAN sees the Rx input signal delayed by the edge filtering. When the integration phase ends, the edge filtering is automatically disabled. This affects the reset of the FD CRC registers at the beginning of the frame. The Classical CRC register are not affected, so this issue does not affect the reception of Classical frames.<br><br>In CAN communication, the M(TT)CAN may enter integrating state (either by resetting M(TT)CANnCCCR.INIT or by protocol exception event) while a frame is active on the bus. In this case the 11 recessive bits are counted between the acknowledge bit and the following start of frame. All nodes have synchronized at the beginning of the dominant acknowledge bit. This means that the edge of the following start of frame bit cannot fall on the sample point, so the issue does not occur. The issue occurs only when the M(TT)CAN is, by local errors, mis-synchronized with regard to the other nodes.<br><br>Glitch filtering as specified in ISO 11898-1:2015 is fully functional.<br><br>Edge filtering was introduced for applications where the data bit time is at least two tq (of the nominal bit time) long. In that case, edge filtering requires at least two consecutive dominant time quanta before the counter counting the 11 recessive bits for idle detection is restarted. This means edge filtering covers the theoretical case of occasional 1-tq-long dominant spikes on the CAN bus that would delay idle detection. Repeated dominant spikes on the CAN bus would disturb all CAN communication, so the filtering to speed up<br>idle detection would not help network performance.<br><br>When this rare event occurs, the M(TT)CAN sends an error frame and the sender of the affected frame retransmits the frame. When the retransmitted frame is received, the M(TT)CAN has left integration phase and the frame will be received correctly. Edge filtering is only applied during integration phase, it is never used during normal operation. As integration phase is very short with respect to "active communication time", the impact on total error frame rate is negligible. The issue has no impact on data integrity.<br><br>The M(TT)CAN enters integration phase under the following conditions:<br>• when M(TT)CANnCCCR.INIT is set to '0' after start-up<br>• after a protocol exception event (only when M(TT)CANnCCCR.PXHD = '0')<br><br>Scope:<br>The erratum is limited to FD frame reception when edge filtering is active (M(TT)CANnCCCR.EFBI = '1') and when the end of the integration phase coincides with a falling edgeat the Rx input pin.<br><br>Effect:<br>The calculated CRC value does not match the CRC value of the received FD frame and the M(TT)CAN sends an error frame. After retransmission the frame is received correctly. |
| | Workaround | Disable edge filtering or wait on retransmission in case this rare event happens. |

ISO CAN FD ISO 11898-1:2015

| | | |
|---|---|---|
| ID2 | | M(TT)CAN - Retransmission in DAR mode due to lost arbitration at the first two identifier bits. |
| | Description | When the M(TT)CAN is configured in DAR mode (M(TT)CANnCCCR.DAR = '1') the Automatic Retransmission for transmitted messages that have been disturbed by an error or have lost arbitration is disabled. When the transmission attempt is not successful, the Tx Buffer's transmission request bit (M(TT)CANnTXBRP.TRPxx) shall be cleared and its cancellation finished bit (M(TT)CANnTXBCF.CFxx) shall be set.<br><br>When the transmitted message looses arbitration at one of the first two identifier bits, it may happen, that instead of the bits of the actually transmitted Tx Buffer, the M(TT)CANnTXBRP.TRPxx and M(TT)CANnTXBCF.CFxx bits of the previously started Tx Buffer (or Tx Buffer 0 if there is no previous transmission attempt) are written (M(TT)CANnTXBRP.TRPxx = '0', M(TT)CANnTXBCF.CFxx = '1').<br><br>If in this case the M(TT)CANnTXBRP.TRPxx bit of the Tx Buffer that lost arbitration at the first two identifier bits has not been cleared, retransmission is attempted.<br>When the M(TT)CAN looses arbitration again at the immediately following retransmission, then actually and previously transmitted Tx Buffer are the same and this Tx Buffer's M(TT)CANnTXBRP.TRPxx bit is cleared and its M(TT)CANnTXBCF.CFxx bit is set.<br><br>Scope:<br>The erratum is limited to the case when the M(TT)CAN looses arbitration at one of the first two transmitted identifier bits while in DAR mode.<br>The problem does not occur when the transmitted message has been disturbed by an error.<br><br>Effects:<br>In this case it may happen, that the M(TT)CANnTXBRP.TRPxx bit is cleared after the second transmision attempt instead of the first.<br>Additionally it may happen that the M(TT)CANnTXBRP.TRPxx bit of the previously started Tx Buffer is cleared, if it has been set again. As in this case the previously started Tx Buffer has lost M(TT)CAN internal arbitration against the active Tx Buffer, its message has a lower identifier priority. It would also have lost arbitration on the CAN bus at the same position. |
| | Workaround | None |

ISO CANFD ISO 11898-1:2015

## 19.9 Difference among P1M-C, P1H-C and P1H-CE

There are differences in channels, interrupts, and external pins. For details, please refer to **Table 19.2**, **Table 19.8**, and **Table 19.9**.

ISO CANFD ISO 11898-1:2015

# Section 20 FlexRay (FLX)

The FlexRay IP-module performs communication according to the FlexRay protocol specification v2.1. With maximum specified sample clock the bitrate is 10 MBit/s. Additional bus driver (BD) hardware is required for connection to the physical layer.

This section contains a generic description of the FlexRay.

The first part of this section describes all RH850/P1x-C specific properties, such as the number of channels, register base addresses, internal input/output signals, etc.

The remainder of this section describes the properties common to all versions of the RH850/P1x-C FlexRay.

**NOTE**

If not other mentioned the meaning of POC in **Section 20** is Protocol Operation Control.

## 20.1 Overview of RH850/P1x-C FlexRay

### 20.1.1 Channels

This microcontroller has the following number of FlexRay modules.

**Table 20.1 Number of FlexRay Modules**

| FlexRay | P1M-C, P1H-C (4MB, BGA-156) | P1H-C (4MB, BGA-292) and P1H-CE |
|---|---|---|
| Number of modules | 1 | 2 |
| Name | FLXn (n = 0) | FLXn (n = 0, 1) |

#### Index n

Throughout this section, the individual modules of the FlexRay is identified by the index “n” , for example, FLXAnFROC for the FlexRay control register.

### 20.1.2 Register Base Addresses

All FlexRay register addresses are given as address offsets to the individual base address<FLXn_base>.

The base address <FLXn_base> of each FlexRay is listed in the following table:

**Table 20.2 Register Base Addresses <FLXn_base>**

| FlexRay Channel | <FLXAn_base> Address |
|---|---|
| FLXA0 | $1002\ 0000_H$ |
| FLXA1 | $1002\ 1000_H$ |

### 20.1.3 Clock Supply

FlexRay provide one clock input.

**Table 20.3 Clock Supply**

| Module | Clock Name | Clock Symbol | Description |
|---|---|---|---|
| FLXAn | High Speed Peripheral clock 1 | CLKP_H1 | FlexRay sample clock |
| | Speed Peripheral clock 1 | CLKP_H1 | NTU clock Source |
| | High speed system clock | CLK_HSB | Bus clock |

Note 1. CLK_HSB must be set to min.44.8125MHz
Note 2. CLKP_H1 must be 80MHz

### 20.1.4 Interrupts

FlexRay can generate the following interrupt requests:

**Table 20.4 Interrupt Requests**

| Unit Interrupt Name | Outline | Interrupt Number | DMA Trigger Number | DTS Trigger Number |
|---|---|---|---|---|
| **FlexRay0** | | | | |
| INTFLX0LINE0 | Universal interrupt chA for FLX0 | 186 | — | — |
| INTFLX0LINE1 | Universal interrupt chB for FLX0 | 187 | — | — |
| INTFLX0TIM0 | Timer 0 interrupt for FLX0 | 188 | — | — |
| INTFLX0TIM1 | Timer 1 interrupt for FLX0 | 189 | — | — |
| INTFLX0TIM2 | Timer 2 interrupt for FLX0 | 190 | — | — |
| INTFLX0FDA | FIFO data available (FIFO not empty) interrupt for FLX0 | 191 | — | — |
| INTFLX0FW | FIFO warning interrupt for FLX0 | 192 | — | — |
| INTFLX0OW | Output transfer warning interrupt for FLX0 | 193 | — | — |
| INTFLX0OT | Output transfer done interrupt for FLX0 | 194 | — | — |
| INTFLX0IQF | Input queue full interrupt for FLX0 | 195 | — | — |
| INTFLX0IQE | Input queue empty interrupt for FLX0 | 196 | — | — |
| **FlexRay1** | | | | |
| INTFLX1LINE0 | Universal interrupt chA for FLX1 | 197 | — | — |
| INTFLX1LINE1 | Universal interrupt chB for FLX1 | 198 | — | — |
| INTFLX1TIM0 | Timer 0 interrupt for FLX1 | 199 | — | — |
| INTFLX1TIM1 | Timer 1 interrupt for FLX1 | 200 | — | — |
| INTFLX1TIM2 | Timer 2 interrupt for FLX1 | 201 | — | — |
| INTFLX1FDA | FIFO data available (FIFO not empty) interrupt for FLX1 | 202 | — | — |
| INTFLX1FW | FIFO warning interrupt for FLX1 | 203 | — | — |
| INTFLX1OW | Output transfer warning interrupt for FLX1 | 204 | — | — |
| INTFLX1OT | Output transfer done interrupt for FLX1 | 205 | — | — |
| INTFLX1IQF | Input queue full interrupt for FLX1 | 206 | — | — |
| INTFLX1IQE | Input queue empty interrupt for FLX1 | 207 | — | — |
| **NTU** | | | | |
| INTFLXNTU | NTU loss interrupt | 40 | — | — |

### 20.1.5 FlexRay Hardware Reset

FlexRay and registers of FlexRay are initialized by the following reset condition:

**Table 20.5 Reset Condition**

| Reset Name | Reset condition | | | | |
|---|---|---|---|---|---|
| | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 | Limited Reset |
| All Registers | √ | √ | √ | √ | √ |

### 20.1.6 I/O Signals

The I/O signals of the FlexRay are listed in the following table.

**Table 20.6 FlexRay I/O Signals**

| Pin name | I/O | Function |
|---|---|---|
| FLXnRXDA | Input | Flex Ray n channel A receive data input |
| FLXnTXDA | Output | Flex Ray n channel A transmit data output |
| FLXnTXENA | Output | Flex Ray n channel A transmit data enable |
| FLXnRXDB | Input | Flex Ray n channel B receive data input |
| FLXnTXDB | Output | Flex Ray n channel B transmit data output |
| FLXnTXENB | Output | Flex Ray n channel B transmit data enable |
| FLXnSTPWT | Input | Flexray n stop watch trigger input |
| FLXNTUOUT | Output | NTU clock output |
| BHPDGRCLK1 | Output | Degraded clock |

### 20.1.7 Functions

For communication on a FlexRay network, individual message buffers with up to 254 data bytes are configurable. The message storage is a Message RAM that is configurable to hold up to 128 message buffers. All functions concerning the handling of messages are implemented in the Message Handler. Those functions are the acceptance filtering, the transfer of messages between the two FlexRay Channel Protocol Controllers and the Message RAM, maintaining the transmission schedule as well as providing message status information.

The register set of the FlexRay IP-module can be accessed directly by an external Host via the module's Host interface. These registers are used to control/configure/monitor the FlexRay Channel Protocol Controllers, Message Handler, Global Time Unit, System Universal Control, Frame and Symbol Processing, Network Management, Interrupt Control, to access the Message RAM via Input / Output Buffer; and to control the data transfer between the Message RAM and the Local RAM/Global RAM.

The FlexRay IP-module supports the following features:

| Item | Specification |
|---|---|
| Communication | Conformance with FlexRay protocol specification v2.1 |
| Data transfer rate | Up to 10 Mbit/s on each channel |
| Data link layer clock frequency | 80 MHz |
| FlexRay channels | 2 (channels A and B) |
| Message buffer | Up to 128 message buffers configurable |
| | Configuration of message buffers with different payload lengths possible |
| | Each message buffer can be configured as receive buffer, as transmit buffer or as part of the receive FIFO |
| | Filtering for slot counter, cycle counter, and channel |
| Message RAM | 8 Kbyte of Message RAM for storage of e.g. |
| | 128 message buffers with max. 48 byte data section |
| | Up to 30 message buffers with 254 byte data section |
| FIFO | One configurable receive FIFO |
| Message buffer access | By Host CPU via Input and Output Buffer<br>Input Buffer: Holds message to be transferred to the Message RAM<br>Output Buffer: Holds message read from the Message RAM |
| | By data transfer function<br>Input transfer: Message buffer content is transferred from Local RAM/Global RAM to Message RAM on CPU request<br>Output transfer: Message buffer content is transferred from Message RAM to Local RAM/Global RAM automatically |
| Network management | Automatic hardware support |
| Interrupts | Maskable module interrupts |
| Timer | 2 absolute timer<br>1 relative timer |
| NTU generation | Generation of FlexRay macrotick<br>Generation of FlexRay cycle |

## 20.1.8 Block Diagram

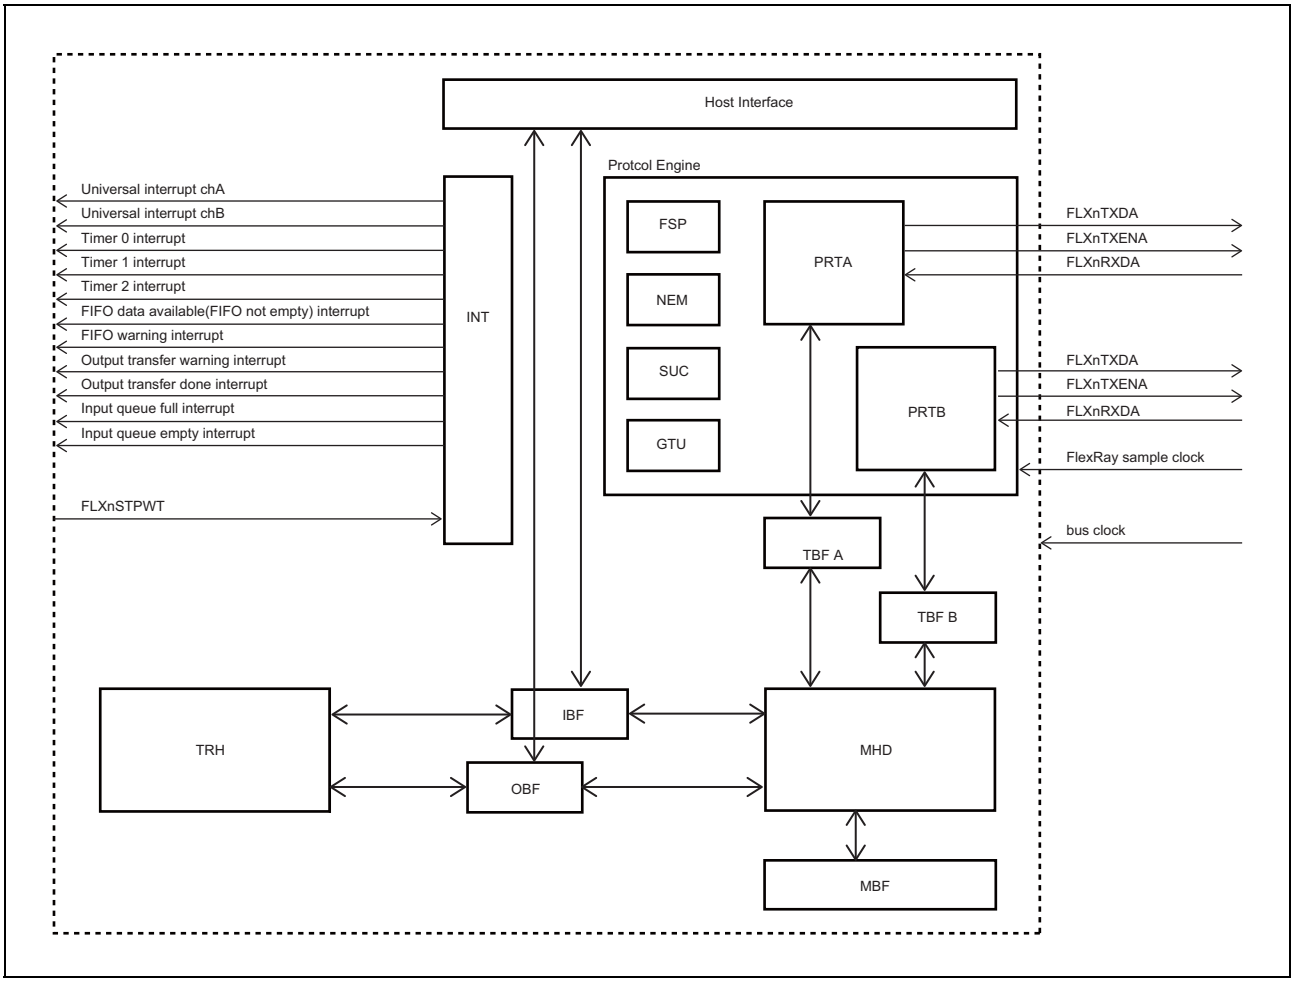

**Figure 20.1 FlexRay IP Block Diagram**

### Input Buffer (IBF)

For write access to the message buffers configured in the Message RAM, the Host can write the header and data section for a specific message buffer to the Input Buffer. The Message Handler then transfers the data from the Input Buffer to the selected message buffer in the Message RAM.

### Output Buffer (OBF)

For read access to a message buffer configured in the Message RAM the Message Handler transfers the selected message buffer to the Output Buffer. After the transfer has completed, the Host can read the header and data section of the transferred message buffer from the Output Buffer.

### Message Handler (MHD)

The FlexRay Message Handler controls data transfers between the following components:

- Input / Output Buffer and Message RAM
- Temporary buffer RAMs of the two FlexRay Protocol Controllers and Message RAM

### Message RAM (MRAM)

The Message RAM consists of a single-ported RAM that store up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

### Temporary buffer RAM (TBF A/B)

Stores the data section of two complete messages.

### FlexRay Channel Protocol Controller (PRT A/B)

The FlexRay Channel Protocol Controllers consist of shift register and FlexRay protocol FSM. They are connected to the Temporary buffer RAMs for intermediate message storage and to the physical layer via bus driver BD.

They perform the following functionality:

- Control and check of bit timing
- Reception / transmission of FlexRay frames and symbols
- Check of header CRC
- Generation / check of frame CRC
- Interfacing to bus driver

### Global Time Unit (GTU)

The Global Time Unit performs the following functions:

- Generation of microtick (µT)
- Generation of macrotick (MT)
- Fault tolerant clock synchronization by FTM algorithm
  - rate correction
  - offset correction
- Cycle counter
- Timing control of static segment
- Timing control of dynamic segment (minislotting)
- Support of external clock correction

### System Universal Control (SUC)

The System Universal Control controls the following functions:

- Configuration
- Wakeup
- Startup
- Normal Operation
- Passive Operation

### Frame and Symbol Processing (FSP)

The Frame and Symbol Processing controls the following functions:

- Checks the correct timing of frames and symbols
- Tests the syntactical and semantical correctness of received frames
- Sets the slot status flags

### Network Management (NEM)

Handles the network management vector.

### Interrupt Control (INT)

The Interrupt Controller performs the following functions:

- Provides error and status interrupt flags
- Enable / disable interrupt sources
- Assignment of interrupt sources to one of the two general module interrupt lines
- Enable / disable module interrupt lines

### Timer (TIM)

The Timer module includes the following macrotick timer:

- two absolute timers
- one relative timer
- one stop watch timer

### Transfer Handler (TRH)

Handles the data transfer between Local RAM/Global RAM and FlexRay module.

The Transfer Handler supports the following transfer types:

- Transfer of buffer configuration data from the Local RAM/Global RAM to the Message RAM
- Transfer of payload data for temporary buffers from the Local RAM/Global RAM to the Message RAM
- Transfer of buffer configuration data and payload data for temporary buffer from the Local RAM/Global RAM to the Message RAM
- Automatic transfer of payload data from receive buffer to the Local RAM/Global RAM upon frame reception
- Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the Local RAM/Global RAM upon frame reception
- Automatic transfer of buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Global RAM in response to slot status update
- Manual transfer of payload data, buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Global RAM

# 20.2 Register

## 20.2.1 Register Map

The FlexRay module allocates an address space as shown in **Table 20.7, FlexRay Register Map**.

Within this specification the “Values after reset” refers to the microcontroller’s HW reset. For registers in the address range $0010_H$ to $0FFF_H$ the “Value after reset” are also applicable when the SW reset (using FLXAnFROC.OE) is applied.

The addresses in this specification are listed as offsets from a base address. The base address <FLXn_base> must thus be added to the addresses.

For <FLXn_base>, see **Section 20.1.2, Register Base Addresses**.

**Table 20.7 FlexRay Register Map (1/5)**

| Register Name | Symbol | Value after Reset | Address | Access Size | Access Protection | |
|---|---|---|---|---|---|---|
| | | | | | HBG/PBG | Other |

## 20.2.2 FlexRay Operation register

### 20.2.2.1 FLXAnFROC — FlexRay Operation Control Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0004_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | T2IE | T1IE | T0IE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | OEP | — | — | — | — | — | BEC | OE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R/W | R/W |

**Table 20.8 FLXAnFROC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 19 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 18 | T2IE | Timer 2 interrupt enable Bit<br>0: Disabled<br>1: Enabled |
| 17 | T1IE | Timer 1 interrupt enable Bit<br>0: Disabled<br>1: Enabled |
| 16 | T0IE | Timer 0 interrupt enable Bit<br>0: Disabled<br>1: Enabled |
| 15 to 8 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 7 | OEP | Operation Enable bit Protection Bit<br>0: OE is unprotected<br>1: OE is protected |
| 6 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | BEC | Byte Endian Control Bit<br>0: Little endian<br>1: Big endian |
| 0 | OE | Operation Enable Bit<br>0: Operation disabled, SW reset<br>1: Operation Enabled |

**(1) FLXAnFROC.T2IE**

Timer 2 interrupt enable Bit

This bit controls the timer 2 interrupt.

0: Disabled

No interrupt will be requested and the timer 2 interrupt line will be released if pending.

1: Enabled

Timer 2 interrupt will be asserted when FLXAnFROTS.T2IS is 1.

**(2) FLXAnFROC.T1IE**

Timer 1 interrupt enable Bit

The user should only set this bit to 1 when timer 1 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.TI1E should be 0).

This bit controls the timer 1 interrupt.

0: Disabled

No interrupt will be requested and the timer 1 interrupt line will be released if pending.

1: Enabled

Timer 1 interrupt will be asserted when FLXAnFROTS.T1IS is 1.

**(3) FLXAnFROC.T0IE**

Timer 0 interrupt enable Bit

The user should only set this bit to 1 when timer 0 interrupt is not enabled in the FlexRay Status interrupt enable register (FLXAnFRSIES.TI0E should be 0).

This bit controls the timer 0 interrupt.

0: Disabled

No interrupt will be requested and the timer 0 interrupt line will be released if pending.

1: Enabled

Timer 0 interrupt will be asserted when FLXAnFROTS.T0IS is 1.

**(4) FLXAnFROC.OEP**

Operation Enable bit Protection Bit

This bit protects against unintended write access to the OE bit.

0: OE is unprotected

Write access to the OE bit is enabled

1: OE is protected

Write access to the OE bit is disabled

### (5) FLXAnFROC.BEC

Byte Endian Control Bit

The user should only change this bit when FLXAnFROS.OS is 1.

This bit controls the byte order on reading and writing the FlexRay Network Management Vector register (FLXAnFRNMVn), FlexRay Write Data Section (FLXAnFRWRDSn) and FlexRay Read Data Section (FLXAnFRRDDSn). This bit also controls the byte order when reading or writing FlexRay payload data using the data transfer function.

For details about the byte alignment see **Section 20.3.17, Byte Alignment**.

0: Little endian

Byte alignment in FLXAnFRNMVn, FLXAnFRWRDSn and FLXAnFRRDDSn is in little endian style.

1: Big endian

Byte alignment in FLXAnFRNMVn, FLXAnFRWRDSn and FLXAnFRRDDSn is in big endian style.

### (6) FLXAnFROC.OE

Operation Enable Bit

The user can only write to this bit when FLXAnFROC.OEP is 0.

The user should only write this bit with 0 when FLXAnFROS.OS is 1.

The user should only write this bit with 1 when FLXAnFROS.OS is 0 and the FlexRay sample clock is enabled.

This bit controls the operation state and serves the software reset of the FlexRay module. The operation status bit (FLXAnFROS.OS) indicates whether the FlexRay module is in reset state or not.

0: Operation disabled, SW reset

Forcibly moves the FlexRay module to its reset state, whatever the state of the FlexRay module is.

1: Operation Enabled

Reset state of the FlexRay module is released.

### 20.2.2.2 FLXAnFROS — FlexRay Operation Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $000C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.9 FLXAnFROS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 19 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 18 | T2IS | Timer 2 Interrupt Status Bit<br>0: Timer 2 has not matched the conditions configured in the FLXAnFRT2C register<br>1: Timer 2 matched the conditions configured in the FLXAnFRT2C register |
| 17 | T1IS | Timer 1 Interrupt Status Bit<br>0: Timer 1 has not matched the conditions configured in the FLXAnFRT1C register<br>1: Timer 1 matched the conditions configured in the FLXAnFRT1C register |
| 16 | T0IS | Timer 0 Interrupt Status Bit<br>0: Timer 0 has not matched the conditions configured in the FLXAnFRT0C register<br>1: Timer 0 matched the conditions configured in the FLXAnFRT0C register |
| 15 to 1 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 0 | OS | Operation Status Bit<br>0: Operation disabled, reset state<br>1: Operation enabled |

**(1) FLXAnFROS.T2IS**

Timer 2 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit represents that the expiration criteria configured in FLXAnFRT2C register has matched the FlexRay local time.

If enabled in FLXAnFROC.T2IE the timer 2 interrupt is generated when FLXAnFROS.T2IS is 1.

[Clearing condition]

This bit is cleared by writing 1 to FLXAnFROS.T2IS.
This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]

This bit is set when the expiration criteria configured in FLXAnFRT2C matches the FlexRay local time.

**(2) FLXAnFROS.T1IS**

Timer 1 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit represents that the expiration criteria configured in FLXAnFRT1C register has matched the FlexRay local time.

If enabled in FLXAnFROC.T1IE the timer 1 interrupt is generated when FLXAnFROS.T1IS is 1.

[Clearing condition]

This bit is cleared by writing 1 to FLXAnFROS.T1IS.
This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]

This bit is set when the expiration criteria configured in FLXAnFRT1C matches the FlexRay local time.

**(3) FLXAnFROS.T0IS**

Timer 0 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit represents that the expiration criteria configured in FLXAnFRT0C register has matched the FlexRay local time.

If enabled in FLXAnFROC.T0IE the timer 0 interrupt is generated when FLXAnFROS.T0IS is 1.

[Clearing condition]

This bit is cleared by writing 1 to FLXAnFROS.T0IS.
This bit is cleared when FLXAnFROS.OS changes from 1 to 0.

[Setting condition]

This bit is set when the expiration criteria configured in FLXAnFRT0C matches the FlexRay local time.

### (4) FLXAnFROS.OS

Operation Status Bit

This bit represents if the FlexRay module is in the reset or the operation state.

When FLXAnFROS.OS is 0 the FlexRay module gets initialized and registers mapped to the address area <FLXn_base> + $0010_H$ to <FLXn_base> + $0FFF_H$ cannot be accessed; read access from these registers will return undefined data.

When FLXAnFROS.OS is 1 it is possible to access to the address area <FLXn_base> + $0010_H$ to <FLXn_base> + $0FFF_H$ and to perform FlexRay communication.

When FLXAnFROS.OS changes from 0 to 1 all registers in the address range <FLXn_base> + $0010_H$ to <FLXn_base> + $0FFF_H$ are set to the “Values after reset”.

[Clearing condition]

When FLXAnFROC.OE is set to 0. It takes up to two peripheral bus clock cycles until FLXAnFROS.OS is set to 0.

[Setting condition]

When FLXAnFROC.OE is set to 1 it takes up to four peripheral clock cycles of the clock with the lower frequency out of the FlexRay sample clock and peripheral bus clock until FLXAnFROS.OS is set to 1.

## 20.2.3 Special Registers

### 20.2.3.1 FLXAnFRLCK — FlexRay Lock Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXAn_base> + $001C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLK[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.10 FLXAnFRLCK Register Contents**

| Bit | Symbol | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 7 to 0 | CLK[7:0] | Configuration Lock Key Bit |

#### (1) FLXAnFRLCK.CLK

Configuration Lock Key Bit

The Lock Register is write-only. Reading the register will return $0000\ 0000_H$.

To leave CONFIG state by writing FLXAnFRSUCC1.CMD (command READY), the write operation has to be directly preceded by two write accesses to the Configuration Lock Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the Configuration Lock Key and the write access to the FLXAnFRSUCC1 register, the CC remains in CONFIG state and the sequence has to be repeated.

First write: FLXAnFRLCK.CLK = "$1100\ 1110_B$" (0xCE)

Second write: FLXAnFRLCK.CLK = "$0011\ 0001_B$" (0x31)

Third write: FLXAnFRSUCC1.CMD

**CAUTION**

In case that the Host uses 8/16-bit accesses to write the listed bit fields, the programmer has to ensure that no "dummy accesses" e.g. to the remaining register bytes / words are inserted by the compiler.

## 20.2.4 Interrupt Registers

### 20.2.4.1 FLXAnFREIR — FlexRay Error Interrupt Register

The flags are set when the CC detects one of the listed error conditions. The flags remain set until the Host clears them.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0020_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 16 | EDA | Error Detected on Channel A Flag<br>0: No error detected on channel A<br>1: Error detected on channel A |
| 15 to 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 | MHF | Message Handler Constraints Flag<br>0: No Message Handler failure detected<br>1: Message Handler failure detected |
| 10 | IOBA | Illegal Output buffer Access Flag<br>0: No illegal Host access to Output Buffer occurred<br>1: Illegal Host access to Output Buffer occurred |

Table 20.11 FLXAnFREIR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 9 | IIBA | Illegal Input Buffer Access Flag<br>0: No illegal Host access to Input Buffer occurred<br>1: Illegal Host access to Input Buffer occurred |
| 8 | EFA | Empty FIFO Access Flag<br>0: No Host access to empty FIFO occurred<br>1: Host access to empty FIFO occurred |
| 7 | RFO | Receive FIFO Overrun Flag<br>0: No receive FIFO overrun detected<br>1: A receive FIFO overrun has been detected |
| 6 | AERR | Access error flag Flag<br>0: Access error is not detected.<br>1: Access error is detected. |
| 5 | CCL | CHI Command Locked Flag<br>0: CHI command accepted<br>1: CHI command not accepted |
| 4 | CCF | Clock Correction Failure Flag<br>0: No clock correction error<br>1: Clock correction failed |
| 3 | SFO | Sync Frame Overflow Flag<br>0: Number of received sync frames ≤ FLXAnFRGTUC2.SNM<br>1: More sync frames received than configured by FLXAnFRGTUC2.SNM |
| 2 | SFBM | Sync Frames Below Minimum Flag<br>0: Sync node: 1 or more sync frames received, non-sync node: 2 or more sync frames received<br>1: Less than the required minimum of sync frames received |
| 1 | CNA | Command Not Accepted Flag<br>0: CHI command accepted<br>1: CHI command not accepted |
| 0 | PEMC | POC Error Mode Changed Flag<br>0: Error mode has not changed<br>1: Error mode has changed |

### (1) FLXAnFREIR.TABB

Transmission Across Boundary Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals to the Host that a transmission across a slot boundary occurred for channel B.

### (2) FLXAnFREIR.LTVB

Latest Transmit Violation Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals a latest transmit violation on channel B to the Host.

**(3) FLXAnFREIR.EDB**

Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This bit is set whenever one of the flags FLXAnFRACS.SEDB, FLXAnFRACS.CEDB, FLXAnFRACS.CIB, FLXAnFRACS.SBVB changes from 0 to 1.

**(4) FLXAnFREIR.TABA**

Transmission Across Boundary Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals to the Host that a transmission across a slot boundary occurred for channel A.

**(5) FLXAnFREIR.LTVA**

Latest Transmit Violation Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals a latest transmit violation on channel A to the Host.

**(6) FLXAnFREIR.EDA**

Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This bit is set whenever one of the flags FLXAnFRACS.SEDA, FLXAnFRACS.CEDA, FLXAnFRACS.CIA, FLXAnFRACS.SBVA changes from 0 to 1.

**(7) FLXAnFREIR.MHF**

Message Handler Constraints Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals a Message Handler constraints violation condition. It is set whenever one of the flags FLXAnFRMHDF.SNUA, FLXAnFRMHDF.SNUB, FLXAnFRMHDF.FNFA, FLXAnFRMHDF.FNFB, FLXAnFRMHDF.TBFA, FLXAnFRMHDF.TBFB, FLXAnFRMHDF.WAHP changes from 0 to 1.

**(8) FLXAnFREIR.IOBA**

Illegal Output buffer Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Host requests the transfer of a message buffer from the Message RAM to the Output Buffer while FLXAnFROBCR.OBSYS is set to 1.

**(9) FLXAnFREIR.IIBA**

Illegal Input Buffer Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Host wants to modify a message buffer via Input Buffer and one of the following conditions applies:

1. The CC is not in CONFIG or DEFAULT_CONFIG state and the Host writes to the Input Buffer Command Request register to modify the
   - Header section of message buffer 0, 1 if configured for transmission in key slot
   - Header section of static message buffers with buffer number < FLXAnFRMRC.FDB while FLXAnFRMRC.SEC = “01”
   - Header section of any static or dynamic message buffer while FLXAnFRMRC.SEC = “1x”
   - Header and / or data section of any message buffer belonging to the receive FIFO
2. The Host writes to any register of the Input Buffer while FLXAnFRIBCR.IBSYH is set to 1.

**(10) FLXAnFREIR.EFA**

Empty FIFO Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Host requests the transfer of a message from the receive FIFO via Output Buffer while the receive FIFO is empty.

**(11) FLXAnFREIR.RFO**

Receive FIFO Overrun Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag is set by the CC when a receive FIFO overrun is detected. When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. The actual state of the FIFO is monitored in register FLXAnFRFSR.

**(12) FLXAnFREIR.AERR**

Access error flag Flag

Writing 0 in this bit has no effect.

This bit is cleared when writing 1 to it.

Notifies of an access error.

When the AMR, ATBF1, or ATBF2 bit in the FLXAnFRMHDS register changes from 0 to 1, this bit is set to 1.

**(13) FLXAnFREIR.CCL**

CHI Command Locked Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the execution of the previous CHI command has not yet completed. In this case bit FLXAnFREIR.CNA is also set to 1.

**(14) FLXAnFREIR.CCF**

Clock Correction Failure Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set at the end of the communication cycle whenever one of the following errors occurred:

- Missing offset and / or rate correction
- Clock correction limit reached

The clock correction status is monitored in registers FLXAnFRCCEV and FLXAnFRSFS. A failure may occur during startup, therefore bit FLXAnFREIR.CCF should be set to 0 after the CC entered NORMAL_ACTIVE state.

**(15) FLXAnFREIR.SFO**

Sync Frame Overflow Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

It is set to 1 when either the number of sync frames received during the last communication cycle or the total number of different sync frame IDs received during the last double cycle exceeds the maximum number of sync frames as defined by FLXAnFRGTUC2.SNM.

**(16) FLXAnFREIR.SFBM**

Sync Frames Below Minimum Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 at the end of a cycle if the number of sync frames received during the last communication cycle was below the limit required for rate or offset correction term calculation (i.e. missing offset and / or missing rate correction). The clock correction status is monitored in FLXAnFRCCEV and FLXAnFRSFS.

This flag may be set to 1 during startup. Therefore this flag should be set to 0 by the Host after the CC entered NORMAL_ACTIVE state.

**(17) FLXAnFREIR.CNA**

Command Not Accepted Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals that the write access to the CHI command vector FLXAnFRSUCC1.CMD was not successful because the requested command was not valid in the actual POC state, or because the CHI command was locked (FLXAnFREIR.CCL = 1).

**(18) FLXAnFREIR.PEMC**

POC Error Mode Changed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 whenever the error mode signaled by FLXAnFRCCEV.ERRM has changed.

### 20.2.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register

The flags are set when the CC detects one of the listed events. The flags remain set until the Host clears them.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0024_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | WST | Wakeup Status Flag<br>0: Wakeup status unchanged<br>1: Wakeup status changed |

### (1) FLXAnFRSIR.MTSB

MTS Received on Channel B Flag (vSS!ValidMTSB)

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Media Access Test symbol received on channel B during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

### (2) FLXAnFRSIR.WUPB

Wakeup Pattern Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 when a wakeup pattern was received on channel B in either of the following states:

- WAKEUP
- READY
- STARTUP state

**(3) FLXAnFRSIR.MTSA**

MTS Received on Channel A Flag (vSS!ValidMTSA)

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Media Access Test symbol received on channel A during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

**(4) FLXAnFRSIR.WUPA**

Wakeup Pattern Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 when a wakeup pattern was received on channel A in either of the following states:

- WAKEUP
- READY
- STARTUP state

**(5) FLXAnFRSIR.SDS**

Start of Dynamic Segment Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the dynamic segment starts.

**(6) FLXAnFRSIR.MBSI**

Message Buffer Status Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the message buffer status FLXAnFRMBS has changed and if bit MBI of that message buffer is 1 (see **Table 20.120**).

**(7) FLXAnFRSIR.SUCS**

Startup Completed Successfully Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever a startup completed successfully and the CC entered NORMAL_ACTIVE state.

**(8) FLXAnFRSIR.SWE**

Stop Watch Event Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set after a stop watch activation when the actual cycle counter and macrotick value are stored in the Stop Watch register (see FLXAnFRSTPW1 — FlexRay Stop Watch Register 1 in **Section 20.2.5.4, FLXAnFRSTPW1 — FlexRay Stop Watch Register 1**).

**(9) FLXAnFRSIR.TOBC**

Transfer Output Buffer Completed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever a transfer from the Message RAM to the Output Buffer has completed and FLXAnFROBCR.OBSYS has been reset by the Message Handler.

**(10) FLXAnFRSIR.TIBC**

Transfer Input Buffer Completed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever a transfer from Input Buffer to the Message RAM has completed and FLXAnFRIBCR.IBSYS has been reset by the Message Handler.

**(11) FLXAnFRSIR.TI1**

Timer 1 Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever timer 1 matches the conditions configured in register FLXAnFRT1C.

FlexRay timer 1 interrupt is generated when the T1IE bit in the FLXAnFROC register is effective.

**(12) FLXAnFRSIR.TI0**

Timer 0 Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever timer 0 matches the conditions configured in register FLXAnFRT0C.

FlexRay timer 0 interrupt is generated when the T0IE bit in the FLXAnFROC register is effective.

**(13) FLXAnFRSIR.NMVC**

Network Management Vector Changed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This is set when a change in the Network Management Vector occurs.

**(14) FLXAnFRSIR.RFCL**

Receive FIFO Critical Level Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRFCL.CL.

**(15) FLXAnFRSIR.RFNE**

Receive FIFO Not Empty Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when a received valid frame was stored into the empty receive FIFO. The actual state of the receive FIFO is monitored in register FLXAnFRFSR.

**(16) FLXAnFRSIR.RXI**

Receive Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC whenever the set condition of a message buffers ND flag is fulfilled (see **Section 20.2.9.6, FLXAnFRNDATi — FlexRay New Data Register i (i = 1 to 4)**), and if bit MBI of that message buffer is set to 1 (see **Table 20.120**)

**(17) FLXAnFRSIR.TXI**

Transmit Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC at the end of frame transmission if bit MBI in the respective message buffer is set to 1 (see **Table 20.120**).

**(18) FLXAnFRSIR.CYCS**

Cycle Start Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when a communication cycle starts.

**(19) FLXAnFRSIR.CAS**

Collision Avoidance Symbol Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC during STARTUP state when a CAS or a potential CAS was received.

**(20) FLXAnFRSIR.WST**

Wakeup Status Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set when FLXAnFRCCSV.WSV changes to a value other than UNDEFINED.

### 20.2.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register

The FlexRay Error Interrupt Line Select register assigns an interrupt generated by a specific error interrupt flag from register FLXAnFREIR to one of the two modules interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0028_H$

**Value after reset:** $0000\ 0000_H$

### 20.2.4.4 FLXAnFRSILS — FlexRay Status Interrupt Line Select Register

The FlexRay Status Interrupt Line Select register assigns an interrupt generated by a specific status interrupt flag from register FLXAnFRSIR to one of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $002C_H$

**Value after reset:** $0303\ FFFF_H$

### 20.2.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register

The settings in the FlexRay Error Interrupt Enable Set (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 sets the interrupt enable bit.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0030_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 20.2.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register

The settings in the FlexRay Error Interrupt Enable Set (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 clears the interrupt enable bit.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0034_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 20.2.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register

The settings in the FlexRay Status Interrupt Enable Set (FLXAnFRSIES) and FlexRay Status Interrupt Enable Reset (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 sets the interrupt enable bit.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0038_H$

**Value after reset:** $0000\ 0000_H$

### 20.2.4.8 FLXAnFRSIER — FlexRay Status Interrupt Enable Reset Register

The settings in the FlexRay Status Interrupt Enable Set (FLXAnFRSIES) and FlexRay Status Interrupt Enable Reset (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 clears the interrupt enable bit.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $003C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 20.2.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register

Each of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt) can be enabled / disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0040_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 20.2.5 FlexRay Timer Registers

### 20.2.5.1 FLXAnFRT0C — FlexRay Timer 0 Configuration Register

This register is an absolute timer. It specifies the point in time when a FlexRay timer 0 interrupt occurs as the values of cycle count and macrotick (MT). When the FlexRay timer 0 passes, FLXAnFRSIR.TI0 and FLXAnFROS.T0IS are set to 1. A timer 0 interrupt then occurs while the FLXAnFROC.T0IE bit is effective.

**CAUTION**

The configuration of timer 0 is compared against the macrotick counter value, there is no separate counter for timer 0.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0044_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.20 FLXAnFRT0C Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 16 | T0MO[13:0] | Timer 0 Macrotick Offset Bit<br>Timer 0 Macrotick Offset |
| 15 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 14 to 8 | T0CC[6:0] | Timer 0 Cycle Code Bit<br>Timer 0 Cycle Code |
| 7 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | T0MS | Timer 0 Mode Select Bit<br>0: Single-shot mode<br>1: Continuous mode |
| 0 | T0RC | Timer 0 Run Control Bit<br>0: Timer 0 halted<br>1: Timer 0 running |

**(1) FLXAnFRT0C.T0MO**

Timer 0 Macrotick Offset Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT0C.T0RC to 0.

Configures the macrotick offset from the beginning of the communication cycle where the interrupt is to occur. The FlexRay timer 0 interrupt occurs at this offset for each cycle of the cycle set.

**(2) FLXAnFRT0C.T0CC**

Timer 0 Cycle Code Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT0C.T0RC to 0.

The 7-bit timer 0 cycle code determines the cycle set used for generation of the FlexRay timer 0 interrupt. For details about the configuration of the cycle code see **Section 20.3.8.2, Cycle Counter Filtering**.

**(3) FLXAnFRT0C.T0MS**

Timer 0 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT0C.T0RC to 0.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

**(4) FLXAnFRT0C.T0RC**

Timer 0 Run Control Bit

Timer 0 can be activated (set FLXAnFRT0C.T0RC to 1) when the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.

Timer 0 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

### 20.2.5.2 FLXAnFRT1C — FlexRay Timer 1 Configuration Register

This register is a relative timer. After the specified number of macroticks (MT) has expired, a FlexRay timer 1 interrupt is asserted. When the FlexRay timer 1 passes, FLXAnFRSIR.TI1 and FLXAnFROS.T1IS are set to 1. A timer 1 interrupt then occurs while the FLXAnFROC.T1IE bit is effective.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0048_H$

**Value after reset:** $0002\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | T1MC[13:0] | | | | | | | | | | | | | |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | T1MS | T1RC |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W |

**Table 20.21 FLXAnFRT1C Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 16 | T1MC[13:0] | Timer 1 Macrotick Count Bit |
| 15 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | T1MS | Timer 1 Mode Select Bit<br>0: Single-shot mode<br>1: Continuous mode |
| 0 | T1RC | Timer 1 Run Control Bit<br>0: Timer 1 halted<br>1: Timer 1 running |

**(1) FLXAnFRT1C.T1MC**

Timer 1 Macrotick Count Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT1C.T1RC to 0.

Valid values are 2 to 16383 MT in continuous mode

Valid values are 1 to 16383 MT in single-shot mode

When the configured macrotick count is reached the FlexRay timer 1 interrupt is generated.

**(2) FLXAnFRT1C.T1MS**

Timer 1 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT1C.T1RC to 0.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

**(3) FLXAnFRT1C.T1RC**

Timer 1 Run Control Bit

Timer 1 can be activated (set FLXAnFRT1C.T1RC to 1) as long as the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.

Timer 1 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

### 20.2.5.3 FLXAnFRT2C — FlexRay Timer 2 Configuration Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0844_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.22 FLXAnFRT2C Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 16 | T2MO[13:0] | Timer 2 Macrotick Offset Bit<br>Timer 2 Macrotick Offset |
| 15 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 14 to 8 | T2CC[6:0] | Timer 2 Cycle Code Bit<br>Timer 2 Cycle Code |
| 7 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | T2MS | Timer 2 Mode Select Bit<br>0: Single-shot mode<br>1: Continuous mode |
| 0 | T2RC | Timer 2 Run Control Bit<br>0: Timer halted<br>1: Timer running |

**(1) FLXAnFRT2C.T2MO**

Timer 2 Macrotick Offset Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.

Allowed range is 0 to FLXAnFRGTUC2.MPC.

These bits represent the timer macrotick value defining the timer expiration condition.

**(2) FLXAnFRT2C.T2CC**

Timer 2 Cycle Code Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.

These bits represent the cycle counter filter code defining the timer expiration condition. See **Section 20.3.8.2, Cycle Counter Filtering** for cycle filtering.

**(3) FLXAnFRT2C.T2MS**

Timer 2 Mode Select Bit

The user can only write to these bits when FLXAnFRT2C.T2RC is 0.

This bit represents the operation mode of the Timer 2.

0: Single-shot mode

The timer is operating in the non-repetitive (single shot) mode. Once the configured expiration criteria are matching the timer will be automatically halted.

1: Continuous mode

The timer is operating in the repetitive (continuous) mode. The timer will expire every time the configured expiration criteria are matching. The timer is not halted.

**(4) FLXAnFRT2C.T2RC**

Timer 2 Run Control Bit

The user can only set this bit to 1 when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

This bit represents the activation state of the Timer 2.

When the expiration criteria are matching for a single shot timer, then this bit is cleared automatically and the Timer 2 is halted.

[Setting condition]

This bit is set by writing 1 to it when the POC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

[Clearing condition]

This bit is cleared when the POC state leaves the NORMAL_ACTIVE or NORMAL_PASSIVE state except for transitions between the two states.
This bit is cleared when the timer is operating in the non-repetitive (single shot) mode (FLXAnFRT2C.T2MS is 0) and the expiration criteria are matching.
This bit is cleared by writing 0 to it.

### 20.2.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1

The stop watch is activated by the following trigger events.

- FlexRay 0 interrupt or FlexRay 1 interrupt
- Writing bit FLXAnFRSTPW1.SSWT to 1

With the macrotick counter increment following next to the stop watch activation the actual cycle counter and macrotick values are captured in register FLXAnFRSTPW1 while the slot counter values for channel A and B are captured in register FLXAnFRSTPW2.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $004C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 16 | SMTV[13:0] | Stop Watch Captured Macrotick Value |
| 15, 14 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 13 to 8 | SCCV[5:0] | Stop Watch Captured Cycle Counter Value |
| 7 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 6 | EINT1 | Enable FlexRay Interrupt 1 Trigger Bit<br>0: Stop watch trigger by FlexRay 1 interrupt disabled<br>1: FlexRay 1 interrupt event triggers stop watch |
| 5 | EINT0 | Enable FlexRay 0 Interrupt Trigger Bit<br>0: Stop watch trigger by FlexRay 0 interrupt disabled<br>1: FlexRay interrupt 0 event triggers stop watch |
| 4 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 3 | SSWT | Software Stop Watch Trigger Bit<br>0: Software trigger reset<br>1: Stop watch activated by software trigger |
| 2 | EDGE | Stop Watch Trigger Edge Select Bit<br>0: Falling edge<br>1: Rising edge |
| 1 | SWMS | Stop Watch Mode Select Bit<br>0: Single-shot mode<br>1: Continuous mode |

Table 20.23 FLXAnFRSTPW1 Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | ESWT | Enable Hardware Stop Watch Trigger Bit<br>0: Stop watch trigger disabled<br>1: Stop watch trigger enabled |

**(1) FLXAnFRSTPW1.SMTV**

Stop Watch Captured Macrotick Value

State of the macrotick counter when the stop watch event occurred.

**(2) FLXAnFRSTPW1.SCCV**

Stop Watch Captured Cycle Counter Value

State of the cycle counter when the stop watch event occurred.

**(3) FLXAnFRSTPW1.EINT1**

Enable FlexRay 1 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 1 interrupt when FLXAnFRSTPW1.ESWT = 1.

**(4) FLXAnFRSTPW1.EINT0**

Enable FlexRay 0 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 0 interrupt when FLXAnFRSTPW1.ESWT = 1.

**(5) FLXAnFRSTPW1.SSWT**

Software Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

Writing 1 in this bit activates the stop watch. This bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

**(6) FLXAnFRSTPW1.EDGE**

Stop Watch Trigger Edge Select Bit

**(7) FLXAnFRSTPW1.SWMS**

Stop Watch Mode Select Bit

**(8) FLXAnFRSTPW1.ESWT**

Enable Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

If enabled, a FlexRay 0 interrupt event or a FlexRay 1 interrupt event activates the stop watch.

In single-shot mode, this bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

### 20.2.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0050_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.24 FLXAnFRSTPW2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 26 to 16 | SSCVB[10:0] | Stop Watch Captured Slot Counter Value Channel B |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | SSCVA[10:0] | Stop Watch Captured Slot Counter Value Channel A |

#### (1) FLXAnFRSTPW2.SSCVB

Stop Watch Captured Slot Counter Value Channel B

State of the slot counter for channel B when the stop watch event occurred.

#### (2) FLXAnFRSTPW2.SSCVA

Stop Watch Captured Slot Counter Value Channel A

State of the slot counter for channel A when the stop watch event occurred.

## 20.2.6 CC Control Registers

This section describes the registers provided by the CC (Communication Controller) to allow the Host to control the operation of the CC. The FlexRay protocol specification requires the Host to write application configuration data in CONFIG state only. Please consider that the configuration registers are not locked for writing in DEFAULT_CONFIG state.

The configuration data is reset when DEFAULT_CONFIG state is entered from reset. To change POC state from DEFAULT_CONFIG to CONFIG state the Host has to apply CHI command CONFIG. If the Host wants the CC to leave CONFIG state, the Host has to execute the lock release sequence as described in **Section 20.2.3.1, FLXAnFRLCK — FlexRay Lock Register**.

### 20.2.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0080_H$

**Value after reset:** $0C40\ 1080_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | CCHB | CCHA | MTSB | MTSA | HCSE | TSM | WUCS | PTA[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 20.25 FLXAnFRSUCC1 Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 27 | CCHB | Connected to Channel B Bit<br>Configures pChannels<br>0: Not connected to channel B<br>1: Node connected to channel B (default after reset) |
| 26 | CCHA | Connected to Channel A Bit<br>Configures pChannels<br>0: Not connected to channel A<br>1: Node connected to channel A (default after reset) |
| 25 | MTSB | Select Channel B for MTS Transmission Bit<br>0: Channel B disabled for MTS transmission<br>1: Channel B selected for MTS transmission |
| 24 | MTSA | Select Channel A for MTS Transmission Bit<br>0: Channel A disabled for MTS transmission<br>1: Channel A selected for MTS transmission |
| 23 | HCSE | Halt due to Clock Sync Error Bit<br>Configures pAllowHaltDueToClock<br>0: CC will enter / remain in NORMAL_PASSIVE<br>1: CC will enter HALT state |
| 22 | TSM | Transmission Slot Mode Bit<br>Configures pSingleSlotEnabled<br>0: ALL Slot Mode<br>1: SINGLE Slot Mode (value after hard reset) |

**Table 20.25 FLXAnFRSUCC1 Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 21 | WUCS | Wakeup Channel Select Bit<br>Configures pWakeupChannel<br>0: Send wakeup pattern on channel A<br>1: Send wakeup pattern on channel B |
| 20 to 16 | PTA[4:0] | Passive to Active Bit<br>Configures pAllowPassiveToActive |
| 15 to 11 | CSA[4:0] | Cold Start Attempts Bit<br>Configures gColdStartAttempts |
| 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 | TXSY | Transmit Sync Frame in Key Slot Bit<br>Configures pKeySlotUsedForSync<br>0: No sync frame transmission in key slot, node is neither sync nor coldstart node<br>1: Key slot used to transmit sync frame, node is sync node |
| 8 | TXST | Transmit Startup Frame in Key Slot Bit<br>Configures pKeySlotUsedForStartup<br>0: No startup frame transmission in key slot, node is non-coldstarter<br>1: Key slot used to transmit startup frame, node is leading or following coldstarter |
| 7 | PBSY | POC Busy Flag<br>0: POC not busy, FLXAnFRSUCC1.CMD writeable<br>1: POC is busy, FLXAnFRSUCC1.CMD locked |
| 6 to 4 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 3 to 0 | CMD[3:0] | CHI Command Vector Bit<br>0000: command_not_accepted<br>0001: CONFIG<br>0010: READY<br>0011: WAKEUP<br>0100: RUN<br>0101: ALL_SLOTS<br>0110: HALT<br>0111: FREEZE<br>1000: SEND_MTS<br>1001: ALLOW_COLDSTART<br>1010: RESET_STATUS_INDICATORS<br>1011: MONITOR_MODE<br>1100: CLEAR_RAMS<br>others: reserved |

**(1) FLXAnFRSUCC1.CCHB**

Connected to Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Configures whether the node is connected to channel B (pChannels).

**(2) FLXAnFRSUCC1.CCHA**

Connected to Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Configures whether the node is connected to channel A (pChannels).

**(3) FLXAnFRSUCC1.MTSB**

Select Channel B for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

FLXAnFRSUCC1.MTSB may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 20.2.3.1, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1 an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD = "$1000_B$".

The bit selects channel B for MTS symbol transmission.

**(4) FLXAnFRSUCC1.MTSA**

Select Channel A for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

FLXAnFRSUCC1.MTSA may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 20.2.3.1, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1 an MTS symbol will be transmitted on both channels when requested by writing FLXAnFRSUCC1.CMD = "$1000_B$".

The bit selects channel A for MTS symbol transmission.

**(5) FLXAnFRSUCC1.HCSE**

Halt due to Clock Sync Error Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Controls the transition to HALT state due to a clock synchronization error (pAllowHaltDueToClock).

**(6) FLXAnFRSUCC1.TSM**

Transmission Slot Mode Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Selects the value after transmission slot mode reset (pSingleSlotEnabled).

In SINGLE slot mode the CC may only transmit in the preconfigured key slot. The key slot ID is configured in the header section of message buffer 0 respectively message buffers 0 and 1 depending on bit FLXAnFRMRC.SPLM.

In case FLXAnFRSUCC1.TSM = 1, message buffer 0 respectively message buffers 0, 1 can be (re)configured in DEFAULT_CONFIG or CONFIG state only. In ALL slot mode the CC may transmit in all slots.

FLXAnFRSUCC1.TSM is a configuration bit which can only be set / reset by the Host.

The CC changes to ALL slot mode when the Host successfully applied the ALL_SLOTS command by writing FLXAnFRSUCC1.CMD = “0101” in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. The actual slot mode is monitored by FLXAnFRCCSV.SLM.

**(7) FLXAnFRSUCC1.WUCS**

Wakeup Channel Select Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

With this bit the Host selects the channel on which the CC sends the Wakeup pattern (pWakeupChannel).

**(8) FLXAnFRSUCC1.PTA**

Passive to Active Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 31 even / odd cycle pairs.

Defines the number of consecutive even / odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state (pAllowPassiveToActive).

If set to “$00000_B$” the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

**(9) FLXAnFRSUCC1.CSA**

Cold Start Attempts Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Must be identical in all nodes of a cluster.

Valid values are 2 to 31.

Configures the maximum number of attempts that a cold starting node is permitted to try to start up the network without receiving any valid response from another node (gColdStartAttempts).

### (10) FLXAnFRSUCC1.TXSY

Transmit Sync Frame in Key Slot Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Defines whether the key slot is used to transmit sync frames (pKeySlotUsedForSync).

**CAUTION**

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

### (11) FLXAnFRSUCC1.TXST

Transmit Startup Frame in Key Slot Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Defines whether the key slot is used to transmit startup frames (pKeySlotUsedForStartup).

**CAUTION**

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

### (12) FLXAnFRSUCC1.PBSY

POC Busy Flag

Signals that the POC is busy and cannot accept a command from the Host. FLXAnFRSUCC1.CMD is locked against write accesses.

Set to 1 after reset during initialization of internal RAM blocks.

### (13) FLXAnFRSUCC1.CMD

CHI Command Vector Bit

The Host may write any CHI command at any time, but certain commands are enabled only in certain POC states. If a command is not enabled, it will not be executed, the CHI command vector FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted, and flag FLXAnFREIR.CNA will be set to 1.

In general the Host must check FLXAnFRSUCC1.PBSY before writing a new CHI command.

In case the previous CHI command has not yet completed, FLXAnFREIR.CCL is set to 1 together with FLXAnFREIR.CNA; the CHI command needs to be repeated.

Except for HALT state, a POC state change command applied while the CC is already in the requested POC state neither causes a state change nor will FLXAnFREIR.CNA be set.

Reading FLXAnFRSUCC1.CMD shows whether the last CHI command was accepted. The actual POC state is monitored by FLXAnFRCCSV.POCS.

- command_not_accepted

  FLXAnFRSUCC1.CMD is reset to "$0000_B$" due to one of the following conditions:

  – Illegal command applied by the Host
  – Host applied command to leave CONFIG state without preceding config lock key
  – Host applied new command while execution of the previous Host command has not completed

– Host writes command_not_accepted

When FLXAnFRSUCC1.CMD is reset to "$0000_B$", FLXAnFREIR.CNA is set to 1, and if enabled an interrupt is generated.

Commands which are not accepted are not executed.

#### CONFIG

Go to POC state CONFIG when called in POC states DEFAULT_CONFIG, or READY. When called in HALT state the CC transits to POC state DEFAULT_CONFIG. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### READY

Go to POC state READY when called in POC states CONFIG, NORMAL_ACTIVE, NORMAL_PASSIVE, STARTUP, or WAKEUP. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### WAKEUP

Go to POC state WAKEUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### RUN

Go to POC state STARTUP when called in POC state READY. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### ALL_SLOTS

Leave SINGLE slot mode and go to ALL-SLOTS mode after successful startup / integration at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### HALT

Set halt request FLXAnFRCCSV.HRQ to 1 and go to POC state HALT at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### FREEZE

Set the freeze status indicator FLXAnFRCCSV.FSI to 1 and go to POC state HALT immediately. Can be called from any state.

#### SEND_MTS

Send single MTS symbol during the next following symbol window on the channel configured by FLXAnFRSUCC1.MTSA, FLXAnFRSUCC1.MTSB, when called in POC state NORMAL_ACTIVE after CC entered ALL slot mode (FLXAnFRCCSV.SLM = "11"). When called in any other state, or when called while a previously requested MTS has not yet been transmitted, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### ALLOW_COLDSTART

The command resets FLXAnFRCCSV.CSI to enable the node to become leading coldstarter. When called in states DEFAULT_CONFIG, CONFIG, or HALT, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted. To become leading coldstarter it is also required that both FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set.

#### RESET_STATUS_INDICATORS

Resets status flags FLXAnFRCCSV.CSNI, FLXAnFRCCSV.CSAI, and FLXAnFRCCSV.WSV to the values after reset. May be called in POC states READY and STARTUP. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

#### CLEAR_RAMS

Sets FLXAnFRMHDS.CRAM to 1 when called in DEFAULT_CONFIG or CONFIG state. When called in any other state, FLXAnFRSUCC1.CMD will be reset to "$0000_B$" = command_not_accepted.

FLXAnFRMHDS.CRAM is also set to 1 when the CC leaves reset. By setting FLXAnFRMHDS.CRAM all internal RAM blocks are initialized to zero. During the initialization of the RAMs, FLXAnFRSUCC1.PBSY will show POC busy. Access to the configuration and status registers is possible during execution of CHI command CLEAR_RAMS.

The initialization of the internal message RAM requires 2048 bus clock cycles. There should be no Host access to IBF or OBF during initialization of the internal RAM blocks after reset or after assertion of CHI command CLEAR_RAMS.

Before asserting CHI command CLEAR_RAMS, the Host should make sure that no transfer between Message RAM and IBF / OBF or the Temporary Buffer RAMs is ongoing and that the data transfer handler has no effect (FLXAnFRITS.ITS = 0 and FLXAnFROTS.OTS = 0). This command also resets the Message Buffer Status registers FLXAnFRMHDS, FLXAnFRLDTS, FLXAnFRFSR, FLXAnFRMHDF, FLXAnFRTXRQ1/2/3/4, FLXAnFRNDAT1/2/3/4, and FLXAnFRMBSC1/2/3/4.

#### CAUTIONS

1. **All accepted commands with exception of CLEAR_RAMS and SEND_MTS will cause a change of the POC state in the FlexRay domain after at most 8 cycles of the slower of the two clocks "bus clock" and "FlexRay", assumed that POC was not busy when the command was applied and that no POC state change was forced by bus activity in that time frame. Reading register FLXAnFRCCSV will show data that is additionally delayed by synchronization from the FlexRay domain to the bus clock domain. The maximum additional delay is 12 cycles of the slower of the two clocks 'bus clock' and "FlexRay".**
2. **When the user restart as leading coldstarter after it has been stopped by FREEZE or READY command, it may happen, depending on the internal state of the FlexRay module, that the FlexRay module does not transmit its startup frame in cycle 0. Only FlexRay module configurations with startup frames configured for slots 1 to 7 are affected by this behaviour.**
   - **Coldstart after hardware reset is not affected.**
   - **Even if it happened, next coldstart attempt successful. Coldstart sequence is lengthened but coldstart of FlexRay system is not prohibited by this behaviour.**
   - **If the use wants to avoid this behavior, they must use a static slot greater or equal 8 for the startup / sync message.**

The below references the CHI commands from the FlexRay Protocol Specification to the FlexRay CHI command vector FLXAnFRSUCC1.CMD.

**Table 20.26 Reference to CHI Host Command Summary from FlexRay Protocol Specification**

| CHI command | Where processed (POC States) | CHI Command Vector CMD |
|---|---|---|
| ALL_SLOTS | POC: normal active, POC: normal passive | ALL_SLOTS |
| ALLOW_COLDSTART | All except POC: default config, POC: config, POC: halt | ALLOW_COLDSTART |
| CONFIG | POC: default config, POC: ready | CONFIG |
| CONFIG_COMPLETE | POC: config | Unlock sequence & READY |
| DEFAULT_CONFIG | POC: halt | CONFIG |
| FREEZE | All | FREEZE |
| HALT | POC: normal active, POC: normal passive | HALT |
| READY | All except POC: default config, POC: config, POC: ready, POC: halt | READY |
| RUN | POC: ready | RUN |
| WAKEUP | POC: ready | WAKEUP |

### 20.2.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0084_H$

**Value after reset:** $0100\ 0504_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.27 FLXAnFRSUCC2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 27 to 24 | LTN[3:0] | Listen Timeout Noise Bit<br>Configures (gListenNoise – 1) |
| 23 to 21 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 20 to 0 | LT[20:0] | Listen Timeout Bit<br>Configures pdListenTimeout |

### (1) FLXAnFRSUCC2.LTN

Listen Timeout Noise Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

The range for gListenNoise is 2 to 16.

FLXAnFRSUCC2.LTN must be configured identical in all nodes of a cluster.

Configures the upper limit for startup and wakeup listen timeout in the presence of noise expressed as a multiple of pdListenTimeout.

**CAUTION**

**The wakeup / startup noise timeout is calculated as follows:**

**pdListenTimeout × gListenNoise = FLXAnFRSUCC2.LT × (FLXAnFRSUCC2.LTN + 1)**

### (2) FLXAnFRSUCC2.LT

Listen Timeout Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

The range for pdListenTimeout is 1284 to 1283846 µT.

Configures wakeup / startup listen time out in µT.

### 20.2.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0088_H$

**Value after reset:** $0000\ 0011_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 20.28 FLXAnFRSUCC3 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 7 to 4 | WCF[3:0] | Maximum Without Clock Correction Fatal Bit (transition to HALT state)<br>Configures gMaxWithoutClockCorrectionFatal |
| 3 to 0 | WCP[3:0] | Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state)<br>Configures gMaxWithoutClockCorrectionPassive |

**(1) FLXAnFRSUCC3.WCF**

Maximum Without Clock Correction Fatal Bit (transition to HALT state)

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 15 cycle pairs.

Must be identical in all nodes of a cluster.

Defines the number of consecutive even / odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

**CAUTION**

**The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set.**

**(2) FLXAnFRSUCC3.WCP**

Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state)

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 15 cycle pairs.

Must be identical in all nodes of a cluster.

Defines the number of consecutive even / odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE to NORMAL_PASSIVE state.

### 20.2.6.4 FLXAnFRNEMC — FlexRay NEM Configuration Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $008C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 20.29 FLXAnFRNEMC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 3 to 0 | NML[3:0] | Network Management Vector Length Bit<br>Configures gNetworkManagementVectorLength |

#### (1) FLXAnFRNEMC.NML

Network Management Vector Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 12 bytes.

The configured length must be identical in all nodes of a cluster.

These bits configure the length of the NM vector.

### 20.2.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0090_H$

**Value after reset:** $084C\ 0633_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.30 FLXAnFRPRTC1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | RWP[5:0] | Repetitions of Tx Wakeup Pattern Bit<br>Configures pWakeupPattern |
| 25 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 24 to 16 | RXW[8:0] | Wakeup Symbol Receive Window Length Bit<br>Configures gdWakeupSymbolRxWindow |
| 15, 14 | BRP[1:0] | Baud Rate Prescaler Bit<br>Configures gdSampleClockPeriod and pSamplesPerMicrotick<br>00 = 10 Mbps<br>01 = 5 Mbps<br>10 = 2.5 Mbps<br>11 = 2.5 Mbps |
| 13, 12 | SPP[1:0] | Strobe Point Position Bit<br>Configures Strobe point position<br>00 = Sample 5<br>01 = Sample 4<br>10 = Sample 6<br>11 = Sample 5 |
| 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 4 | CASM[6:0] | Collision Avoidance Symbol Max Bit<br>Configures gdCASRxLowMax |
| 3 to 0 | TSST[3:0] | Transmission Start Sequence Transmitter Bit<br>Configures gdTSSTransmitter |

**(1) FLXAnFRPRTC1.RWP**

Repetitions of Tx Wakeup Pattern Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 63.

Configures the number of repetitions (sequences) of the Tx wakeup symbol.

**(2) FLXAnFRPRTC1.RXW**

Wakeup Symbol Receive Window Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 76 to 301 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the received wakeup pattern.

**(3) FLXAnFRPRTC1.BRP**

Baud Rate Prescaler Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

The Baud Rate Prescaler configures the baud rate on the FlexRay bus. The baud rates listed below are valid with a sample clock set to 80 MHz. One bit time always consists of 8 samples independent of the configured baud rate.

00 = 10 MBit/s

gdSampleClockPeriod = 12.5 ns = 1 * “sample clock”

pSamplesPerMicrotick = 2 (1 µT = 25 ns)

01 = 5 MBit/s

gdSampleClockPeriod = 25 ns = 2 * “sample clock”

pSamplesPerMicrotick = 1 (1 µT = 25 ns)

10, 11 = 2.5 MBit/s

gdSampleClockPeriod = 50 ns = 4 * “sample clock”

pSamplesPerMicrotick = 1 (1 µT = 50 ns)

### (4) FLXAnFRPRTC1.SPP

Strobe Point Position Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Defines the sample count value for strobing. The strobed bit value is set to the voted value when the sample count is incremented to the value configured by FLXAnFRPRTC1.SPP.

**CAUTION**

**The current revision 2.1 of the FlexRay protocol requires that FLXAnFRPRTC1.SPP = “00”. The alternate strobe point positions could be used to compensate for asymmetries in the physical layer.**

### (5) FLXAnFRPRTC1.CASM

Collision Avoidance Symbol Max Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

CASM6 is fixed to 1.

Valid values are 67 to 99 bit times.

Configures the upper limit of the acceptance window for a collision avoidance symbol (CAS).

### (6) FLXAnFRPRTC1.TSST

Transmission Start Sequence Transmitter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 3 to 15 bit times.

Must be identical in all nodes of a cluster.

Configures the duration of the Transmission Start Sequence (TSS) in terms of bit times (1 bit time = 4 µT = 100ns @ 10Mbps).

### 20.2.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0094_H$

**Value after reset:** $0F2D\ 0A0E_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.31 FLXAnFRPRTC2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 24 | TXL[5:0] | Wakeup Symbol Transmit Low Bit<br>Configures gdWakeupSymbolTxLow |
| 23 to 16 | TXI[7:0] | Wakeup Symbol Transmit Idle Bit<br>Configures gdWakeupSymbolTxIdle |
| 15, 14 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 13 to 8 | RXL[5:0] | Wakeup Symbol Receive Low Bit<br>Configures gdWakeupSymbolRxLow |
| 7, 6 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 5 to 0 | RXI[5:0] | Wakeup Symbol Rx Idle Bit<br>Configures gdWakeupSymbolRxIdle |

**(1) FLXAnFRPRTC2.TXL**

Wakeup Symbol Transmit Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 15 to 60 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the low phase of the wakeup symbol.

**(2) FLXAnFRPRTC2.TXI**

Wakeup Symbol Transmit Idle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 45 to 180 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the idle phase of the wakeup symbol.

**(3) FLXAnFRPRTC2.RXL**

Wakeup Symbol Receive Low Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 10 to 55 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the low phase of the received wakeup symbol.

**(4) FLXAnFRPRTC2.RXI**

Wakeup Symbol Rx Idle Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 14 to 59 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the idle phase of the received wakeup symbol.

### 20.2.6.7 FLXAnFRMHDC — FlexRay MHD Configuration Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0098_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | SLT[12:0] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | SFDL[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.32 FLXAnFRMHDC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 28 to 16 | SLT[12:0] | Start of Latest Transmit Bit<br>Configures pLatestTx |
| 15 to 7 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 6 to 0 | SFDL[6:0] | Static Frame Data Length Bit<br>Configures gPayloadLengthStatic |

#### (1) FLXAnFRMHDC.SLT

Start of Latest Transmit Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7981 minislots.

Configures the maximum minislot value allowed before inhibiting frame transmission in the dynamic segment of the cycle. There is no transmission in dynamic segment if FLXAnFRMHDC.SLT is set to zero.

#### (2) FLXAnFRMHDC.SFDL

Static Frame Data Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 127.

The payload length must be identical in all nodes of a cluster.

Configures the cluster-wide payload length for all frames sent in the static segment in double bytes.

### 20.2.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00A0_H$

**Value after reset:** $0000\ 0280_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.33 FLXAnFRGTUC1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 19 to 0 | UT[19:0] | Setting of Communication Cycle in Microticks Bit<br>Configures pMicroPerCycle |

#### (1) FLXAnFRGTUC1.UT

Setting of Communication Cycle in Microticks Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 640 to 640000 µT.

Configures the duration of the communication cycle in microticks.

### 20.2.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00A4_H$

**Value after reset:** $0002\ 000A_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.34 FLXAnFRGTUC2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 19 to 16 | SNM[3:0] | Sync Node Max Bit |
| 15, 14 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 13 to 0 | MPC[13:0] | Setting of Communication Cycle in Macrotick Bit<br>Configures gMacroPerCycle |

#### (1) FLXAnFRGTUC2.SNM

Sync Node Max Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 15.

Must be identical in all nodes of a cluster.

Maximum number of frames within a cluster with sync frame indicator bit SYN set to 1.

#### (2) FLXAnFRGTUC2.MPC

Setting of Communication Cycle in Macrotick Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 10 to 16000 MT.

The cycle length must be identical in all nodes of a cluster.

Configures the duration of one communication cycle in macroticks.

### 20.2.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00A8_H$

**Value after reset:** $0202\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | MIOB[6:0] | | | | | | | — | MIOA[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | UIOB[7:0] | | | | | | | | UIOA[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.35 FLXAnFRGTUC3 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 30 to 24 | MIOB[6:0] | Macrotick Initial Offset Channel B Bit<br>Configures pMacroInitialOffset[B] |
| 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | MIOA[6:0] | Macrotick Initial Offset Channel A Bit<br>Configures pMacroInitialOffset[A] |
| 15 to 8 | UIOB[7:0] | Microtick Initial Offset Channel B Bit<br>Configures pMicroInitialOffset[B] |
| 7 to 0 | UIOA[7:0] | Microtick Initial Offset Channel A Bit<br>Configures pMicroInitialOffset[A] |

**(1) FLXAnFRGTUC3.MIOB**

Macrotick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

Must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

**(2) FLXAnFRGTUC3.MIOA**

Macrotick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

Must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

**(3) FLXAnFRGTUC3.UIOB**

Microtick Initial Offset Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 240 µT.

Configures the number of microticks between the actual time reference point on channel B and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [B] and therefore has to be set for each channel independently.

**(4) FLXAnFRGTUC3.UIOA**

Microtick Initial Offset Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 240 µT.

Configures the number of microticks between the actual time reference point on channel A and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [A] and therefore has to be set for each channel independently.

### 20.2.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4

For details about configuration of FLXAnFRGTUC4.NIT and FLXAnFRGTUC4.OCS see **Section 20.3.2.5, Configuration of NIT Start and Offset Correction Start**.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00AC_H$

**Value after reset:** $0008\ 0007_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 20.36 FLXAnFRGTUC4 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 16 | OCS[13:0] | Offset Correction Start Bit<br>Configures (gOffsetCorrectionStart – 1) |
| 15, 14 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 13 to 0 | NIT[13:0] | Network Idle Time Start Bit<br>Configures (gMacroPerCycle -gdNIT – 1) |

**(1) FLXAnFRGTUC4.OCS**

Offset Correction Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 8 to 15998 MT.

For cluster consisting of E-Ray implementations only, it is sufficient to program FLXAnFRGTUC4.OCS = FLXAnFRGTUC4.NIT + 1.

Must be identical in all nodes of a cluster.

Determines the start of the offset correction within the NIT phase, calculated from start of cycle.

**(2) FLXAnFRGTUC4.NIT**

Network Idle Time Start Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 7 to 15997 MT.

Must be identical in all nodes of a cluster.

Configures the starting point of the Network Idle Time NIT at the end of the communication cycle expressed in terms of macroticks from the beginning of the cycle. The start of NIT is recognized if Macrotick = gMacroPerCycle-gdNIT -1 and the increment pulse of Macrotick is set.

### 20.2.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00B0_H$

**Value after reset:** $0E00\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.37 FLXAnFRGTUC5 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | DEC[7:0] | Decoding Correction Bit<br>Configures pDecodingCorrection |
| 23 to 21 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 20 to 16 | CDD[4:0] | Cluster Drift Damping Bit<br>Configures pClusterDriftDamping |
| 15 to 8 | DCB[7:0] | Delay Compensation Channel B Bit<br>Configures pDelayCompensation[B] |
| 7 to 0 | DCA[7:0] | Delay Compensation Channel A Bit<br>Configures pDelayCompensation[A] |

#### (1) FLXAnFRGTUC5.DEC

Decoding Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 14 to 143 µT.

Configures the decoding correction value in microticks used to determine the primary time reference point.

#### (2) FLXAnFRGTUC5.CDD

Cluster Drift Damping Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 20 µT.

Configures the cluster drift damping value in microticks used in clock synchronization to minimize accumulation of rounding errors.

### (3) FLXAnFRGTUC5.DCB

Delay Compensation Channel B Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 200 µT.

Used to compensate for reception delays on channel B. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

### (4) FLXAnFRGTUC5.DCA

Delay Compensation Channel A Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 200 µT.

Used to compensate for reception delays on channel A. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

### 20.2.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00B4_H$

**Value after reset:** $0002\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.38 FLXAnFRGTUC6 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 26 to 16 | MOD[10:0] | Maximum Oscillator Drift Bit<br>Configures pdMaxDrift |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | ASR[10:0] | Accepted Startup Range Bit<br>Configures pdAcceptedStartupRange |

#### (1) FLXAnFRGTUC6.MOD

Maximum Oscillator Drift Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1923 µT.

Maximum drift offset between two nodes that operate with unsynchronized clocks over one communication cycle in µT.

#### (2) FLXAnFRGTUC6.ASR

Accepted Startup Range Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 1875 µT.

Number of microticks constituting the expanded range of measured deviation for startup frames during integration.

### 20.2.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00B8_H$

**Value after reset:** $0002\ 0004_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| | — | — | — | — | — | — | SSL[9:0] | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.39 FLXAnFRGTUC7 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 25 to 16 | NSS[9:0] | Number of Static Slots Bit<br>Configures gNumberOfStaticSlots |
| 15 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 to 0 | SSL[9:0] | Static Slot Length Bit<br>Configures gdStaticSlot |

#### (1) FLXAnFRGTUC7.NSS

Number of Static Slots Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1023.

The number of static slots must be identical in all nodes of a cluster.

Configures the number of static slots in a cycle.

#### (2) FLXAnFRGTUC7.SSL

Static Slot Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 4 to 659 MT.

The static slot length must be identical in all nodes of a cluster.

Configures the length of a static slot in macroticks.

### 20.2.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00BC_H$

**Value after reset:** $0000\ 0002_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | NMS[12:0] | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | MSL[5:0] | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.40 FLXAnFRGTUC8 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 28 to 16 | NMS[12:0] | Number of Minislots Bit<br>Configures gNumberOfMinislots |
| 15 to 6 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 5 to 0 | MSL[5:0] | Minislot Length Bit<br>Configures gdMinislot |

#### (1) FLXAnFRGTUC8.NMS

Number of Minislots Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7986.

The number of minislots must be identical in all nodes of a cluster.

Configures the number of minislots within the dynamic segment of a cycle.

#### (2) FLXAnFRGTUC8.MSL

Minislot Length Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 63 MT.

The minislot length must be identical in all nodes of a cluster.

Configures the length of a minislot in macroticks.

### 20.2.6.16 FLXAnFRGTUC9 — FlexRay GTU Configuration Register 9

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00C0_H$

**Value after reset:** $0000\ 0101_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | DSI[1:0] | |

| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.41 FLXAnFRGTUC9 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 18 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 17, 16 | DSI[1:0] | Dynamic Slot Idle Phase Bit<br>Configures gdDynamicSlotIdlePhase |
| 15 to 13 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 12 to 8 | MAPO[4:0] | Minislot Action Point Offset Bit<br>Configures gdMinislotActionPointOffset |
| 7, 6 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 5 to 0 | APO[5:0] | Action Point Offset Bit<br>Configures gdActionPointOffset |

**(1) FLXAnFRGTUC9.DSI**

Dynamic Slot Idle Phase Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 2 Minislot.

Must be identical in all nodes of a cluster.

Configures the duration of the dynamic slot idle phase in the number of minislots. The duration has to be greater or equal than the idle detection time.

**(2) FLXAnFRGTUC9.MAPO**

Minislot Action Point Offset Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 31 MT.

Must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within the minislots of the dynamic segment.

**(3) FLXAnFRGTUC9.APO**

Action Point Offset Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 63 MT.

Must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within static slots and symbol window.

### 20.2.6.17 FLXAnFRGTUC10 — FlexRay GTU Configuration Register 10

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00C4_H$

**Value after reset:** $0002\ 0005_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.42 FLXAnFRGTUC10 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 26 to 16 | MRC[10:0] | Maximum Rate Correction Bit<br>Configures pRateCorrectionOut |
| 15, 14 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 13 to 0 | MOC[13:0] | Maximum Offset Correction Bit<br>Configures pOffsetCorrectionOut |

#### (1) FLXAnFRGTUC10.MRC

Maximum Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1923 µT.

Holds the maximum permitted rate correction value to be applied by the internal clock synchronization algorithm. The CC checks only the internal rate correction value against the maximum rate correction value (absolute value).

#### (2) FLXAnFRGTUC10.MOC

Maximum Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 5 to 15266 µT.

Holds the maximum permitted offset correction value (absolute value) to be applied by the internal clock synchronization algorithm (absolute value). The CC checks only the internal offset correction value against the maximum offset correction value.

### 20.2.6.18 FLXAnFRGTUC11 — FlexRay GTU Configuration Register 11

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $00C8_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9, 8 | ERCC[1:0] | External Rate Correction Control Bit<br>Configures vExternRateControl<br>00: External rate correction is prohibited.<br>01: External rate correction is prohibited.<br>10: Subtract<br>11: Add |
| 7 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1, 0 | EOCC[1:0] | External Offset Correction Control Bit<br>Configures vExternOffsetControl<br>00: External offset correction is prohibited.<br>01: External offset correction is prohibited.<br>10: Subtract<br>11: Add |

**(1) FLXAnFRGTUC11.ERC**

External Rate Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7 µT.

Holds the external rate correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted / added from / to the calculated rate correction value. The value is applied during NIT.

**(2) FLXAnFRGTUC11.EOC**

External Offset Correction Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7 µT.

Holds the external offset correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted / added from / to the calculated offset correction value. The value is applied during NIT.

**(3) FLXAnFRGTUC11.ERCC**

External Rate Correction Control Bit

Should be modified only outside NIT (Network Idle Time).

By writing to FLXAnFRGTUC11.ERCC the external rate correction is enabled as specified below.

00 = External rate correction is prohibited.

01 = External rate correction is prohibited.

10 = Subtract

External rate correction value subtracted from calculated rate correction value

11 = Add

External rate correction value added to calculated rate correction value

**(4) FLXAnFRGTUC11.EOCC**

External Offset Correction Control Bit

Should be modified only outside NIT (Network Idle Time).

By writing to FLXAnFRGTUC11.EOCC the external offset correction is enabled as specified below.

00 = External offset correction is prohibited.

01 = External offset correction is prohibited.

10 = Subtract

External offset correction value subtracted from calculated offset correction value

11 = Add

External offset correction value added to calculated offset correction value

## 20.2.7 CC Status Registers

During 8/16-bit accesses to status variables coded with more than 8/16-bit, the variable might be updated by the CC between two accesses (non-atomic read accesses).

### 20.2.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0100_H$

**Value after reset:** $0010\ 4000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | PSL[5:0] | | | | | | RCA[4:0] | | | | | WSV[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.44 FLXAnFRCCSV Register Contents (1/2)**

| Bit | Symbol | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 24 | PSL[5:0] | POC Status Log Flag<br>Status of FLXAnFRCCSV.POCS immediately before entering HALT state. |
| 23 to 19 | RCA[4:0] | Remaining Coldstart Attempts Flag<br>Indicates vRemainingColdstartAttempts |
| 18 to 16 | WSV[2:0] | Wakeup Status Flag<br>Indicates vPOC!WakeupStatus<br>000: UNDEFINED<br>001: RECEIVED_HEADER<br>010: RECEIVED_WUP<br>011: COLLISION_HEADER<br>100: COLLISION_WUP<br>101: COLLISION_UNKNOWN<br>110: TRANSMITTED<br>111: Reserved |
| 15 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 14 | CSI | Cold Start Inhibit Flag<br>Indicates vColdStartInhibit<br>0: Cold starting of node enabled<br>1: Cold starting of node disabled |
| 13 | CSAI | Coldstart Abort Indicator Flag |
| 12 | CSNI | Coldstart Noise Indicator Flag<br>Indicates vPOC!ColdstartNoise |
| 11, 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |

Table 20.44 FLXAnFRCCSV Register Contents (2/2)

| Bit | Symbol | Function |
|---|---|---|
| 9, 8 | SLM[1:0] | Slot Mode Flag<br>Indicates vPOC!SlotMode<br>00: SINGLE<br>01: reserved<br>10: ALL_PENDING<br>11: ALL |
| 7 | HRQ | Halt Request Flag<br>Indicates vPOC!CHIHaltRequest |
| 6 | FSI | Freeze Status Indicator Flag<br>Indicates vPOC!Freeze |
| 5 to 0 | POCS[5:0] | Protocol Operation Control Status Flag |

### (1) FLXAnFRCCSV.PSL

POC Status Log Flag

Set the value of FLXAnFRCCSV.POCS immediately before entering HALT state.

Set to HALT when FREEZE command is applied during HALT state and FLXAnFRCCSV.FSI is not already set i.e. the HALT state was not reached by FREEZE command.

Reset to “B’000000” when leaving HALT state.

### (2) FLXAnFRCCSV.RCA

Remaining Coldstart Attempts Flag

Indicates the number of remaining coldstart attempts (vRemainingColdstartAttempts).

The value after a reset of FLXAnFRCCSV.RCA during CONFIG and DEFAULT_CONFIG state is also FLXAnFRSUCC1.CSA.

The RUN command resets this counter to the maximum number of coldstart attempts as configured by FLXAnFRSUCC1.CSA.

### (3) FLXAnFRCCSV.WSV

Wakeup Status Flag

Indicates the status of the current wakeup attempt (vPOC!WakeupStatus).

Reset to 0 when entering Wakeup state, by CHI command RESET_STATUS_INDICATORS, or by transition from DEFAULT_CONFIG to CONFIG state

$000_B$ = UNDEFINED

Wakeup not yet executed by the CC.

$001_B$ = RECEIVED_HEADER

Set when the CC finishes wakeup due to the reception of a frame header without coding violation on either channel in WAKEUP_LISTEN state.

$010_B$ = RECEIVED_WUP

Set when the CC finishes wakeup due to the reception of a valid wakeup pattern on the configured wakeup channel in WAKEUP_LISTEN state.

$011_B$ = COLLISION_HEADER

Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid header on either channel.

$100_B$ = COLLISION_WUP

Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid wakeup pattern on the configured wakeup channel.

$101_B$ = COLLISION_UNKNOWN

Set when the CC stops wakeup by leaving WAKEUP_DETECT state after expiration of the wakeup timer without receiving a valid wakeup pattern or a valid frame header.

$110_B$ = TRANSMITTED

Set when the CC has successfully completed the transmission of the wakeup pattern.

$111_B$ = reserved

**(4) FLXAnFRCCSV.CSI**

Cold Start Inhibit Flag

Indicates that the node is disabled from cold starting (vColdStartInhibit).

The flag is set to 1 whenever the POC enters READY state due to CHI command READY.

The flag has to be reset under control of the Host by CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = “1001”).

**(5) FLXAnFRCCSV.CSAI**

Coldstart Abort Indicator Flag

Coldstart aborted.

Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

**(6) FLXAnFRCCSV.CSNI**

Coldstart Noise Indicator Flag

Indicates that the cold start procedure occurred under noisy conditions (vPOC!ColdstartNoise).

Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

**(7) FLXAnFRCCSV.SLM**

Slot Mode Flag

Indicates the actual slot mode of the POC (vPOC!SlotMode) in states READY, WAKEUP, STARTUP, NORMAL_ACTIVE, and NORMAL_PASSIVE.

Default value is SINGLE. Changes to ALL, depending on FLXAnFRSUCC1.TSM.

In NORMAL_ACTIVE or NORMAL_PASSIVE state the CHI command ALL_SLOTS will change the slot mode from SINGLE over ALL_PENDING to ALL.

Set FLXAnFRSUCC1.TSM to SINGLE except for NORMAL_ACTIVE or NORMAL_PASSIVE.

**(8) FLXAnFRCCSV.HRQ**

Halt Request Flag

Indicates that a request from the Host has been received to halt the POC at the end of the communication cycle (vPOC!CHIHaltRequest).

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

**(9) FLXAnFRCCSV.FSI**

Freeze Status Indicator Flag

Indicates that the POC has entered the HALT state due to CHI command FREEZE or due to an error condition requiring an immediate POC halt (vPOC!Freeze).

Reset by transition from HALT to DEFAULT_CONFIG state.

**(10) FLXAnFRCCSV.POCS**

Protocol Operation Control Status Flag

Indicates the actual state of operation of the CC Protocol Operation Control

$00\ 0000_B$ = DEFAULT_CONFIG state

$00\ 0001_B$ = READY state

$00\ 0010_B$ = NORMAL_ACTIVE state

$00\ 0011_B$ = NORMAL_PASSIVE state

$00\ 0100_B$ = HALT state

$00\ 0110_B$…$00\ 1110_B$ = reserved

$00\ 1111_B$ = CONFIG state

Indicates the actual state of operation of the POC in the wakeup path

$01\ 0000_B$ = WAKEUP_STANDBY state

$01\ 0001_B$ = WAKEUP_LISTEN state

$01\ 0010_B$ = WAKEUP_SEND state

$01\ 0011_B$ = WAKEUP_DETECT state

Indicates the actual state of operation of the POC in the startup path

$10\ 0000_B$ = STARTUP_PREPARE state

$10\ 0001_B$ = COLDSTART_LISTEN state

$10\ 0010_B$ = COLDSTART_COLLISION_RESOLUTION state

$10\ 0011_B$ = COLDSTART_CONSISTENCY_CHECK state

$10\ 0100_B$ = COLDSTART_GAP state

$10\ 0101_B$ = COLDSTART_JOIN State

$10\ 0110_B$ = INTEGRATION_COLDSTART_CHECK state

$10\ 0111_B$ = INTEGRATION_LISTEN state

$10\ 1000_B$ = INTEGRATION_CONSISTENCY_CHECK state

$10\ 1001_B$ = INITIALIZE_SCHEDULE state

$10\ 1010_B$ = ABORT_STARTUP state

$10\ 1011_B$ = STARTUP_SUCCESS state

others = reserved

### 20.2.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0104_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | PTAC[4:0] | | | | | ERRM[1:0] | | — | — | CCFC[3:0] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.45 FLXAnFRCCEV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 12 to 8 | PTAC[4:0] | Passive to Active Count Flag<br>Indicates vAllowPassiveToActive |
| 7, 6 | ERRM[1:0] | Error Mode Flag<br>Indicates vPOC!ErrorMode<br>00: ACTIVE<br>01: PASSIVE<br>10: COMM_HALT<br>11: reserved |
| 5, 4 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 3 to 0 | CCFC[3:0] | Clock Correction Failed Counter<br>Indicates vClockCorrectionFailed |

**(1) FLXAnFRCCEV.PTAC**

Passive to Active Count Flag

Indicates the number of consecutive even / odd cycle pairs that have passed with valid rate and offset correction terms, while the node is waiting to transit from NORMAL_PASSIVE state to NORMAL_ACTIVE state. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA –1.

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

**(2) FLXAnFRCCEV.ERRM**

Error Mode Flag

Indicates the actual error mode of the POC (vPOC!ErrorMode).

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

**(3) FLXAnFRCCEV.CCFC**

Clock Correction Failed Counter

Indicates the clockcorrection failed counter of the POC (vClockCorrectionFailed).

The Clock Correction Failed Counter is incremented by one at the end of any odd communication cycle where either the missing offset correction error or missing rate correction error are active.

The Clock Correction Failed Counter is reset to 0 at the end of an odd communication cycle if neither the offset correction failed nor the rate correction failed errors are active.

The Clock Correction Failed Counter stops at 15.

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

### 20.2.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0110_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SCCB[10:0] | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.46 FLXAnFRSCV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 26 to 16 | SCCB[10:0] | Slot Counter Channel B<br>Indicates vSlotCounter[B] |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | SCCA[10:0] | Slot Counter Channel A<br>Indicates vSlotCounter[A] |

#### (1) FLXAnFRSCV.SCCB

Slot Counter Channel B

Current slot counter value on channel B (vSlotCounter[B]). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

#### (2) FLXAnFRSCV.SCCA

Slot Counter Channel A

Current slot counter value on channel A (vSlotCounter[A]). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

### 20.2.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0114_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| | — | — | MTV[13:0] | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.47 FLXAnFRMTCCV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 21 to 16 | CCV[5:0] | Cycle Counter Value<br>Indicates vCycleCounter |
| 15, 14 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 13 to 0 | MTV[13:0] | Macrotick Value<br>Indicates vMacrotick |

#### (1) FLXAnFRMTCCV.CCV

Cycle Counter Value

Current cycle counter value (vCycleCounter). The value is incremented by the CC at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

#### (2) FLXAnFRMTCCV.MTV

Macrotick Value

Current macrotick value (vMacrotick). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

### 20.2.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0118_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | RCV[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.48 FLXAnFRRCV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 to 0 | RCV[11:0] | Rate Correction Value Flag<br>Indicates vRateCorrection |

#### (1) FLXAnFRRCV.RCV

Rate Correction Value Flag

Indicates internal rate correction value (vRateCorrection/ two's complement) before limitation. If the FLXAnFRRCV.RCV value exceeds the limits defined by FLXAnFRGTUC10.MRC, flag FLXAnFRSFS.RCLR is set to 1.

**CAUTION**

The external rate correction value is added to the limited rate correction value.

### 20.2.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $011C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.49 FLXAnFROCV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 19 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 18 to 0 | OCV[18:0] | Offset Correction Value Flag<br>Indicates vOffsetCorrection |

#### (1) FLXAnFROCV.OCV

Offset Correction Value Flag

Indicates offset correction value (vOffsetCorrection/two's complement) before limitation. If the FLXAnFROCV.OCV value exceeds the limits defined by FLXAnFRGTUC10.MOC, flag FLXAnFRSFS.OCLR is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

**CAUTION**

The external offset correction value is added to the limited offset correction value.

### 20.2.7.7 FLXAnFRSFS — FlexRay Sync Frame Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0120_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.50 FLXAnFRSFS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 19 | RCLR | Rate Correction Limit Reached Flag<br>0: Rate correction below limit<br>1: Rate correction limit reached |
| 18 | MRCS | Missing Rate Correction Signal Flag<br>0: Rate correction signal valid<br>1: Missing rate correction signal |
| 17 | OCLR | Offset Correction Limit Reached Flag<br>0: Offset correction below limit<br>1: Offset correction limit reached |
| 16 | MOCS | Missing Offset Correction Signal Flag<br>0: Offset correction signal valid<br>1: Missing offset correction signal |
| 15 to 12 | VSBO[3:0] | Valid Sync Frames Channel B, odd communication cycle |
| 11 to 8 | VSBE[3:0] | Valid Sync Frames Channel B, even communication cycle |
| 7 to 4 | VSAO[3:0] | Valid Sync Frames Channel A, odd communication cycle |
| 3 to 0 | VSAE[3:0] | Valid Sync Frames Channel A, even communication cycle |

**(1) FLXAnFRSFS.RCLR**

Rate Correction Limit Reached Flag

The Rate Correction Limit Reached flag signals to the Host, that the rate correction value has exceeded its limit as defined by FLXAnFRGTUC10.MRC10 to MRC0. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(2) FLXAnFRSFS.MRCS**

Missing Rate Correction Signal Flag

The Missing Rate Correction flag signals to the Host, that no rate correction calculation can be performed because no pairs of even / odd sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(3) FLXAnFRSFS.OCLR**

Offset Correction Limit Reached Flag

The Offset Correction Limit Reached flag signals to the Host, that the offset correction value has exceeded its limit as defined by FLXAnFRGTUC10.MOC. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(4) FLXAnFRSFS.MOCS**

Missing Offset Correction Signal Flag

The Missing Offset Correction flag signals to the Host, that no offset correction calculation can be performed because no sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(5) FLXAnFRSFS.VSBO**

Valid Sync Frames Channel B, odd communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHB is 1.

Holds the number of valid sync frames received on channel B in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(6) FLXAnFRSFS.VSBE**

Valid Sync Frames Channel B, even communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHB is 1.

Holds the number of valid sync frames received on channel B in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(7) FLXAnFRSFS.VSAO**

Valid Sync Frames Channel A, odd communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHA is 1.

Holds the number of valid sync frames received on channel A in the odd communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

**(8) FLXAnFRSFS.VSAE**

Valid Sync Frames Channel A, even communication cycle

These bits are only valid when FLXAnFRSUCC1.CCHA is 1.

Holds the number of valid sync frames received on channel A in the even communication cycle. If transmission of sync frames is enabled by FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

### 20.2.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register

Symbol window related status information is updated by the CC at the end of the symbol window for each channel. NIT related status information is updated by the CC at the end of the NIT for each channel.

During startup the status data is not updated.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0124_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 4 | SBSB | Slot Boundary Violation in Symbol Window Channel B Flag<br>0: No slot boundary violation detected<br>1: Slot boundary violation during symbol window detected on channel B |
| 3 | SESB | Syntax Error in Symbol Window Channel B Flag<br>0: No syntax error detected<br>1: Syntax error during symbol window detected on channel B |

Table 20.51 FLXAnFRSWNIT Register Contents (2/2)

| Bit | Symbol | Function |
|---|---|---|
| 2 | TCSA | Transmission Conflict in Symbol Window Channel A Flag<br>0: No transmission conflict detected<br>1: Transmission conflict in symbol window detected on channel A |
| 1 | SBSA | Slot Boundary Violation in Symbol Window Channel A Flag<br>0: No slot boundary violation detected<br>1: Slot boundary violation during symbol window detected on channel A |
| 0 | SESA | Syntax Error in Symbol Window Channel A Flag<br>0: No syntax error detected<br>1: Syntax error during symbol window detected on channel A |

**(1) FLXAnFRSWNIT.SBNB**

Indicates a Slot Boundary Violation during NIT Channel B Flag (vSS!BViolationB).

Reset when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFRSWNIT.SENB**

Indicates a Syntax Error during NIT Channel B Flag (vSS!SyntaxErrorB).

Reset when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFRSWNIT.SBNA**

Indicates a Slot Boundary Violation during NIT Channel A Flag (vSS!BViolationA).

Reset when leaving CONFIG state or when entering STARTUP state.

**(4) FLXAnFRSWNIT.SENA**

Indicates a Syntax Error during NIT Channel A Flag (vSS!SyntaxErrorA).

Reset when leaving CONFIG state or when entering STARTUP state.

**(5) FLXAnFRSWNIT.MTSB**

Indicates a MTS Received on Channel B Flag (vSS!ValidMTSB).

Media Access Test symbol received on channel B during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to 1, also interrupt flag FLXAnFRSIR.MTSB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

**(6) FLXAnFRSWNIT.MTSA**

Indicates a MTS Received on Channel A Flag (vSS!ValidMTSA).

Media Access Test symbol received on channel A during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to 1, also interrupt flag FLXAnFRSIR.MTSA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

**(7) FLXAnFRSWNIT.TCSB**

Indicates a Transmission Conflict in Symbol Window Channel B Flag (vSS!TxConflictB).

Reset when leaving CONFIG state or when entering STARTUP state.

**(8) FLXAnFRSWNIT.SBSB**

Indicates a Slot Boundary Violation in Symbol Window Channel B Flag (vSS!BViolationB).

Reset when leaving CONFIG state or when entering STARTUP state.

**(9) FLXAnFRSWNIT.SESB**

Indicates a Syntax Error in Symbol Window Channel B Flag (vSS!SyntaxErrorB).

Reset when leaving CONFIG state or when entering STARTUP state.

**(10) FLXAnFRSWNIT.TCSA**

Indicates a Transmission Conflict in Symbol Window Channel A Flag (vSS!TxConflictA).

Reset when leaving CONFIG state or when entering STARTUP state.

**(11) FLXAnFRSWNIT.SBSA**

Indicates a Slot Boundary Violation in Symbol Window Channel A Flag (vSS!BViolationA).

Reset when leaving CONFIG state or when entering STARTUP state.

**(12) FLXAnFRSWNIT.SESA**

Indicates a Syntax Error in Symbol Window Channel A Flag (vSS!SyntaxErrorA).

Reset when leaving CONFIG state or when entering STARTUP state.

### 20.2.7.9 FLXAnFRACS — FlexRay Aggregated Channel Status Register

The aggregated channel status provides the Host with an accrued status of channel activity for all communication slots regardless of whether they are assigned for transmission or subscribed for reception.

The aggregated channel status also includes status data from the symbol window and the network idle time.

The status data is updated (set) after each slot and aggregated until it is reset by the Host.

During startup the status data is not updated.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0128_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| 8 | VFRB | Valid Frame Received on Channel B Flag<br>0: No valid frame received<br>1: Valid frame(s) received on channel B |
| 7 to 5 | Reserved | These bits are always read as 0. The write value should be always 0. |
| 4 | SBVA | Slot Boundary Violation on Channel A Flag<br>0: No slot boundary violation observed<br>1: Slot boundary violation(s) observed on channel A |
| 3 | CIA | Communication Indicator Channel A Flag<br>0: No valid frame(s) received in slots containing any additional communication<br>1: Valid frame(s) received on channel A in slots containing any additional communication |

Table 20.52 FLXAnFRACS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | CEDA | Content Error Detected on Channel A Flag<br>0: No frame with content error received<br>1: Frame(s) with content error received on channel A |
| 1 | SEDA | Syntax Error Detected on Channel A Flag<br>0: No syntax error observed<br>1: Syntax error(s) observed on channel A |
| 0 | VFRA | Valid Frame Received on Channel A Flag<br>0: No valid frame received<br>1: Valid frame(s) received on channel A |

### (1) FLXAnFRACS.SBVB

Slot Boundary Violation on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more slot boundary violations were observed on channel B at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

### (2) FLXAnFRACS.CIB

Communication Indicator Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel B in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

**CAUTION**

The set condition of the flag FLXAnFRACS.CIB is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.
When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.
Reset when leaving CONFIG state or when entering STARTUP state.

### (3) FLXAnFRACS.CEDB

Content Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more frames with a content error were received on channel B in any static or dynamic slot during the observation period.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

#### (4) FLXAnFRACS.SEDB

Syntax Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel B.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

#### (5) FLXAnFRACS.VFRB

Valid Frame Received on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel B in any static or dynamic slot during the observation period.

Reset when leaving CONFIG state or when entering STARTUP state.

#### (6) FLXAnFRACS.SBVA

Slot Boundary Violation on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Slot boundary violations were observed on channel A at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

#### (7) FLXAnFRACS.CIA

Communication Indicator Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel A in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

**CAUTION**

The set condition of the flag FLXAnFRACS.CIA is also fulfilled if there is only one single frame in the slot and the slot boundary at the end of the slot is reached during the frames channel idle recognition phase.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

**(8) FLXAnFRACS.CEDA**

Content Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more frames with a content error were received on channel A in any static or dynamic slot during the observation period.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

**(9) FLXAnFRACS.SEDA**

Syntax Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel A.

When this flag changes from 0 to 1, interrupt flag FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

**(10) FLXAnFRACS.VFRA**

Valid Frame Received on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel A in any static or dynamic slot during the observation period.

Reset when leaving CONFIG state or when entering STARTUP state.

### 20.2.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m (m = 1 to 15)

Registers FLXAnFRESID1 to FLXAnFRESID15 hold the frame IDs of the sync frames received in even communication cycles used for clock synchronisation up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFRESID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an even communication cycle, register FLXAnFRESID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFRESID1.RXEA, FLXAnFRESID1.RXEB are set. The value is updated during the NIT of each even communication cycle.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0130_H$ to <FLXn_base> + $0168_H$ (<FLXn_base> + $0130_H$ + (n – 1) *4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RXEB | RXEA | — | — | — | — | EID[9:0] | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.53 FLXAnFRESIDn (n = 1 to 15) Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 15 | RXEB | Received / Configured Even Sync ID on Channel B Flag<br>0: No sync frame received on channel B / node not configured to transmit sync frames<br>1: Sync frame received on channel B / node configured to transmit sync frames |
| 14 | RXEA | Received / Configured Even Sync ID on Channel A Flag<br>0: No sync frame received on channel A / node not configured to transmit sync frames<br>1: Sync frame received on channel A / node configured to transmit sync frames |
| 13 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 to 0 | EID[9:0] | Even Sync ID (vsSyncIDListA, B even) Flag |

**(1) FLXAnFRESIDn.RXEB**

Received / Configured Even Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel B or that the node is configured to be a sync node with key slot = FLXAnFRESID1.EID.

Reset when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFRESIDn.RXEA**

Received / Configured Even Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel A or that the node is configured to be a sync node with key slot = FLXAnFRESID1.EID.

Reset when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFRESIDn.EID**

Even Sync ID Flag (vsSyncIDListA, B even)

Sync frame ID even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

### 20.2.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m (m = 1 to 15)

Registers FLXAnFROSID1 to FLXAnFROSID15 hold the frame IDs of the sync frames received in odd communication cycles used for clock synchronisation up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFROSID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an odd communication cycle, register FLXAnFROSID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFROSID1.RXOA, FLXAnFROSID1.RXOB are set. The value is updated during the NIT of each odd communication cycle.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0170_H$ to <FLXn_base> + $01A8_H$ (<FLXn_base> + $0170_H$ + (n – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.54 FLXAnFROSIDn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 15 | RXOB | Received / Configured Odd Sync ID on Channel B Flag<br>0: No sync frame received on channel B / node not configured to transmit sync frames<br>1: Sync frame received on channel B / node configured to transmit sync frames |
| 14 | RXOA | Received / Configured Odd Sync ID on Channel A Flag<br>0: No sync frame received on channel A / node not configured to transmit sync frames<br>1: Sync frame received on channel A / node configured to transmit sync frames |
| 13 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 to 0 | OID[9:0] | Odd Sync ID Flag (vsSyncIDListA, B odd) |

**(1) FLXAnFROSIDn.RXOB**

Received / Configured Odd Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel B or that the node is configured to be a sync node with key slot = FLXAnFROSID1.OID.

Reset when leaving CONFIG state or when entering STARTUP state.

**(2) FLXAnFROSIDn.RXOA**

Received / Configured Odd Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel A or that the node is configured to be a sync node with key slot = FLXAnFROSID1.OID.

Reset when leaving CONFIG state or when entering STARTUP state.

**(3) FLXAnFROSIDn.OID**

Odd Sync ID Flag (vsSyncIDListA, B odd)

Sync frame ID odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

### 20.2.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m (m = 1 to 3)

The three network management registers hold the accrued NM vector (see **Section 20.3.7, Network Management**).

The CC updates the NM vector at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.

NMVn-bytes exceeding the configured NM vector length are not valid.

For information about the byte alignment of the received NM vector in this register see **Section 20.3.17, Byte Alignment**.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $01B0_H$ to <FLXn_base> + $01B8_H$ (<FLXn_base> + $01B0_H$ + (n – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NM[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NM[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.55 FLXAnFRNMVn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | NM[31:0] | NM Vector<br>The three network management vector registers hold the accrued NM vector (configurable 0 to 12 bytes). The NM vector to be held is generated by bit-wise logic OR for each NM vector received on each channel (valid static frames with PPI = 1) (see **Section 20.3.7, Network Management**).<br>For information about the byte alignment of the received NM vector in this register see **Section 20.3.17, Byte Alignment**.<br>NMVn-bytes exceeding the configured NM vector length are not valid.<br>The Register Contents are updated at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.<br>These bits are cleared when leaving CONFIG state or when entering STARTUP state. |

## 20.2.8 Message Buffer Control Registers

### 20.2.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register

The Message RAM Configuration register defines the number of message buffers assigned to the static segment, dynamic segment, and FIFO.

The Message RAM can be divided into up three different areas; Static Buffer area, Static and Dynamic Buffer area, FIFO area. If present, the Static Buffer area is starting at Message Buffer 0.

The start of the Static and Dynamic Buffer area is configured by FLXAnFRMRC.FDB. FLXAnFRMRC.FDB defines the end of the Static Buffer area. If no Static Buffer area is present, the Static and Dynamic Buffer area starts at Message Buffer 0.

The start of the FIFO area is configured by FLXAnFRMRC.FFB. FLXAnFRMRC.FFB defines the end of the previous area, which can be either the Static Buffer area or the Static and Dynamic Buffer area. If no Static Buffer area and no Static and Dynamic Buffer area is present, the FIFO area starts at Message Buffer 0.

With FLXAnFRMRC.LCB the end of the last configured area is configured which can be the Static Buffer area, the Static and Dynamic Buffer area or the FIFO area.

**Figure 20.2** shows an example configuration of the Message RAM where all there area are configured.

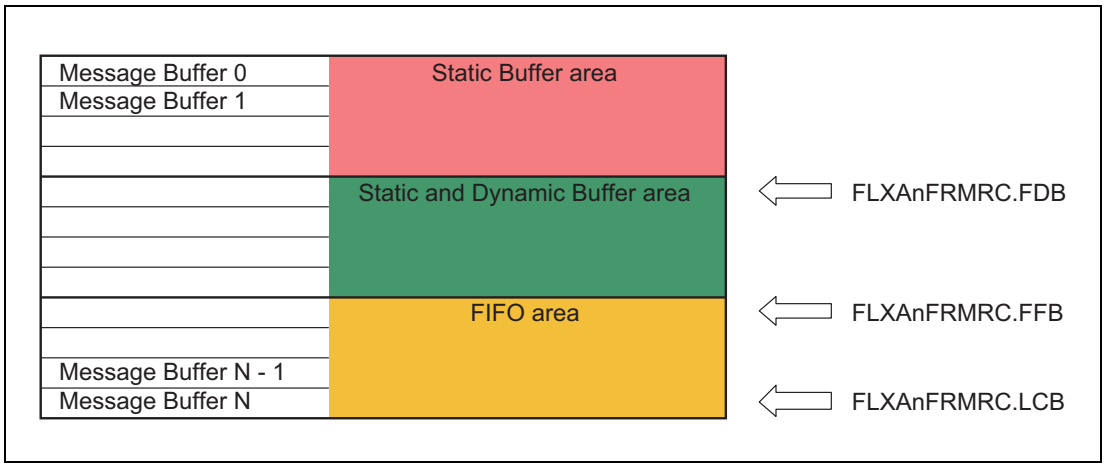

Figure 20.2 FLXAnFRNMVn Register Contents

**CAUTIONS**

1. **In case the node is configured as sync node (FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (FLXAnFRSUCC1.TSM = 1), message buffer 0 resp. 1 is reserved for sync frames or single slot frames and have to be configured with the node-specific key slot ID. In case the node is neither configured as sync node nor for single slot operation message buffer 0 resp. 1 is treated like all other message buffers.**
2. **The maximum number of header sections is 128. This means a maximum of 128 message buffers can be configured. The maximum length of a data section is 254 bytes. The length of the data section may be configured differently for each message buffer. For details see Section 20.3.13, Message RAM.**
3. **In case two or more message buffers are assigned to slot 1 by use of cycle filtering, all of them must be located either in the “Static Buffers” or at the**

**beginning of the “Static + Dynamic Buffers” section.**

4. **The FlexRay protocol specification requires that each node has to send a frame in its key slot. Therefore at least message buffer 0 is reserved for transmission in the key slot. Due to this requirement a maximum number of 127 message buffers can be assigned to the FIFO. Nevertheless, a non protocol conform configuration without a transmission slot in the static segment would still be operational.**
5. **The payload length configured and the length of the data section need to be configured identical for all message buffers belonging to the FIFO via FLXAnFRWRHS2.PL and FLXAnFRWRHS3.DP. When the CC is not in DEFAULT_CONFIG or CONFIG state reconfiguration of message buffers belonging to the FIFO is locked.**

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0300_H$

**Value after reset:** $0180\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.56 FLXAnFRMRC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 26 | SPLM | Sync Frame Payload Multiplex Bit<br>0: Only message buffer 0 locked against reconfiguration<br>1: Both message buffers 0 and 1 are locked against reconfiguration |
| 25, 24 | SEC[1:0] | Secure Buffers Bit<br>00: all buffers unlocked<br>01: static buffers locked, FIFO locked, limited transmission<br>10: all buffers locked<br>11: all buffers locked, limited transmission |
| 23 to 16 | LCB[7:0] | Last Configured Buffer Bit<br>0 to 127: Number of message buffers is FLXAnFRMRF.LCB + 1<br>128: No message buffer assigned to the FIFO |
| 15 to 8 | FFB[7:0] | First Buffer of FIFO Bit<br>0: All message buffers assigned to the FIFO<br>1 to 127: Message buffers from FLXAnFRMRC.FFB to FLXAnFRMRC.LCB assigned to the FIFO<br>128: No message buffer configured |
| 7 to 0 | FDB[7:0] | First Dynamic Buffer Bit<br>0: No group of message buffers exclusively for the static segment configured<br>1 to 127: Message buffers 0 to FLXAnFRMRC.FDB – 1 reserved for static segment<br>128: No dynamic message buffers configured |

**(1) FLXAnFRMRC.SPLM**

Sync Frame Payload Multiplex Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

This bit is only evaluated if the node is configured as sync node (FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (FLXAnFRSUCC1.TSM = 1).

When this bit is set to 1 message buffers 0 and 1 are dedicated for sync frame transmission with different payload data on channel A and B.

When this bit is set to 0, sync frames are transmitted from message buffer 0 with the same payload data on all channels configured. Note that the channel filter configuration for message buffer 0 resp. message buffer 1 has to be chosen accordingly.

**(2) FLXAnFRMRC.SEC**

Secure Buffers Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Not evaluated when the CC is in DEFAULT_CONFIG or CONFIG state.

For temporary unlocking, see **Section 20.3.13.4, Host Handling of Access Errors**.

$00_B$ = all buffers unlocked

Reconfiguration of message buffers enabled with numbers < FLXAnFRMRC.FFB enabled

Exception: In nodes configured for sync frame transmission or for single slot mode operation message buffer 0 (and if FLXAnFRMRC.SPLM = 1, also message buffer 1) is always locked

$01_B$ = static buffers locked, FIFO locked, limited transmission

Reconfiguration of message buffers with numbers < FLXAnFRMRC.FDB and with numbers ≥ FLXAnFRMRC.FFB locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled

$10_B$ = all buffers locked

Reconfiguration of all message buffers locked

$11_B$ = all buffers locked, limited transmission

Reconfiguration of all message buffers locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled

**(3) FLXAnFRMRC.LCB**

Last Configured Buffer Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FDB.

When a FIFO area is configured (FLXAnFRMRC.FFB < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FFB.

**(4) FLXAnFRMRC.FFB**

First Buffer of FIFO Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (FLXAnFRMRC.FDB < 128), the user should configure FLXAnFRMRC.FFB > FLXAnFRMRC.FDB.

**(5) FLXAnFRMRC.FDB**

First Dynamic Buffer Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

### 20.2.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register

The FIFO Rejection Filter defines a user specified sequence of bits to which channel, frame ID, and cycle count of the incoming frames are compared. Together with the FIFO Rejection Filter Mask this register determines whether a message is rejected by the FIFO.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0304_H$

**Value after reset:** $0180\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | RNF | RSS | CYF[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| | — | — | — | FID[10:0] | | | | | | | | | | | CH[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.57 FLXAnFRFRF Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 25 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 24 | RNF | Reject Null Frames Bit<br>0: Null frames are stored in the FIFO<br>1: Reject all null frames |
| 23 | RSS | Reject in Static Segment Bit<br>0: FIFO also used for static segment<br>1: Reject messages in static segment |
| 22 to 16 | CYF[6:0] | Cycle Counter Filter Bit<br>Cycle Counter Filter |
| 15 to 13 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 12 to 2 | FID[10:0] | Frame ID Filter Bit<br>0 to 2047: Frame ID filter values |
| 1, 0 | CH[1:0] | Channel Filter Bit<br>00: receive on both channels<br>01: receive only on channel B<br>10: receive only on channel A<br>11: no reception |

#### (1) FLXAnFRFRF.RNF

Reject Null Frames Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

If this bit is set to 1, received null frames are not stored in the FIFO.

**(2) FLXAnFRFRF.RSS**

Reject in Static Segment Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

If this bit is set to 1, the FIFO is used only for the dynamic segment.

**(3) FLXAnFRFRF.CYF**

Cycle Counter Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected. For details about the configuration of the cycle counter filter see **Section 20.3.8.2, Cycle Counter Filtering**.

**(4) FLXAnFRFRF.FID**

Frame ID Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

Determines the frame ID to be rejected by the FIFO. With the additional configuration of register FLXAnFRFRFM, the corresponding frame ID filter bits are ignored, which results in further rejected frame IDs. When FLXAnFRFRFM.MFID is zero, a frame ID filter value of zero means that no frame ID is rejected.

**(5) FLXAnFRFRF.CH**

Channel Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

If reception on both channels is configured, also in static segment always both frames (from channel A and B) are stored in the FIFO, even if they are identical.

### 20.2.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register

The FlexRay FIFO Rejection Filter Mask specifies which of the corresponding frame ID filter bits are relevant for rejection filtering. If a bit is set to 1, it indicates that the corresponding bit in the FLXAnFRFRF register will not be considered for rejection filtering.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0308_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | MFID[10:0] | | | | | | | | | | | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

**Table 20.58 FLXAnFRFRFM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 13 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 12 to 2 | MFID[10:0] | Mask Frame ID Filter Bit<br>0: Corresponding frame ID filter bit is used for rejection filtering<br>1: Ignore corresponding frame ID filter bit. |
| 1, 0 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |

#### (1) FLXAnFRFRFM.MFID

Mask Frame ID Filter Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

### 20.2.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $030C_H$

**Value after reset:** $0000\ 0080_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CL[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.59 FLXAnFRFCL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 7 to 0 | CL[7:0] | Critical Level Bit<br>Critical Level |

#### (1) FLXAnFRFCL.CL

Critical Level Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

When the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level configured by FLXAnFRFCL.CL, the receive FIFO critical level flag FLXAnFRFSR.RFCL is set to 1.

If FLXAnFRFCL.CL is programmed to values > 128, bit FLXAnFRFSR.RFCL is never set to 1.

## 20.2.9 Message Buffer Status Registers

### 20.2.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0310_H$

**Value after reset:** $0000\ 0080_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | MBU[6:0] | | | | | | | — | MBT[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 20.60 FLXAnFRMHDS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 30 to 24 | MBU[6:0] | Message Buffer Updated Flag<br>Message Buffer Updated |
| 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | MBT[6:0] | Message Buffer Transmitted Flag<br>Message Buffer Transmitted |
| 15 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 14 to 8 | FMB[6:0] | Faulty Message Buffer Number Flag |
| 7 | CRAM | Clear all internal RAM's Flag<br>0: No execution of the CHI command CLEAR_RAMS<br>1: Execution of the CHI command CLEAR_RAMS ongoing |
| 6 | MFMB | Multiple Faulty Message Buffer Detection Flag<br>0 = No additional faulty message buffer.<br>1 = Additional faulty message buffer was detected while the FMBD flag is set to 1. |
| 5 | FMBD | Faulty Message Buffer Detection Flag<br>0 = No faulty message buffer.<br>1 = Message buffer referenced by FLXAnFRMHDS.FMB holds faulty data with a parity error. |
| 4 | ATBF2 | Temporary Buffer RAM B Access Error Flag<br>0 = No access error<br>1 = Access error occurred when reading the RAM B. |
| 3 | ATBF1 | Temporary Buffer RAM A Access Error Flag<br>0 = No access error.<br>1 = Access error occurred when reading the RAM A. |
| 2 | AMR | Message RAM Access Error Flag<br>0 = No access error<br>1 = Access error occurred when reading the Message RAM. |
| 1, 0 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |

**(1) FLXAnFRMHDS.MBU**

Message Buffer Updated Flag

Number of message buffer that was updated last by the CC. For this message buffer the respective ND and / or MBC flag in the FLXAnFRNDAT1/2/3/4 registers and the FLXAnFRMBSC1/2/3/4 registers are also set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(2) FLXAnFRMHDS.MBT**

Message Buffer Transmitted Flag

Number of last successfully transmitted message buffer.

If the message buffer is configured for single-shot mode, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 registers was reset to 0.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(3) FLXAnFRMHDS.FMB**

Faulty Message Buffer Number Flag

This flag indicates that an access error occurred when reading from the message buffer referenced by FLXAnFRMHDS.FMB.

The value of this flag is only valid when FLXAnFRMHDS.AMR and flag FLXAnFRMHDS.FMBD are set to 1.

This flag is not updated while the FLXAnFRMHDS.FMBD flag is 1.

This flag is cleared by the CHI command CLEAR_RAMS.

**(4) FLXAnFRMHDS.CRAM**

Internal RAM Clear Flag

This flag indicates that the CHI command CLEAR_RAMS is ongoing (all bits of the message RAM, input buffer, output buffer and nonresident buffer are written to 0).

This flag is set by the CHI command CLEAR_RAMS.

**(5) FLXAnFRMHDS.MFMB**

Multiple Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This bit indicates that an additional faulty message buffer was detected while the FMBD flag is set.

This bit is cleared by the CHI command CLEAR_RAMS.

**(6) FLXAnFRMHDS.FMBD**

Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This bit indicates that the message buffer referenced by FLXAnFRMHDS.FMB holds faulty data due to an access error.

This bit is cleared by the CHI command CLEAR_RAMS.

### (7) FLXAnFRMHD.ATBF2

Temporary Buffer RAM B Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the RAM B.

**CAUTION**

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1. This flag can be reset by the CHI command CLEAR_RAMS.

### (8) FLXAnFRMHD.ATBF1

Temporary Buffer RAM A Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the RAM A.

**CAUTION**

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1. This flag can be reset by the CHI command CLEAR_RAMS.

### (9) FLXAnFRMHDS.AMR

Message RAM Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the Message RAM.

**CAUTION**

When this flag changes from 0 to 1, the AERR bit in the FLXAnFREIR register is set to 1. This flag can be reset by the CHI command CLEAR_RAMS.

### 20.2.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0314_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | LDTB[10:0] | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | LDTA[10:0] | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.61 FLXAnFRLDTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 26 to 16 | LDTB[10:0] | Last Dynamic Transmission Channel B Flag |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | LDTA[10:0] | Last Dynamic Transmission Channel A Flag |

#### (1) FLXAnFRLDTS.LDTB

Last Dynamic Transmission Channel B Flag

Stores the value of vSlotCounter[B] at the time of the last frame transmission on channel B in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS of channel B.

#### (2) FLXAnFRLDTS.LDTA

Last Dynamic Transmission Channel A Flag

Stores the value of vSlotCounter[A] at the time of the last frame transmission on channel A in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS of channel A.

### 20.2.9.3 FLXAnFRFSR — FlexRay FIFO Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0318_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.62 FLXAnFRFSR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 15 to 8 | RFFL[7:0] | Receive FIFO Fill Level Flag |
| 7 to 3 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 2 | RFO | Receive FIFO Overrun Flag<br>0: No receive FIFO overrun detected<br>1: A receive FIFO overrun has been detected |
| 1 | RFCL | Receive FIFO Critical Level Flag<br>0: Receive FIFO below critical level<br>1: Receive FIFO critical level reached |
| 0 | RFNE | Receive FIFO Not Empty Flag<br>0: Receive FIFO is empty<br>1: Receive FIFO is not empty |

**(1) FLXAnFRFSR.RFFL**

Receive FIFO Fill Level Flag

Indicates the number of FIFO buffers filled with new data not yet read by the Host. Maximum value is 128.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(2) FLXAnFRFSR.RFO**

Receive FIFO Overrun Flag

The flag is set to 1 by the CC when a receive FIFO overrun is detected.

When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, interrupt flag FLXAnFREIR.RFO is set to 1.

The flag is cleared by the next FIFO read access issued by the Host.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(3) FLXAnFRFSR.RFCL**

Receive FIFO Critical Level Flag

This flag is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRFCL.CL.

When FLXAnFRFSR.RFCL changes from 0 to 1 bit FLXAnFRSIR.RFCL is set to 1, and if enabled, an interrupt is generated.

The flag is cleared by the CC as soon as FLXAnFRFSR.RFFL drops below FLXAnFRFCL.CL.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(4) FLXAnFRFSR.RFNE**

Receive FIFO Not Empty Flag

This flag is set to 1 by the CC when a received valid frame (data or null frame depending on rejection mask) was stored in the FIFO. In addition, interrupt flag FLXAnFRSIR.RFNE is set to 1.

The bit is reset to 0 after the Host has read all messages from the FIFO.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

### 20.2.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register

Some constraints exist for the Message Handler regarding bus clock frequency, Message RAM configuration, and FlexRay bus traffic. To simplify software development, constraints violations are reported by setting flags in the FLXAnFRMHDF.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $031C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| 1 | SNUB | Status Not Updated Channel B Flag<br>0: No overload condition occurred when updating MBS for channel B<br>1: MBS for channel B not updated |
| 0 | SNUA | Status Not Updated Channel A Flag<br>0: No overload condition occurred when updating MBS for channel A<br>1: MBS for channel A not updated |

**(1) FLXAnFRMHDF.WAHP**

Write Attempt to Header Partition Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Outside DEFAULT_CONFIG and CONFIG state this flag is set to 1 by the CC when the message handler tries to write message data into the header partition of the Message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(2) FLXAnFRMHDF.TNSB**

Transmission Not Started Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(3) FLXAnFRMHDF.TNSA**

Transmission Not Started Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(4) FLXAnFRMHDF.TBFB**

Temporary buffer Access Failure B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when a read or write access to TBF B requested by PRT (Protocol controller) B could not complete within the available time.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(5) FLXAnFRMHDF.TBFA**

Temporary buffer Access Failure A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when a read or write access to TBF A requested by PRT A could not complete within the available time.

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(6) FLXAnFRMHDF.FNFB**

Find Sequence Not Finished Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(7) FLXAnFRMHDF.FNFA**

Find Sequence Not Finished Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(8) FLXAnFRMHDF.SNUB**

Status Not Updated Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

**(9) FLXAnFRMHDF.SNUA**

Status Not Updated Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).

When this flag changes from 0 to 1 in addition interrupt flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

### 20.2.9.5 FLXAnFRTXRQi — FlexRay Transmission Request i (i = 1 to 4)

The four registers reflect the state of the TXR flags of all configured message buffers. The flags are evaluated for transmit buffers only. If the number of configured message buffers is less than 128, the remaining TXR flags have no meaning.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0320_H$ to <FLXn_base> + $032C_H$ (<FLXn_base> + $0320_H$ + (i – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TXRo[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TXRo[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.64 FLXAnFRTXRQi Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31:0 | TXRo[31:0] | Transmission Request Flag o |

#### (1) FLXAnFRTXRQi.TXRo (o = (i – 1)*32 to (i*32 – 1))

Transmission Request Flag o

If the flag is set to 1, the respective message buffer is ready for transmission respectively transmission of this message buffer is in progress.

In single-shot mode the flags are reset to 0 after transmission has completed.

This bit is cleared by the CHI command CLEAR_RAMS.

### 20.2.9.6 FLXAnFRNDATi — FlexRay New Data Register i (i = 1 to 4)

The four registers reflect the state of the ND flags of all configured message buffers. ND flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128, the remaining ND flags have no meaning.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0330_H$ to <FLXn_base> + $033C_H$ (<FLXn_base> + $0330_H$ + (i – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NDn[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | NDn[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.65 FLXAnFRNDATi Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | NDn[31:0] | New Data Flag n |

#### (1) FLXAnFRNDATi.NDn (n = (i – 1)*32 to (i*32 – 1))

New Data Flag n

The flags are set to 1 when a valid received data frame matches the message buffer's filter configuration, independent of the payload length received or the payload length configured for that message buffer.

The flags are not set to 1 after reception of null frames except for message buffers belonging to the receive FIFO.

An ND flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the Output Buffer.

Reset when leaving CONFIG state or when entering STARTUP state.

This bit is cleared by the CHI command CLEAR_RAMS.

### 20.2.9.7 FLXAnFRMBSCi — FlexRay Message Buffer Status Changed Register i (i = 1 to 4)

The four registers reflect the state of the MBC flags of all configured message buffers. If the number of configured message buffers is less than 128, the remaining MBC flags have no meaning.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0340_H$ to <FLXn_base> + $034C_H$ (<FLXn_base> + $0340_H$ + (i – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MBCm[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MBCm[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.66 FLXAnFRMBSCi (i = 1 to 4) Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | MBCm[31:0] | Message Buffer Status Changed Flag m |

#### (1) FLXAnFRMBSCi.MBCm (m = (i – 1)*32 to (i*32 – 1))

Message Buffer Status Changed Flag m

Indicates whether the Message Handler has changed one of the status flags VFRA, VFRB, SEOA, SEOB, CEOA, CEOB, SVOA, SVOB, TCIA, TCIB, ESA, ESB, MLST, FTA, FTB in the header section (see **Section 20.2.12.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** and **Section 20.3.13.1, Header Partition** of the respective message buffer.

An MBC flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the Output Buffer.

Reset when leaving CONFIG state or when entering STARTUP state.

This bit is cleared by the CHI command CLEAR_RAMS.

## 20.2.10 Identification Registers

### 20.2.10.1 FLXAnFRPV — FlexRay Product Version Register

**Access:** This register can be read/ in 32-bit units.

**Address:** <FLXn_base> + $0000_H$

**Value after reset:** 2A10 $2300_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | AID[7:0] | | | | | | | | INV[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |

| Value after reset | 0 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.67 FLXAnFRPV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | AID[7:0] | AUTOSAR ID<br>Fixed to $2A_H$ |
| 23 to 16 | INV[7:0] | Internal version<br>Release version of the FlexRay IP |
| 15 to 8 | JID[7:0] | JEDEC ID<br>Fixed to $23_H$ |
| 7 to 0 | Reserved | When read, the value after reset always is read. When writing |

#### (1) FLXAnFRPV.AID

AUTOSAR ID

#### (2) FLXAnFRPV.INV

Internal version

These bits show the release version of the FlexRay IP

The bits FLXAnFRPV.INV[7:4] show the main release number and the bits FLXAnFRPV.INV[3:0] show the sub release number.

Examples:

10h = IP release 1.0

11h = IP release 1.1

20h = IP release 2.0

#### (3) FLXAnFRPV.JID

JEDEC ID

### 20.2.11 Input Buffer

Double buffer structure consisting of Input Buffer Host and Input Buffer Shadow. While the Host can write to Input Buffer Host, the transfer to the Message RAM is done from Input Buffer Shadow. The Input Buffer holds the header and data sections to be transferred to the selected message buffer in the Message RAM. It is used to configure the message buffers in the Message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the Message RAM from the Input Buffer, the Message Buffer Status as described in **Section 20.2.12.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** is automatically reset to zero.

The header sections of message buffers belonging to the receive FIFO can only be (re)configured when the CC is in DEFAULT_CONFIG or CONFIG state. For those message buffers only the payload length configured and the data pointer need to be configured via FLXAnFRWRHS2.PLC and FLXAnFRWRHS3.DP. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask.

The data transfer between Input Buffer (IBF) and Message RAM is described in detail in **Section 20.3.12.2, Host access to Message RAM**.

These registers cannot be written when the input data transfer function shown in **Section 20.3.16.1, Input Data Transfer** is used and the FLXAnFRITS.ITS bit is 1.

### 20.2.11.1 FLXAnFRWRDSx — FlexRay Write Data Section Register x (x = 1 to 64)

This register holds the data words to be transferred to the data section of the specified message buffer. The number of data words written to the Message RAM is defined by the payload length configured in FLXAnFRWRHS2.PLC bit.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0400_H$ to <FLXn_base> + $04FC_H$ (<FLXn_base> + $0400_H$ + (x – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MD[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MD[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.68 FLXAnFRWRDSx Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | MD[31:0] | Message Data Bit |

#### (1) FLXAnFRWRDSx.MD

Message Data Bit

For information about the byte alignment of the message data in this register see **Section 20.3.17, Byte Alignment**.

**CAUTIONS**

1. In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.
2. When writing to FLXAnFRWRDSn, each 32-bit word has to be filled up by one 32-bit access OR two consecutive 16-bit accesses OR four consecutive 8- bit accesses before the transfer from the Input Buffer to the Message RAM is started. If not all bytes of a 32- bit word have been written by the Host (8/16-bit access only), FLXAnFRWRDSn holds partly undefined data.
   Reset by the CHI command CLEAR_RAMS.

### 20.2.11.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0500_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 20.69 FLXAnFRWRHS1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 | MBI | Message Buffer Interrupt Bit<br>0: The corresponding message buffer interrupt is disabled<br>1: The corresponding message buffer interrupt is enabled |
| 28 | TXM | Transmission Mode Setting Bit<br>0: Continuous mode<br>1: Single-shot mode |
| 27 | PPIT | Payload Preamble Indicator Transmit Bit<br>0: Payload Preamble Indicator is set to 0<br>1: Payload Preamble Indicator is set to 1 |
| 26 | CFG | Message Buffer Direction Configuration Bit<br>0: The corresponding buffer is configured as Receive Buffer<br>1: The corresponding buffer is configured as Transmit Buffer |
| 25, 24 | CH[1:0] | Channel Filter Control Bit |
| 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | CYC[6:0] | Cycle Code Bit |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | FID[10:0] | Frame ID Bit |

#### (1) FLXAnFRWRHS1.MBI

Message Buffer Interrupt Enable Bit

This bit enables the message buffer interrupt.

After a dedicated receive buffer has been updated by the Message Handler, flag FLXAnFRSIR.RXI and /or FLXAnFRSIR.MBSI are set to 1. After a transmission has completed flag FLXAnFRSIR.TXI is set to 1.

#### (2) FLXAnFRWRHS1.TXM

Transmission Mode Setting Bit

This bit selects transmit mode of the corresponding message buffer. For transmit mode, see **Section 20.3.9.3, Transmit Buffers**.

#### (3) FLXAnFRWRHS1.PPIT

Payload Preamble Indicator Transmit Bit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames in transmit frames of the corresponding message buffer.

If the bit is set to 1 in a static message buffer, the respective message buffer holds network management information.

If the bit is set to 1 in a dynamic message buffer the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the Host.

#### (4) FLXAnFRWRHS1.CFG

Message Buffer Direction Configuration Bit

This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO the bit is not evaluated.

If the user doesn't leave at least 32bit unused area at the head of Data Partition, the user should configure the Message Buffer which Data Section is located directly following the Header partition (the last configured buffer) as transmit buffer by setting this bit to “1”.

#### (5) FLXAnFRWRHS1.CH

Channel Filter Control Bit

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

| CH[1:0] | Transmit Buffer transmit frame on | Receive Buffer store frame received from |
|---|---|---|
| 00 | No transmission | Ignore frame |
| 01 | Channel A | Channel A |
| 10 | Channel B | Channel B |
| 11 | Both channels (static segment only) | Channel A or B (store first semantically valid frame; static segment only) |

**CAUTION**

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted resp. received frames are ignored (same function as CH = “$00_B$”)

**(6) FLXAnFRWRHS1.CYC**

Cycle Code Bit

The 7-bit cycle code determines the cycle set used for cycle counter filtering.

For details about the configuration of the cycle code **Section 20.3.8.2, Cycle Counter Filtering**.

**(7) FLXAnFRWRHS1.FID**

Frame ID Bit

Frame ID of the selected message buffer. The frame ID defines the slot number for transmission / reception of the respective message.

Message buffers with frame ID = 0 are considered as not valid.

### 20.2.11.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0504_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | PLC[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | CRC[10:0] | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.70 FLXAnFRWRHS2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | PLC[6:0] | Payload Length Configured Bit |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | CRC[10:0] | Header CRC Bit (vRF!Header!HeaderCRC)<br>Receive Buffer: Configuration not required<br>Transmit Buffer: Header CRC is configured |

#### (1) FLXAnFRWRHS2.PLC

Payload Length Configured Bit

Length of data section (number of 2-byte words) as configured by the Host.

During static segment the static frame payload length as configured by FLXAnFRMHDC.SFDL defines the payload length for all static frames. If the payload length configured by FLXAnFRWRHS2.PLC is shorter than this value padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is "$0000_H$" (see **Section 20.3.9.3, Transmit Buffers**).

#### (2) FLXAnFRWRHS2.CRC

Header CRC Bit (vRF!Header!HeaderCRC)

Setting of the receive buffer is not required.

Transmitting of the message buffer needs the header CRC calculation and setting.

For calculation of the header CRC the payload length of the frame send on the bus has to be considered. In static segment the payload length of all frames is configured by FLXAnFRMHDC.SFDL.

### 20.2.11.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0508_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | DP[10:0] | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.71 FLXAnFRWRHS3 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | DP[10:0] | Data Pointer Bit |

#### (1) FLXAnFRWRHS3.DP

Data Pointer Bit

Configures the pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

### 20.2.11.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register

Configures how the message buffer in the Message RAM selected by register FLXAnFRIBCR is updated. When IBF Host and IBF Shadow are swapped, also mask bits FLXAnFRIBCM.LHSH, FLXAnFRIBCM.LDSH, and FLXAnFRIBCM.STXRH are swapped with bits FLXAnFRIBCM.LHSS, FLXAnFRIBCM.LDSS, and FLXAnFRIBCM.STXRS.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0510_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | STXRS | LDSS | LHSS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | STXRH | LDSH | LHSH |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

**Table 20.72 FLXAnFRIBCM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 19 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 18 | STXRS | Set Transmission Request Shadow Flag<br>0: Reset TXR flag<br>1: Set TXR flag, transmit buffer released for transmission (operation ongoing or finished) |
| 17 | LDSS | Load Data Section Shadow Flag<br>0: Data section is not updated<br>1: Data section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished) |
| 16 | LHSS | Load Header Section Shadow Flag<br>0: Header section is not updated<br>1: Header section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished) |
| 15 to 3 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 2 | STXRH | Set Transmission Request Host Bit<br>0: Reset TXR flag<br>1: Set TXR flag, transmit buffer released for transmission |
| 1 | LDSH | Load Data Section Host Bit<br>0: Data section is not updated<br>1: Data section selected for transfer from Input Buffer to the Message RAM |
| 0 | LHSH | Load Header Section Host Bit<br>0: Header section is not updated<br>1: Header section selected for transfer from Input Buffer to the Message RAM |

**(1) FLXAnFRIBCM.STXRS**

Set Transmission Request Shadow Flag

**(2) FLXAnFRIBCM.LDSS**

Load Data Section Shadow Flag

**(3) FLXAnFRIBCM.LHSS**

Load Header Section Shadow Flag

**(4) FLXAnFRIBCM.STXRH**

Set Transmission Request Host Bit

If this bit is set to 1, the TXR flag for the selected message buffer is set in the FLXAnFRTXRQ1/2/3/4 registers to release the message buffer for transmission. In single-shot mode the flag is cleared by the CC after transmission has completed.

TXR is evaluated for transmit buffers only.

**(5) FLXAnFRIBCM.LDSH**

Set Load Data Section Host Bit

**(6) FLXAnFRIBCM.LHSH**

Set Load Header Section Host Bit

### 20.2.11.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped (see **Section 20.3.12.2 (1), Data Transfer from Input Buffer to Message RAM**).

With this write operation the FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message into the IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0. FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS are also swapped.

Any write access to an Input Buffer register while both FLXAnFRIBCR.IBSYS and FLXAnFRIBCR.IBSYH are set to 1 will cause the error flag FLXAnFREIR.IIBA to be set to 1.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0514_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.73 FLXAnFRIBCR Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | IBSYS | Input Buffer Busy Shadow Flag<br>0: Transfer between IBF Shadow and Message RAM completed<br>1: Transfer between IBF Shadow and Message RAM in progress |
| 30 to 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | IBRS[6:0] | Input Buffer Request Shadow Flag |

Table 20.73 FLXAnFRIBCR Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 | IBSYH | Input Buffer Busy Host Flag<br>0: No request pending<br>1: Request while transfer between IBF Shadow and Message RAM in progress |
| 14 to 7 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 6 to 0 | IBRH[6:0] | Input Buffer Request Host Bit |

#### (1) FLXAnFRIBCR.IBSYS

Input Buffer Busy Shadow Flag

Set to 1 after writing FLXAnFRIBCR.IBRH.

This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.

When the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0.

#### (2) FLXAnFRIBCR.IBRS

Input Buffer Request Shadow Flag

Number of the target message buffer actually updated / lately updated.

#### (3) FLXAnFRIBCR.IBSYH

Input Buffer Busy Host Flag

Set to 1 by writing FLXAnFRIBCR.IBRH while FLXAnFRIBCR.IBSYS is still 1.

This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.

After the ongoing transfer between IBF Shadow and the Message RAM has completed, the FLXAnFRIBCR.IBSYH is set back to 0.

#### (4) FLXAnFRIBCR.IBRH

Input Buffer Request Host Bit

Selects the target message buffer in the Message RAM for data transfer from Input Buffer.

## 20.2.12 Output Buffer

Double buffer structure consisting of Output Buffer Host and Output Buffer Shadow. Used to read out message buffers from the Message RAM. While the Host can read from Output Buffer Host, the Message Handler transfers the selected message buffer from Message RAM to Output Buffer Shadow. The data transfer between Message RAM and Output Buffer (OBF) is described in **Section 20.3.12.2 (2), Data Transfer from Message RAM to Output Buffer**.

These registers cannot be written when the output data transfer function shown in **Section 20.3.16.2, Output Data Transfer**, in Output Data Transfer is used and the FLXAnFROTS.OTS bit is 1.

### 20.2.12.1 FLXAnFRRDDSx — FlexRay Read Data Section Register x (x = 1 to 64)

Holds the data words read from the data section of the addressed message buffer. This register holds the data words to be transferred to the data section of the specified message buffer. The number of data words (DWn) read from the Message RAM is defined by the payload length configured in FLXAnFRRDHS2.PLC bit.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0600_H$ to <FLXn_base> + $06FC_H$ (<FLXn_base> + $0600_H$ + (x – 1)*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MD[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.74 FLXAnFRRDDSn Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | MD[31:0] | Message Data |

#### (1) FLXAnFRRDDSn.MD

Message Data Flag

For information about the byte alignment of the data words in this register see **Section 20.3.17, Byte Alignment**.

**CAUTION**

In case FLXAnFRWRHS2.PLC specifies an odd payload length, the remaining message data bytes are unused.

Reset by the CHI command CLEAR_RAMS.

### 20.2.12.2 FLXAnFRRDHS1 — FlexRay Read Header Section Register 1

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0700_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.75 FLXAnFRRDHS1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 | MBI | Message Buffer Interrupt Flag |
| 28 | TXM | Transmission Mode Flag |
| 27 | PPIT | Payload Preamble Indicator Transmit Flag |
| 26 | CFG | Message Buffer Direction Configuration Flag |
| 25, 24 | CH[1:0] | Channel Filter Control Flag |
| 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | CYC[6:0] | Cycle Code |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | FID[10:0] | Frame ID |

#### (1) FLXAnFRRDHS1.MBI

Message Buffer Interrupt Flag

Values as configured by the Host via FLXAnFRWRHS1.MBI.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

#### (2) FLXAnFRRDHS1.TXM

Transmission Mode Flag

Values as configured by the Host via FLXAnFRWRHS1.TXM.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

**(3) FLXAnFRRDHS1.PPIT**

Payload Preamble Indicator Transmit Flag

Values as configured by the Host via FLXAnFRWRHS1.PPIT.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

**(4) FLXAnFRRDHS1.CFG**

Message Buffer Direction Configuration Flag

Values as configured by the Host via FLXAnFRWRHS1.CFG.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

**(5) FLXAnFRRDHS1.CH**

Channel Filter Control Flag

Values as configured by the Host via FLXAnFRWRHS1.CH.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

**(6) FLXAnFRRDHS1.CYC**

Cycle Code

Values as configured by the Host via FLXAnFRWRHS1.CYC.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

**(7) FLXAnFRRDHS1.FID**

Frame ID

Values as configured by the Host via FLXAnFRWRHS1.FID

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are holding the received frame ID.

### 20.2.12.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0704_H$

**Value after reset:** $0000\ 0000_H$

**CAUTION**

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRWRHS2 is updated from data frames only.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.76 FLXAnFRRDHS2 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 30 to 24 | PLR[6:0] | Payload Length Received Flag (vRF!Header!Length) |
| 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | PLC[6:0] | Payload Length Configured Flag |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | CRC[10:0] | Header CRC Flag (vRF!Header!HeaderCRC) |

#### (1) FLXAnFRRDHS2.PLR

Payload Length Received Flag (vRF!Header!Length)

Payload length (vRF!Header!Length) value updated from received data frames (exception: if message buffer belongs to the receive FIFO FLXAnFRRDSH2.PLR is also updated from received null frames).

#### (2) FLXAnFRRDHS2.PLC

Payload Length Configured Flag

Length of data section (number of 2-byte words) as configured by the Host.

#### (3) FLXAnFRRDHS2.CRC

Header CRC Flag (vRF!Header!HeaderCRC)

Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames

Transmit Buffer: Header CRC configured by the Host

### (4) Data storage

When a message is stored into a message buffer the following behavior with respect to payload length received and payload length configured is implemented:

FLXAnFRRDHS2.PLR > FLXAnFRRDHS2.PLC:

The payload data stored in the message buffer is truncated to the payload length configured if FLXAnFRRDHS2.PLC even or else truncated to FLXAnFRRDHS2.PLC + 1.

FLXAnFRRDHS2.PLR <= FLXAnFRRDHS2.PLC:

The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by FLXAnFRRDHS2.PLC are filled with undefined data.

FLXAnFRRDHS2.PLR = zero:

The message buffer’s data section is filled with undefined data

FLXAnFRRDHS2.PLC = zero:

Message buffer has no data section configured. No data is stored into the message buffer's data section.

**CAUTIONS**

1. The Message RAM is organized in 4-byte words. When received data is stored into a message buffer’s data section, the number of 2-byte data words written into the message buffer is FLXAnFRRDHS2.PLC rounded to the next even value.
2. FLXAnFRRDHS2.PLC should be configured identical for all message buffers belonging to the receive FIFO. Header 2 is updated from data frames only.
   For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRWRHS2 is updated from data frames only.

### 20.2.12.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3

**CAUTION**

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area FLXAnFRWRHS3 is updated from data frames only.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0708_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.77 FLXAnFRRDHS3 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 | RES | Reserved Bit Indicator Flag (vRF!Header!Reserved) |
| 28 | PPI | Payload Preamble Indicator (vRF!Header!PPIndicator) |
| 27 | NFI | Null Frame Indicator Flag (vRF!Header!NFIndicator)<br>0: Up to now no data frame has been stored into the respective message buffer<br>1: At least one data frame has been stored into the respective message buffer |
| 26 | SYN | Sync Frame Indicator Flag (vRF!Header!SyFIndicator)<br>0: The received frame is not a sync frame<br>1: The received frame is a sync frame |
| 25 | SFI | Startup Frame Indicator Flag (vRF!Header!SuFIndicator)<br>0: The received frame is not a startup frame<br>1: The received frame is a startup frame |
| 24 | RCI | Received on Channel Indicator Flag (vSS!Channel)<br>0: Frame received on channel B<br>1: Frame received on channel A |
| 23, 22 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 21 to 16 | RCC[5:0] | Receive Cycle Counter (vRF!Header!CycleCount) |
| 15 to 11 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 10 to 0 | DP[10:0] | Data Pointer Flag |

**(1) FLXAnFRRDHS3.RES**

Reserved Bit Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as 0.

**(2) FLXAnFRRDHS3.PPI**

Payload Preamble Indicator Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

0 = The payload segment of the received frame does not contain a network management vector nor a message ID

1 = Static segment: Network management vector in the first part of the payload
Dynamic segment: Message ID in the first part of the payload

**(3) FLXAnFRRDHS3.NFI**

Null Frame Indicator Flag (vRF!Header!NFIndicator)

Is set to 1 after storage of the first received data frame.

**(4) FLXAnFRRDHS3.SYN**

Sync Frame Indicator Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.

**(5) FLXAnFRRDHS3.SFI**

Startup Frame Indicator Flag (vRF!Header!SuFIndicator)

A startup frame is marked by the startup frame indicator.

**(6) FLXAnFRRDHS3.RCI**

Received on Channel Indicator Flag (vSS!Channel)

Indicates the channel from which the received data frame was taken to update the respective receive buffer.

**(7) FLXAnFRRDHS3.RCC**

Receive Cycle Counter (vRF!Header!CycleCount)

Cycle counter value updated from received data frame.

**(8) FLXAnFRRDHS3.DP**

Data Pointer Flag

Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

The bit value is the same as that set in the FLXAnFRWRHS3.DP bit.

### 20.2.12.5 FLXAnFRMBS — FlexRay Message Buffer Status Register

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

If only one channel (A or B) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel-specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the Host updates a message buffer via Input Buffer, all FLXAnFRMBS flags are reset to zero independent of which FLXAnFRIBCM bits are set or not.

For details about receive / transmit filtering see **Section 20.3.8, Filtering and Masking**, **Section 20.3.9, Transmit Process** and **Section 20.3.10, Receive Process**.

Whenever the Message Handler changes one of the flags FLXAnFRMBS.VFRA, FLXAnFRMBS.VFRB, FLXAnFRMBS.SEOA, FLXAnFRMBS.SEOB, FLXAnFRMBS.CEOA, FLXAnFRMBS.CEOB, FLXAnFRMBS.SVOA, FLXAnFRMBS.SVOB, FLXAnFRMBS.TCIA, FLXAnFRMBS.TCIB, FLXAnFRMBS.ESA, FLXAnFRMBS.ESB, FLXAnFRMBS.MLST, FLXAnFRMBS.FTA, FLXAnFRMBS.FTB the respective message buffer's MBC flag in registers FLXAnFRMBSC1/2/3/4 is set.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $070C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 13 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 12 | MLST | Message Lost Flag<br>0: No message lost<br>1: Unprocessed message was overwritten |
| 11 | ESB | Empty Slot Channel B Flag<br>0: Bus activity detected in the assigned slot on channel B<br>1: No bus activity detected in the assigned slot on channel B |
| 10 | ESA | Empty Slot Channel A Flag<br>0: Bus activity detected in the assigned slot on channel A<br>1: No bus activity detected in the assigned slot on channel A |
| 9 | TCIB | Transmission Conflict Indication Channel B Flag (vSS!TxConflictB)<br>0: No transmission conflict occurred on channel B<br>1: Transmission conflict occurred on channel B |
| 8 | TCIA | Transmission Conflict Indication Channel A Flag (vSS!TxConflictA)<br>0: No transmission conflict occurred on channel A<br>1: Transmission conflict occurred on channel A |
| 7 | SVOB | Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB)<br>0: No slot boundary violation observed on channel B<br>1: Slot boundary violation observed on channel B |
| 6 | SVOA | Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA)<br>0: No slot boundary violation observed on channel A<br>1: Slot boundary violation observed on channel A |
| 5 | CEOB | Content Error Observed on Channel B Flag (vSS!ContentErrorB)<br>0: No content error observed on channel B<br>1: Content error observed on channel B |
| 4 | CEOA | Content Error Observed on Channel A Flag (vSS!ContentErrorA)<br>0: No content error observed on channel A<br>1: Content error observed on channel A |
| 3 | SEOB | Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB)<br>0: No syntax error observed on channel B<br>1: Syntax error observed on channel B |
| 2 | SEOA | Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA)<br>0: No syntax error observed on channel A<br>1: Syntax error observed on channel A |
| 1 | VFRB | Valid Frame Received on Channel B (vSS!ValidFrameB)<br>0: No valid frame received on channel B<br>1: Valid frame received on channel B |
| 0 | VFRA | Valid Frame Received on Channel A Flag (vSS!ValidFrameA)<br>0: No valid frame received on channel A<br>1: Valid frame received on channel A |

### (1) FLXAnFRMBS.RESS

Reserved Bit Status Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as 0.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

### (2) FLXAnFRMBS.PPIS

Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

0 = PPI indicator set to 0
The payload segment of the received frame does not contain a network management vector or a message ID

1 = PPI indicator set to 1
Static segment: Network management vector at the beginning of the payload
Dynamic segment: Message ID at the beginning of the payload

### (3) FLXAnFRMBS.NFIS

Null Frame Indicator Status Flag (vRF!Header!NFIndicator)

If set to 0 the payload segment of the received frame contains no usable data.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

### (4) FLXAnFRMBS.SYNS

Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

### (5) FLXAnFRMBS.SFIS

Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator)

The startup frame indicator specifies a startup frame.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

#### (6) FLXAnFRMBS.RCIS

Received on Channel Indicator Status Flag (vSS!Channel)

Indicates the channel on which the frame was received.

For receive buffers (FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

#### (7) FLXAnFRMBS.CCS

Cycle Count Status Flag

Actual cycle count when status was updated.

#### (8) FLXAnFRMBS.FTB

Frame Transmitted on Channel B Flag

Indicates that this node has transmitted a data frame in the configured slot on channel B.

**CAUTION**

The FlexRay protocol specification requires that FLXAnFRMBS.FTB can only be reset by the Host. Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where the bit is set to 1.

#### (9) FLXAnFRMBS.FTA

Frame Transmitted on Channel A Flag

Indicates that this node has transmitted a data frame in the configured slot on channel A.

**CAUTION**

The FlexRay protocol specification requires that FLXAnFRMBS.FTA can only be reset by the Host. Therefore the Cycle Count Status FLXAnFRMBS.CCS for this bit is only valid for the cycle where this bit is set to 1.

#### (10) FLXAnFRMBS.MLST

Message Lost Flag

The flag is set in case the Host did not read the message before the message buffer was updated from a received data frame.

Not affected by reception of null frames except for message buffers belonging to the receive FIFO. The flag is reset to 0 by a Host write to the message buffer via IBF or when a new message is stored into the message buffer after the message buffers ND flag was reset to 0 by reading out the message buffer via OBF.

#### (11) FLXAnFRMBS.ESB

Empty Slot Channel B Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

**(12) FLXAnFRMBS.ESA**

Empty Slot Channel A Flag

In an empty slot, there is no activity on the bus. This means that any frame transmission is not detected. This state can be checked in static and dynamic slots.

**(13) FLXAnFRMBS.TCIB**

Transmission Conflict Indication Channel B Flag (vSS!TxConflictB)

A transmission conflict indication is set to 1 if a transmission conflict has occurred on channel B.

**(14) FLXAnFRMBS.TCIA**

Transmission Conflict Indication Channel A Flag (vSS!TxConflictA)

A transmission conflict indication is set if a transmission conflict has occurred on channel A.

**(15) FLXAnFRMBS.SVOB**

Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on channel B.

**(16) FLXAnFRMBS.SVOA**

Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA)

A slot boundary violation (channel active at the start or at the end of the assigned slot) was observed on channel A.

**(17) FLXAnFRMBS.CEOB**

Content Error Observed on Channel B Flag (vSS!ContentErrorB)

A content error was observed in the assigned slot on channel B.

**(18) FLXAnFRMBS.CEOA**

Content Error Observed on Channel A Flag (vSS!ContentErrorA)

A content error was observed in the assigned slot on channel A.

**(19) FLXAnFRMBS.SEOB**

Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB)

A syntax error was observed in the assigned slot on channel B.

**(20) FLXAnFRMBS.SEOA**

Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA)

A syntax error was observed in the assigned slot on channel A.

**(21) FLXAnFRMBS.VFRB**

Valid Frame Received on Channel B Flag (vSS!ValidFrameB)

A valid frame indication is set if a valid frame was received on channel B.

**(22) FLXAnFRMBS.VFRA**

Valid Frame Received on Channel A Flag (vSS!ValidFrameA)

A valid frame indication is set if a valid frame was received on channel A.

### 20.2.12.6 FLXAnFROBCM — FlexRay Output Buffer Command Mask Register

Configures how the Output Buffer is updated from the message buffer in the Message RAM selected by FLXAnFROBCR.OBRS.

Mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to the register internal storage when a Message RAM transfer is requested by FLXAnFROBCR.REQ.

When OBF Host and OBF Shadow are swapped, mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register internal storage to keep them attached to the respective Output Buffer transfer.

The data transfer between Output Buffer and Message RAM is described in detail in **Section 20.3.12.2 (2), Data Transfer from Message RAM to Output Buffer**.

**CAUTION**

After the transfer of the header section from the Message RAM to OBF Shadow has completed, the message buffer status changed flag MBC of the selected message buffer in the FLXAnFRMBSC1/2/3/4 registers is cleared. After the transfer of the data section from the Message RAM to OBF Shadow has completed, the new data flag ND of the selected message buffer in the FLXAnFRNDAT1/2/3/4 registers is cleared.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0710_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 20.79 FLXAnFROBCM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 18 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 17 | RDSH | Read Data Section Host Flag<br>0: Data section is not read<br>1: Data section selected for transfer from Message RAM to Output Buffer |
| 16 | RHSH | Read Header Section Host Flag<br>0: Header section is not read<br>1: Header section selected for transfer from Message RAM to Output Buffer |
| 15 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | RDSS | Read Data Section Shadow Bit<br>0: Data section is not read<br>1: Data section selected for transfer from Message RAM to Output Buffer |
| 0 | RHSS | Read Header Section Shadow Bit<br>0: Header section is not read<br>1: Header section selected for transfer from Message RAM to Output Buffer |

**(1) FLXAnFROBCM.RDSH**

Read Data Section Host Flag

**(2) FLXAnFROBCM.RHSH**

Read Header Section Host Flag

**(3) FLXAnFROBCM.RDSS**

Read Data Section Shadow Bit

**(4) FLXAnFROBCM.RHSS**

Read Header Section Shadow Bit

### 20.2.12.7 FLXAnFROBCR — FlexRay Output Buffer Command Request Register

After setting bit FLXAnFROBCR.REQ to 1 while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1, FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. When the transfer between the Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCM.OBSYS back to 0.

By setting bit FLXAnFROBCR.VIEW to 1 while FLXAnFROBCR.OBSYS is 0, OBF Host and OBF Shadow are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the register FLXAnFROBCM internal storage to keep them attached to the respective Output Buffer transfer. FLXAnFROBCR.OBRH signals the number of the message buffer currently accessible by the Host.

If bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are set to 1 with the same write access while FLXAnFROBCR.OBSYS is 0, FLXAnFROBCR.OBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0.

Any write access to FLXAnFROBCR[15:8] while FLXAnFROBCR.OBSYS is set to 1 will cause the error flag FLXAnFREIR.IOBA to be set to 1. In this case, this write access has no effect and the Output Buffer will not be changed.

The data transfer between Output Buffer and Message RAM is described in detail in **Section 20.3.12.2 (2), Data Transfer from Message RAM to Output Buffer**.

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0714_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

Table 20.80 FLXAnFROBCR Register Contents

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | OBRH[6:0] | Output Buffer Request Host Flag |
| 15 | OBSYS | Output Buffer Busy Shadow Flag<br>0: No transfer in progress<br>1: Transfer between Message RAM and OBF Shadow in progress |
| 14 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 | REQ | Request Message RAM Transfer Bit<br>0: No request<br>1: Transfer to OBF Shadow requested |
| 8 | VIEW | View Shadow Buffer Bit<br>0: No action<br>1: Swap OBF Shadow and OBF Host |
| 7 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 6 to 0 | OBRS[6:0] | Output Buffer Request Shadow Bit |

### (1) FLXAnFROBCR.OBRH

Output Buffer Request Host Flag

Number of message buffer currently accessible by the Host via FLXAnFRRDHS[1…3], FLXAnFRMBS, and FLXAnFRRDDS[1…64].

By writing FLXAnFROBCR.VIEW to 1 OBF Shadow and OBF Host are swapped and the transferred message buffer is accessible by the Host.

### (2) FLXAnFROBCR.OBSYS

Output Buffer Busy Shadow Flag

Set to 1 after setting bit FLXAnFROBCR.REQ. When the transfer between the Message RAM and OBF Shadow has completed, FLXAnFROBCR.OBSYS is set back to 0.

### (3) FLXAnFROBCR.REQ

Request Message RAM Transfer Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.

Requests transfer of message buffer addressed by FLXAnFROBCR.OBRS from Message RAM to OBF Shadow.

### (4) FLXAnFROBCR.VIEW

View Shadow Buffer Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.

Toggles between OBF Shadow and OBF Host.

### (5) FLXAnFROBCR.OBRS

Output Buffer Request Shadow Bit

Only writeable while FLXAnFROBCR.OBSYS = 0.

Number of source message buffer to be transferred from the Message RAM to OBF Shadow.

If the number of the first message buffer of the receive FIFO is written to this register the Message Handler transfers the message buffer addressed by the GET Index (GIDX, see **Section 20.3.11, FIFO Function**) to OBF Shadow.

## 20.2.13 Data Transfer Control Register

### 20.2.13.1 FLXAnFRITC — FlexRay Input Transfer Configuration Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0800_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | ITM[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | IQEIE | IQFIE | — | — | — | — | — | — | IQHR | ITE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

**Table 20.81 FLXAnFRITC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | ITM[6:0] | Input queue Table Max Bit<br>These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue. |
| 15 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 | IQEIE | Input Queue Empty Interrupt Enable Bit<br>0: Disabled<br>1: Enabled |
| 8 | IQFIE | Input Queue Full Interrupt Enable Bit<br>0: Disabled<br>1: Enabled |
| 7 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | IQHR | Input Queue Halt Request Bit<br>0: Input queue run request<br>1: Input queue halt request |
| 0 | ITE | Input Transfer Enable Bit<br>0: Operation Disable request<br>1: Operation Enable request |

**(1) FLXAnFRITC.ITM**

Input queue Table Max Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0.

These bits configure the number of entries in the input pointer table the input buffer handler is capable to maintain in the input queue.

Valid values are $00_H$ (1 queue entry) to $7F_H$ (128 queue entries).

Note that each entry requires two long words in the input pointer table.

**(2) FLXAnFRITC.IQEIE**

Input Queue Empty Interrupt Enable Bit

This bit controls the input queue empty interrupt.

0: Disabled
No interrupt will be requested and the input queue empty interrupt line will be released.

1: Enabled
Input queue empty interrupt will be asserted when FLXAnFRITS.IQEIS is 1.

**(3) FLXAnFRITC.IQFIE**

Input Queue Full Interrupt Enable Bit

This bit controls the input queue full interrupt.

0: Disabled
No interrupt will be requested and the input queue full interrupt line will be released.

1: Enabled
Input queue full interrupt will be asserted when FLXAnFRITS.IQFIS is 1.

**(4) FLXAnFRITC.IQHR**

Input Queue Halt Request Bit

The IQHR bit should not be set to 1 when FLXAnFRITS.ITS is 0.

This bit requests a halt of the input queue.

The status of the halt request is shown in the FLXAnFRITS.IQH register.

See **Section 20.3.16.1 (5), Halting the input queue** about usage of this bit.

0: Input queue run request
The input queue resumes their operation.

1: Input queue halt request
The input queue gets halted. An active input transfer will be completed but no further transfer request will start.

**(5) FLXAnFRITC.ITE**

Input Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFRIBCR.IBSYS is 0.

The user should only set this bit to 0 when FLXAnFRITC.IQHR 0. Otherwise committed input transfers get lost.

This bit controls the operation mode of the input transfer queue.

The operation status of the input transfer queue function is shown in FLXAnFRITS.ITS.

See **Section 20.3.16.1 (1), Activation and deactivation** about usage of this bit.

0: Operation Disable request
The input transfer queue gets disabled when it becomes empty.

1: Operation Enable request
The input transfer queue gets enabled. Input data structures are transferred to the FlexRay internal message RAM.

### 20.2.13.2 FLXAnFROTC — FlexRay Output Transfer Configuration Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0804_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | FTM[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | FWIE | OWIE | FIE | OIE | — | — | — | — | — | — | OTCS | OTE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R/W | R/W |

**Table 20.82 FLXAnFROTC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 21 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 20 to 16 | FTM[4:0] | FIFO Table Max Bit<br>Configures the number of FIFO entries the output transfer handler is capable to maintain in the Local RAM/Global RAM. |
| 15 to 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 | FWIE | FIFO transfer Warning Interrupt Enable Bit<br>0: Disabled<br>1: Enabled |
| 10 | OWIE | Output transfer Warning Interrupt Enable Bit<br>0: Disabled<br>1: Enabled |
| 9 | FIE | FIFO transfer Interrupt Enable Bit<br>0: Disabled<br>1: Enabled |
| 8 | OIE | Output transfer Interrupt Enable Bit<br>0: Disabled<br>1: Enabled |
| 7 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | OTCS | Output Transfer Condition Select Bit<br>0: New data only mode<br>1: New data and status changed mode |
| 0 | OTE | Output Transfer Enable Bit<br>0: Operation Disable request<br>1: Operation Enable request |

**(1) FLXAnFROTC.FTM**

FIFO Table Max Bit

The user can only write to these bits when FLXAnFROTS.OTS is 0.

Configures the number of FIFO entries the output transfer handler is capable to maintain in the Local RAM/Global RAM.

Valid values are $00_H$ (1 FIFO entry) to $1F_H$ (32 FIFO entries).

**(2) FLXAnFROTC.FWIE**

FIFO transfer Warning Interrupt Enable Bit

This bit controls the FIFO transfer warning interrupt.

0: Disabled
No interrupt will be requested and the FIFO transfer warning interrupt line will be released.

1: Enabled
FIFO transfer warning interrupt will be asserted when FLXAnFROTS.FWIS is 1.

**(3) FLXAnFROTC.OWIE**

Output transfer Warning Interrupt Enable Bit

This bit controls the output transfer warning interrupt.

0: Disabled
No interrupt will be requested and the output transfer warning interrupt line will be released.

1: Enabled
Output transfer warning interrupt will be asserted when FLXAnFROTS.OWIS is 1.

**(4) FLXAnFROTC.FIE**

FIFO transfer Interrupt Enable Bit

This bit controls the FIFO transfer interrupt.

0: Disabled
No interrupt will be requested and the FIFO transfer interrupt line will be released.

1: Enabled
FIFO transfer interrupt will be asserted when FLXAnFROTS.FIS is 1.

**(5) FLXAnFROTC.OIE**

Output transfer Interrupt Enable Bit

This bit controls the output transfer interrupt.

0: Disabled
No interrupt will be requested and the output transfer interrupt line will be released.

1: Enabled
Output transfer interrupt will be asserted when FLXAnFROTS.OTIS is 1.

### (6) FLXAnFROTC.OTCS

Output Transfer Condition Select Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.

This bit controls the output transfer condition.

0: New data only mode
The ND bits in the FLXAnFRNDATi registers are used to detect a transfer condition for dedicated receive buffer

1: New data and status changed mode
The ND bits in the FLXAnFRNDATi registers and the MBSC bits in the FLXAnFRMBSC register are used to detect a transfer condition for dedicated transmit and receive buffer

### (7) FLXAnFROTC.OTE

Output Transfer Enable Bit

The user should only set this bit to 1 when FLXAnFROBCR.OBSYS is 0.

This bit controls the operation mode of the output transfer function.

The operation status of the output buffer transfer function is shown in FLXAnFROTS.OTS.

See **Section 20.3.16.2 (2), Output transfer data structure** about usage of this bit.

0: Operation Disable request
The output buffer transfer gets disabled.
An active message buffer transfer will be completed but no further transfer will start.

1: Operation Enable request
The output buffer transfer gets enabled. Message buffers are transferred from the FlexRay internal message RAM to output data structures.

The user should not change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

### 20.2.13.3 FLXAnFRIBA — FlexRay Input Pointer Table Base Address Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0808_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ITA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ITA[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

**Table 20.83 FLXAnFRIBA Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | ITA[31:0] | Input Table Address Bit<br>These bits configure the base address of the input pointer table. |

#### (1) FLXAnFRIBA.ITA

Input Table Address Bit

The user can only write to this bit when FLXAnFRITS.ITS is 0.

The address should be 32 bit aligned, thus the bits FLXAnFRIBA.ITA[1:0] are always 0.

These bits configure the base address of the input pointer table.

The table is used for the input transfer queue transferring message buffers from the Local RAM/Global RAM into the FlexRay internal message RAM.

The size of the input queue is configured in FLXAnFRITC.ITM.

Note that each entry requires two long words in the input pointer table.

### 20.2.13.4 FLXAnFRFBA — FlexRay FIFO Pointer Table Base Address Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $080C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FTA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FTA[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

**Table 20.84 FLXAnFRFBA Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | FTA[31:0] | FIFO pointer Table Address Bit<br>These bits configure the base address of the FIFO pointer table. |

#### (1) FLXAnFRFBA.FTA

FIFO pointer Table Address Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.

The address should be 32 bit aligned, thus the bits FLXAnFRFBA.FTA[1:0] are always 0.

These bits configure the base address of the FIFO pointer table.

The table is used for message buffers transferred from the FlexRay internal FIFO to the Local RAM/ Global RAM.

The size of the FIFO is configured in FLXAnFROTC.FTM.

### 20.2.13.5 FLXAnFROBA — FlexRay Output Pointer Table Base Address Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0810_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OTA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | OTA[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R |

**Table 20.85 FLXAnFROBA Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | OTA[31:0] | Output pointer Table Address Bit<br>These bits configure the base address of the output pointer table. |

#### (1) FLXAnFROBA.OTA

Output pointer Table Address Bit

The user can only write to this bit when FLXAnFROTS.OTS is 0.

The address should be 32 bit aligned, thus the bits FLXAnFROBA.OTA[1:0] are always 0.

These bits configure the base address of the output pointer table.

The table is used for message buffers transferred from the FlexRay internal message RAM to the Local RAM/Global RAM.

The size of the table depends on the utilization of the FlexRay internal message RAM and can have up to 128 entries.

### 20.2.13.6 FLXAnFRIQC — FlexRay Input Queue Control Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0814_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | IMBNR[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | W | W | W | W | W | W | W |

**Table 20.86 FLXAnFRIQC Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 6 to 0 | IMBNR[6:0] | Input Message Buffer NumbeR Bit<br>Message buffer number added to the input queue |

#### (1) FLXAnFRIQC.IMBNR

Input Message Buffer NumbeR Bit

The user can only write to this bit when FLXAnFRITS.IQFP is 0.

The user should not write to this register when FLXAnFRITS.ITS is 0 or when FLXAnFRITC.ITE is 0.

These bits are read as 0.

This value specifies the message buffer added to the input queue.

The number has to be identical to FLXAnFRWRHS4.IMBNR (see **Section 20.3.16.1 (3), Input pointer table**) of the input pointer table.

The address to the input data structure has to be provided in the input pointer table at the put index (FLXAnFRITS.IPIDX) before writing to this register.

Writing to this register increments the input put index (FLXAnFRITS.IPIDX).

### 20.2.13.7 FLXAnFRUIR — FlexRay User Input Transfer Request Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0818_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.87 FLXAnFRUIR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 7 to 0 | UIDX[7:0] | User requested Input inDeX Bit<br>Input pointer table index requested for input transfer |

#### (1) FLXAnFRUIR.UIDX

User requested Input inDeX Bit

The user can only write to this bit when FLXAnFRITS.UIRP is 0.

The user should not write to this register when FLXAnFRITS.ITS is 0.

The user should not write to this register when FLXAnFRITS.UIRP is 1.

The user should not write to this register when FLXAnFRITS.IQH is 1.

The user should only write FLXAnFRITC.ITM + 1 to this register.

This value specifies the input pointer table index for the user requested input transfer.

The address to the input data structure has to be provided in the input pointer table at the index UIDX before writing to this register.

When writing to this register, the requested input data structure will be transferred from input data structure position to the FlexRay internal message RAM.

In opposite to queued input transfers the related DA flag in the FLXAnFRDA register is not influenced by the user input transfer.

### 20.2.13.8 FLXAnFRUOR — FlexRay User Output Transfer Request Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $081C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | URDS | — | — | UMBNR[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.88 FLXAnFRUOR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 | URDS | User request Read Data Section Bit<br>0: Data section is not transferred<br>1: Data section is transferred |
| 8, 7 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 6 to 0 | UMBNR[6:0] | User requested output Message Buffer NumbeR Bit<br>Message buffer number requested for output transfer |

#### (1) FLXAnFRUOR.URDS

User request Read Data Section Bit

The user can only write to this bit when FLXAnFROTS.UORP is 0.

The user should not write to this register when FLXAnFROTS.OTS is 0.

The user should not write to this register when FLXAnFROTS.UORP is 1.

0: Data section is not transferred
The data section of the message buffer selected by the bits UMBNR is not requested

1: Data section is transferred
The data section of the message buffer selected by the bits UMBNR is requested

#### (2) FLXAnFRUOR.UMBNR

User requested output Message Buffer NumbeR Bit

The user can only write to this bit when FLXAnFROTS.UORP is 0.

The user should not write to this register when FLXAnFROTS.OTS is 0.

The user should not write to this register when FLXAnFROTS.UORP is 1.

The user should restrict UMBNR to dedicated receive and transmit buffers when the FlexRay module is not in the CONFIG state.

When writing to this register, the header sections and optionally the data section (configurable by URDS) of the requested message buffer will be transferred from the FlexRay internal message RAM to the output data structure position defined by the output structure data pointer in the output pointer table.

## 20.2.14 Data Transfer Status Register

### 20.2.14.1 FLXAnFRITS — FlexRay Input Transfer Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0820_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | IGIDX[6:0] | | | | | | | — | IPIDX[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | IQFP | — | — | IQEIS | IQFIS | — | — | — | — | — | UIRP | IQH | ITS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R/W | R/W | R | R | R | R | R | R | R | R |

**Table 20.89 FLXAnFRITS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 30 to 24 | IGIDX[6:0] | Input queue Get InDeX Bit<br>Represents the get index of the input pointer table |
| 23 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 22 to 16 | IPIDX[6:0] | Input queue Put InDeX Bit<br>Represents the put index of the input pointer table |
| 15 to 13 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 12 | IQFP | Input Queue Full condition Pending Bit<br>0: Entries in the input queue are available<br>1: All entries in the input queue are occupied |
| 11, 10 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 9 | IQEIS | Input Queue Empty Interrupt Status Bit<br>0: No input queue empty condition detected<br>1: Input queue empty condition detected |
| 8 | IQFIS | Input Queue Full Interrupt Status Bit<br>0: No input queue full condition detected<br>1: Input queue full condition detected |
| 7 to 3 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 2 | UIRP | User Input transfer Request Pending Bit<br>0: No user input transfer request pending<br>1: User input transfer request pending |
| 1 | IQH | Input Queue Halted Bit<br>0: Input queue not halted<br>1: Input queue halted |
| 0 | ITS | Input Transfer Status Bit<br>0: Disabled<br>1: Enabled |

**(1) FLXAnFRITS.IGIDX**

Input queue Get InDeX Bit

These bits are only valid when FLXAnFRITS.IQH is 1

These bits represent the input pointer index the input queue handler will transfer next.

Valid values are $00_H$ to FLXAnFRITC.ITM.

The get index is incremented when the input data structure has been transferred from the Local RAM/ Global RAM and the related DA flag in the FLXAnFRDA register is cleared.

The index is set to $00_H$ when FLXAnFRITS.ITS changes from 0 to 1.

**(2) FLXAnFRITS.IPIDX**

Input queue Put InDeX Bit

These bits represent the index where the next input data structure pointer in the input pointer table should be stored.

Valid values are $00_H$ to FLXAnFRITC.ITM.

After reaching the maximum value the put index continues from $00_H$.

The index is incremented when writing to FLXAnFRIQC.IMBNR.

The index is set to $00_H$ when FLXAnFRITS.ITS changes from 0 to 1.

**(3) FLXAnFRITS.IQFP**

Input Queue Full condition Pending Bit

This bit represents that the input queue is full.

There should be no further input transfer requests, by writing to FLXAnFRIQC.IMBNR, as long as FLXAnFRITS.IQFP is 1.

[Clearing condition]

This bit is cleared when there is one free entry in the input queue.

[Setting condition]

This bit is set when all entries in the input queue are occupied.

**(4) FLXAnFRITS.IQEIS**

Input Queue Empty Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFRITC.IQEIE the input queue empty interrupt is generated when FLXAnFRITS.IQEIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRITS.IQEIS.
This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1.

[Setting condition]

This bit is set when all pending input transfers have been processed and consequently the input queue becomes empty.

**(5) FLXAnFRITS.IQFIS**

Input Queue Full Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFRITC.IQFIE the input queue full interrupt is generated when FLXAnFRITS.IQFIS is 1.

This flag is intended as interrupt status flag. It does not represent the current input queue status; for this status see FLXAnFRITS.IQFP.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRITS.IQFIS.

This bit is cleared when FLXAnFRITS.ITS changes from 0 to 1.

[Setting condition]

This bit is set when all entries in the input queue are occupied.

**(6) FLXAnFRITS.UIRP**

User Input transfer Request Pending Bit

This bit represents that a user input transfer is still pending.

There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1.

[Clearing condition]

This bit is cleared when the user input transfer request is processed by the input transfer handler.

[Setting condition]

This bit is set when writing to FLXAnFRUIR.UIDX.

**(7) FLXAnFRITS.IQH**

Input Queue Halted Bit

This bit represents the status of the input queue.

There should be no further write access to FLXAnFRUIR.UIDX when this bit is 1.

[Clearing condition]

This bit is cleared when FLXAnFRITC.IQHR is set to 0.

[Setting condition]

This bit is set immediately when the FLXAnFRITC.IQHR is set to 1 and there is no ongoing input transfer.
This bit is set only after an ongoing input transfer has been completed and FLXAnFRITC.IQHR is set to 1.

**(8) FLXAnFRITS.ITS**

Input Transfer Status Bit

This bit represents the status of the input queue handler.

While this bit is 1, there should be no read or write access to the address area <FLXn_base> + $0400_H$ to <FLXn_base> + $05FF_H$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD register.

The input transfer queue indexes and related status flags are set to 0 when FLXAnFRITS.ITS changes from 0 to 1.

[Clearing condition]

This bit is cleared immediately when FLXAnFRITC.ITE is set to 0 and there are no pending input transfers

This bit is cleared after all pending requests have been processed and FLXAnFRITC.ITE is 0.

[Setting condition]

This bit is set when FLXAnFRITC.ITE is set to 1.

### 20.2.14.2 FLXAnFROTS — FlexRay Output Transfer Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0824_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | FFL[5:0] | | | | | | — | — | — | FGIDX[4:0] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R/W | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

**Table 20.90 FLXAnFROTS Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 29 to 24 | FFL[5:0] | FIFO Fill Level Bit<br>Represent the number of unprocessed output FIFO structures |
| 23 to 21 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 20 to 16 | FGIDX[4:0] | FIFO Get InDeX Bit<br>Represent the get index in the FIFO pointer table |
| 15 | FWP | FIFO transfer Warning condition Pending Bit<br>0: No FIFO transfer warning condition pending<br>1: FIFO transfer warning condition pending |
| 14 | OWP | Output transfer Warning condition Pending<br>0: No output transfer warning condition pending<br>1: Output transfer warning condition pending |
| 13 | FDA | FIFO Data Available Bit<br>0: No available FIFO structures<br>1: FIFO structures available at current FLXAnFROTS.FGIDX index |
| 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 | FWIS | FIFO transfer Warning Interrupt Status Bit<br>0: No FIFO transfer warning condition detected<br>1: FIFO transfer warning condition detected |
| 10 | OWIS | Output transfer Warning Interrupt Status Bit<br>0: No output transfer warning condition detected<br>1: Output transfer warning condition detected |
| 9 | FIS | FIFO transfer Interrupt Status Bit<br>0: No FIFO structure updated in Local RAM/Global RAM<br>1: FIFO structure updated in Local RAM/Global RAM |
| 8 | OTIS | Output transfer Interrupt Status Bit<br>0: No output structure updated in Local RAM/Global RAM<br>1: Output structure updated in Local RAM/Global RAM |
| 7 to 3 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |

Table 20.90 FLXAnFROTS Register Contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | UORP | User Output transfer Request Pending Bit<br>0: No user output transfer request pending<br>1: User output transfer request pending |
| 1 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 0 | OTS | Output Transfer Status Bit<br>0: Disabled<br>1: Enabled |

### (1) FLXAnFROTS.FFL

FIFO Fill Level Bit

These bits represent the number of available output FIFO structures in the Local RAM/Global RAM.

Valid values are $00_H$ to FLXAnFROTC.FTM + 1.

The value $00_H$ represents that the FIFO is empty.

The value FLXAnFROTC.FTM + 1 represents that the FIFO is full and no further FIFO transfers will be done.

The FIFO fill level is incremented when a FIFO data structure has been transferred from the FlexRay internal FIFO into the Local RAM/Global RAM.

The FIFO fill level is decremented when the user releases a FIFO data structure in the Local RAM/Global RAM by writing 1 to FLXAnFROTS.FDA.

The FIFO fill level is set to $00_H$ when the bit FLXAnFROTS.OTS changes from 0 to 1.

### (2) FLXAnFROTS.FGIDX

FIFO Get InDeX Bit

These bits represent the index where the current output data structure pointer in the FIFO pointer table is available for reading.

Valid values are $00_H$ to FLXAnFROTC.FTM.

After reaching the maximum value the get index continues from $00_H$.

The index is incremented when a FIFO data structure is released by writing 1 to FLXAnFROTS.FDA.

The index is set to $00_H$ when FLXAnFROTS.OTS changes from 0 to 1.

### (3) FLXAnFROTS.FWP

FIFO transfer Warning condition Pending Bit

This bit represents the FIFO transfer warning condition.

[Clearing condition]

This bit is cleared when there are free output data structures (FLXAnFROTS.FFL <= FLXAnFROTC.FTM).

This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

### (4) FLXAnFROTS.OWP

Output transfer Warning condition Pending Bit

This bit represents the output transfer warning condition.

[Clearing condition]

This bit is cleared, when all output structure pointers that have a pending output handler transfer condition detected, are released (for dedicated transmit and receive message buffers or a user output transfer request).

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

### (5) FLXAnFROTS.FDA

FIFO Data Available Bit

Writing 0 has no effect on the bit value.

When this bit is 1, the next valid output data structure is available.

The related data structure pointer is in the FIFO pointer table at FLXAnFROTS.FGIDX.

Writing 1 to FLXAnFROTS.FDA

- increments FLXAnFROTS.FGIDX and
- decrements the FIFO fill level (FLXAnFROTS.FFL)

If there are still unprocessed data structures FLXAnFROTS.FDA remains 1.

[Clearing condition]

This bit is cleared when writing 1 to FLXAnFROTS.FDA and the FIFO fill level becomes $00_H$.

This bit is cleared when the FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when there is at least one FIFO data structure available in the Local RAM/Global RAM.

### (6) FLXAnFROTS.FWIS

FIFO transfer Warning Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.FWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.FWIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.FWIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition for FIFO message buffers but there are no free output data structures (FLXAnFROTS.FFL = FLXAnFROTC.FTM + 1).

### (7) FLXAnFROTS.OWIS

Output transfer Warning Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.OWIE the FIFO transfer warning interrupt is generated when FLXAnFROTS.OWIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.OWIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when the output transfer handler detects a transfer condition (for dedicated transmit and receive message buffers or a user output transfer request) but the related output structure pointer was not yet released by the application (data available flag is still set to 1).

This bit is set when the output transfer handler detects a transfer condition for dedicated transmit and receive message buffers but there is a pending input transfer for the same message buffer (data available flag is set to 1 due to the input transfer request).

### (8) FLXAnFROTS.FIS

FIFO transfer Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.FIE the FIFO transfer interrupt is generated when FLXAnFROTS.FIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.FIS.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when a FIFO data structure is updated by the transfer handler or the FFL bit changes from $00_H$ to $01_H$.

### (9) FLXAnFROTS.OTIS

Output transfer Interrupt Status Bit

Writing 0 has no effect on the bit value.

If enabled in FLXAnFROTC.OIE the output transfer interrupt is generated when FLXAnFROTS.OTIS is 1.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFROTS.OTIS.
This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when an output data structure is updated by the transfer handler (from a dedicated transmit or receive message buffer or by a user output transfer request).

### (10) FLXAnFROTS.UORP

User Output transfer Request Pending Bit

This bit represents that a user output transfer is still pending.

There should be no further write access to FLXAnFRUOR.UMBNR when this bit is 1.

[Clearing condition]

This bit is cleared when the user output transfer request is processed by the output transfer handler.

This bit is cleared when the bit FLXAnFROTS.OTS changes from 0 to 1.

[Setting condition]

This bit is set when writing to FLXAnFRUOR.UMBNR.

### (11) FLXAnFROTS.OTS

Output Transfer Status Bit

This bit represents the status of the output transfer handler.

While this bit is 1, there should be no read or write access to the address area <FLXn_base> + $0600_H$ to <FLXn_base> + $07FF_H$ and there should be no CLEAR_RAMS command applied to FLXAnFRSUCC1.CMD register.

While this bit is 1, the user should not change the E-Ray message RAM configuration by writing to the FLXAnFRMRC register.

The output hander transfer indexes and related status flags are set to 0 when FLXAnFROTS.OTS changes from 0 to 1.

[Clearing condition]

This bit is cleared immediately when FLXAnFROTC.OTE is set to 0 and there are no ongoing output transfers.

This bit is cleared after an ongoing transfer has been completed and FLXAnFROTC.OTE is 0.

[Setting condition]

This bit is set when FLXAnFROTC.OTE is set to 1.

### 20.2.14.3 FLXAnFRAES — FlexRay Access Error Status Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0828_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | MAE | FAE | OAE | IAE | EIDX[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R | R | R | R | R | R | R |

**Table 20.91 FLXAnFRAES Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 | MAE | Multiple Access Errors Bit<br>0: No multiple access errors occurred<br>1: Multiple access errors occurred |
| 10 | FAE | FIFO transfer Access Error Bit<br>0: No access error occurred during FIFO transfer<br>1: Access error occurred during FIFO transfer |
| 9 | OAE | Output transfer Access Error Bit<br>0: No access error occurred during output transfer<br>1: Access error occurred during output transfer |
| 8 | IAE | Input transfer Access Error Bit<br>0: No access error occurred during input transfer<br>1: Access error occurred during input transfer |
| 7 to 0 | EIDX[7:0] | Error InDeX Bit<br>Data structure pointer index number |

**(1) FLXAnFRAES.MAE**

Multiple Access Errors Bit

Writing 0 has no effect on the bit value.

This bit represents that there were multiple access errors during a data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.MAE.

[Setting condition]

This bit is set when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE are set and

- an access to a protected address occurred during a FIFO data transfer or
- an access to a protected address occurred during an output data transfer or
- an access to a protected address occurred during an input data transfer

**(2) FLXAnFRAES.FAE**

FIFO transfer Access Error Bit

Writing 0 has no effect on the bit value.

This bit represents that there was an access error during a FIFO data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.FAE.

[Setting condition]

This bit is set when a Local RAM/Global RAM access error was detected during a FIFO transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

**(3) FLXAnFRAES.OAE**

Output transfer Access Error Bit

Writing 0 has no effect on the bit value.

This bit represents that there was an access error during an output data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.OAE.

[Setting condition]

This bit is set when a Local RAM/Global RAM access error was detected during an output transfer and the bits FLXAnFRAES.FAE, FLXAnFRAES.IAE and FLXAnFRAES.MAE are 0.

**(4) FLXAnFRAES.IAE**

Input transfer Access Error Bit

Writing 0 has no effect on the bit value.

This bit represents that there was an access error during an input data transfer.

[Clearing condition]

This bit is cleared when writing a 1 to FLXAnFRAES.IAE.

[Setting condition]

This bit is set when a Local RAM/Global RAM access error was detected during an output transfer and the bits FLXAnFRAES.OAE, FLXAnFRAES.FAE and FLXAnFRAES.MAE are 0.

### (5) FLXAnFRAES.EIDX

Error InDeX Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1.

When the bit FLXAnFRAES.FAE is 1, FLXAnFRAES.EIDX holds the used FIFO put index when the access error has occurred.

When the bit FLXAnFRAES.OAE is '1', FLXAnFRAES.EIDX holds the used output table entry (which is related to message buffer number) when the access error has occurred.

When the bit FLXAnFRAES.IAE is '1', FLXAnFRAES.EIDX holds the used input pointer table get index when the access error has occurred during the input transfer or user requested input transfer.

These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changing from 0 to 1.

### 20.2.14.4 FLXAnFRAEA — FlexRay Access Error Address Register

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $082C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | AEA[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | AEA[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.92 FLXAnFRAEA Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | AEA[31:0] | Access Error Address Bit<br>Address in the Local RAM/Global RAM when an access error has occurred |

#### (1) FLXAnFRAEA.AEA

Access Error Address Bit

This value is only valid when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is 1.

These bits represent the address of the access error indicated in the FLXAnFRAES register.

These bits are updated when one of the bits FLXAnFRAES.FAE, FLXAnFRAES.OAE or FLXAnFRAES.IAE is changing from 0 to 1.

### 20.2.14.5 FLXAnFRDAi — FlexRay message Data Available Register i (i = 0 to 3)

**Access:** This register can be read/written in 8-, 16-, or 32-bit units.

**Address:** <FLXn_base> + $0830_H$ to <FLXn_base> + $083C_H$ (<FLXn_base> + $0830_H$ + i*4)

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DAb[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DAb[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.93 FLXAnFRDAi Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | DAb[31:0] | Data Available Bit<br>0: No data available for destination<br>1: Data available for destination |

#### (1) FLXAnFRDAi.DAb (b = i*32 to ((i+1)*32) –1)

Data Available Bit b

The user should not write a 1 to bits that are 0.

To maintain the status of input transfers, the user should not clear bits related to input transfers.

This register is used for input and output transfers.

Each flag corresponds to a FlexRay message buffer.

[Clearing condition]

Input transfer:
This bit is cleared when the input data structure has been transferred from the Local RAM/Global RAM. The data structure and the data structure pointer can be changed when the related flag is 0.

Output transfer:
This bit is cleared when writing a 1 to it.

[Setting condition]

Input transfer:
This bit is set when the corresponding message buffer number has been written to FLXAnFRIQC.IMBNR.

As long as this bit is 1, the input data structure and the data structure pointer corresponding to this input transfer request should not be changed.

Output transfer:

This bit is set when the output data structure corresponding to this message buffer has been updated. As long as this bit is 1, the data structure is stable; no further update of the data structure will be done by the output handler. While this bit is 1, the application is allowed to change the output data structure pointer in the output pointer table for this message buffer number.

## 20.2.15 NTU loss monitor register

### 20.2.15.1 NTU0RST — NTU loss monitor reset register

**Access:** This register can be read/written in 32-bit units.

**Address:** FFF9 CC00$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NTUCRST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | W |

**Table 20.94 NTU0RST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 0 | NTUCRST | NTU reset<br>0: No function<br>1: Reset the NTU operation |

#### (1) NTU0RST.NTUCRST

NTU loss monitor reset

Setting this bit resets the NTU operation. This bit always returns 0 when it is read.

### 20.2.15.2 NTU0CFG — NTU configuration register

**Access:** This register can be read/written in 32-bit units.

**Address:** FFF9 CC04$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CLKSEL | — | — | — | — | — | NTUSEL[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R/W | R/W |

**Table 20.95 NTU0CFG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 8 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 7 | CLKSEL | NTU Output Clock Select<br>0: NTU signal is output<br>1: Backup clock is output |
| 6 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1, 0 | NTUSEL[1:0] | NTU Input Signal Select<br>00: FLXA0 macro tick signal is input to NTU (MT0)<br>01: FLXA0 cycle tick signal is input to NTU (CS0)<br>10: FLXA1 macro tick signal is input to NTU (MT1)<br>11: FLXA1 cycle tick signal is input to NTU (CS1) |

#### (1) NTU0CFG.CLKSEL

NTU output clock select.

This bit is used to select between NTU clock signal and Backup clock signal as the output of NTU. After detection of the NTU loss signal, the application has to switch the NTU output clock using this bit.

#### (2) NTU0CFG.NTUSEL

NTU input clock select.

This bit is used to select between macro tick clock signal and cycle tick clock signal as the monitored input of NTU. Additionally it can be selected if FlexRay macro 0 or 1 should be used as a source.

**NOTE**

Not all devices are equipped with two FlexRay macros. In case only one macro is available, please do not set the NTUSEL[1:0] bits to “10” or “11”.

### 20.2.15.3 NTU0CLMEN — NTU enable register

**Access:** This register can be read/written in 32-bit units.

**Address:** FFF9 CC08$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NTUCEN |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 20.96 NTU0CLMEN Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 0 | NTUCEN | NTU Enable<br>0: Disable NTU operation<br>1: Enable NTU operation |

#### (1) NTU0CLMEN.NTUCEN

NTU enable bit.

This bit is used to enable or disable NTU operation.

### 20.2.15.4 NTU0MON — NTU status register

**Access:** This register can be read in 32-bit units.

**Address:** FFF9 CC0C$_H$

**Value after reset:** 0000 0000$_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | NTUMON | NTUCMON |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 20.97 NTU0MON Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1 | NTUMON | NTU Monitor Status<br>0: Monitored NTU input is lost<br>1: Monitored NTU input is correct |
| 0 | NTUCMON | NTU Status<br>0: NTU does not operate<br>1: NTU is operating |

#### (1) NTU0MON.NTUMON

NTU monitor status bit.

This bit shows the status of the monitored input signal.

#### (2) NTU0MON.NTUCMON

NTU status bit.

This bit shows the status of the NTU operation.

### 20.2.15.5 NTU0PRSCTL — NTU prescaler control register

**Access:** This register can be read/written in 8-bit units.

**Address:** FFF9 C008$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | NPRSCE | — | — | NPRSCCS[1:0] | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R | R | R/W | R/W |

**Table 20.98 NTU0PRSCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 4 | NPRSCE | NTU Prescaler Enable<br>0: Disables NTU prescaler<br>1: Enables NTU prescaler |
| 3, 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 0 | NPRSCCS[1:0] | NTU Prescaler Selection<br>00: Prescaler counter clock is CLKP_H1<br>01: Prescaler counter clock is CLKP_H1/2<br>10: Prescaler counter clock is CLKP_H1/4<br>11: Prescaler counter clock is CLKP_H1/8 |

#### (1) NTU0NPRSCTL.NPRSCE

NTU prescaler enable bit.

This bit enables the NTU prescaler (NPRS). See **Figure 20.33**.

#### (2) NTU0NPRSCTL.NPRSCCS

NTU prescaler selection bits.

These bits set the scaling factor of the input clock (CLKP_H1).

### 20.2.15.6 NTU0PRSCMP — NTU prescaler compare register

**Access:** This register can be read/written in 8-bit units.

**Address:** FFF9 C00C$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NPRSCMP[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.99 NTU0PRSCMP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | NPRSCMP[7:0] | NTU Prescaler Compare Value<br>Compare match value of the NTU prescaler counter |

#### (1) NTU0PRSCMP.NPRSCMP

NTU prescaler compare match value bits.

These bits set the NTU prescaler output clock period according to the equation below:

Prescaler_output_clock_period = NPRS_counter_clock / (2 * NPRSCMP)

NPRS_counter_clock is selected using the NTU0PRSCTL register.

### 20.2.15.7 NTU0CCTL0 — NTU compare unit control register

**Access:** This register can be read/written in 8-bit units.

**Address:** FFF9 C800$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | NTUCCMPE |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W |

**Table 20.100 NTU0CCTL0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 1 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 0 | NTUCCMPE | NTU Compare Unit Enable<br>0: Disable NTU compare unit operation<br>1: Enable NTU compare unit operation |

#### (1) NTU0CCTL0.NTUCCMPE

NTU compare unit enable bit.

This bit is used to enable or disable NTU compare unit operation.

### 20.2.15.8 NTU0CCMPH — NTU compare unit threshold register H

**Access:** This register can be read/written in 16-bit units.

**Address:** FFF9 C80C$_H$

**Value after reset:** 03FF$_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | NTUCCMPH[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.101 NTU0CCMPH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 to 0 | NTUCCMPH [11:0] | Compare Unit Upper Threshold<br>Sets the upper threshold value of the compare unit |

#### (1) NTU0CCMPH.NTUCCMPH[11:0]

NTU compare unit upper threshold value.

The value set in these bits is used as the upper threshold value for the compare unit. The compare unit counter is counting up using the Base clock (see **Figure 20.33**). Additionally the NTU ticks are counted. If the amount of the NTU ticks fits into the window set by the NTU0CCMPH and NTU0CCMPL registers, the NTU loss is not detected. If the amount of NTU ticks is lower than NTUCCMPL register value, or higher than NTU0CCMPH register value the NTU loss is detected and it will be signalled to the application by an interrupt. The output clock signal has to be switched to the Backup clock by the application. See **Figure 20.33**.

Setting range: 004$_H$ to FFF$_H$

The setting value must be higher than NTU0CCMPL + 003$_H$.

### 20.2.15.9 NTU0CCMPL — NTU compare unit threshold register L

**Access:** This register can be read/written in 16-bit units.

**Address:** FFF9 C808$_H$

**Value after reset:** 0001$_H$

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | NTUCCMPL[11:0] | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.102 NTU0CCMPL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 15 to 12 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 11 to 0 | NTUCCMPL [11:0] | Compare Unit Upper Threshold<br>Sets the upper threshold value of the compare unit |

#### (1) NTU0CCMPL.NTUCCMPL[11:0]

NTU compare unit lower threshold value.

The value set in these bits is used as the upper threshold value for the compare unit. The compare unit counter is counting up using the Base clock (see **Figure 20.33**). Additionally the NTU ticks are counted. If the amount of the NTU ticks fits into the window set by the NTU0CCMPH and NTU0CCMPL registers, the NTU loss is not detected. If the amount of NTU ticks is lower than NTUCCMPL register value, or higher than NTU0CCMPH register value the NTU loss is detected and it will be signalled to the application by an interrupt. The output clock signal has to be switched to the Backup clock by the application. See **Figure 20.33**.

Setting range: 001$_H$ to FFC$_H$

The setting value must be higher than NTU0CCMPL + 0x003$_H$.

### 20.2.15.10NTU0CPCMD — NTU compare unit protection command register.

**Access:** This register can be written in 8-bit units.

**Address:** FFF9 C810$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NTUCREG[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W |

**Table 20.103 NTU0PCMD Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | NTUCREG[7:0] | NTU Compare Unit Protection Command<br>Protection command– A5$_H$ |

#### (1) NTU0CPCMD.NTUCREG

NTU compare unit protection command bits.

Accessing NTU protected registers is allowed when protection sequence using the NTU0CPCMD register has been done. The protection sequence flow is shown below:

- Write A5$_H$ value to the NTU0CPCMD register
- Write required value to the protected register (example: 01$_H$ to NTU0CCTL0)
- Write inverted value to the protected register (FE$_H$ to NTU0CCTL0)
- Write again required value to the protected register (01$_H$ to NTU0CCTL0)

### 20.2.15.11NTU0CPS — NTU compare unit protection status register

**Access:** This register can be read in 8-bit units.

**Address:** FFF9 C814$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 1, 0 | NCPRSCCS [1:0] | NTU Compare Unit Prescaler Selection<br>00: Prescaler counter clock is output of NPRS<br>01: Prescaler counter clock is output of NPRS/2<br>10: Prescaler counter clock is output of NPRS/4<br>11: Prescaler counter clock is output of NPRS/8 |

### (1) NTU0CPRSCTL.NCPRSCE

NTU compare unit prescaler enable bit.

This bit enables the NTU compare unit prescaler (NCPRS). See **Figure 20.33**

### (2) NTU0CPRSCTL.NCPRSCCS

NTU compare unit prescaler selection bits.

These bits set the scaling factor of the input clock (NPRS output).

### 20.2.15.13NTU0CPRSCMP — NTU compare unit prescaler compare register

**Access:** This register can be read/written in 8-bit units.

**Address:** $FFF9C20C_H$

**Value after reset:** $00_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NCPRSCMP[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.106 NTU0CPRSCMP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | NCPRSCMP [7:0] | NTU Compare Unit Prescaler Compare Value<br>Compare match value of the NTU compare unit counter |

#### (1) NTU0CPRSCMP.NCPRSCMP

NTU compare unit prescaler compare match value bits.

These bits set the NTU compare unit prescaler output clock period according to the equation below:

Compare_Unit_Prescaler_output_clock_period = NCPRS_counter_clock / (2 * NCPRSCMP)

NCPRS_counter_clock is selected using the NTU0CPRSCTL register.

## 20.2.15.14NTU0BPRSCTL — NTU backup clock prescaler setting register

**Access:** This register can be read/written in 8-bit units.

**Address:** FFF9 C108$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

**Table 20.107 NTU0BPRSCTL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 5 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 4 | NBPRSCE | NTU Backup Clock Prescaler Enable<br>0: Disables NTU backup clock prescaler<br>1: Enables NTU backup clock prescaler |
| 3, 2 | Reserved | When read, the value after reset always is read. When writing, always write the value after reset. |
| 1, 0 | NBPRSCCS[1:0] | NTU Backup Clock Prescaler Selection<br>00: Prescaler counter clock is output of NPRS<br>01: Prescaler counter clock is output of NPRS/2<br>10: Prescaler counter clock is output of NPRS/4<br>11: Prescaler counter clock is output of NPRS/8 |

### (1) NTU0BPRSCTL.NBPRSCE

NTU backup clock prescaler enable bit.

This bit enables the NTU backup clock prescaler (NBPRS). See **Figure 20.33**.

### (2) NTU0BPRSCTL.NBPRSCCS

NTU backup clock prescaler selection bits.

These bits set the scaling factor of the input clock (NPRS output).

### 20.2.15.15NTU0BPRSCMP — NTU backup clock prescaler compare register

**Access:** This register can be read/written in 8-bit units.

**Address:** FFF9 C10C$_H$

**Value after reset:** 00$_H$

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | NBPRSCMP[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 20.108 NTU0BPRSCMP Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | NBPRSCMP [7:0] | NTU Backup Clock Prescaler Compare Value<br>Compare match value of the NTU backup clock counter |

#### (1) NTU0BPRSCMP.NBPRSCMP[7:0]

NTU compare unit prescaler compare match value bits.

These bits set the NTU compare unit prescaler output clock period according to the equation below:

Backup_Clock_Prescaler_output_clock_period = NBPRS_counter_clock / (2 * NBPRSCMP)

NBPRS_counter_clock is selected using the NTU0BPRSCTL register.

# 20.3 Operation

This chapter describes the FlexRay implementation together with the related FlexRay protocol features. More information about the FlexRay protocol itself can be found in the FlexRay protocol specification.

## 20.3.1 FlexRay Module Operation Control

### 20.3.1.1 FlexRay Module Enable

After hardware reset or after the FlexRay module has been disabled (following **Section 20.3.1.2, FlexRay Module Disable**) the FlexRay module is in the reset state (FLXAnFROS.OS is 0) and the clocks of the FlexRay core module are disabled.

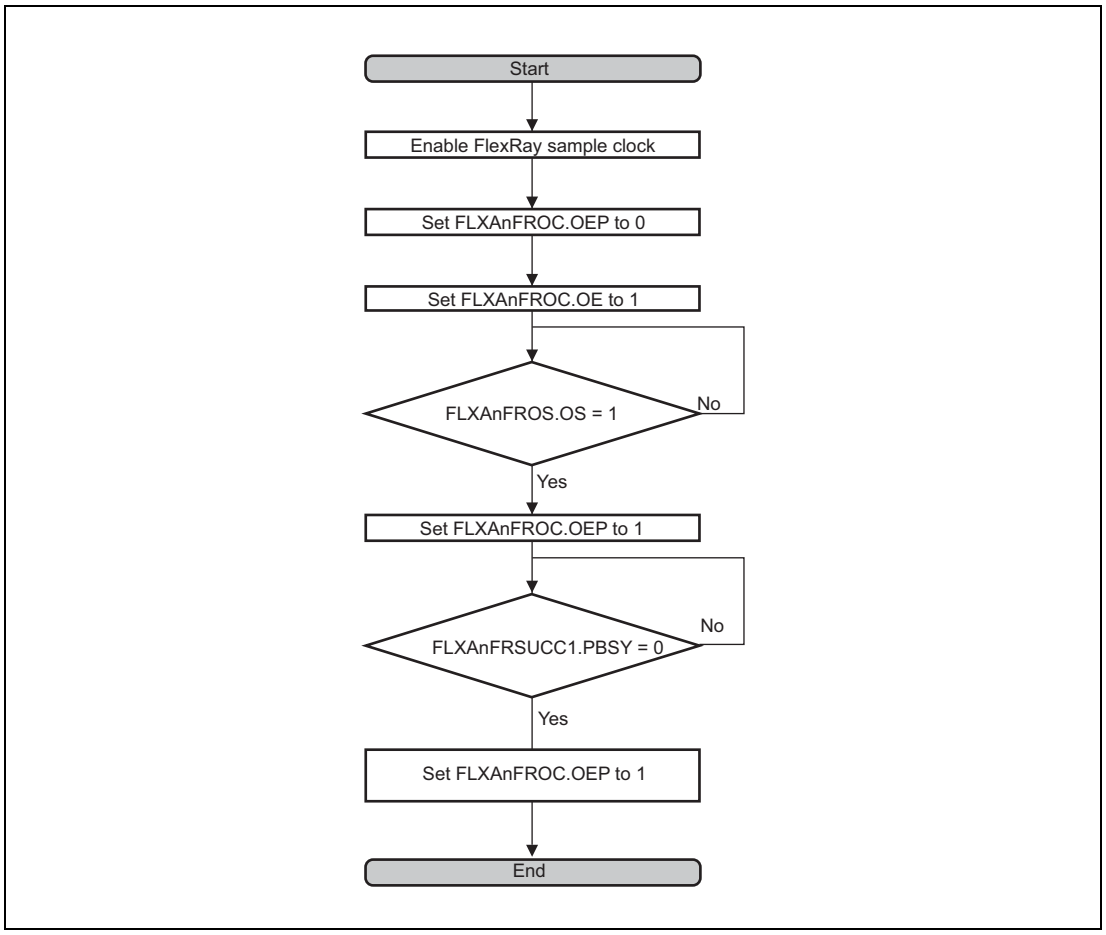

**Figure 20.3 FlexRay enable flow**

### 20.3.1.2 FlexRay Module Disable

The FlexRay module can be disabled at any time. However, it is recommended to disable the FlexRay module using the FLXAnFROC.OE register only when the FlexRay module is in HALT, CONFIG or DEFAULT_CONFIG state. Resetting the FlexRay module in any other state will terminate any ongoing FlexRay communication.

If the data transfer function is used, it is also required to disable this function before disabling the FlexRay module (see **Section 20.3.16.1 (1), Activation and deactivation** for suspending input transfer function and **Section 20.3.16.2 (2), Output transfer data structure**for suspending output transfer).

The following flow should be executed to disable the FlexRay module.

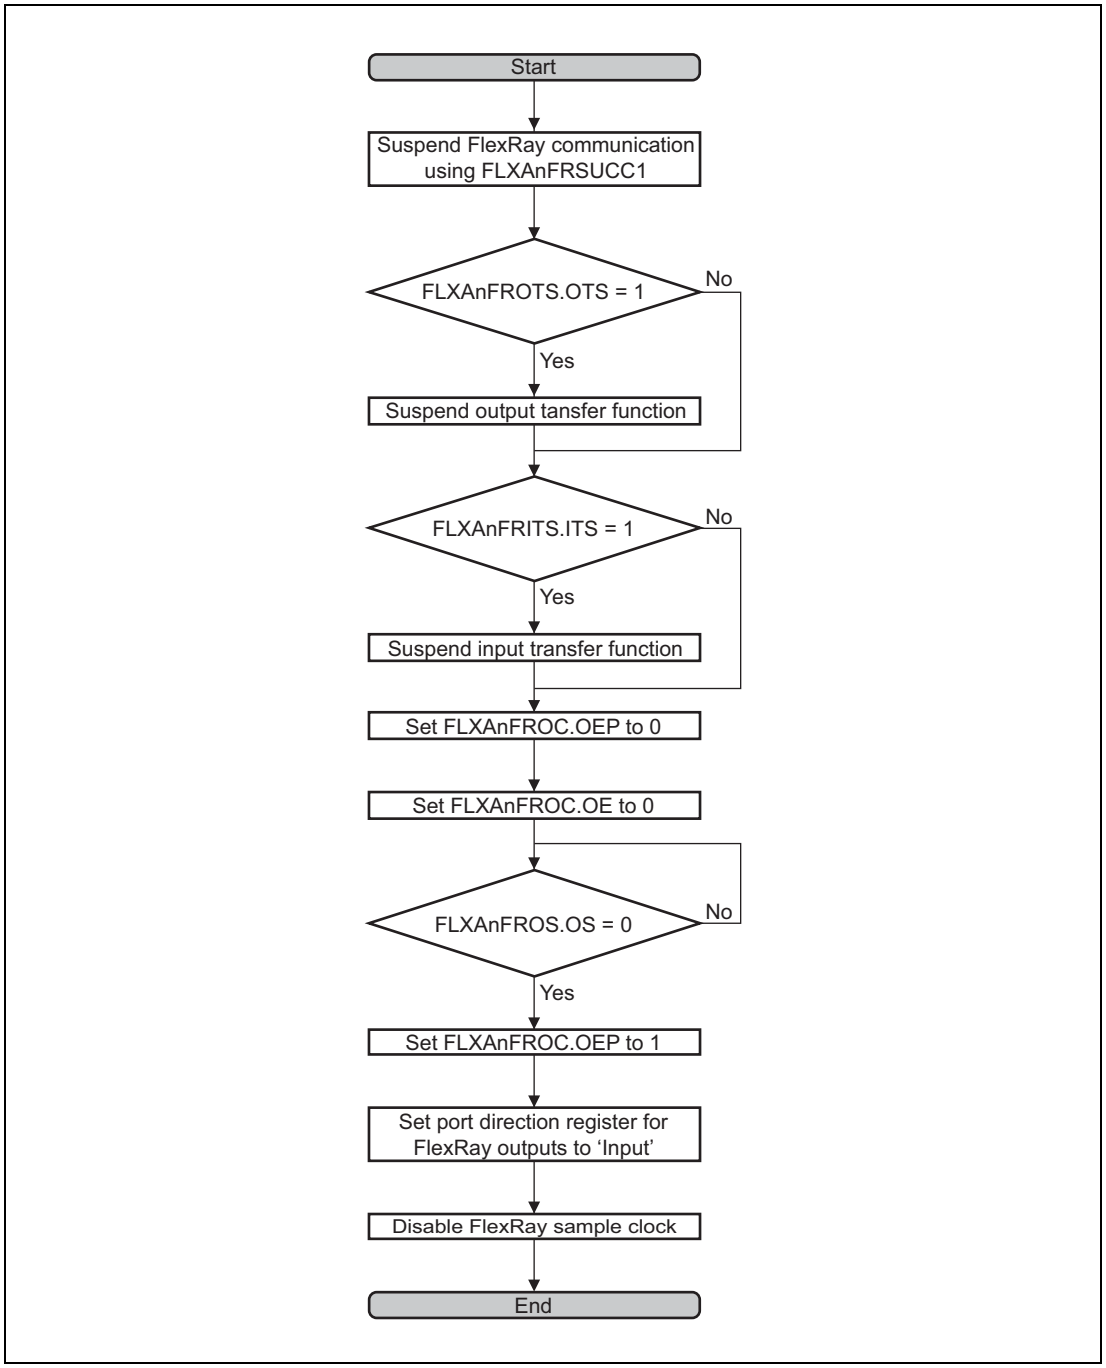

**Figure 20.4 FlexRay disable flow**

### 20.3.2 Communication Cycle

Communication on FlexRay networks is based on frames and symbols. The wakeup symbol (WUS) and the collision avoidance symbol (CAS) are transmitted outside the communication cycle to setup the time schedule. Frames and media access test symbols (MTS) are transmitted inside the communication cycle.

A FlexRay communication cycle consists of the following elements:

- Static Segment
- Dynamic Segment (optional)
- Symbol Window (optional)
- Network Idle Time (NIT)

Static segment, dynamic segment, and symbol window form the Network Communication Time (NCT). For each communication channel the slot counter starts at 1 and counts up until the end of the dynamic segment is reached. Both channels share the same arbitration grid which means that they use the same synchronized macrotick.

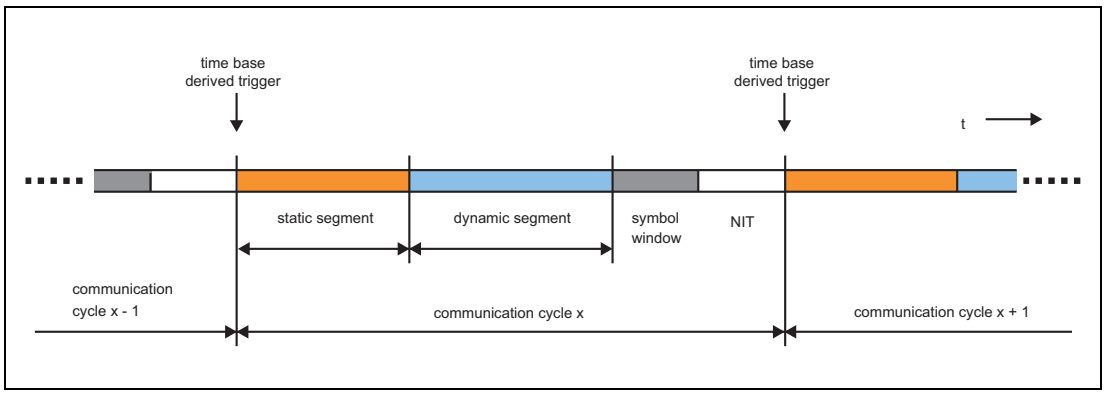

**Figure 20.5 Structure of Communication Cycle**

#### 20.3.2.1 Static Segment

The Static Segment is characterized by the following features:

- Time slots of fixed length (optionally protected by bus guardian)
- Start of frame transmission at action point of the respective static slot
- Payload length same for all frames on both channels

**Parameters:**

Number of Static Slots (FLXAnFRGTUC7.NSS)

Static Slot Length (FLXAnFRGTUC7.SSL)

Payload Length Static (FLXAnFRMHDC.SFDL)

Action Point Offset (FLXAnFRGTUC9.APO)

#### 20.3.2.2 Dynamic Segment

The Dynamic Segment is characterized by the following features:

- All controllers have bus access (no bus guardian protection possible)
- Variable payload length and duration of slots, different for both channels
- Start of transmission at minislot action point

**Parameters:**

Number of Minislots (FLXAnFRGTUC8.NMS)

Minislot Length (FLXAnFRGTUC8.MSL)

Minislot Action Point Offset (FLXAnFRGTUC9.MAPO)

Start of Latest Transmit (last minislot) (FLXAnFRMHDC.SLT)

#### 20.3.2.3 Symbol Window

During the symbol window only one media access test symbol (MTS) may be transmitted per channel. MTS symbols are send in NORMAL_ACTIVE state to test the bus guardian.

The symbol window is characterized by the following features:

- Send single symbol
- Transmission of the MTS symbol starts at the symbol windows action point

**Parameters:**

Symbol Window Action Point Offset (FLXAnFRGTUC9.APO) (same as for static slots)

Network Idle Time Start (FLXAnFRGTUC4.NIT)

#### 20.3.2.4 Network Idle Time (NIT)

During network idle time the CC has to perform the following tasks:

- Calculate clock correction terms (offset and rate)
- Distribute offset correction over multiple macroticks after offset correction start
- Perform cluster cycle related tasks

**Parameters:**

Network idle time start bit (FLXAnFRGTUC4.NIT)

Offset correction start bit (FLXAnFRGTUC4.OCS)

### 20.3.2.5 Configuration of NIT Start and Offset Correction Start

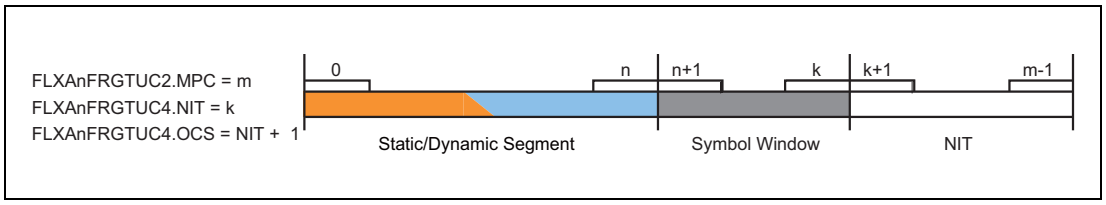

**Figure 20.6 Configuration of NIT Start and Offset Correction Start**

The number of macroticks per cycle gMacroPerCycle is assumed to be m. It is configured by programming FLXAnFRGTUC2.MPC = m.

The static / dynamic segment starts with macrotick 0 and ends with macrotick n:

n = static segment length + dynamic segment offset + dynamic segment length - 1MT

n = gNumberOfStaticSlots * gdStaticSlot + dynamic segment offset + gNumberOfMinislots * gdMinislot - 1 MT

The static segment length is configured by FLXAnFRGTUC7.SSL and FLXAnFRGTUC7.NSS.

The dynamic segment length is configured by FLXAnFRGTUC8.MSL and FLXAnFRGTUC8.NMS.

The dynamic segment offset is:

If gdActionPointOffset <= gdMinislotActionPointOffset:

dynamic segment offset = 0 MT

Else if gdActionPointOffset > gdMinislotActionPointOffset:

dynamic segment offset = gdActionPointOffset -gdMinislotActionPointOffset

The NIT starts with macrotick k + 1 and ends with the last macrotick of cycle m-1. It has to be configured by setting FLXAnFRGTUC4.NIT = k.

For the FlexRay module the offset correction start is required to be FLXAnFRGTUC4.OCS ≥ FLXAnFRGTUC4.NIT + 1 = k + 1.

The length of symbol window results from the number of macroticks between the end of the static / dynamic segment and the beginning of the NIT. It can be calculated by the number of macroticks (k – n).

### 20.3.3 Communication Modes

The FlexRay Protocol Specification defines the Time-Triggered Distributed (TT-D) mode.

#### 20.3.3.1 Time-triggered Distributed (TT-D)

In TT-D mode the following configurations are possible:

- Pure static: Minimum 2 static slots + symbol window (optional)
- Mixed static/dynamic: Minimum 2 static slots + dynamic segment + symbol window (optional)

A minimum of two coldstart nodes needs to be configured for distributed time-triggered operation. Two fault-free coldstart nodes are necessary for the cluster startup. Each startup frame must be a sync frame, therefore all coldstart nodes are sync nodes.

### 20.3.4 Clock Synchronization

In TT-D mode a distributed clock synchronization is used. Each node individually synchronizes itself to the cluster by observing the timing of received sync frames from other nodes.

#### 20.3.4.1 Global Time

Activities in a FlexRay node, including communication, are based on the concept of a global time. It is the clock synchronization mechanism that differentiates the FlexRay cluster from other node collections with independent clock mechanisms. The global time is a vector of two values; the cycle (cycle counter) and the cycle time (macrotick counter).

Cluster specific:

- Macrotick (MT) = basic unit of time measurement in a FlexRay network, a macrotick consists of an integer number of microticks (µT)
- Cycle length = duration of a communication cycle in units of macroticks (MT)

#### 20.3.4.2 Local Time

Internally, nodes time their behavior with microtick resolution. Microticks are time units derived from the oscillator clock tick of the specific node. Therefore microticks are controller-specific units. They may have different duration in different controllers. The precision of a node's local time difference measurements is a microtick (µT).

Node specific:

- Oscillator clock → prescaler → microtick (µT)
- µT = basic unit of time measurement in a CC, clock correction is done in units of µTs
- Cycle counter + macrotick counter = nodes local view of the global time

#### 20.3.4.3 Synchronization Process

Clock synchronization is performed by means of sync frames. Only preconfigured nodes (sync nodes) are allowed to send sync frames. In a two-channel cluster a sync node has to send its sync frame on both channels.

For synchronization in FlexRay the following constraints have to be considered:

- Max. one sync frame per node in one communication cycle
- Max. 15 sync frames per cluster in one communication cycle
- Every node has to use a preconfigured number of sync frames (FLXAnFRGTUC2.SNM) for clock synchronization
- Minimum of two sync nodes required for clock synchronization and startup

For clock synchronization the time difference between expected and observed arrival time of sync frames received during the static segment is measured. In a two channel cluster the sync node has to be configured to send sync frames on both channels. The calculation of correction terms is done during NIT (offset: every cycle, rate: every odd cycle) by using an FTM algorithm. For details see FlexRay protocol specification v2.1, chapter 8.

### (1) Offset (phase) Correction

- Only deviation values measured and stored in the current cycle used
- For a two channel node the smaller value will be taken
- Calculation during NIT of every communication cycle
- Offset correction value calculated in even cycles used for error checking only
- Checked against limit values
- Correction value is a signed integer number of µTs
- Correction done in odd numbered cycles, distributed over the macroticks beginning at offset correction start up to cycle end (end of NIT) to shift nodes next start of cycle (MTs lengthened / shortened)

### (2) Rate (frequency) Correction

- Pairs of deviation values measured and stored in even / odd cycle pair used
- For a two channel node the average of the differences from the two channels is used
- Calculated during NIT of odd numbered cycles
- Cluster drift damping is performed using global damping value
- Checked against limit values
- Correction value is a signed integer number of µTs
- Distributed over macroticks comprising the next even / odd cycle pair (MTs lengthened / shortened)

### (3) Sync Frame Transmission

Sync frame transmission is only possible from buffer 0 and 1. Message buffer 1 may be used for sync frame transmission in case that sync frames should have different payloads on the two channels. In this case bit FLXAnFRMRC.SPLM has to be programmed to 1.

Message buffers used for sync frame transmission have to be configured with the key slot ID and can be (re) configured in DEFAULT_CONFIG or CONFIG state only. For nodes transmitting sync frames FLXAnFRSUCC1.TXSY must be set to 1.

### (4) External Clock Synchronization

During normal operation, independent clusters can drift significantly. If synchronous operation across independent clusters is desired, external synchronization is necessary; even though the nodes within each cluster are synchronized. This can be accomplished with synchronous application of host-deduced rate and offset correction terms to the clusters.

- External offset / rate correction value is a signed integer
- External offset / rate correction value is added to calculated offset / rate correction value
- Aggregated offset / rate correction term (external + internal) is not checked against configured limits

### 20.3.5 Error Handling

The implemented error handling concept is intended to ensure that, in case of a lower layer protocol error in one single node, communication between non-affected nodes can be maintained. In some cases, higher layer program activity is required for the CC to resume normal operation. A change of the error handling state will set FLXAnFREIR.PEMC to 1 and may trigger an interrupt to the Host if enabled. The actual error mode is signaled by FLXAnFRCCEV.ERRM.

**Table 20.109 Error modes of the POC (degradation model)**

| Error Mode | Activity |
|---|---|
| ACTIVE | Full operation, State: NORMAL_ACTIVE<br>The CC is fully synchronized and supports the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. |
| PASSIVE | Reduced operation, State: NORMAL_PASSIVE, CC self rescue allowed<br>The CC stops transmitting frames and symbols, but received frames are still processed. Clock synchronization mechanisms are continued based on received frames. No active contribution to the cluster wide clock synchronization. The host is informed of any error condition(s) or status change by interrupt (if enabled) or by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. |
| COMM_HALT | Operation halted, State: HALT, CC self rescue not allowed<br>The CC stops frame and symbol processing, clock synchronization processing, and the macrotick generation. The host has still access to error and status information by reading the error and status interrupt flags from registers FLXAnFREIR and FLXAnFRSIR. The bus drivers are disabled. |

#### 20.3.5.1 Clock Correction Failed Counter

When the Clock Correction Failed Counter reaches the “maximum without clock correction passive” limit defined by FLXAnFRSUCC3.WCP, the POC transits from NORMAL_ACTIVE to NORMAL_PASSIVE state. When it reaches the “maximum without clock correction fatal” limit defined by FLXAnFRSUCC3.WCF, it transits from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

The Clock Correction Failed Counter FLXAnFRCCEV.CCFC allows the Host to monitor the duration of the inability of a node to compute clock correction terms after the CC passed protocol startup phase. It will be incremented by one at the end of any odd communication cycle during which either the missing offset correction FLXAnFRSFS.MOCS or the missing rate correction FLXAnFRSFS.MRCS flag is set to 1.

The Clock Correction Failed Counter is reset to zero at the end of an odd communication cycle if neither the missing offset correction FLXAnFRSFS.MOCS nor the missing rate correction FLXAnFRSFS.MRCS flag is set to 1.

The Clock Correction Failed Counter stops incrementing when the “maximum without clock correction fatal” value FLXAnFRSUCC3.WCF is reached (i.e. incrementing the counter at its maximum value will not cause it to wrap around back to zero). The Clock Correction Failed Counter is initialized to zero when the CC enters READY state or when NORMAL_ACTIVE state is entered.

**CAUTION**

**The transition to HALT state is prevented if FLXAnFRSUCC1.HCSE is not set to 1.**

#### 20.3.5.2 Passive to Active Counter

The passive to active counter controls the transition of the POC from NORMAL_PASSIVE to NORMAL_ACTIVE state. FLXAnFRSUCC1.PTA defines the number of consecutive even / odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state. If FLXAnFRSUCC1.PTA is set to zero the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

#### 20.3.5.3 HALT Command

In case the Host wants to stop FlexRay communication of the local node it can bring the CC into HALT state by asserting the HALT command. This can be done by writing FLXAnFRSUCC1.CMD = “0110”. In order to shut down communication on an entire FlexRay network, a higher layer protocol is required to assure that all nodes apply the HALT command at the same time.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

When called in NORMAL_ACTIVE or NORMAL_PASSIVE state the POC transits to HALT state at the end of the current cycle. When called in any other state FLXAnFRSUCC1.CMD will be reset to “0000” = command_not_accepted and bit FLXAnFREIR.CNA is set to 1. If enabled an interrupt to the Host is generated.

#### 20.3.5.4 FREEZE Command

In case the Host detects a severe error condition it can bring the CC into HALT state by asserting the FREEZE command. This can be done by writing FLXAnFRSUCC1.CMD = “0111”. The FREEZE command triggers the entry of the HALT state immediately regardless of the actual POC state.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

**CAUTION**

**When the user restart as leading coldstarter after it has been stopped by FREEZE or READY command, it may happen, depending on the internal state of the FlexRay module, that the FlexRay module does not transmit its startup frame in cycle 0. Only FlexRay module configurations with startup frames configured for slots 1 to 7 are affected by this behaviour.**

**Coldstart after hardware reset is not affected.**

**Even if it happened, next coldstart attempt successful. Coldstart sequence is lengthened but coldstart of FlexRay system is not prohibited by this behaviour.**

**If the use wants to avoid this behavior, they must use a static slot greater or equal 8 for the startup / sync message.**

## 20.3.6 Communication Controller States

### 20.3.6.1 Communication Controller State Diagram

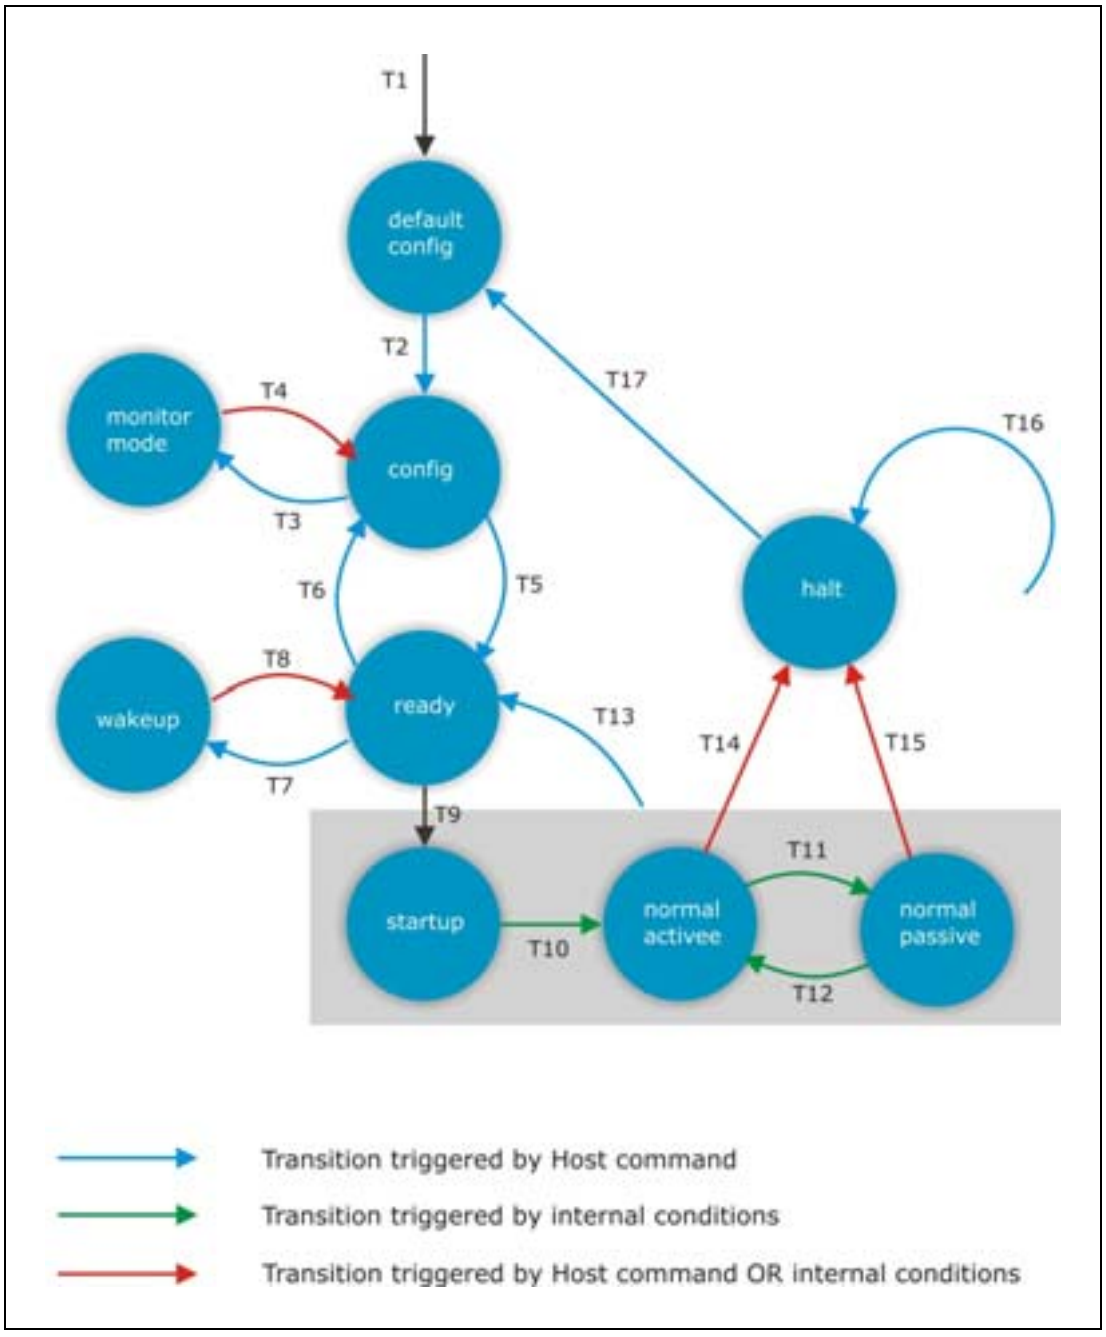

**Figure 20.7 Overall State Diagram of FlexRay Communication Controller**

State transitions are controlled by reset, FLXAnFR0RXDA, FLXAnFR0RXDB, by the POC state machine, and by the CHI Command Vector FLXAnFRSUCC1.CMD.

The CC transits from all states to HALT state after application of the FREEZE command (FLXAnFRSUCC1.CMD = “0111”).

**Table 20.110 State Transitions of FlexRay Overall State Machine**

| T# | Condition | From | To |
|---|---|---|---|
| 1 | Reset | All States | DEFAULT_CONFIG |
| 2 | Command CONFIG, FLXAnFRSUCC1.CMD = “0001” | DEFAULT_CONFIG | CONFIG |
| 3 | Unlock sequence followed by command MONITOR_MODE, FLXAnFRSUCC1.CMD[3:0] = “1011” | CONFIG | MONITOR_MODE |
| 4 | Command CONFIG, FLXAnFRSUCC1.CMD = "0001" | MONITOR_MODE | CONFIG |
| 5 | Unlock sequence followed by command READY, FLXAnFRSUCC1.CMD = “0010” | CONFIG | READY |
| 6 | Command CONFIG, FLXAnFRSUCC1.CMD = “0001” | READY | CONFIG |
| 7 | Command WAKEUP, FLXAnFRSUCC1.CMD = “0011” | READY | WAKEUP |
| 8 | Complete, non-aborted transmission of wakeup pattern OR received WUP OR received frame header OR wakeup collision OR command READY, FLXAnFRSUCC1.CMD = “0010” | WAKEUP | READY |
| 9 | Command RUN, FLXAnFRSUCC1.CMD = “0100” | READY | STARTUP |
| 10 | Successful startup | STARTUP | NORMAL_ACTIVE |
| 11 | Clock Correction Failed counter reached Maximum Without Clock Correction Passive limit configured by FLXAnFRSUCC3.WCP | NORMAL_ACTIVE | NORMAL_PASSIVE |
| 12 | Number of valid correction terms reached the Passive to Active limit configured by FLXAnFRSUCC1.PTA | NORMAL_PASSIVE | NORMAL_ACTIVE |
| 13 | Command READY, FLXAnFRSUCC1.CMD = “0010” | STARTUP, NORMAL_ACTIVE, NORMAL_PASSIVE | READY |
| 14 | Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF AND bit FLXAnFRSUCC1.HCSE set to ’1’ OR command HALT, FLXAnFRSUCC1.CMD = “0110” | NORMAL_ACTIVE | HALT |
| 15 | Clock Correction Failed counter reached Maximum Without Clock Correction Fatal limit configured by FLXAnFRSUCC3.WCF AND bit FLXAnFRSUCC1.HCSE set to ’1’ OR command HALT, FLXAnFRSUCC1.CMD = “0110” | NORMAL_PASSIVE | HALT |
| 16 | Command FREEZE, FLXAnFRSUCC1.CMD = “0111” | All States | HALT |
| 17 | Command CONFIG, FLXAnFRSUCC1.CMD = “0001” | HALT | DEFAULT_CONFIG |

#### 20.3.6.2 DEFAULT_CONFIG State

In DEFAULT_CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state.

The CC enters this state

- When the reset is applied (HW reset or SW reset)
- When exiting from HALT state

To leave DEFAULT_CONFIG state the Host has to write FLXAnFRSUCC1.CMD = “0001”. The CC then transits to CONFIG state.

#### 20.3.6.3 CONFIG State

In CONFIG state, the CC is stopped. All configuration registers are accessible and the pins to the physical layer are in their inactive state. This state is used to initialize the CC configuration.

The CC enters this state

- When exiting from DEFAULT_CONFIG state
- When exiting from READY state

When the state has been entered via HALT and DEFAULT_CONFIG state, the Host can analyse status information and configuration. Before leaving CONFIG state the Host has to assure that the configuration is fault-free.

To leave CONFIG state, the Host has to perform the unlock sequence as described is **Section 20.2.3.1, FLXAnFRLCK — FlexRay Lock Register**. Directly after unlocking the CONFIG state the Host has to write FLXAnFRSUCC1.CMD to enter the next state.

**CAUTION**

**Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from CONFIG to READY state.**

When the CC is in CONFIG state it is also possible to bring the CC into a power saving mode by halting the module clocks (bus clock and sample clock). To do this the Host has to assure that all Message RAM transfers have finished before turning off the clocks.

#### 20.3.6.4 READY State

After unlocking CONFIG state and writing FLXAnFRSUCC1.CMD = “0010” the CC enters READY state. From this state the CC can transit to WAKEUP state and perform a cluster wakeup or to STARTUP state to perform a coldstart or to integrate into a running cluster.

The CC enters this state

- When exiting from CONFIG, WAKEUP, STARTUP, NORMAL_ACTIVE, or NORMAL_PASSIVE state by writing FLXAnFRSUCC1.CMD = “$0010_B$” (READY command).

The CC exits from this state

- To CONFIG state by writing FLXAnFRSUCC1.CMD = “$0001_B$” (CONFIG command)
- To WAKEUP state by writing FLXAnFRSUCC1.CMD = “$0011_B$” (WAKEUP command)
- To STARTUP state by writing FLXAnFRSUCC1.CMD = “$0100_B$” (RUN command)

Internal counters and the CC status flags are reset when the CC enters STARTUP state.

**CAUTION**

**Status bits FLXAnFRMHDS[14:0], registers FLXAnFRTXRQ1/2/3/4, and status data stored in the Message RAM are not affected by the transition of the POC from READY to STARTUP state.**

### 20.3.6.5 WAKEUP State

The description below is intended to help configuring wakeup for the FlexRay IP-module. A detailed description of the wakeup procedure together with the respective SDL diagrams can be found in the FlexRay protocol specification v2.1, **Section 7.1**.

The CC enters this state

- When exiting from READY state by writing FLXAnFRSUCC1.CMD = "$0011_B$" (WAKEUP command).

The CC exits from this state to READY state

- After complete non-aborted transmission of wakeup pattern
- After WUP reception
- After detecting a WUP collision
- After reception of a frame header
- By writing FLXAnFRSUCC1.CMD = "$0010_B$" (READY command)

The cluster wakeup must precede the communication startup in order to ensure that all nodes in a cluster are awake. The minimum requirement for a cluster wakeup is that all bus drivers are supplied with power. A bus driver has the ability to wake up the other components of its node when it receives a wakeup pattern on its channel. At least one node in the cluster needs an external wakeup source.

The Host completely controls the wakeup procedure. It is informed about the state of the cluster by the bus driver and the CC and configures bus guardian (if available) and CC to perform the cluster wakeup. The CC provides to the Host the ability to transmit a special wakeup pattern on each of its available channels separately. The CC needs to recognize the wakeup pattern only during WAKEUP state.

Wakeup may be performed on only one channel at a time. The Host has to configure the wakeup channel while the CC is in CONFIG state by writing FLXAnFRSUCC1.WUCS. The CC ensures that ongoing communication on this channel is not disturbed. The CC cannot guarantee that all nodes connected to the configured channel awake upon the transmission of the wakeup pattern, since these nodes cannot give feedback until the startup phase. The wakeup procedure enables single-channel devices in a two-channel system to trigger the wakeup, by only transmitting the wakeup pattern on the single channel to which they are connected. Any coldstart node that deems a system startup necessary will then wake the remaining channel before initiating communication startup.

The wakeup procedure tolerates any number of nodes simultaneously trying to wakeup a single channel and resolves this situation such that only one node transmits the pattern. Additionally the wakeup pattern is collision resilient, so even in the presence of a fault causing two nodes to simultaneously transmit a wakeup pattern, the resulting collided signal can still wake the other nodes.

After wakeup the CC returns to READY state and signals the change of the wakeup status to the Host by setting flag FLXAnFRSIR.WST. The wakeup status vector can be read from FLXAnFRCCSV.WSV. If a valid wakeup pattern was received also either flag FLXAnFRSIR.WUPA or flag FLXAnFRSIR.WUPB is set to 1.

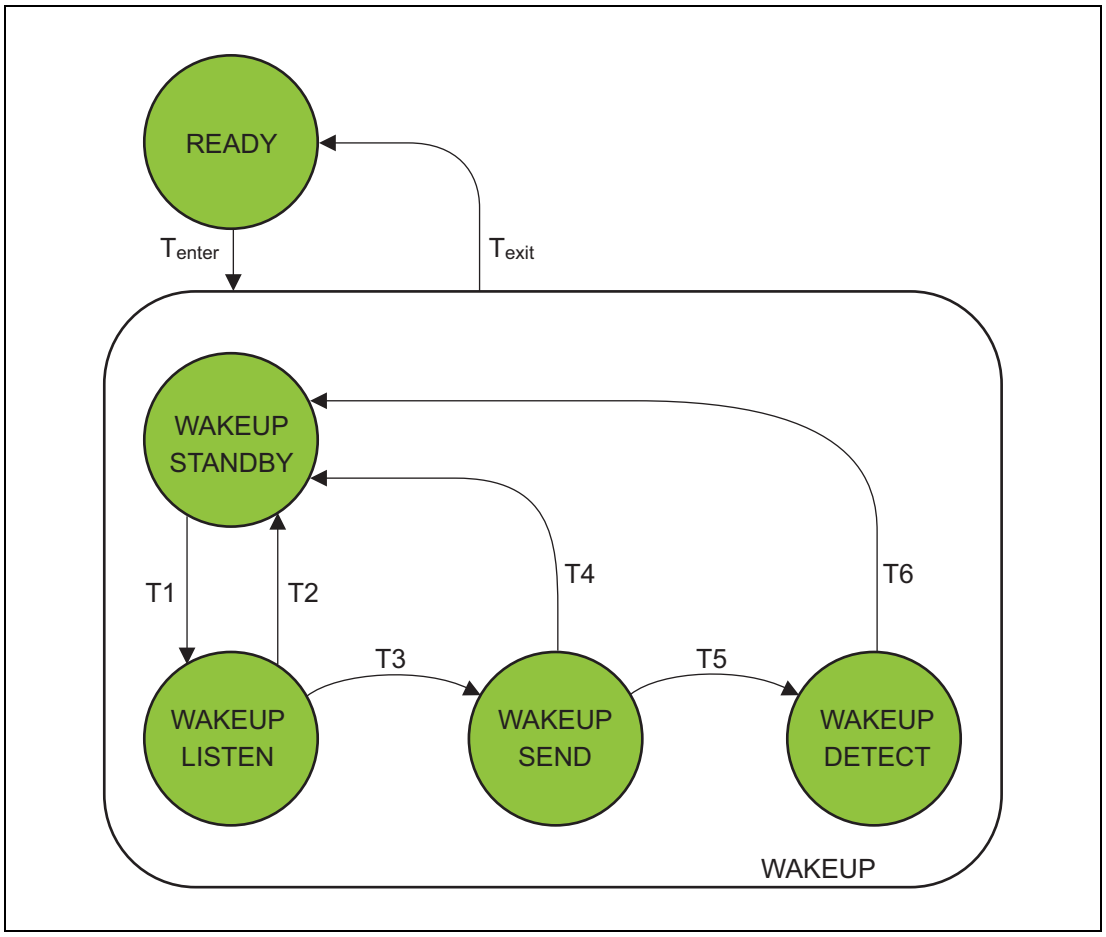

**Figure 20.8 Structure of POC State WAKEUP**

**Table 20.111 State Transitions WAKEUP (1/2)**

| T# | Condition | From | To |
|---|---|---|---|
| enter | Host commands change to WAKEUP state by writing FLXAnFRSUCC1.CMD = “0011” (WAKEUP command) | READY | WAKEUP |
| 1 | CHI command WAKEUP triggers wakeup FSM to transit to WAKEUP_LISTEN state | WAKEUP_STANDBY | WAKEUP_LISTEN |
| 2 | Received WUP on wakeup channel selected by bit FLXAnFRSUCC1.WUCS or frame header on either available channel | WAKEUP_LISTEN | WAKEUP_STANDBY |
| 3 | Timer event | WAKEUP_LISTEN | WAKEUP_SEND |
| 4 | Complete, non-aborted transmission of wakeup pattern | WAKEUP_SEND | WAKEUP_STANDBY |
| 5 | Collision detected | WAKEUP_SEND | WAKEUP_DETECT |
| 6 | Wakeup timer expired or WUP detected on wakeup channel selected by bit FLXAnFRSUCC1.WUCS or frame header received on either available | WAKEUP_DETECT | WAKEUP_STANDBY |

Table 20.111 State Transitions WAKEUP (2/2)

| T# | Condition | From | To |
|---|---|---|---|
| exit | Wakeup completed (after T2 or T4 or T6) or Host commands change to READY state by writing FLXAnFRSUCC1.CMD = “0010” (READY command). This command also resets the wakeup FSM to WAKEUP_STANDBY state | WAKEUP | READY |

The WAKEUP_LISTEN state is controlled by the wakeup timer and the wakeup noise timer. The two timers are controlled by the parameters listen timeout FLXAnFRSUCC2.LT and listen timeout noise FLXAnFRSUCC2.LTN. Listen timeout enables a fast cluster wakeup in case of a noise free environment, while listen timeout noise enables wakeup under more difficult conditions regarding noise interference.

In WAKEUP_SEND state the CC transmits the wakeup pattern on the configured channel and checks for collisions. After return from wakeup the Host has to bring the CC into STARTUP state by CHI command RUN.

In WAKEUP_DETECT state the CC attempts to identify the reason for the wakeup collision detected in WAKEUP_SEND state. The monitoring is bounded by the expiration of listen timeout as configured by FLXAnFRSUCC2.LT. Either the detection of a wakeup pattern indicating a wakeup attempt by another node or the reception of a frame header indicating ongoing communication, causes the direct transition to READY state. Otherwise WAKEUP_DETECT is left after expiration of listen timeout; in this case the reason for wakeup collision is unknown.

The Host has to be aware of possible failures of the wakeup and act accordingly. It is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal time it takes another coldstart node to become awake and to be configured.

The FlexRay Protocol Specification recommends that two different CCs shall awake the two channels.

### (1) Host activities

The host must coordinate the wakeup of the two channels and must decide whether, or not, to wake a specific channel. The sending of the wakeup pattern is initiated by the Host. The wakeup pattern is detected by the remote BDs and signaled to their local Host.

**Wakeup procedure controlled by Host (single-channel wakeup):**

- Configure the CC in CONFIG state
  - Select wakeup channel by programming bit FLXAnFRSUCC1.WUCS
- Check local BDs whether a WUP was received
- Activate BD of selected wakeup channel
- Command CC to enter READY state
- Command CC to start wakeup on the configured channel by writing FLXAnFRSUCC1.CMD = “0011”
  - CC enters WAKEUP
  - CC returns to READY state and signals status of wakeup attempt to the Host
- Wait predefined time to allow the other nodes to wakeup and configure themselves
- Coldstart node:

  - In a dual channel cluster wait for WUP on the other channel
  - Reset coldstart inhibit flag FLXAnFRCCSV.CSI by writing FLXAnFRSUCC1.CMD = “1001” (ALLOW_COLDSTART command)
- Command CC to enter startup by writing FLXAnFRSUCC1.CMD = “0100” (RUN command)

**Wakeup procedure triggered by BD:**

- Wakeup recognized by BD
- BD triggers power-up of Host (if required)
- BD signals wakeup event to Host
- Host configures its local CC
- If necessary, Host commands wakeup of second channel and waits predefined time to allow the other nodes to wakeup and configure themselves
- Host commands CC to enter STARTUP state by writing FLXAnFRSUCC1.CMD = “0100” (RUN command)

### (2) Wakeup pattern (WUP)

The wakeup pattern (WUP) is composed of at least two wakeup symbols (WUS). Wakeup symbol and wakeup pattern are configured by registers FLXAnFRPRTC1 and FLXAnFRPRTC2.

- Single channel wakeup, wakeup symbol may not be sent on both channels at the same time
- Wakeup symbol collision resilient for at least two sending nodes (two overlapping wakeup symbols always recognizable)
- Wakeup symbol must be configured identical in all nodes of a cluster
- Wakeup symbol transmit low time configured by FLXAnFRPRTC2.TXL
- Wakeup symbol idle time used to listen for activity on the bus, configured by FLXAnFRPRTC2.TXI
- A wakeup pattern composed of at least two Tx-wakeup symbols needed for wakeup
- Number of repetitions configurable by FLXAnFRPRTC1.RWP (2 to 63 repetitions)
- Wakeup symbol receive window length configured by FLXAnFRPRTC1.RXW
- Wakeup symbol receive low time configured by FLXAnFRPRTC2.RXL
- Wakeup symbol receive idle time configured by FLXAnFRPRTC2.RXI

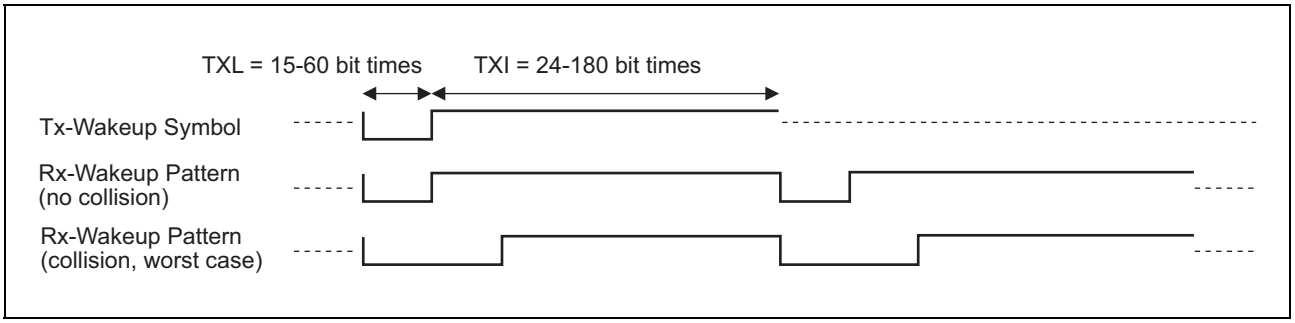

**Figure 20.9 Timing of Wakeup Pattern**

#### 20.3.6.6 STARTUP State

The description below is intended to help configuring startup for the FlexRay IP-module. A detailed description of the startup procedure together with the respective SDL diagrams can be found in the FlexRay protocol specification v2.1, **Section 7.2**.

Any node entering STARTUP state that has coldstart capability should assure that both channels attached have been awakened before initiating coldstart.

It cannot be assumed that all nodes and stars need the same amount of time to become completely awake and to be configured. Since at least two nodes are necessary to start up the cluster communication, it is advisable to delay any potential startup attempt of the node having instigated the wakeup by the minimal amount of time it takes another coldstart node to become awake, to be configured and to enter startup. It may require several hundred milliseconds (depending on the hardware used) before all nodes and stars are completely awakened and configured.

Startup is performed on all channels synchronously. During startup, a node only transmits startup frames. Startup frames are both sync frames and null frames during startup.

A fault-tolerant, distributed startup strategy is specified for initial synchronization of all nodes. In general, a node may enter NORMAL_ACTIVE state via (see **Figure 20.10**):

- Coldstart path initiating the schedule synchronization (LeadingColdstart node)
- Coldstart path joining other coldstart nodes (FollowingColdstart node)
- Integration path integrating into an existing communication schedule (all other nodes)

A coldstart attempt begins with the transmission of a collision avoidance symbol (CAS). Only a coldstart node that had transmitted the CAS transmits frames in the first four cycles after the CAS, it is then joined firstly by the other coldstart nodes and afterwards by all other nodes.

A coldstart node has bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY set to 1. Message buffer 0 holds the key slot ID which defines the slot number where the startup frame is send. In the frame header of the startup frame the startup frame indicator bit is set to 1.

In clusters consisting of three or more nodes, at least three nodes shall be configured to be coldstart nodes. In clusters consisting of two nodes, both nodes must be coldstart nodes. At least two fault-free coldstart nodes are necessary for the cluster to startup.

Each startup frame must also be a sync frame; therefore each coldstart node will also be a sync node. The number of coldstart attempts is configured by FLXAnFRSUCC1.CSA.

A non-coldstart node requires at least two startup frames from distinct nodes for integration. It may start integration before the coldstart nodes have finished their startup. It will not finish its startup until at least two coldstart nodes have finished their startup.

Both non-coldstart nodes and coldstart nodes start passive integration via the integration path as soon as they receive sync frames from which to derive the TDMA schedule information. During integration, the node has to adapt its own clock to the global clock (rate and offset) and has to make its cycle time consistent with the global schedule observable at the network. Afterwards, these settings are checked for consistency with all available network nodes. The node can only leave the integration phase and actively participate in communication when these checks are passed.

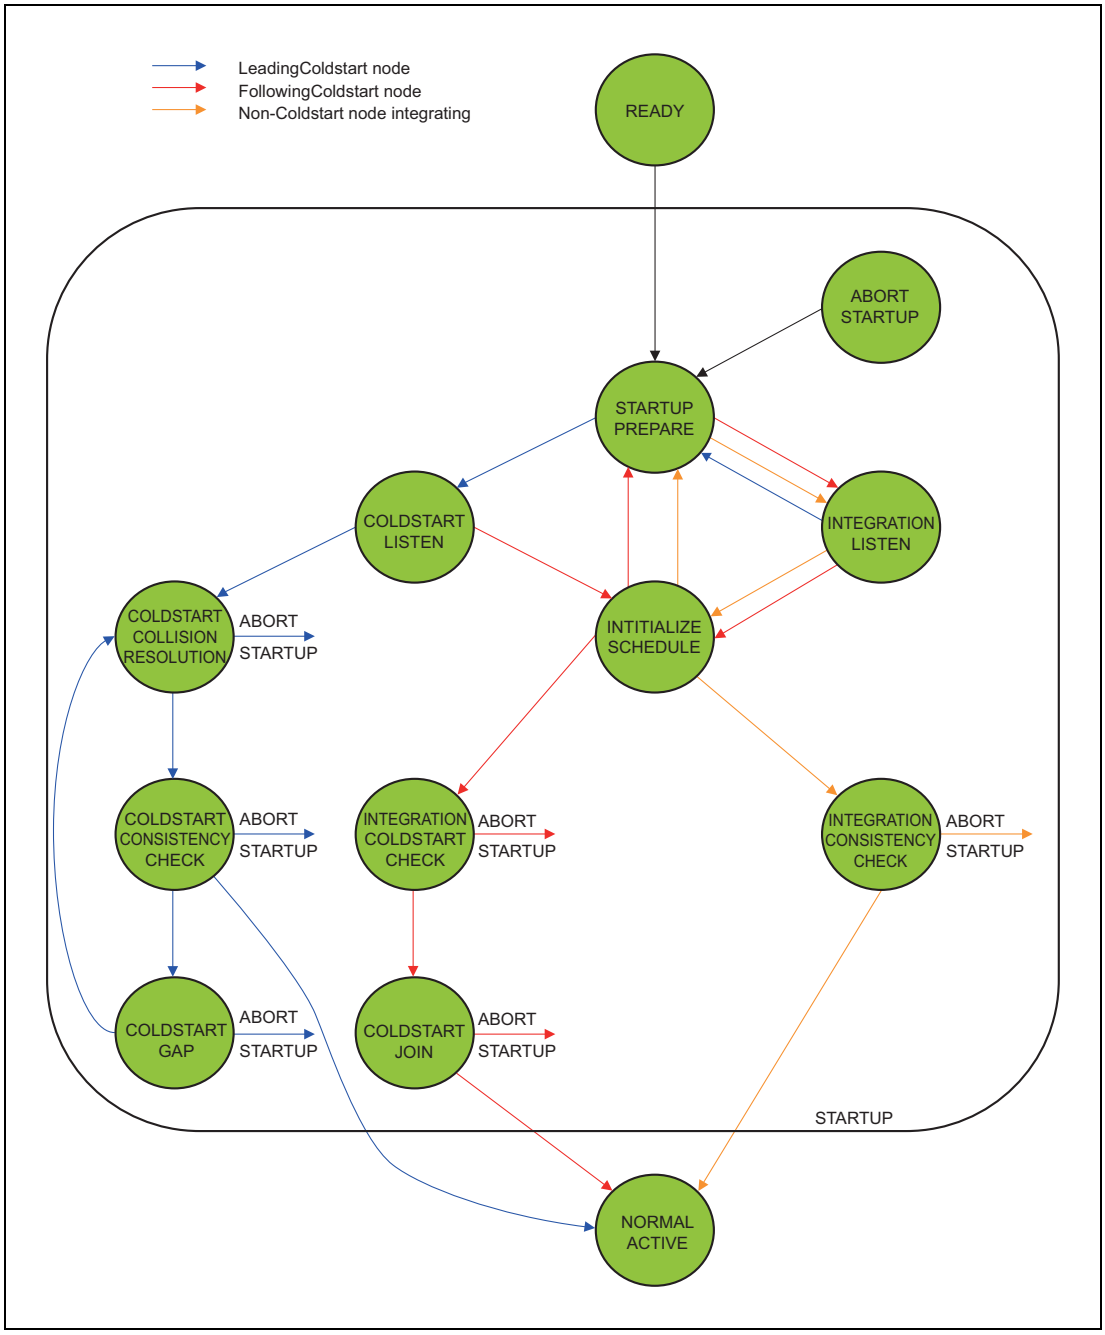

**Figure 20.10 State Diagram Time-Triggered Startup**

### (1) Coldstart Inhibit Mode

In coldstart inhibit mode the node is prevented from initializing the TDMA communication schedule. If bit FLXAnFRCCSV.CSI is set to 1, the node is not allowed to initialize the cluster communication, i.e. entering the coldstart path is prohibited. The node is allowed to integrate to a running cluster or to transmit startup frames after another coldstart node started the initialization of the cluster communication.

The coldstart inhibit bit FLXAnFRCCSV.CSI is set to 1 whenever the POC enters READY state. The bit has to be cleared under control of the Host by CHI command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = “1001”)

### (2) Startup Timeouts

The CC supplies two different µT timers supporting two timeout values, startup timeout and startup noise timeout. The two timers are started when the CC enters the COLDSTART_LISTEN state. The expiration of either of these timers causes the node to leave the initial sensing phase (COLDSTART_LISTEN state) with the intention of starting up communication.

**CAUTION**

**The startup and startup noise timers are identical with the wakeup and wakeup noise timers and use the same configuration values FLXAnFRSUCC2.LT and FLXAnFRSUCC2.LTN.**

#### (a) Startup Timeout

The startup timeout limits the listen time used by a node to determine if there is already communication between other nodes or at least one coldstart node actively requesting the integration of others. The startup timer is configured by programming FLXAnFRSUCC2.LT (see **Section 20.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2**).

The startup timeout is:

pdListenTimeout = FLXAnFRSUCC2.LT

The startup timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Both channels reaching idle state while in COLDSTART_LISTEN state

The startup timer is stopped:

- If communication channel activity is detected on one of the configured channels while the node is in the COLDSTART_LISTEN state
- When the COLDSTART_LISTEN state is left

Once the startup timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The timer status is kept for further processing by the startup state machine.

#### (b) Startup Noise Timeout

At the same time the startup timer is started for the first time (transition from STARTUP_PREPARE state to COLDSTART_LISTEN state), the startup noise timer is started. This additional timeout is used to improve reliability of the startup procedure in the presence of noise. The startup noise timeout is configured by programming FLXAnFRSUCC2.LTN (see **Section 20.2.6.2, FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2**).

The startup noise timeout is:

pdListenTimeout * gListenNoise = FLXAnFRSUCC2.LT * (FLXAnFRSUCC2.LTN + 1)

The startup noise timer is restarted upon:

- Entering the COLDSTART_LISTEN state
- Reception of correctly decoded headers or CAS symbols while the node is in COLDSTART_LISTEN state

The startup noise timer is stopped when the COLDSTART_LISTEN state is left.

Once the startup noise timeout expires, neither an overflow nor a cyclic restart of the timer is performed. The status is kept for further processing by the startup state machine. Since the startup noise timer won't be restarted when random channel activity is sensed, this timeout defines the fall-back solution that guarantees that a node will try to start up the communication cluster even in the presence of noise.

### (3) Path of Leading Coldstart Node (initiating coldstart)

When a coldstart node enters COLDSTART_LISTEN, it listens to its attached channels.

If no communication is detected, the node enters the COLDSTART_COLLISION_RESOLUTION state and commences a coldstart attempt. The initial transmission of a CAS symbol is succeeded by the first regular cycle. This cycle has the number zero.

From cycle zero on, the node transmits its startup frame. Since each coldstart node may perform a coldstart attempt, it may occur that several nodes simultaneously transmit the CAS symbol and enter the coldstart path. This situation is resolved during the first four cycles after CAS transmission.

As soon as a node that initiates a coldstart attempt receives a CAS symbol or a frame header during these four cycles, it re-enters the COLDSTART_LISTEN state. Thereby, only one node remains in this path. In cycle four, other coldstart nodes begin to transmit their startup frames.

After four cycles in COLDSTART_COLLISION_RESOLUTION state, the node that initiated the coldstart enters the COLDSTART_CONSISTENCY_CHECK state. It collects all startup frames from cycle four and five and performs the clock correction. If the clock correction does not deliver any errors and it has received at least one valid startup frame pair, the node leaves COLDSTART_CONSISTENCY_CHECK and enters NORMAL_ACTIVE state.

The number of coldstart attempts that a node is allowed to perform is configured by FLXAnFRSUCC1.CSA. The number of remaining coldstarts attempts can be read from FLXAnFRCCSV.RCA. The number of remaining coldstart attempts is reduced by one for each attempted coldstart. A node may enter the COLDSTART_LISTEN state only if this value is larger than one and it may enter the COLDSTART_COLLISION_RESOLUTION state only if this value is larger than zero. If the number of coldstart attempts is one, coldstart is inhibited but integration is still possible.

### (4) Path of Following Coldstart Node (responding to Leading Coldstart Node)

When a coldstart node enters the COLDSTART_LISTEN state, it tries to receive a valid pair of startup frames to derive its schedule and clock correction from the leading coldstart node.

As soon as a valid startup frame has been received the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_COLDSTART_CHECK state is entered.

In INTEGRATION_COLDSTART_CHECK state it is assured that the clock correction can be performed correctly and that the coldstart node from which this node has initialized its schedule is still available. The node collects all sync frames and performs clock correction in the following double-cycle. If clock correction does not signal any errors and if the node continues to receive sufficient frames from the same node it has integrated on, the COLDSTART_JOIN state is entered.

In COLDSTART_JOIN state following coldstart nodes begin to transmit their own startup frames and continue to do so in subsequent cycles. Thereby, the leading coldstart node and the nodes joining it can check if their schedules agree with each other. If the clock correction signals any error, the node aborts the integration attempt. If a node in this state sees at least one valid startup frame during all even cycles in this state and at least one valid startup frame pair during all double cycles in this state, the node

leaves COLDSTART_JOIN state and enters NORMAL_ACTIVE state. Thereby it leaves STARTUP at least one cycle after the node that initiated the coldstart.

### (5) Path of Non-coldstart Node

When a non-coldstart node enters the INTEGRATION_LISTEN state, it listens to its attached channels.

As soon as a valid startup frame has been received, the INITIALIZE_SCHEDULE state is entered. If the clock synchronization can successfully receive a matching second valid startup frame and derive a schedule from this, the INTEGRATION_CONSISTENCY_CHECK state is entered.

In INTEGRATION_CONSISTENCY_CHECK state the node verifies that the clock correction can be performed correctly and that enough coldstart nodes (at least 2) are sending startup frames that agree with the node's own schedule. Clock correction is activated, and if any errors are signaled, the integration attempt is aborted.

During the first even cycle in this state, either two valid startup frames or the startup frame of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

During the first double-cycle in this state, either two valid startup frame pairs or the startup frame pair of the node that this node has integrated on must be received; otherwise the node aborts the integration attempt.

If after the first double-cycle less than two valid startup frames are received within an even cycle, or less than two valid startup frame pairs are received within a double-cycle, the startup attempt is aborted.

Nodes in this state need to see two valid startup frame pairs for two consecutive double-cycles each to be allowed to leave STARTUP and enter NORMAL_OPERATION. Consequently, they leave startup at least one double-cycle after the node that initiated the coldstart and only at the end of a cycle with an odd cycle number.

### 20.3.6.7 NORMAL_ACTIVE State

As soon as the node that transmitted the first CAS symbol (resolving the potential access conflict and entering STARTUP via coldstart path) and one additional node have entered the NORMAL_ACTIVE state, the startup phase for the cluster has finished. In the NORMAL_ACTIVE state, all configured messages are scheduled for transmission. This includes all data frames as well as the sync frames. Rate and offset measurement is started in all even cycles (even / odd cycle pairs required).

In NORMAL_ACTIVE state the CC supports regular communication functions

- The CC performs transmissions and reception on the FlexRay bus as configured
- Clock synchronization is running
- The Host interface is operational

The CC exits from that state to

- HALT state by writing FLXAnFRSUCC1.CMD = "$0110_B$" (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "$0111_B$" (FREEZE command, immediately)
- HALT state due to change of the error state from ACTIVE to COMM_HALT
- NORMAL_PASSIVE state due to change of the error state from ACTIVE to PASSIVE
- READY state by writing FLXAnFRSUCC1.CMD = "$0010_B$" (READY command)

### 20.3.6.8 NORMAL_PASSIVE State

NORMAL_PASSIVE state is entered from NORMAL_ACTIVE state when the error state changes from ACTIVE to PASSIVE.

In NORMAL_PASSIVE state, the node is able to receive all frames (node is fully synchronized and performs clock synchronization). Contrary to the NORMAL_ACTIVE state, the node does not actively participate in communication, i.e. neither symbols nor frames are transmitted.

In NORMAL_PASSIVE state

- The CC performs reception on the FlexRay bus
- The CC does not transmit any frames or symbols on the FlexRay bus
- Clock synchronization is running
- The Host interface is operational

The CC exits from this state to

- HALT state by writing FLXAnFRSUCC1.CMD = "0110" (HALT command, at the end of the current cycle)
- HALT state by writing FLXAnFRSUCC1.CMD = "0111" (FREEZE command, immediately)
- HALT state due to change of the error state from PASSIVE to COMM_HALT
- NORMAL_ACTIVE state due to change of the error state from PASSIVE to ACTIVE. The transition takes place when FLXAnFRCCEV.PTAC equals FLXAnFRSUCC1.PTA - 1
- To READY state by writing FLXAnFRSUCC1.CMD = "0010" (READY command)

#### 20.3.6.9 HALT State

In this state all communication (reception and transmission) is stopped.

The CC enters this state

- By writing FLXAnFRSUCC1.CMD = "$0110_B$" (HALT command) while the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state
- By writing FLXAnFRSUCC1.CMD = "$0111_B$" (FREEZE command) from all states
- When exiting from NORMAL_ACTIVE state because the clock correction failed counter reached the "maximum without clock correction fatal" limit and FLXAnFRSUCC1.HCSE is set to 1
- When exiting from NORMAL_PASSIVE state because the clock correction failed counter reached the "maximum without clock correction fatal" limit and FLXAnFRSUCC1.HCSE is set to 1

The CC exits from this state to DEFAULT_CONFIG state

- By writing FLXAnFRSUCC1.CMD = "$0001_B$" (CONFIG command)

When the CC enters HALT state, all configuration and status data is maintained for analysing purposes.

When the Host writes FLXAnFRSUCC1.CMD = "$0110_B$" (HALT command), the CC sets bit FLXAnFRCCSV.HRQ to 1 and enters HALT state at the next end of cycle.

When the Host writes FLXAnFRSUCC1.CMD = "$0111_B$" (FREEZE command), the CC enters HALT state immediately and sets bit FLXAnFRCCSV.FSI to 1.

The POC state from which the transition to HALT state took place can be read from FLXAnFRCCSV.PSL.

### 20.3.7 Network Management

The accrued Network Management (NM) vector can be read from registers FLXAnFRNMV1…3. The CC performs a bit-wise OR operation over all NM vectors out of all received valid NM frames with the Payload Preamble Indicator (PPI) bit set. Only static frames may be configured to hold NM information. The CC updates the NM vector at the end of each cycle.

The length of the NM vector can be configured from 0 to 12 bytes by FLXAnFRNEMC.NML. The NM vector length must be configured identically in all nodes of a cluster.

To configure a transmit buffer to send FlexRay frames with the PPI bit set as 1, bit PPIT in the header section of the respective transmit buffer has to be set to 1 via FLXAnFRWRHS1.PPIT. In addition the Host has to write the NM information to the data section of the respective transmit buffer.

The evaluation of the NM vector has to be done by the application running on the Host.

**Section 20.3.17, Byte Alignment**, for byte alignment of the received NM vector in registers FLXAnFRNMV1 to FLXAnFRNMV3.

**CAUTIONS**

1. **In case a message buffer is configured for transmission / reception of network management frames, the payload length configured in header 2 of that message buffer should be equal or greater than the length of the NM vector configured by FLXAnFRNEMC.NML.**
2. **When the CC transits to HALT state, the cycle count is not incremented and therefore the NM vector is not updated. In this case FLXAnFRNMV1…3 holds the value from the cycle before.**

### 20.3.8 Filtering and Masking

Filtering is done by comparison of the configuration of assigned message buffers against actual slot and cycle counter values and channel ID (channel A, B). A message buffer is only updated / transmitted if the required matches occur.

Filtering is done on:

- Slot Counter
- Cycle Counter
- Channel ID

The following filter combinations for acceptance / transmit filtering are allowed:

- Slot Counter + Channel ID
- Slot Counter + Cycle Counter + Channel ID

All configured filters must match in order to store a received message in a message buffer.

**CAUTION**

**For the FIFO the acceptance filter is configured by the FIFO Rejection Filter (FLXAnFRFRF) and the FIFO Rejection Filter Mask (FLXAnFRFRFM).**

A message will be transmitted in the time slot corresponding to the configured frame ID on the configured channel(s). If cycle counter filtering is enabled the configured cycle filter value must also match.

#### 20.3.8.1 Slot Counter Filtering

Every transmit and receive buffer contains a frame ID stored in the header section. This frame ID is compared against the actual slot counter value in order to assign receive and transmit buffers to the corresponding slot.

If two or more message buffers are configured with the same frame ID and channel ID, and if they have a matching cycle counter filter value for the same slot, then the message buffer with the lowest message buffer number is used.

#### 20.3.8.2 Cycle Counter Filtering

Cycle counter filtering is based on the notion of a cycle set. For filtering purposes, a match is detected if any one of the elements of the cycle set is matched. The cycle set is defined by the cycle code field in header section 1 of each message buffer.

If message buffer 0 resp. 1 is configured to hold the startup / sync frame or the single slot frame by bits FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM, cycle counter filtering for message buffer 0 resp. 1 shall be disabled.

**CAUTION**

**Sharing of a static time slot via cycle counter filtering between different nodes of a FlexRay network is not allowed.**

The set of cycle numbers belonging to a cycle set is determined as described.

**Table 20.112 Definition of cycle set**

| Cycle Code | Matching Cycle Counter Values |
|---|---|
| 0b000000x | all Cycles |
| 0b000001c | every second Cycle at (Cycle Count) mod2 = c |
| 0b00001cc | every fourth Cycle at (Cycle Count) mod4 = cc |
| 0b0001ccc | every eighth Cycle at (Cycle Count) mod8 = ccc |
| 0b001cccc | every sixteenth Cycle at (Cycle Count) mod16 = cccc |
| 0b01ccccc | every thirty-second Cycle at (Cycle Count) mod32 = ccccc |
| 0b1cccccc | every sixty-fourth Cycle at (Cycle Count) mod64 = cccccc |

The below table gives some examples for valid cycle sets to be used for cycle counter filtering.

**Table 20.113 Examples for valid cycle sets**

| Cycle Code | Matching Cycle Counter Values |
|---|---|
| 0b0000011 | 1-3-5-7-…. -63 |
| 0b0000100 | 0-4-8-12-…. -60 |
| 0b0001110 | 6-14-22-30-…. -62 |
| 0b0011000 | 8-24-40-56 |
| 0b0100011 | 3-35 |
| 0b1001001 | 9 |

The received message is stored only if the cycle counter value of the cycle during which the message is received matches an element of the receive buffer's cycle set. Channel ID and frame ID must also be met.

The content of a transmit buffer is transmitted on the configured channel(s) when an element of the cycle set matches the current cycle counter value. Channel ID and frame ID must also be met.

### 20.3.8.3 Channel ID Filtering

There is a 2-bit channel filtering field (CH) located in the header section of each message buffer in the Message RAM. It serves as a filter for receive buffers, and as a control field for transmit buffers.

**Table 20.114 Channel filtering configuration**

| CH[1:0] | **Transmit Buffer** transmit frame | **Receive Buffer store valid receive frame** |
|---|---|---|
| 00 | no transmission | ignore frame |
| 01 | on channel A | received on channel A |
| 10 | on channel B | received on channel B |
| 11 | on both channels (static segment only) | received on channel A or B (store first semantically valid frame, static segment only) |

The contents of a transmit buffer is transmitted on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a transmit buffer may be set up for transmission on both channels (CH = "$11_B$").

Valid received frames are stored if they are received on the channels specified in the channel filtering field when the slot counter filtering and cycle counter filtering criteria are also met. Only in static segment a receive buffer may be setup for reception on both channels (CH = “11”).

**CAUTION**

**If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted resp. received frames are ignored (same function as CH = “00”).**

#### 20.3.8.4 FIFO Filtering

For FIFO filtering registers FLXAnFRFRF and FLXAnFRFRFM are used. The FIFO filter consists of channel filter FLXAnFRFRF.CH, frame ID filter FLXAnFRFRF.FID, and cycle counter filter FLXAnFRFRF.CYF. Registers FLXAnFRFRF and FLXAnFRFRFM can be configured in DEFAULT_CONFIG or CONFIG state only. The filter configuration in the header section of message buffers belonging to the FIFO is ignored.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected.

A valid received frame is stored in the FIFO if channel ID, frame ID, and cycle counter are not rejected by the configured rejection filter and rejection filter mask, and if there is no matching dedicated receive buffer.

## 20.3.9 Transmit Process

### 20.3.9.1 Static Segment

For the static segment, if there are several messages pending for transmission, the message with the frame ID corresponding to the next sending slot is selected for transmission.

The data section of transmit buffers assigned to the static segment can be updated until the end of the preceding time slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

### 20.3.9.2 Dynamic Segment

In the dynamic segment, if several messages are pending, the message with the highest priority (lowest frame ID) is selected next. In the dynamic segment different slot counter sequences on channel A and channel B are possible (concurrent sending of different frame IDs on both channels).

The data section of transmit buffers assigned to the dynamic segment can be updated until the end of the preceding slot. This means that a transfer from the Input Buffer has to be started by writing to the Input Buffer Command Request register latest at this time.

The start of latest transmit configured by FLXAnFRMHDC.SLT defines the maximum minislot value allowed before inhibiting new frame transmission in the dynamic segment of the current cycle.

### 20.3.9.3 Transmit Buffers

FlexRay message buffers can be configured as transmit buffers by programming bit CFG in the header section of the respective message buffer to 1 via FLXAnFRWRHS1.

There exist the following possibilities to assign a transmit buffer to the CC channels:

- Static segment: channel A or channel B,
  channel A and channel B
- Dynamic segment: channel A or channel B

Message buffer 0 resp. 1 is dedicated to hold the startup frame, the sync frame, or the designated single slot frame as configured by FLXAnFRSUCC1.TXST, FLXAnFRSUCC1.TXSY, and FLXAnFRSUCC1.TSM. In this case, it can be reconfigured in DEFAULT_CONFIG or CONFIG state only. This ensures that any node transmits at most one startup / sync frame per communication cycle. Transmission of startup / sync frames from other message buffers is not possible.

All other message buffers configured for transmission in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see **Section 20.3.12.1, Reconfiguration of Message Buffers**). Due to the organization of the data partition in the Message RAM (reference by data pointer), reconfiguration of the configured payload length and the data pointer in the header section of a message buffer may lead to erroneous configurations.

If a message buffer is reconfigured (header section updated) during runtime, it may happen that this message buffer is not send out in the respective communication cycle.

The CC does not have the capability to calculate the header CRC. The Host is supposed to provide the header CRCs for all transmit buffers. If network management is required, the Host has to set the PPIT bit in the header section of the respective message buffer to 1 and write the network management information to the data section of the message buffer (see **Section 20.3.7, Network Management**).

The payload length field configures the payload length in 2-byte words. If the configured payload length of a static transmit buffer is shorter than the payload length configured for the static segment by

FLXAnFRMHDC.SFDL, the CC generates padding bytes to ensure that frames have proper physical length. The padding pattern is "$0000_H$".

**CAUTION**

**In case of an odd payload length (PLC = 1, 3, 5,...) the application has to write zero to the last 16 bit of the message buffers data section to ensure that the padding pattern is "$0000_H$".**

Each transmit buffer provides a transmission mode flag TXM that allows the Host to configure the transmission mode for the transmit buffer. If this bit is set, the transmitter operates in the single-shot mode. If this bit is cleared, the transmitter operates in the continuous mode.

In single-shot mode the CC resets the respective TXR flag to 0 after transmission has completed. Now the Host may update the transmit buffer.

In continuous mode, the CC does not reset the respective transmission request flag TXR to 0 after successful transmission. In this case a frame is sent out each time the filter criteria match. The TXR flag can be reset to 0 by the Host by writing the respective message buffer number to the FLXAnFRIBCR register while bit FLXAnFRIBCM.STXRH is set to 0.

If two or more transmit buffers meet the filter criteria simultaneously, the transmit buffer with the lowest message buffer number will be transmitted in the respective slot.

### 20.3.9.4 Frame Transmission

The following steps are required to prepare a message buffer for transmission:

- Configure the transmit buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Write the data section of the transmit buffer via FLXAnFRWRDSn
- Transfer the configuration and message data from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR
- If configured in register FLXAnFRIBCM, the transmission request flag TXR for the respective message buffer will be set as soon as the transfer has completed, and the message buffer is ready for transmission.
- Check whether the message buffer has been transmitted by checking the respective TXR bit (TXR = 0) in the FLXAnFRTRXQ1/2/3/4 registers (single-shot mode only).

After transmission has completed, the respective TXR flag in the FLXAnFRTXRQ1/2/3/4 register is reset to 0 (single-shot mode), and, if bit MBI in the header section of the message buffer is set to 1, flag FLXAnFRSIR.TXI is set to 1. If enabled, an interrupt is generated.

### 20.3.9.5 Null Frame Transmission

If in static segment the Host does not set the transmission request flag to 1 before transmit time, the CC transmits a null frame with the null frame indication bit set to 0 and the payload data set to zero.

In the following cases the CC transmits a null frame:

- If the message buffer with the lowest message buffer number matching the filter criteria does not have its transmission request flag set (TXR = 0) to 1.
- No transmit buffer configured for the slot has a cycle counter filter that matches the current cycle. In this case, no message buffer status FLXAnFRMBS is updated.

Null frames are not transmitted in the dynamic segment.

## 20.3.10 Receive Process

### 20.3.10.1 Dedicated Receive Buffers

A portion of the FlexRay message buffers can be configured as dedicated receive buffers by programming bit CFG in the header section of the respective message buffer to 0 via FLXAnFRWRHS1.

The following possibilities exist to assign a receive buffer to the CC channels:

- Static segment: channel A or channel B,
  channel A and channel B (the CC stores the first semantically valid frame)
- Dynamic segment: channel A or channel B

The CC transfers the payload data of valid received messages from the shift register of the FlexRay channel protocol controller (channel A or B) to the receive buffer with the matching filter configuration. A receive buffer stores all frame elements except the frame CRC.

All message buffers configured for reception in static or dynamic segment are reconfigurable during runtime depending on the configuration of FLXAnFRMRC.SEC (see **Section 20.3.12.1, Reconfiguration of Message Buffers**). If a message buffer is reconfigured (header section updated) during runtime it may happen that in the respective communication cycle a received message is lost.

If two or more receive buffers meet the filter criteria simultaneously, the receive buffer with the lowest message buffer number is updated with the received message.

### 20.3.10.2 Frame Reception

The following steps are required to prepare a dedicated message buffer for reception:

- Configure the receive buffer in the Message RAM via FLXAnFRWRHS1, FLXAnFRWRHS2, and FLXAnFRWRHS3
- Transfer the configuration from Input Buffer to the Message RAM by writing the number of the target message buffer to register FLXAnFRIBCR

Once these steps are performed, the message buffer functions as an active receive buffer and participates in the internal acceptance filtering process which takes place every time the CC receives a message. The first matching receive buffer is updated from the received message.

If a valid payload segment was stored in the data section of a message buffer, the respective ND flag in the FLXAnFRNDAT1/2/3/4 registers is set to 1, and, if bit MBI in the header section of that message buffer is set to 1, flag FLXAnFRSIR.RXI is set to 1. If enabled, an interrupt is generated.

In case that bit ND was already set to 1 when the Message Handler updates the message buffer, bit FLXAnFRMBS.MLST of the respective message buffer is set to 1 and the unprocessed message data is lost.

If no frame, a null frame, or a corrupted frame was received in a slot, the data section of the message buffer configured for this slot is not updated. In this case only the respective message buffer status FLXAnFRMBS is updated.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 registers is set to 1, and if bit MBI in the header section of that message buffer is set, flag FLXAnFRSIR.MBSI is set to 1. If enabled an interrupt is generated.

If the payload length of a received frame PLR is longer than the value programmed by PLC in the header section of the respective message buffer, the data field stored in the message buffer is truncated to that length.

To read a receive buffer from the Message RAM via the Output Buffer, proceed as described in **Section 20.3.12.2 (2), Data Transfer from Message RAM to Output Buffer**.

**CAUTION**

**The ND and MBC flags are automatically cleared by the Message Handler when the payload data and the header of a received message have been transferred to the Output Buffer, respectively.**

### 20.3.10.3 Null Frame Reception

The payload segment of a received null frame is not copied into the matching dedicated receive buffer. If a null frame has been received, only the message buffer status FLXAnFRMBS of the matching message buffer is updated from the received null frame. All bits in header 2 and 3 of the matching message buffer remain unchanged. They are updated from received data frames only.

When the Message Handler changed the message buffer status FLXAnFRMBS in the header section of a message buffer, the respective MBC flag in the FLXAnFRMBSC1/2/3/4 register is set to 1, and if bit MBI in the header section of that message buffer is set to 1, flag FLXAnFRSIR.MBSI is set to 1. If enabled, an interrupt is generated.

## 20.3.11 FIFO Function

### 20.3.11.1 Description

A portion of the message buffers can be configured as a cyclic First-In-First-Out (FIFO) buffer. The group of message buffers belonging to the FIFO is contiguous in the register map starting with the message buffer referenced by FLXAnFRMRC.FFB and ending with the message buffer referenced by FLXAnFRMRC.LCB. Up to 127 message buffers can be assigned to the FIFO.

Every valid incoming message not matching with any dedicated receive buffer but passing the programmable FIFO filter is stored into the FIFO. In this case frame ID, payload length, receive cycle count, and the message buffer status FLXAnFRMBS of the addressed FIFO message buffer are overwritten with frame ID, payload length, receive cycle count, and the status from the received frame. Bit FLXAnFRSIR.RFNE shows that the FIFO is not empty, bit FLXAnFRSIR.RFCL is set to 1 when the receive FIFO fill level FLXAnFRFSR.RFFL is equal or greater than the critical level as configured by FLXAnFRFCL.CL, bit FLXAnFREIR.RFO shows that a FIFO overrun has been detected. If enabled, interrupts are generated.

If null frames are not rejected by the FIFO rejection filter, the null frames will be treated like data frames when they are stored into the FIFO.

There are two index registers associated with the FIFO. The PUT Index Register (PIDX) is an index to the next available location in the FIFO. When a new message has been received it is written into the message buffer addressed by the PIDX register. The PIDX register is then incremented and addresses the next available message buffer. If the PIDX register is incremented past the highest numbered message buffer of the FIFO, the PIDX register is loaded with the number of the first (lowest numbered) message buffer in the FIFO chain. The GET Index Register (GIDX) is used to address the next message buffer of the FIFO to be read. The GIDX register is incremented after transfer of the contents of a message buffer belonging to the FIFO to the Output Buffer. The PUT Index Register and the GET Index Register are not accessible by the Host.

The FIFO is completely filled when the PUT index (PIDX) reaches the value of the GET index (GIDX). When the next message is written to the FIFO before the oldest message has been read, both PUT index and GET index are incremented and the new message overwrites the oldest message in the FIFO. This will set FIFO overrun flag FLXAnFREIR.RFO to 1.

A FIFO non empty status is detected when the PUT index (PIDX) differs from the GET index (GIDX). In this case flag FLXAnFRSIR.RFNE is set to 1. This indicates that there is at least one received message in the FIFO. The FIFO empty, FIFO not empty, and the FIFO overrun states are explained in **Figure 20.11** for a three message buffer FIFO.

The programmable FlexRay FIFO Rejection Filter (FLXAnFRFRF) defines a filter pattern for messages to be rejected. The FIFO filter consists of channel filter, frame ID filter, and cycle counter filter. If bit FLXAnFRFRF.RSS is set to 1, all messages received in the static segment are rejected by the FIFO. If bit FLXAnFRFRF.RNF is set to 1, received null frames are not stored in the FIFO.

The FlexRay FIFO Rejection Filter Mask (FLXAnFRFRFM) specifies which bits of the frame ID filter in the FIFO Rejection Filter register are marked 'don't care' for rejection filtering.

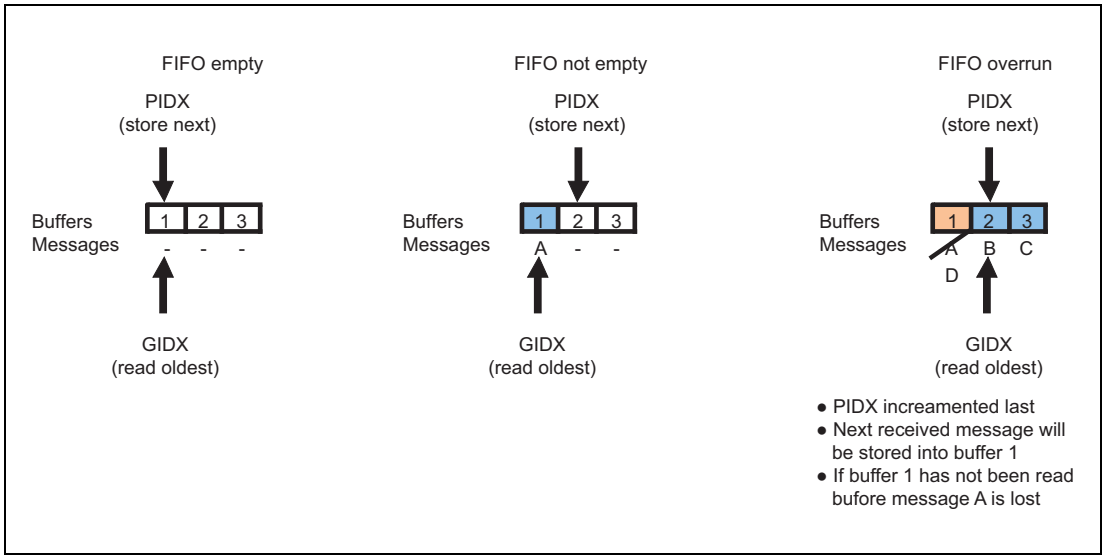

**Figure 20.11 FIFO Status: Empty, Not Empty, Overrun**

### 20.3.11.2 Configuration of the FIFO

(Re)configuration of message buffers belonging to the FIFO is only possible when the CC is in DEFAULT_CONFIG or CONFIG state. While the CC is in DEFAULT_CONFIG or CONFIG state, the FIFO function is not available.

For all message buffers belonging to the FIFO the payload length configured should be programmed to the same value via FLXAnFRWRHS2.PLC. The data pointer to the first 32-bit word of the data section of the respective message buffer in the Message RAM has to be configured via FLXAnFRWRHS3.DP.

All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask. The values configured in the header sections of the message buffers belonging to the FIFO are, with exception of DP and PLC, irrelevant.

**CAUTIONS**

1. **It is recommended to program the MBI bits of the message buffers belonging to the FIFO to 0 via FLXAnFRWRHS1.MBI to avoid generation of RX interrupts.**
2. **If the payload length of a received frame is longer than the value programmed by FLXAnFRWRHS2.PLC in the header section of the respective message buffer, the data field stored in a message buffer of the FIFO is truncated to that length.**

#### 20.3.11.3 Access to the FIFO

**(1) When the output buffer is used:**

For FIFO access outside DEFAULT_CONFIG and CONFIG state, the Host has to trigger a transfer from the Message RAM to the Output Buffer by writing the number of the first message buffer of the FIFO (referenced by FLXAnFRMRC.FFB) to the register FLXAnFROBCR. The Message Handler then transfers the message buffer addressed by the GET Index Register (GIDX) to the Output Buffer. After this transfer the GET Index Register (GIDX) is incremented.

**(2) When the data transfer function is used:**

The message received in FIFO can be transferred to the Local RAM/Global RAM by using the output data transfer function. For the output data transfer function, see **Section 20.3.16.2, Output Data Transfer**, Output Data Transfer.

### 20.3.12 Message Handling

The Message Handler controls data transfers between the Input / Output Buffer and the Message RAM and between the Message RAM and the two Temporary buffers.

Access to the message buffers stored in the Message RAM is done under control of the Message Handler state machine. This avoids conflicts between accesses of the two FlexRay channel protocol controllers and the Host to the Message RAM.

Frame IDs of message buffers assigned to the static segment have to be in the range from 1 to FLXAnFRGTUC7.NSS. Frame IDs of message buffers assigned to the dynamic segment have to be in the range from FLXAnFRGTUC7.NSS + 1 to 2047.

Received messages with no matching dedicated receive buffer (static or dynamic segment) are stored in the receive FIFO (if configured) if they pass the FIFO rejection filter.

Access of the Host to the message buffer contents using the input or output buffer function is described in this subsection. Access to the message buffer contents using the data transfer function is mentioned in **Section 20.3.16, Usage of Data Transfer**.

#### 20.3.12.1 Reconfiguration of Message Buffers

In case that an application needs to operate with more than 128 different messages, static and dynamic message buffers may be reconfigured during FlexRay operation. This is done by updating the header section of the respective message buffer via Input Buffer registers FLXAnFRWRHS1…3.

Reconfiguration has to be enabled via control bits FLXAnFRMRC.SEC in the Message RAM Configuration register.

If a message buffer has not been transmitted / updated from a received frame before reconfiguration starts, the respective message is lost.

The point in time when a reconfigured message buffer is ready for transmission / reception according to the reconfigured frame ID depends on the actual state of the slot counter when the update of the header section has completed. Therefore it may happen that a reconfigured message buffer is not transmitted / updated from a received frame in the cycle where it was reconfigured.

The Message RAM is scanned according to below.

**Table 20.115 Scan of Message RAM**

| Start of Scan in Slot | Scan for Slots |
|---|---|
| 1 | 2…15, 1 (next cycle) |
| 8 | 16…23, 1 (next cycle) |
| 16 | 24…31, 1 (next cycle) |
| 24 | 32…39, 1 (next cycle) |
| … | … |

A Message RAM scan is terminated with the start of NIT regardless whether it has completed or not. The scan of the Message RAM for slots 2 to 15 starts at the beginning of slot 1 of the actual cycle. The scan of the Message RAM for slot 1 is done in the cycle before by checking in parallel to each scan of the Message RAM whether there is a message buffer configured for slot 1 of the next cycle.

The number of the first dynamic message buffer is configured by FLXAnFRMRC.FDB. In case a Message RAM scan starts while the CC is in dynamic segment, the scan starts with the message buffer number configured by FLXAnFRMRC.FDB.

In case a message buffer should be reconfigured to be used in slot 1 of the next cycle, the following has to be considered:

- If the message buffer to be reconfigured for slot 1 is part of the “Static Buffers”, it will only be found if it is reconfigured before the last Message RAM scan in the static segment of the actual cycle evaluates this message buffer.
- If the message buffer to be reconfigured for slot 1 is part of the “Static + Dynamic Buffers”, it will be found if it is reconfigured before the last Message RAM scan in the actual cycle evaluates this message buffer.
- The start of NIT terminates the Message RAM scan. In case the Message RAM scan has not evaluated the reconfigured message buffer until this point in time, the message buffer will not be considered for the next cycle.

**CAUTION**

**Reconfiguration of message buffers may lead to the loss of messages and therefore has to be used very carefully. In worst case (reconfiguration in consecutive cycles) it may happen that a message buffer is never transmitted / updated from a received frame.**

### 20.3.12.2 Host access to Message RAM

The message transfer between Input Buffer and Message RAM as well as between Message RAM and Output Buffer is triggered by the Host by writing the number of the target / source message buffer to be accessed to FLXAnFRIBCR or FLXAnFROBCR register.

The FLXAnFRIBCM and FLXAnFROBCM registers can be used to write / read header and data section of the selected message buffer separately.

If bit FLXAnFRIBCM.STXR is set to = 1, the transmission request flag TXR of the selected message buffer is automatically set to 1 after the message buffer has been updated. If bit FLXAnFRIBCM.STXR is reset to 0, the transmission request flag TXR of the selected message buffer is reset. This can be used to stop transmission from message buffers operated in continuous mode.

Input Buffer (IBF) and Output Buffer (OBF) are build up as a double buffer structure. One half of this double buffer structure is accessible by the Host (IBF Host / OBF Host), while the other half (IBF Shadow / OBF Shadow) is accessed by the Message Handler for data transfers between IBF / OBF and Message RAM.

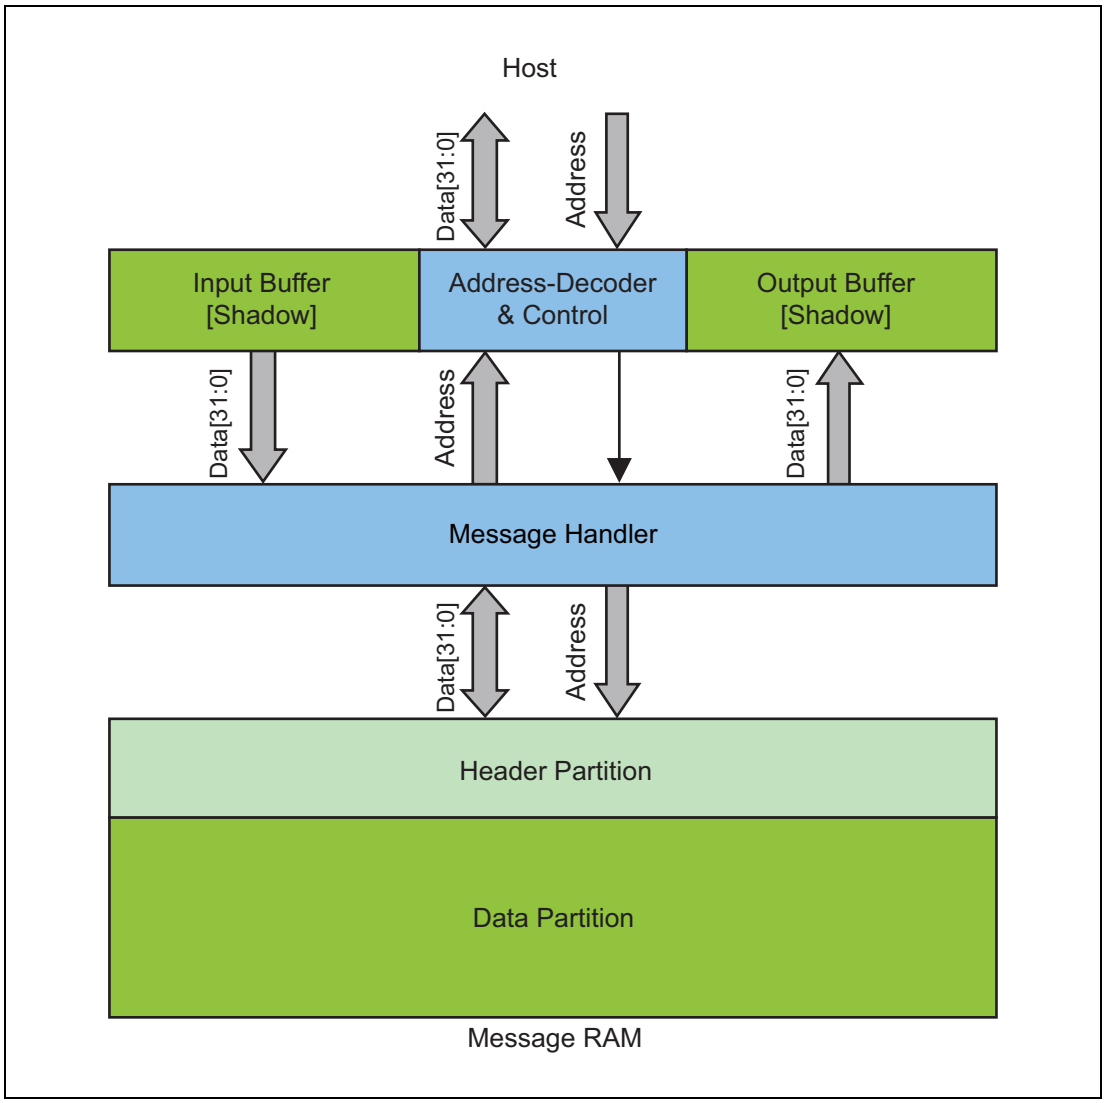

**Figure 20.12 Host access to Message RAM**

### (1) Data Transfer from Input Buffer to Message RAM

To configure / update a message buffer in the Message RAM, the Host has to write the data to FLXAnFRWRDSn and the header to FLXAnFRWRHS1…3. The specific action is selected by configuring the FlexRay Input Buffer Command Mask FLXAnFRIBCM.

When the Host writes the number of the target message buffer in the Message RAM to FLXAnFRIBCR.IBRH, IBF Host and IBF Shadow are swapped (see **Figure 20.14**).

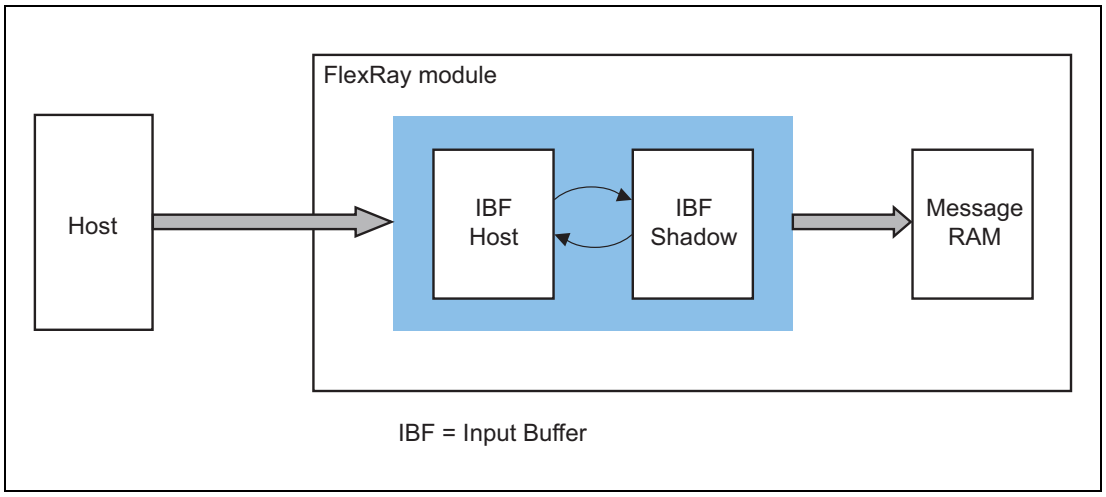

**Figure 20.13 Double Buffer Structure Input Buffer**

In addition the bits in the FLXAnFRIBCM and FLXAnFRIBCR registers are also swapped to keep them attached to the respective IBF section (see **Figure 20.14**).

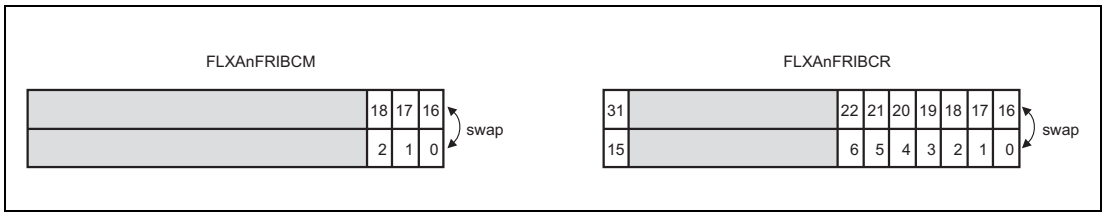

**Figure 20.14 Swapping of FLXAnFRIBCM and FLXAnFRIBCR bits**

With this write operation bit FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by FLXAnFRIBCR.IBRS.

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message to IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, bit FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to FLXAnFRIBCR.IBRH.

If a write access to FLXAnFRIBCR.IBRH occurs while FLXAnFRIBCR.IBSYS is 1, FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, FLXAnFRIBCR.IBSYH is reset to 0, FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under FLXAnFRIBCR.IBRH and FLXAnFRIBCR.IBRS and the command mask flags are also swapped.

**Example of a 8/16/32-bit Host access sequence:**

Configure / update n-th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSn
- Write header section to FLXAnFRWRHS1…3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

Configure / update (n+1)th message buffer via IBF

- Wait until FLXAnFRIBCR.IBSYH is reset
- Write data section to FLXAnFRWRDSn
- Write header section to FLXAnFRWRHS1…3
- Write Command Mask: write FLXAnFRIBCM.STXRH, FLXAnFRIBCM.LDSH, FLXAnFRIBCM.LHSH
- Demand data transfer to target message buffer: write FLXAnFRIBCR.IBRH

**CAUTION**

**Any write access to IBF while FLXAnFRIBCR.IBSYH is 1 will set error flag FLXAnFREIR.IIBA to 1. In this case the write access has no effect.**

**Table 20.116 Assignment of FLXAnFRIBCM Bits**

| Pos. | Access | Bit | Function |
|---|---|---|---|
| 18 | r | STXRS | Set Transmission Request Shadow ongoing or finished |
| 17 | r | LDSS | Load Data Section Shadow ongoing or finished |
| 16 | r | LHSS | Load Header Section Shadow ongoing or finished |
| 2 | r/w | STXRH | Set Transmission Request Host |
| 1 | r/w | LDSH | Load Data Section Host |
| 0 | r/w | LHSH | Load Header Section Host |

**Table 20.117 Assignment of FLXAnFRIBCR Bits**

| Pos. | Access | Bit | Function |
|---|---|---|---|
| 31 | r | IBSYS | IBF Busy Shadow, signals ongoing transfer from IBF Shadow to Message RAM |
| 22…16 | r | IBRS | IBF Request Shadow, number of message buffer currently / lately updated |
| 15 | r | IBSYH | IBF Busy Host, transfer request pending for message buffer referenced by IBRH |
| 6…0 | r/w | IBRH | IBF Request Host, number of message buffer to be updated next |

### (2) Data Transfer from Message RAM to Output Buffer

To read a message buffer from the Message RAM, the Host has to write to register FLXAnFROBCR to trigger the data transfer as configured in FLXAnFROBCM. After the transfer has completed, the Host can read the transferred data from FLXAnFRRDDSn, FLXAnFRRDHS1…3, and FLXAnFRMBS.

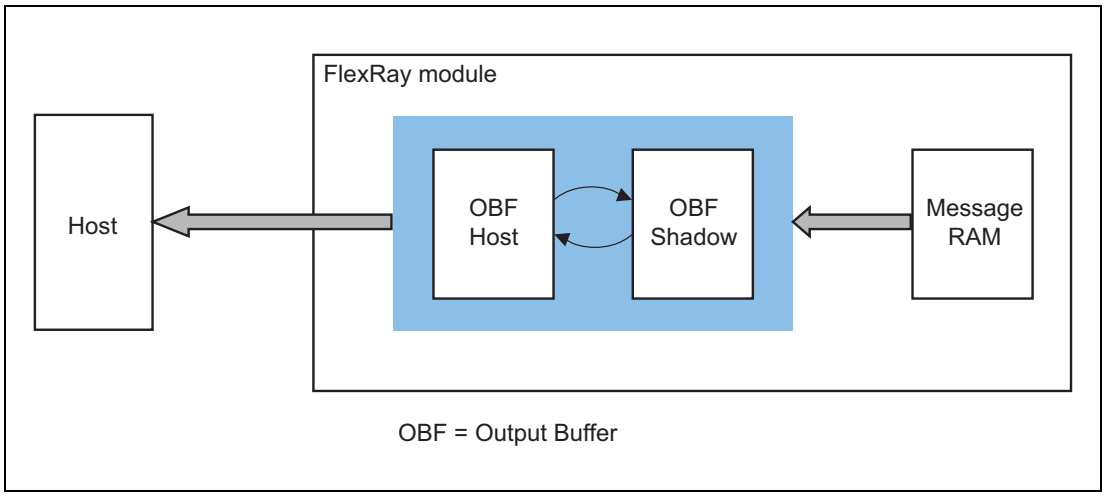

**Figure 20.15 Double buffer structure Output Buffer**

OBF Host and OBF Shadow as well as bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS, FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH and bits FLXAnFROBCR.OBRS, FLXAnFROBCR.OBRH are swapped under control of bits FLXAnFROBCR.VIEW and FLXAnFROBCR.REQ.

Writing bit FLXAnFROBCR.REQ to 1 copies bits FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS and bits FLXAnFROBCR.OBRS to an internal storage (see **Figure 20.16**).

After setting FLXAnFROBCR.REQ to 1, FLXAnFROBCR.OBSYS is set to 1, and the transfer of the message buffer selected by FLXAnFROBCR.OBRS from the Message RAM to OBF Shadow is started. After the transfer between the Message RAM and OBF Shadow has completed, the FLXAnFROBCR.OBSYS bit is set back to 0. Bits FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW can only be set to 1 while FLXAnFROBCR.OBSYS is 0.

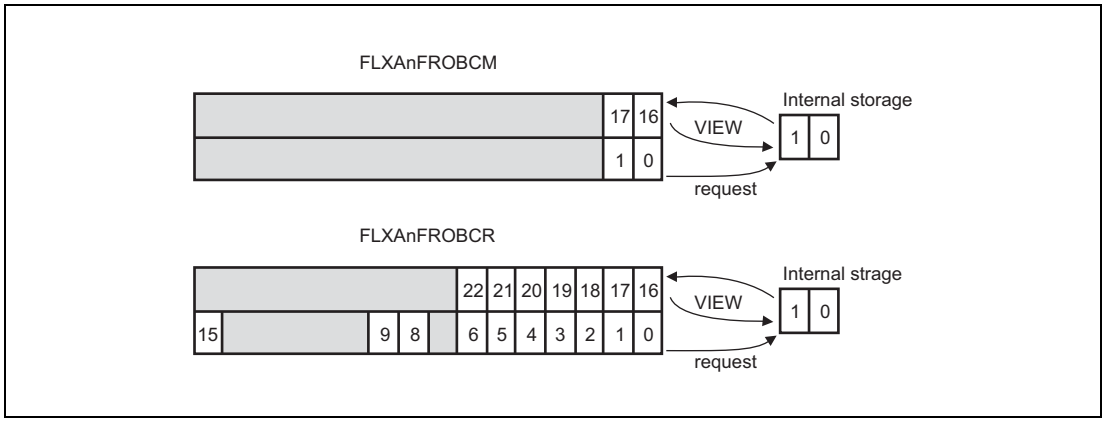

**Figure 20.16 Swapping of FLXAnFROBCM and FLXAnFROBCR bits**

OBF Host and OBF Shadow are swapped by setting bit FLXAnFROBCR.VIEW to 1 while bit FLXAnFROBCR.OBSYS is 0 (see **Figure 20.15**).

In addition bits FLXAnFROBCR.OBRH and bits FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH are swapped with the registers internal storage thus assuring that the message buffer number stored in FLXAnFROBCR.OBRH and the mask configuration stored in FLXAnFROBCM.RHSH, FLXAnFROBCM.RDSH matches the transferred data stored in OBF Host (see **Figure 20.16**).

Now the Host can read the transferred message buffer from OBF Host while the Message Handler may transfer the next message from the Message RAM to OBF Shadow.

If bits REQ and VIEW are set to 1 with the same write access while FLXAnFROBSYS is 0, FLXAnFROBSYS is automatically set to 1 and OBF Shadow and OBF Host are swapped. Additionally mask bits FLXAnFROBCM.RDSH and FLXAnFROBCM.RHSH are swapped with the registers internal storage to keep them attached to the respective Output Buffer transfer. Afterwards FLXAnFROBCR.OBRS is copied to the register internal storage, mask bits FLXAnFROBCM.RDSS and FLXAnFROBCM.RHSS are copied to register FLXAnFROBCM internal storage, and the transfer of the selected message buffer from the Message RAM to OBF Shadow is started. While the transfer is ongoing the Host can read the message buffer transferred by the previous transfer from OBF Host. When the current transfer between Message RAM and OBF Shadow has completed, this is signaled by setting FLXAnFROBCR.OBSYS back to 0.

#### Example of an 8/16/32-bit Host access to a single message buffer:

If a single message buffer has to be read out, two separate write accesses to FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW are necessary:

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS
- Request transfer of message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of and 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).
- Wait until FLXAnFROBCR.OBSYS is reset
- Toggle OBF Shadow and OBF Host by writing FLXAnFROBCR.VIEW = 1
- Read out transferred message buffer by reading FLXAnFRRDDSn, FLXAnFRRDHS1…3, and FLXAnFRMBS

#### Example of an 8/16/32-bit Host access sequence:

Request transfer of 1st message buffer to OBF Shadow

- Wait until FLXAnFROBCR.OBSYS is reset
- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 1st message buffer
- Request transfer of 1st message buffer to OBF Shadow by writing FLXAnFROBCR.OBRS and FLXAnFROBCR.REQ (in case of an 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ).

Toggle OBF Shadow and OBF Host to read out 1st transferred message buffer and request transfer of 2nd message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0

- Write Output Buffer Command Mask FLXAnFROBCM.RHSS, FLXAnFROBCM.RDSS for 2nd message buffer
- Toggle OBF Shadow and OBF Host and start transfer of 2nd message buffer to OBF Shadow simultaneously by writing FLXAnFROBCR.OBRS of 2nd message buffer, FLXAnFROBCR.REQ, and FLXAnFROBCR.VIEW (in case of and 8-bit Host interface, FLXAnFROBCR.OBRS has to be written before FLXAnFROBCR.REQ and FLXAnFROBCR.VIEW).
- Read out 1st transferred message buffer by reading FLXAnFRRDDSn, FLXAnFRRDHS1…3, and FLXAnFRMBS

…

Demand access to last requested message buffer without request of another message buffer:

- Wait until FLXAnFROBCR.OBSYS is reset to 0
- Demand access to last transferred message buffer by writing FLXAnFROBCR.VIEW
- Read out last transferred message buffer by reading FLXAnFRRDDSn, FLXAnFRRDHS1…3, and FLXAnFRMBS

**Table 20.118 Assignment of FLXAnFROBCM bits**

| Pos. | Access | Bit | Function |
|---|---|---|---|
| 17 | r | RDSH | Data Section available for Host access |
| 16 | r | RHSH | Header Section available for Host access |
| 1 | r/w | RDSS | Read Data Section Shadow |
| 0 | r/w | RHSS | Read Header Section Shadow |

**Table 20.119 Assignment of FLXAnFROBCR bits**

| Pos. | Access | Bit | Function |
|---|---|---|---|
| 22…16 | r | OBRH | OBF Request Host,<br>number of message buffer available for Host access |
| 15 | r | OBSYS | OBF Busy Shadow,<br>signals ongoing transfer from Message RAM to OBF Shadow |
| 9 | r/w | REQ | Request Transfer from Message RAM to OBF Shadow |
| 8 | r/w | VIEW | View OBF Shadow, swap OBF Shadow and OBF Host |
| 6…0 | r/w | OBRS | OBF Request Shadow, number of message buffer for next request |

### 20.3.12.3 FlexRay Protocol Controller Access to Message RAM

The two Temporary buffers (TBF A, B) are used to buffer the data for transfer between the two FlexRay Protocol Controllers and the Message RAM.

Each Temporary buffer is build up as a double buffer, able to store two complete FlexRay messages. There is always one buffer assigned to the corresponding Protocol Controller while the other one is accessible by the Message Handler.

If e.g. the Message Handler writes the next message to be sent to Temporary buffer Tx, the FlexRay Channel Protocol Controller can access Temporary buffer Rx to store the message it is actually receiving. During transmission of the message stored in Temporary buffer Tx, the Message Handler transfers the last received message stored in Temporary buffer Rx to the Message RAM (if it passes acceptance filtering) and updates the respective message buffer.

Data transfers between the Temporary buffers and the shift registers of the FlexRay Channel Protocol Controllers are done in words of 32 bit. This enables the use of a 32 bit shift register independent of the length of the FlexRay messages.

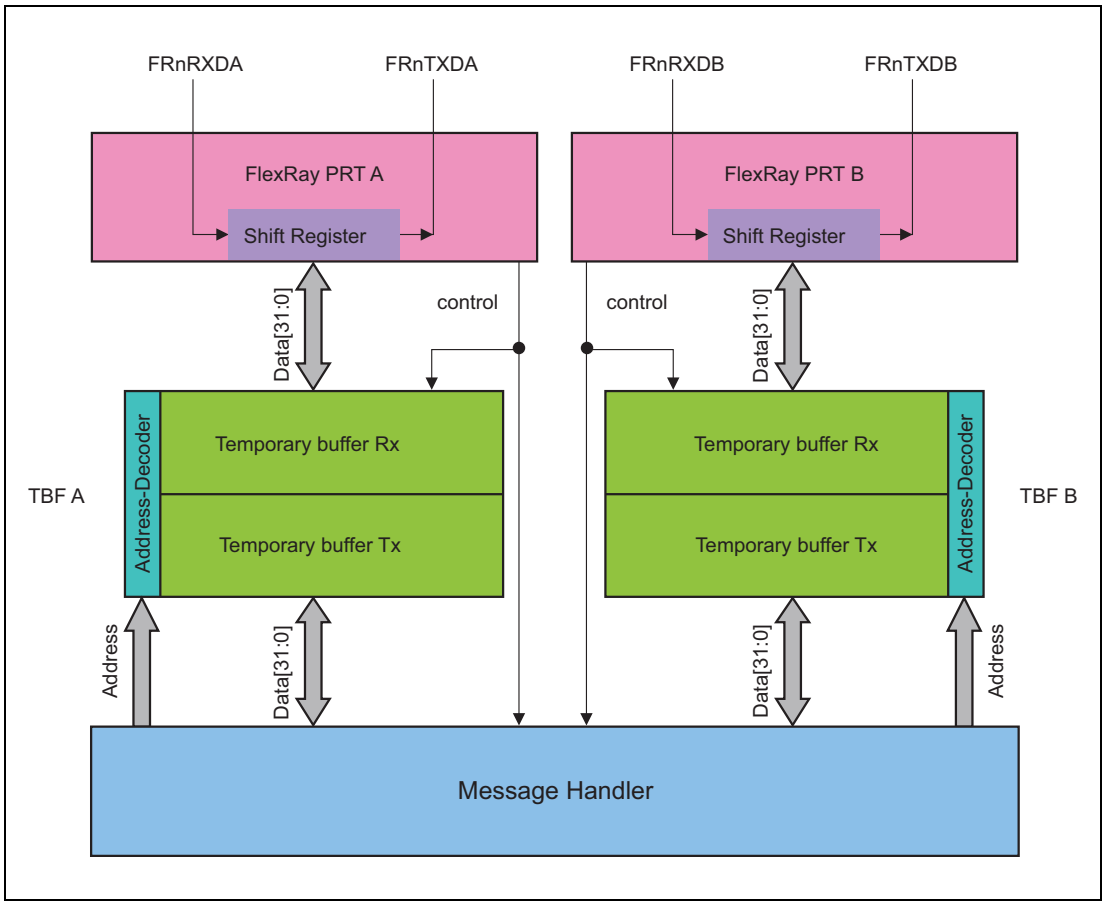

**Figure 20.17 Access to Temporary Buffers**

### 20.3.13 Message RAM

To avoid conflicts between Host access to the Message RAM and FlexRay message reception / transmission, the Host cannot directly access the message buffers in the Message RAM. These accesses are handled via the Input and Output Buffers. The Message RAM is able to store up to 128 message buffers depending on the configured payload length.

The Message RAM is able to store up to 2048 32-bit words. To achieve the required flexibility with respect to different numbers of data bytes per FlexRay frame (0…254), the Message RAM has a structure as shown in **Figure 20.18**.

The data partition is allowed to start at Message RAM word number: (FLXAnFRMRC.LCB + 1) * 4

When the Message Buffer which Data Section is located directly following the Header Partition is configured as receive buffer(FLXAnFRWRHS1.CFG set to "0") or receive FIFO, the user should leave at least 32bit unused area at the head of Data Partition. In this case the data partition is allowed to start at Message RAM word number: ((bits FLXAnFRMRC.LCB[7:0] + 1) * 4) + 1.

When the Message Buffer which Data Section is located directly following the Header Partition is configured as transmit buffer (FLXAnFRWRHS1.CFG set to "1"), the data partition is allowed to start at Message RAM word number:(bits FLXAnFRMRC.LCB[7:0] + 1) * 4.

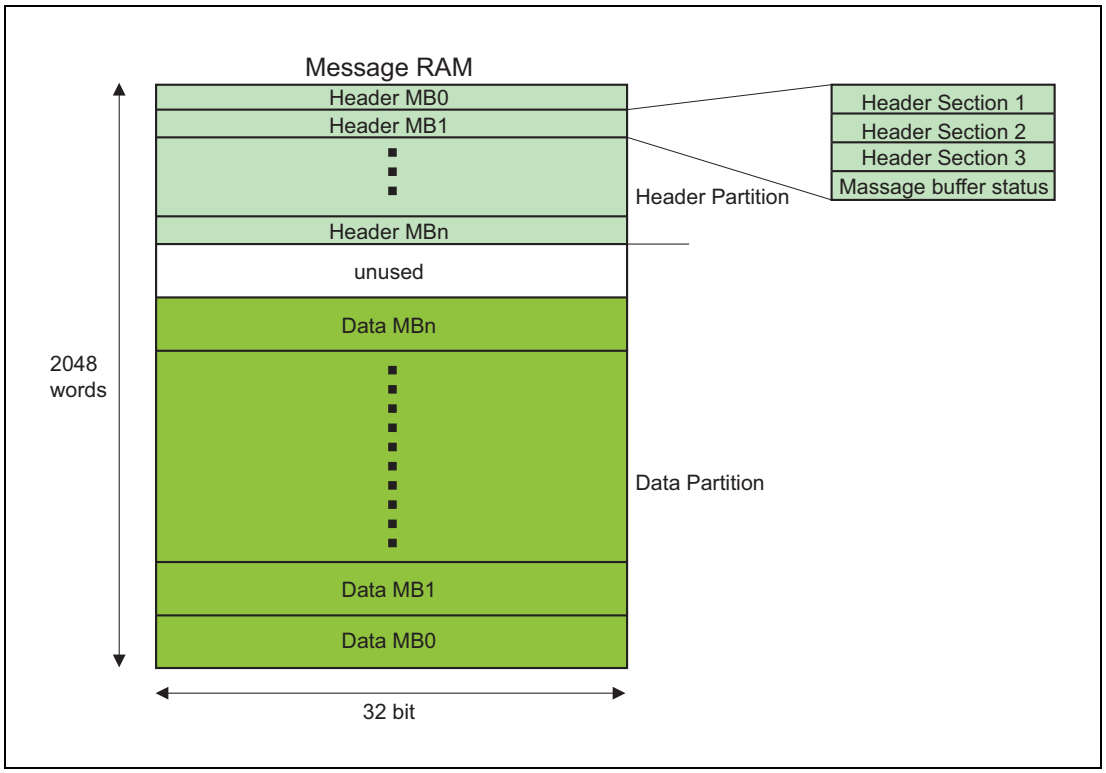

**Figure 20.18 Configuration Example of Message Buffers in the Message RAM**

#### Header Partition

Stores header sections of the configured message buffers:

- Supports a maximum of 128 message buffers
- Each message buffer has a header section of four 32 bit words
- Header 3 of each message buffer holds the 11-bit data pointer to the respective data section in the data partition

**Data Partition**

Flexible storage of data sections with different length. Some maximum values are:

- 30 message buffers with 254 byte data section each
- Or 56 message buffers with 128 byte data section each
- Or 128 message buffers with 48 byte data section each

**CAUTION**

**header partition + data partition may not occupy more than 2048 32-bit words.**

### 20.3.13.1 Header Partition

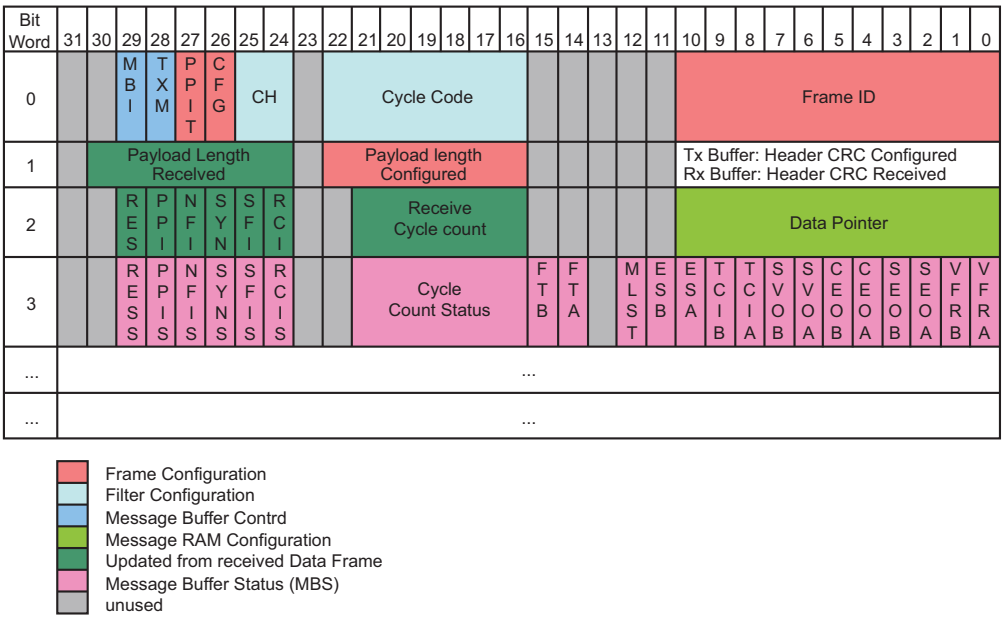
The elements used for configuration of a message buffer as well as the actual message buffer status are stored in the header partition of the Message RAM as listed in below. Configuration of the header sections of the message buffers is done via IBF (FLXAnFRWRHS1…3). Read access to the header sections is done via OBF (FLXAnFRRDHS1…3 + FLXAnFRMBS). The data pointer has to be calculated by the programmer to define the starting point of the data section for the respective message buffer in the data partition of the Message RAM. The data pointer should not be modified during runtime. For message buffers belonging to the receive FIFO (re)configuration is possible in DEFAULT_CONFIG or CONFIG state only.

The header section of each message buffer occupies four 32-bit words in the header partition of the Message RAM. The header of message buffer 0 starts with the first word in the Message RAM.

For transmit buffers the Header CRC has to be calculated by the Host.

Payload Length Received PLR, Receive Cycle Count RCC, Received on Channel Indicator RCI, Startup Frame Indicator SFI, Sync Frame Indicator SYN, Null Frame Indicator NFI, Payload Preamble Indicator PPI, and Reserved Bit RES are updated from received valid data frames only.

**Table 20.120 Header Section of a Message Buffer in the Message RAM**



**(1) Header section 1 (word 0)**

Write access via FLXAnFRWRHS1, read access via FLXAnFRRDHS1:

- Frame ID
  - Slot counter filtering configuration
- Cycle Code
  - Cycle counter filtering configuration
- CH
  - Channel filtering configuration
- CFG
  - Message buffer direction configuration: receive / transmit
- PPIT
  - Payload Preamble Indicator Transmit
- TXM
  - Transmit mode configuration: single-shot / continuous
- MBI
  - Message buffer receive / transmit interrupt enable

**(2) Header section 2 (word 1)**

Write access via FLXAnFRWRHS2, read access via FLXAnFRRDHS2:

- Header CRC
  - Transmit Buffer: Configured by the Host (calculated from frame header)
  - Receive Buffer: Updated from received frame
- Payload Length Configured
  - Length of data section (2-byte words) as configured by the Host
- Payload Length Received
  - Length of payload segment (2-byte words) stored from received frame

**(3) Header section 3 (word 2)**

Write access via FLXAnFRWRHS3, read access via FLXAnFRRDHS3:

- Data Pointer
  - Pointer to the beginning of the corresponding data section in the data partition

Read access via FLXAnFRRDHS3, valid for receive buffers only, updated from received frames:

- Receive Cycle Count
  - Cycle count from received frame
- RCI
  - Received on Channel Indicator

- SFI
  - Startup Frame Indicator
- SYN
  - Sync Frame Indicator
- NFI
  - Null Frame Indicator
- PPI
  - Payload Preamble Indicator
- RES
  - Reserved bit

#### (4) Message Buffer Status FLXAnFRMBS (word 3)

Read access via FLXAnFRMBS, updated by the CC at the end of the configured slot.

- VFRA
  - Valid Frame Received on channel A
- VFRB
  - Valid Frame Received on channel B
- SEOA
  - Syntax Error Observed on channel A
- SEOB
  - Syntax Error Observed on channel B
- CEOA
  - Content Error Observed on channel A
- CEOB
  - Content Error Observed on channel B
- SVOA
  - Slot boundary Violation Observed on channel A
- SVOB
  - Slot boundary Violation Observed on channel B
- TCIA
  - Transmission Conflict Indication channel A
- TCIB
  - Transmission Conflict Indication channel B
- ESA
  - Empty Slot Channel A

- ESB
  - Empty Slot Channel B
- MLST
  - Message LoST
- FTA
  - Frame Transmitted on Channel A
- FTB
  - Frame Transmitted on Channel B
- Cycle Count Status
  - Actual cycle count when status was updated
- RCIS
  - Received on Channel Indicator Status
- SFIS
  - Startup Frame Indicator Status
- SYNS
  - Sync Frame Indicator Status
- NFIS
  - Null Frame Indicator Status
- PPIS
  - Payload Preamble Indicator Status
- RESS
  - Reserved bit Status

### 20.3.13.2 Data Partition

The data partition of the Message RAM stores the data sections of the message buffers configured for reception / transmission as defined in the header partition. The number of data bytes for each message buffer can vary from 0 to 254. To optimize the data transfer between the shift registers of the two FlexRay Protocol Controllers and the Message RAM as well as between the Host interface and the Message RAM, the physical width of the Message RAM is set to 4 bytes.

The data partition starts after the last word of the header partition. When configuring the message buffers in the Message RAM the programmer has to assure that the data pointers point to addresses within the data partition. **Table 20.121** below shows an example how the data sections of the configured message buffers can be stored in the data partition of the Message RAM.

The beginning and the end of a message buffer's data section is determined by the data pointer and the payload length configured in the message buffer's header section, respectively. This enables a flexible usage of the available RAM space for storage of message buffers with different data length.

If the size of the data section is an odd number of 2-byte words, the remaining 16 bits in the last 32bit word are unused (see **Table 20.121** below).

Table 20.121 Example for Structure of the Data Partition in the Message RAM

| Bit Word | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

### 20.3.13.3 Message Data Integrity Check

There is a data integrity checking mechanism implemented in the FlexRay core to assure the integrity of the data stored in the related RAM. Each RAM has a checksum generator / checker attached as shown in **Figure 20.19**.

When data is written to a RAM, the local checksum generator generates the checksum. The checksum is stored together with the respective data word. The checksum is checked each time a data word is read from a RAM.

If a checksum error is detected, the respective access error flag is set. The access error flags FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, FLXAnFRMHDS.ATBF2 and the faulty message buffer indicators FLXAnFRMHDS.FMBD, FLXAnFRMHDS.MFMB, FLXAnFRMHDS.FMB are located in the FlexRay Message Handler Status register. These single access error flags control the error interrupt flag FLXAnFREIR.AERR.

**Figure 20.19** shows the data paths between the Input Buffer, Temporary Buffer and Message RAM.

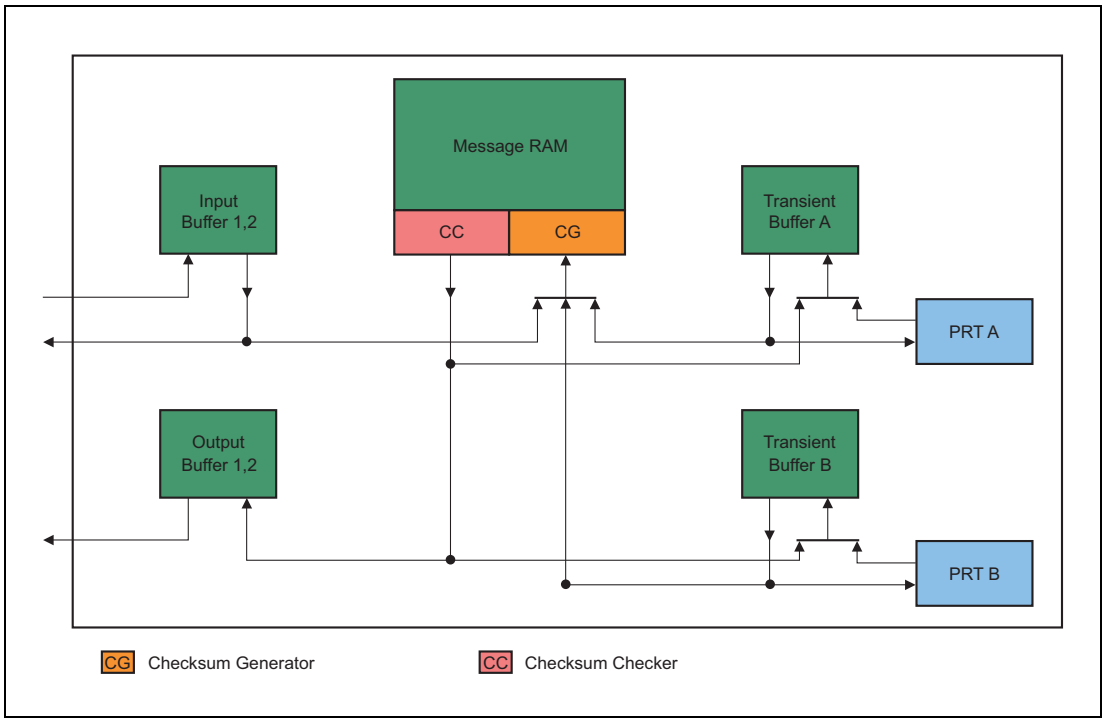

Figure 20.19 Checksum Generation and Check

When an access error has been detected the following actions will be performed:

**In all cases:**

- The respective access error flag in FLXAnFRMHDS register is set
- The access error flag FLXAnFREIR.AERR is set and, if enabled, a module interrupt to the Host will be generated.

**Additionally in specific cases:**

(1) Access error during data transfer from Input Buffer 1, 2 to Message RAM when reading header section of respective message buffer from Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.
- Transmit buffer: Transmission request for the respective message buffer is not set.

(2) Access error during scan of header sections in Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Ignore message buffer (message buffer is skipped).

(3) Access error during data transfer from Message RAM to Temporary Buffer 1, 2:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- Frame not transmitted, frames already in transmission are invalidated by setting the frame CRC to zero.

(4) Access error during data transfer from Temporary Buffer 1, 2 to Message RAM when reading header section of respective message buffer from Message RAM:

- FLXAnFRMHDS.AMR is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.
- The data section of the respective message buffer is not updated.

(5) Access error during data transfer from Message RAM to Output Buffer:

- The access error flag FLXAnFRMHDS.AMR is set.

- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

(6) Access error during a data transfer from Temporary Buffer 1, 2 to Protocol Controller 1, 2:

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- Frames already in transmission are invalidated by setting the frame CRC to zero.

(7) Access error during data transfer from Temporary Buffer 1, 2 to Message RAM when reading Temporary Buffer RAM 1, 2:

- FLXAnFRMHDS.ATBF1, 2 bit is set.
- FLXAnFRMHDS.FMBD bit is set to indicate that FLXAnFRMHDS.FMB points to a faulty message buffer.
- FLXAnFRMHDS.FMB indicates the number of the faulty message buffer.

(8) Access error during data read of Temporary Buffer RAM 1, 2:

- When an access error occurs while the Message Handler read a frame with network management information (PPI = 1) from the Temporary Buffer RAM 1, 2, the corresponding network management vector registers FLXAnFRNMV1 to 3 are not updated from this frame.

### 20.3.13.4 Host Handling of Access Errors

Access error caused by temporary bit flips can be fixed by:

#### (1) Self-healing

Access errors located in the Data Section of Message RAM, Temporary Buffer RAM A or Temporary Buffer RAM B are overwritten with the next write access to the disturbed bit(s) caused by Host access or by FlexRay communication.

#### (2) CLEAR_RAMS Command

The POC command CLEAR_RAMS initializes the message RAM to zero, when called in the DEFAULT_CONFIG or CONFIG state.

#### (3) Temporary Unlocking of Header Section

An access error in the header section of a locked message buffer can be fixed by a transfer from the Input Buffer to the locked buffer Header Section. For this transfer, the write access to the FLXAnFRIBCR (specifying the message buffer number) must be immediately preceded by the unlock sequence normally used to leave CONFIG state (see **Section 20.2.3.1, FLXAnFRLCK — FlexRay Lock Register**).

For that single transfer the respective message buffer header is unlocked, regardless whether it belongs to the FIFO or whether its locking is controlled by FLXAnFRMRC.SEC, and will be updated with new data.

### 20.3.14 Module Interrupt

In general, interrupts provide a close link to the protocol timing as they are triggered almost immediately when an error or status change is detected by the CC, a frame is received or transmitted, a configured timer interrupt is activated, or a stop watch event occurred. This enables the Host to react very quickly on specific error conditions, status changes, or timer events. On the other hand too many interrupts can cause the Host to miss deadlines required for the application. Therefore the CC supports enable / disable controls for each individual interrupt source separately.

An interrupt may be triggered when

- An error was detected
- A status flag is set to 1
- A timer reaches a preconfigured value
- A message transfer from Input Buffer to Message RAM or from Message RAM to Output Buffer has completed
- A message transfer from the Local RAM/Global RAM to Message RAM or from Message RAM to Local RAM/Global RAM has completed
- A stop watch event occurred

Tracking status and generating interrupts when a status change or an error occurs are two independent tasks. Regardless of whether an interrupt is enabled or not, the corresponding status is tracked and indicated by the CC. The Host has access to the actual status and error information by reading registers FLXAnFREIR, FLXAnFRSIR, FLXAnFROS, FLXAnFROTS and FLXAnFRITS.

The general purpose interrupt lines to the Host, FlexRay Interrupt 0, FlexRay Interrupt 1, are controlled by the enabled interrupts in FLXAnFREIES and FLXAnFRSIES. In addition each of the two interrupt lines can be enabled / disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

The input data transfer interrupt lines to the Host, FlexRay input queue empty interrupt, FlexRay input queue full interrupt, are controlled by the enabled interrupts in FLXAnFRITS. In addition each of the input data transfer interrupts can be enabled / disabled separately by programming the related bits in FLXAnFRITC.

The output data transfer interrupt lines to the Host, FlexRay FIFO transfer warning interrupt, FlexRay output transfer warning interrupt, FlexRay FIFO transfer interrupt, FlexRay output transfer interrupt, are controlled by the enabled interrupts in FLXAnFROTS. In addition each of the output data transfer interrupts can be enabled / disabled separately by programming the related bits in FLXAnFROTC.

The three timer interrupts lines to the Host are controlled by the enabled interrupts in FLXAnFROS. In addition each of the interrupt lines can be enabled / disabled separately by programming bit FLXAnFROC.T0IE, FLXAnFROC.T1IE and FLXAnFROC.T2IE.

When a transfer between IBF / OBF and the Message RAM has completed bit FLXAnFRSIR.TIBC or FLXAnFRSIR.TOBC is set to 1.

### 20.3.15 Assignment of FlexRay Configuration Parameters

Table 20.122 FlexRay configuration parameters (1/2)

| Parameter | Bit (field) |
|---|---|
| pKeySlotusedForStartup | FLXAnFRSUCC1.TXST |
| pKeySlotUsedForSync | FLXAnFRSUCC1.TXSY |
| gColdStartAttempts | FLXAnFRSUCC1.CSA |
| pAllowPassiveToActive | FLXAnFRSUCC1.PTA |
| pWakeupChannel | FLXAnFRSUCC1.WUCS |
| pSingleSlotEnabled | FLXAnFRSUCC1.TSM |
| pAllowHaltDueToClock | FLXAnFRSUCC1.HCSE |
| pChannels | FLXAnFRSUCC1.CCH |
| pdListenTimeOut | FLXAnFRSUCC2.LT |
| gListenNoise | FLXAnFRSUCC2.LTN |
| gMaxWithoutClockCorrectionPassive | FLXAnFRSUCC3.WCP |
| gMaxWithoutClockCorrectionFatal | FLXAnFRSUCC3.WCF |
| gNetworkManagementVectorLength | FLXAnFRNEMC.NML |
| gdTSSTransmitter | FLXAnFRPRTC1.TSST |
| gdCASRxLowMax | FLXAnFRPRTC1.CASM |
| gdSampleClockPeriod | FLXAnFRPRTC1.BRP |
| pSamplesPerMicrotick | FLXAnFRPRTC1.BRP |
| gdWakeupSymbolRxWindow | FLXAnFRPRTC1.RXW |
| pWakeupPattern | FLXAnFRPRTC1.RWP |
| gdWakeupSymbolRxIdle | FLXAnFRPRTC2.RXI |
| gdWakeupSymbolRxLow | FLXAnFRPRTC2.RXL |
| gdWakeupSymbolTxIdle | FLXAnFRPRTC2.TXI |
| gdWakeupSymbolTxLow | FLXAnFRPRTC2.TXL |
| gPayloadLengthStatic | FLXAnFRMHDC.SFDL |
| pLatestTx | FLXAnFRMHDC.SLT |
| pMicroPerCycle | FLXAnFRGTUC1.UT |
| gMacroPerCycle | FLXAnFRGTUC2.MPC |
| gSyncNodeMax | FLXAnFRGTUC2.SNM |
| pMicroInitialOffset[A] | FLXAnFRGTUC3.UIOA |
| pMicroInitialOffset[B] | FLXAnFRGTUC3.UIOB |
| pMacroInitialOffset[A] | FLXAnFRGTUC3.MIOA |
| pMacroInitialOffset[B] | FLXAnFRGTUC3.MIOB |
| gdNIT | FLXAnFRGTUC4.NIT |
| gOffsetCorrectionStart | FLXAnFRGTUC4.OCS |
| pDelayCompensation[A] | FLXAnFRGTUC5.DCA |
| pDelayCompensation[B] | FLXAnFRGTUC5.DCB |
| pClusterDriftDamping | FLXAnFRGTUC5.CDD |
| pDecodingCorrection | FLXAnFRGTUC5.DEC |
| pdAcceptedStartupRange | FLXAnFRGTUC6.ASR |
| pdMaxDrift | FLXAnFRGTUC6.MOD |
| gdStaticSlot | FLXAnFRGTUC7.SSL |
| gNumberOfStaticSlots | FLXAnFRGTUC7.NSS |

**Table 20.122 FlexRay configuration parameters (2/2)**

| Parameter | Bit (field) |
|---|---|
| gdMinislot | FLXAnFRGTUC8.MSL |
| gNumberOfMinislots | FLXAnFRGTUC8.NMS |
| gdActionPointOffset | FLXAnFRGTUC9.APO |
| gdMinislotActionPointOffset | FLXAnFRGTUC9.MAPO |
| gdDynamicSlotIdlePhase | FLXAnFRGTUC9.DSI |
| pOffsetCorrectionOut | FLXAnFRGTUC10.MOC |
| pRateCorrectionOut | FLXAnFRGTUC10.MRC |
| pExternOffsetCorrection | FLXAnFRGTUC11.EOC |
| pExternRateCorrection | FLXAnFRGTUC11.ERC |

### 20.3.16 Usage of Data Transfer

A mechanism is implemented to allow storage of FlexRay messages directly into the Local RAM/ Global RAM (user RAM) and have transfers between the FlexRay internal message RAM and the Local RAM/Global RAM and vice versa with minimum CPU support. The data in the Local RAM/ Global RAM should be indexed by data structure pointers located in data pointer tables stored in the Local RAM/Global RAM.

Data transfer from the Local RAM/Global RAM to the FlexRay internal message RAM (input transfer) needs to be initiated by the application. These transfers can be used to configure message buffers or to update transmit data.

A data transfer from the FlexRay internal message RAM to the Local RAM/Global RAM (output transfer) is initiated automatically by a reception into a receive message buffer or FlexRay internal FIFO or by a change in the slot status. It can be initiated also by a specific user transfer request.

The input and output data transfer can be activated independently. When the input data transfer is activated the application should not directly access message buffers using the FlexRay input buffer. When the output data transfer is activated the application should not directly access message buffers using the FlexRay output buffer.

### 20.3.16.1 Input Data Transfer

When the automatic input data transfer function is enabled, committed input data structures are transferred from the Local RAM/Global RAM to the FlexRay internal message RAM with minimum CPU support.

#### (1) Activation and deactivation

The input data transfer function should be activated before usage. The activation of the input transfer handler initializes the input queue put index (FLXAnFRITS.IPIDX) and get index (FLXAnFRITS.IGIDX) to zero. Also the interrupt status flags in the FLXAnFRITS register (IQEIS and IQFIS) are set to 0.

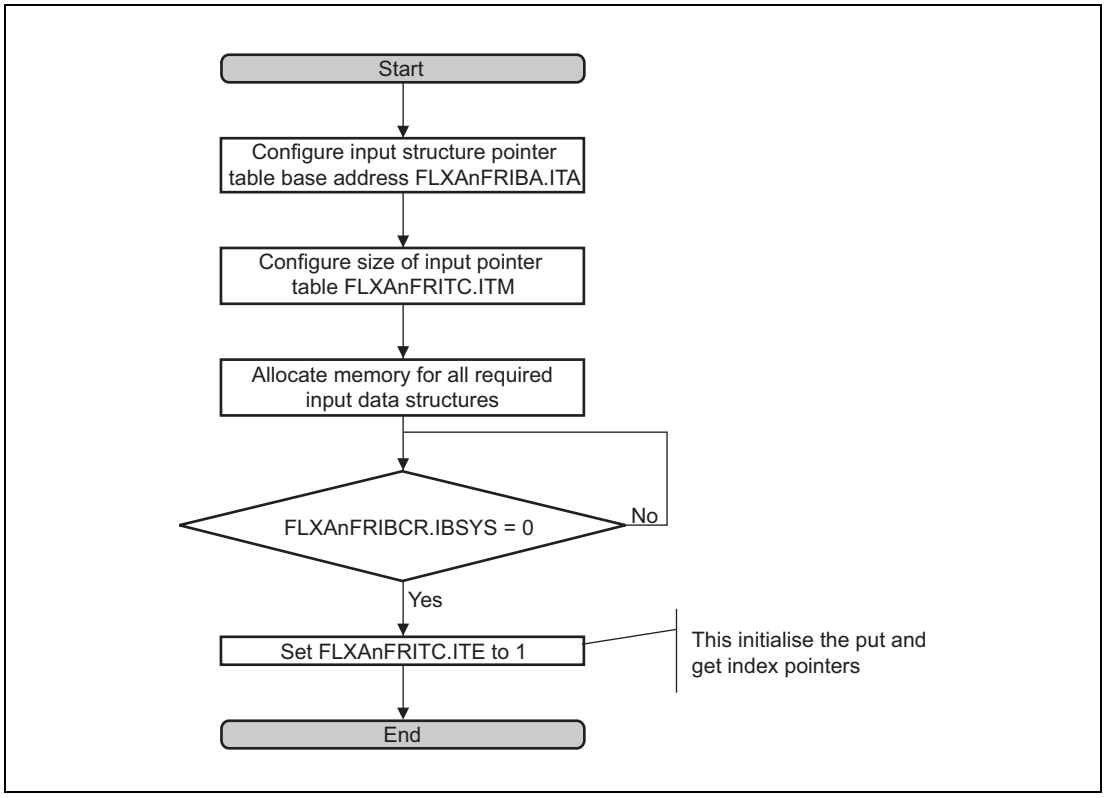

**Figure 20.20 Input transfer enable flow**

A deactivation request of the input transfer function can be made at any time. The input queue put index and the input queue status are maintained independently from the input transfer function state.

Before the transfer function gets disabled (status indicated by FLXAnFRITS.ITS), user requested input transfers and all committed input transfers will be completed.

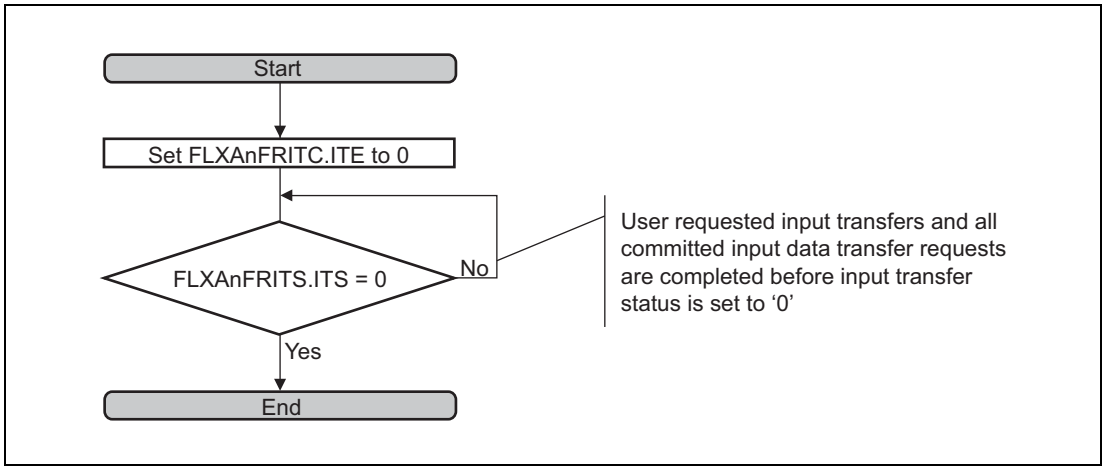

**Figure 20.21 Input transfer disable flow**

### (2) Input data structure

The application has to reserve a location in the Local RAM/Global RAM to provide the content for message buffer configuration (input data structure).

The location of this input data structure needs to be defined by an input data structure pointer also located in the Local RAM/Global RAM.

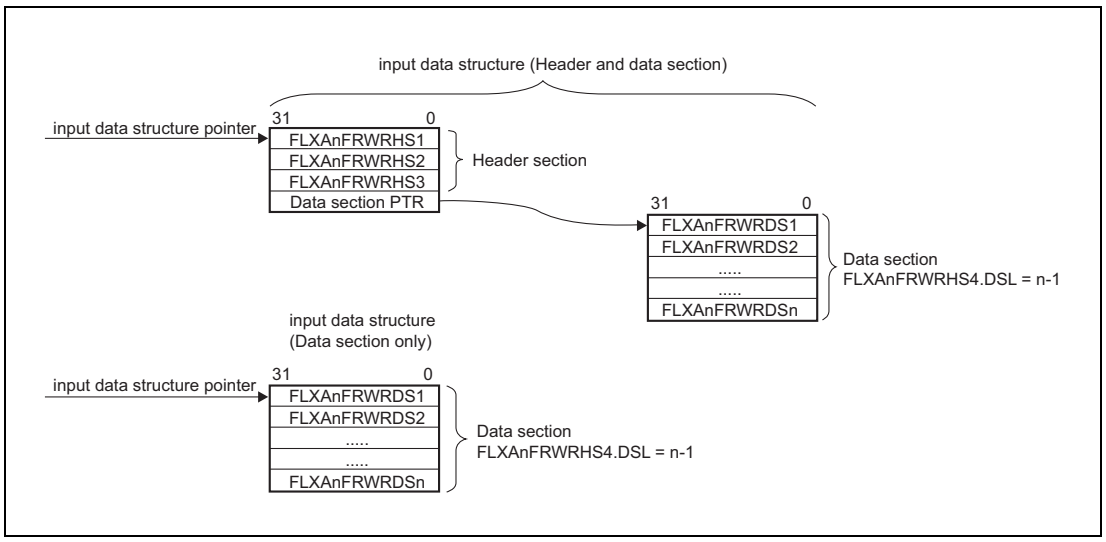

**Figure 20.22 Input data structure**

In general the input data structure consists of two sections, the header and the data section.

The header section consists of FLXAnFRWRHS1, FLXAnFRWRHS2, FLXAnFRWRHS3 and the data section pointer.

For bit alignment and bit function in the header section, see **Section 20.3.13.1, Header Partition**.

Depending on the settings in the control field (FLXAnFRWRHS4) located in the input pointer table, the data structure pointer is a reference to the address of FLXAnFRWRHS1 or FLXAnFRWRDS1. The data structure pointer has to be aligned to a 32 bit address.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid header section. In this case FLXAnFRWRHS1 is the first element of the data structure.

If the bit LHS in the address related to FLXAnFRWRHS4 is set to 0 a header section is not required. In this case FLXAnFRWRDS1 is the first element of the data structure.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 1 it is required to provide a valid data section. The pointer to the data section is a reference to the address of the first payload long word (FLXAnFRWRDS1) and has to be aligned to a 32 bit address.

If the bit LDS in the address related to FLXAnFRWRHS4 is set to 0 a data section is not required. The data section pointer is not evaluated by the input handler.

The byte order for the FlexRay payload data in the input data structure is determined by FLXAnFROC.BEC. For information about the payload data alignment within the data section see **Section 20.3.13.2, Data Partition** and **Section 20.3.17, Byte Alignment**.

The length of the data section and the size to be allocated in the Local RAM/Global RAM depends on the configuration of the bits DSL in the address related to FLXAnFRWRHS4.

For the transfer into the FlexRay core internal message RAM the number of 16 bit words configured by FLXAnFRWRHS2.PLC is used. The application has to ensure, that a proper number of data words is provided in the Local RAM/Global RAM. In case the buffer is configured by FLXAnFRWRHS2.PLC to hold an odd payload length, the application has to write zero to the last 16 bit of the payload section to ensure that the padding data is all zero.

### (3) Input pointer table

To transfer data from the input data structures located in the Local RAM/Global RAM to the FlexRay internal message RAM the related input data structure pointer and control field needs to be added to the input pointer table which is located in the Local RAM/Global RAM.

The location of the first element of this table is identified by the input pointer table base address (FLXAnFRIBA.ITA). This base address has to be aligned to a 32 bit address.

The maximum number of input requests that can be queued is defined by the Input queue Table Max register (FLXAnFRITC.ITM).

Each Input pointer table entry requires two long words. The required address range of the input pointer table for the queued transfer requests can be calculated by

$$\text{Input pointer table size (byte)} = (((\text{FLXAnFRTTC.ITM} + 1) \times D \times 2) \times 4)$$

**Equation 1**

The input pointer entry for the user requested input transfer should be added after the end of the input pointer table.

The pointer table index related to this entry and hence the number to be written to FLXAnFRUIR.UIDX, is FLXAnFRITC.ITM+1. The address in the input pointer table related to the user requested input transfer (user input address) can be calculated by

User input address = FLXAnFRIBA.ITA + Input pointer table size

**Equation 2**

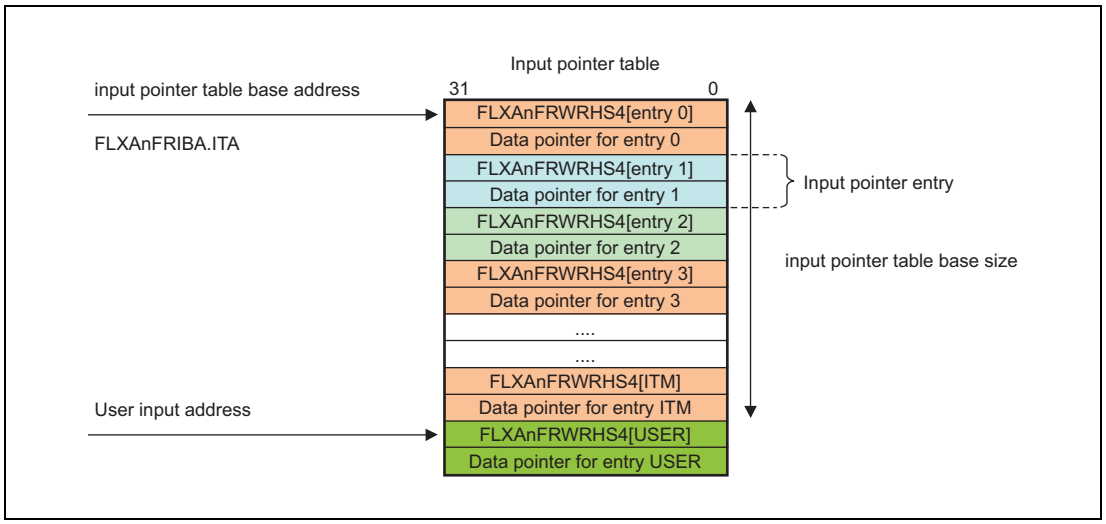

**Figure 20.23 Input pointer table**

The input pointer table holds the control field FLXAnFRWRHS4 and the pointers to the Local RAM/ Global RAM location where the message buffer content (header section and/or data section) is stored.

The application has to write FLXAnFRWRHS4 and the input data structure pointer at the addresses in the input pointer table related to the put index position before a transfer request is initiated.

**FLXAnFRWRHS4:**

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | DSL[5:0] | | | | | |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 20.123 FLXAnFRWRHS4 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 22 | Reserved | When read, an undefined value is read. When writing, always write 0. |
| 21 to 16 | DSL[5:0] | Data Section Length Bit<br>Specifies the length of the data section in terms of 32 bit values. |
| 15 to 12 | Reserved | When read, an undefined value is read. When writing, always write 0. |
| 11 | INV | Invalidate entry Bit<br>0: The data structure is valid and will be transferred to the FlexRay internal message RAM.<br>1: The data structure is invalid. FlexRay internal message RAM is not updated using this input pointer entry. |
| 10 | STR | Set transmission request Bit<br>0: The bit FLXAnFRTXRQi.TXR for the message buffer selected by the bits IMBNR is set to 0. No data from this message buffer is transmitted.<br>1: The bit FLXAnFRTXRQi.TXR for the message buffer selected by the bits IMBNR is set to 1 to release the message buffer for transmission The application should not set the bit STR to 1 for receive buffers. |
| 9 | LDS | Load data section Bit<br>0: No update of data section.<br>1: Data section for the message buffer selected by the bits IMBNR is updated. |
| 8 | LHS | Load header section Bit<br>0: no update of header section.<br>1: Header section for the message buffer selected by the bits IMBNR is updated. |
| 7 | Reserved | When read, an undefined value is read. When writing, always write 0. |
| 6 to 0 | IMBNR[6:0] | Message buffer number to be updated Bit<br>Selects the target message buffer number in the FlexRay internal message RAM for transfer |

Note that the LHS bit should not be set for protected message buffers.

The bit LDS defines if the data section of the message buffer selected by the bits IMBNR should be updated.

If LDS is set to 1 (DSL + 1) 32 bit words of payload data are transferred from the Local RAM/Global RAM to the message buffer selected by the bits IMBNR.

If LDS is set to 0 no payload data is transferred from the Local RAM/Global RAM.

Note that the payload transferred is independent from the configured payload length (bits PLC in the address related to FLXAnFRWRHS2).

The bit INV can be used to invalidate a committed data structure. This bit should be only used to cancel the transfer of committed data structures when the input queue is halted (see **Section 20.3.16.1 (5), Halting the input queue**).

When this bit is set to 1 the message buffer number IMBNR is not updated. When the bit is set to 0 the message buffer number IMBNR is updated.

#### (4) Transfer function of input data structure

To use the input data structure transfer function the input transfer has to be activated (see **Section 20.3.16.1 (1), Activation and deactivation**). The activation process requires the setup of the input pointer table (see **Section 20.3.16.1 (3), Input pointer table**) in order to specify the source location (input data structures) for the data structures to be transferred. When the input transfer gets enabled the get index pointer is initialized to zero.

All FlexRay internal message buffers can be updated using the input transfer queue which is built in the input pointer table. The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. For that purpose the application has to maintain a put index for the input pointer table that indicates where the pointer has to be written to.

To commit this table entry to the input handler, the application has to write the target message buffer number to the input queue control register (FLXAnFRIQC.IMBNR). Afterwards the application has to increment the application internal put index.

By writing to the input queue control register the data available flag (FLXAnFRDAi.DA[IMBNR]) is automatically set to 1. The input transfer handler also maintains the put index pointer in the status register (FLXAnFRITS.IPIDX).

In case the input queue gets full (number of queued input transfer requests is equal to the input queue table size) FLXAnFRITS.IQFP and FLXAnFRITS.IQFIS are set to 1. The input queue full condition pending flag (FLXAnFRITS.IQFP) changes from 1 to 0 when there are entries in the input queue available, whereby the input queue full interrupt status flag (FLXAnFRITS.IQFIS) needs to be cleared by the application.

The application should not make any further write access to the bit IMBNR in the FLXAnFRIQC register as long as the bit IQFP in the FLXAnFRITS register is 1.

In case the input queue gets empty (number of queued input transfer requests changes to zero) FLXAnFRITS.IQEIS is set to 1. The input queue empty interrupt status flag (FLXAnFRITS.IQEIS) needs to be cleared by the application.

The transfer of the input data structures to the FlexRay message RAM is controlled by a get index pointer which is handled inside the FlexRay module and flagged in FLXAnFRITS.IGIDX. Note that the index is referring to the input entry and not the address offset in the input pointer table.

If the input queue is not empty, the transfer handler reads out the input pointer table entry of the transfer queue and starts the transfer of the input data structure from the address the input pointer is referring to. When all required data words are transferred to the FlexRay module, the data available flag for the transferred message buffer number is set to 0 and the get index in the transfer handler is incremented by one.

In case of an invalidated data structure (see **Section 20.3.16.1 (5), Halting the input queue**) no FlexRay internal message buffer is updated and the related data available flag is automatically set to 0. The change of the data available flag can be used to confirm the cancellation a transmit request.

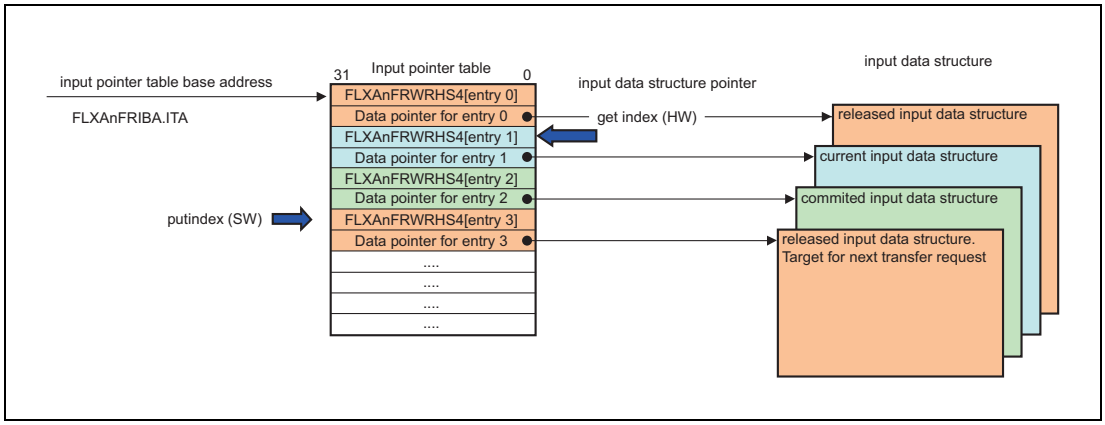

**Figure 20.24 Input Pointer Table**

Receive message buffers can be also configured using the input data transfer by setting up the required header sections and mark only the header section (FLXAnFRWRHS4.LDS = 0, FLXAnFRWRHS4.LHS = 1) to be updated in the FlexRay module.

### (5) Halting the input queue

Committed data structures cannot be removed, but can be invalidated or updated when the input queue is halted.

To cancel data structures already committed to the input queue, the queue can be halted by writing a 1 to FLXAnFRITC.IQHR.

After the ongoing input transfer has been completed the queue is halted and FLXAnFRITS.IQH changes from 0 to 1.

To invalidate an entry of the input queue FLXAnFRWRHS4.INV has to be set to 1. All other bits in FWRHS4 should be unchanged.

Following flow shall be used to analyse whether a committed message has been already transferred to the FlexRay internal message RAM or not.

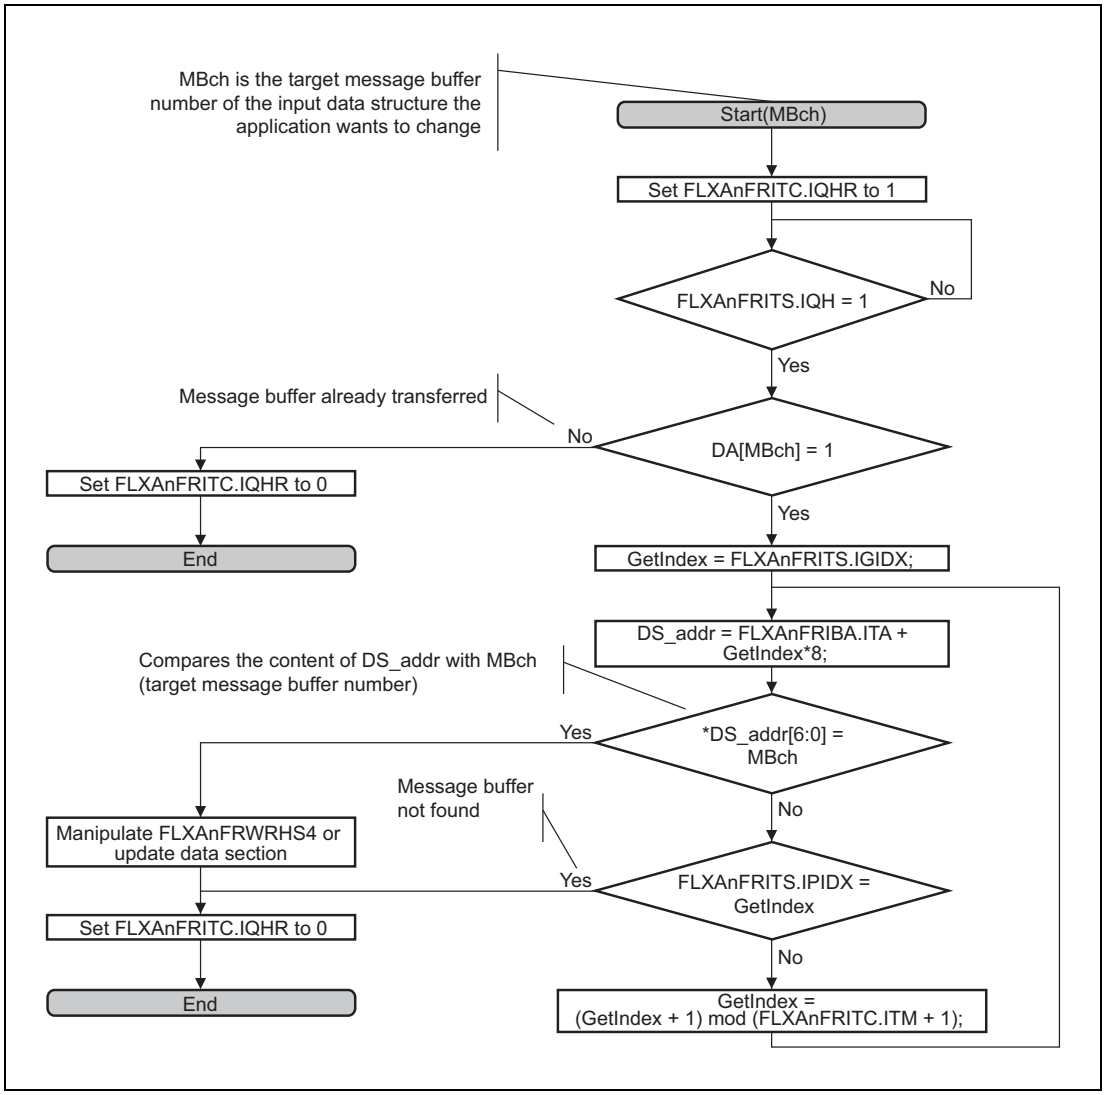

**Figure 20.25 Input Table Analysis**

In case the message buffer was already transferred to the FlexRay internal message RAM, the user input transfer request can be used to bypass the actual queue and update the required message buffer (see **Section 20.3.16.1 (6), Transfer function of user requested input transfers**).

### (6) Transfer function of user requested input transfers

To use this function the input transfer has to be activated (see **Section 20.3.16.1 (1), Activation and deactivation**).

The application is capable, by using FLXAnFRUIR.UIDX, to request a transfer of an input data structure. The user input transfer request is serviced first.

The application has to write the pointer and control field (table entry) to the data structure to be transferred into the input pointer table. The table entry for the user input transfer request should be added after the end of the input pointer table (see **Section 20.3.16.1 (3), Input pointer table**).

To commit this table entry to the input handler, the application has to write the index (FLXAnFRITC.ITM+1) to the user input transfer request register (FLXAnFRUIR.UIDX).

By writing to the user input transfer request register, the user input transfer request pending flag (FLXAnFRITS.UIRP) is automatically set to 1.

As long this flag is 1 the application should not make any further user input transfer requests.

The user input transfer request pending flag (FLXAnFRITS.UIRP) changes from 1 to 0 when the requested input transfer is completed. As next the pending transfers are processed.

### 20.3.16.2 Output Data Transfer

When the output data transfer function is enabled, received messages (either in dedicated message buffers or in the FlexRay receive FIFO) are transferred to the Local RAM/Global RAM by the output data handler. The output data handler can also transfer the message buffer content to the Local RAM/ Global RAM on application request. When enabled the output handler is also capable to initiate a transfer when the message buffer status has changed.

#### (1) Activation and deactivation

The output data transfer function should be activated before usage. The activation of the output transfer hander will initialise the FIFO put and get index pointer and FIFO fill level (FLXAnFROTS.FGIDX and FLXAnFROTS.FFL) to zero, set the bits FLXAnFROTS.FDA, FLXAnFROTS.OWP, FLXAnFROTS.FWP and FLXAnFROTS.UORP to 0. Also the interrupt status flags FLXAnFROTS.OTIS, FLXAnFROTS.FIS, FLXAnFROTS.OWIS and FLXAnFROTS.FWIS) are set to 0.

The activation has no influence to the data available flags (FLXAnFRDAi.DA) which are related to the dedicated buffers; these flags have to be cleared by the application.

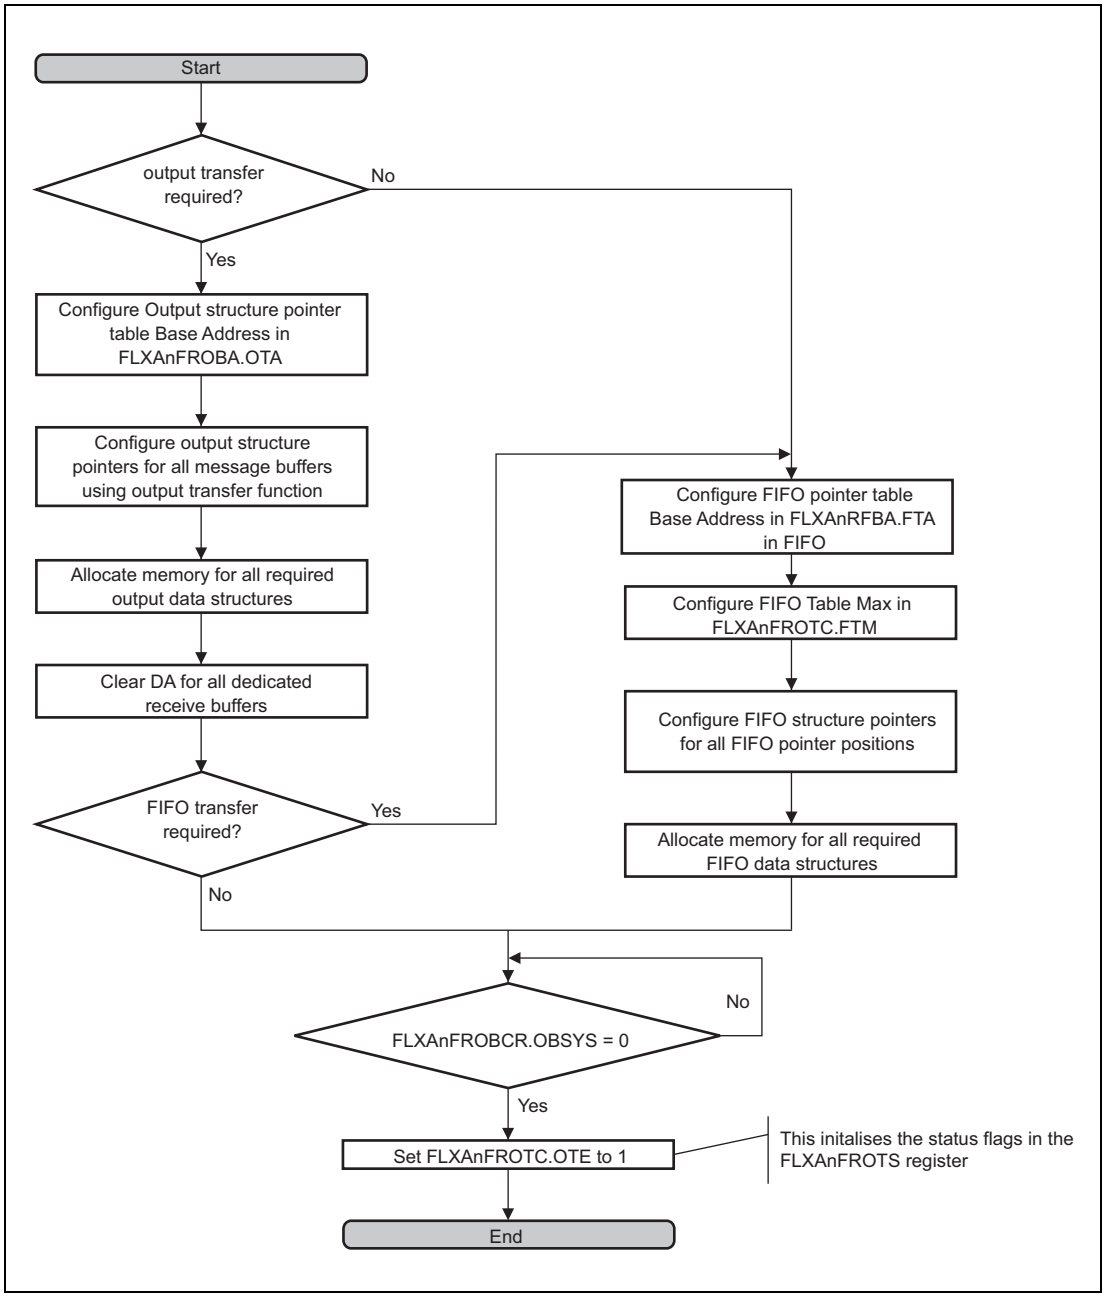

**Figure 20.26 Output Transfer Enable Flow**

A deactivation request of the output data transfer function can be made at any time. An ongoing transfer will be completed and the completion of this transfer will be flagged. During this time FLXAnFROTS.OTS remains 1.

When FLXAnFROTS.OTS changes from 1 to 0, the output transfer function is deactivated. The data available status flags and the FIFO get index are still maintained when the output transfer function is disabled.

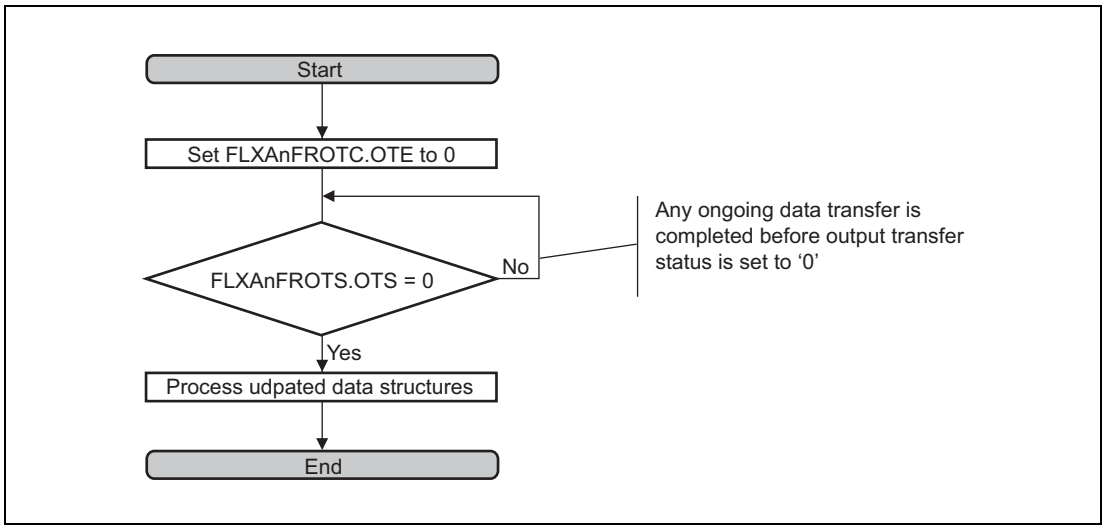

**Figure 20.27 Output Transfer Disable Flow**

### (2) Output transfer data structure

The data in the Local RAM/Global RAM is stored in an output data structure. The location of the output data structures are determined by output data structure pointers also located in the Local RAM/ Global RAM. The output data structure and indexing is visualized in **Figure 20.28**.

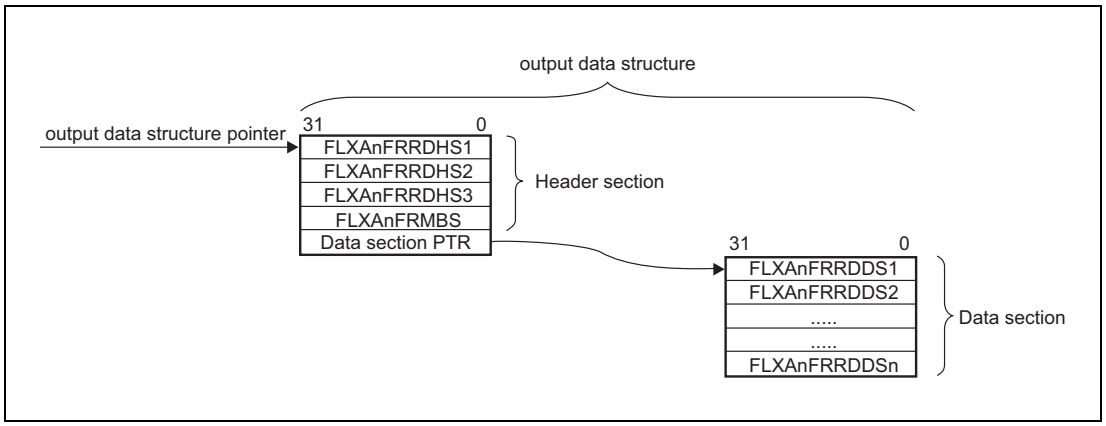

**Figure 20.28 Output Data Structure**

The output data structure consists of two sections, the header and data section. The header section consists of FLXAnFRRDHS1, FLXAnFRRDHS2, FLXAnFRRDHS3, FLXAnFRMBS and the data section pointer. FLXAnFRRDHS1 is the first element of the structure and has to be aligned to a 32 bit address. The data structure pointer is a reference to the address of FLXAnFRRDHS1. For information about the bit alignment and bit function within the header section see **Section 20.3.13.1, Header Partition**.

FLXAnFRRDDS1 is the first element of the data section. The data section pointer is a reference to the address of FLXAnFRRDDS1 and has to be aligned to a 32 bit address. The byte order for the FlexRay payload data in the output data structure is determined by the bit BEC in the FLXAnFROC register. For information about the payload data alignment within the data section see **Section 20.3.13.2, Data Partition**.

The length of the data section as well as the total structure size to be allocated in the Local RAM/ Global RAM depends on the configured payload length (FLXAnFRRDHS2.PLC) of the related message buffer. In case the configured payload length is an odd number of words or the received payload length (FLXAnFRRDHS2.PLR) is smaller than the configured payload length, the remaining data words in the Local RAM/Global RAM are unused and should not be used by the application.

The output data structure is identical for all three kinds of output transfers. In case only the header section is transferred the data section pointer is not evaluated by the output handler and the data section remains unchanged.

### (3) Output pointer table

For the output data transfer function the application needs to setup an output pointer table in the Local RAM/Global RAM. The location of the first element of this table should be programmed into the output pointer table base address (FLXAnFROBA.OTA). This base address has to be aligned to a 32 bit address.

The size of the output pointer table is defined by the maximum of: the last configured dedicated message buffer and the highest message buffer number which will be used for the user output transfer request.

The output pointer table holds pointers (output data structure pointers) to the Local RAM/Global RAM location where a memory space is reserved for the target message buffer content (header section and data section).

There is a fixed linear relationship between the address of the entries in the output pointer table and the number of the related message buffers (see **Figure 20.29**): the output pointer table starts with the entry for message buffer number 0 at the address configured in FLXAnFROBA.OTA and continues in ascending order for each following message buffer number, by 32 bit aligned address (e.g. message buffer 1 at address OTA + 4, message buffer 2 at address OTA + 8, etc.) for all possible message buffers.

When a set ND bit is the only transfer condition (FLXAnFROTC.OTCS is set to 0) only message buffers configured as a dedicated receive buffer or that will be used for user output transfer requests need have valid pointer entries.

When a set ND bit or a set MBSC bit is the transfer condition (FLXAnFROTC.OTCS is set to 1) all dedicated receive buffer and dedicated transmit buffers need to have valid pointer entries.

### (4) FIFO output pointer table

The FlexRay module internal FIFO can be extended by a queued buffer structure in the Local RAM/ Global RAM.

If the FlexRay module internal FIFO is used the application needs to setup the FIFO output pointer table. The location of the first element of this table is identified by the FIFO pointer table base address (FLXAnFRFBA.FTA). This base address has to be aligned to a 32 bit address.

The size of the FIFO pointer table and hence the maximum number of messages that can be added to the queue, is defined by FIFO Table Max (FLXAnFROTC.FTM).

The FIFO pointer table holds pointers (output data structure pointers) to the Local RAM/Global RAM location where a memory space is reserved the target message buffer content (header section and data section). For each table entry a data pointer shall be configured in this table.

### (5) Transfer function of dedicated message buffers

To use this transfer function the output transfer has to be activated (see **Section 20.3.16.1 (1), Activation and deactivation**). The activation process requires to setup the output pointer table (see **Section 20.3.16.2 (3), Output pointer table**) in order to specify the destination location (output data structures) for the data to transfer. **Figure 20.29** shows how the output pointer table references the output data structures.

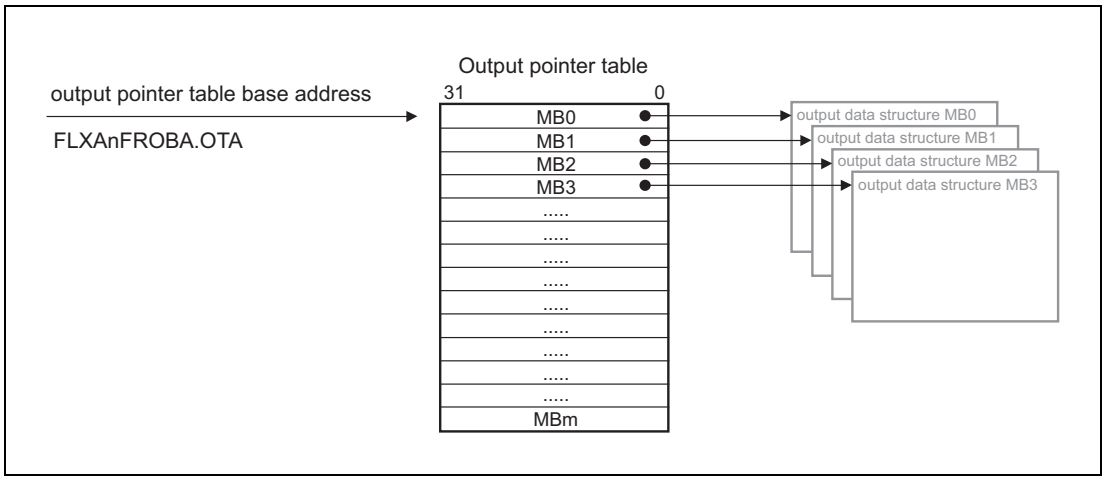

**Figure 20.29 Output Data Structure and Indexing**

With FLXAnFROTC.OTCS the output transfer condition can be selected between the ‘New data only mode’ and the ‘New data and status changed mode’.

In the ‘New data only mode’ an output data transfer is initiated when a valid FlexRay data frame has been stored into a dedicated receive buffer which causes the related ND flag in the FLXAnFRNDAT register to set. The ND flag in the FLXAnFRNDAT register is automatically set to 0 during the transfer procedure. The header section is also transferred and hence the MBSC flag in the FLXAnFRMBSC register is set to 0.

In the ‘New data and status changed mode’ an output data transfer is initiated as described in the ‘New data only mode’. In addition an output data transfer is initiated when only the message buffer status has been changed which causes the related MBSC flag in the FLXAnFRMBSC register to be set. In this case only the header section is transferred. The MBSC flag in the FLXAnFRMBSC register is automatically set to 0 during the transfer procedure.

After transferring the message buffer data from the FlexRay internal message RAM to the output data structure the corresponding data available flag in the FLXAnFRDAi (i = 0 to 3) registers is set to 1. The update of the output data structure is also flagged by the setting of the output transfer interrupt status flag (FLXAnFROTS.OTIS).

As long as the data available flag remains 1 the corresponding output data structure will not be updated.

In the case

- the data available flag is 1 and a valid received message was stored or
- when FLXAnFROTC.OTCS is 1 and the message buffer status was updated,

the output transfer warning interrupt flag (FLXAnFROTS.OWIS) is set to 1 notifying the application that new data is available but the output data structure transfer cannot be processed. In addition FLXAnFROTS.OWP is set to 1 that continuously flags that status of the output transfer warning condition.

If a valid receive message in the FlexRay internal message RAM is overwritten by an additional receive message, the message lost flag (FLXAnFRMBS.MLST) is set to 1. This flag can be evaluated after the message buffer has been transferred into an output data structure.

Following sections are giving a guidance how output data structures can be handled.

(a) Data section copy method

One option is to copy the information from the output data structure to a different location of the Local RAM/Global RAM and then release the output data structure by clearing the related data available flag. The application should use the copied information for further processing.

(b) Data structure pointer method

A different option is to modify the output data structure pointer in the output pointer table and to release the output data structure by clearing the related data available flag. The changed output data pointer should refer to a free data structure. The application should use the old data structure for further processing.

(c) Data section pointer method

A third option is to modify the data section pointer in the output data structure and to release the output data structure by clearing the related data available flag. The changed data section pointer should refer to a free memory area. The application should use the old data section for further processing by forwarding the data section pointer.

### (6) Transfer function of FIFO message buffers

To use this buffer transfer function the output transfer has to be activated (see **Section 20.3.16.1 (1), Activation and deactivation**). The activation process requires the setup of the FIFO pointer table (see **Section 20.3.16.2 (4), FIFO output pointer table**) in order to specify a location in the Local RAM/Global RAM reserved for the storage of the required output data structures.

A FIFO data transfer is initiated when a valid FlexRay data frame has been stored in the FlexRay internal FIFO.

After transfers from the internal FIFO to the output data structure, the FIFO interrupt status flag (FLXAnFROTS.FIS) and FLXAnFROTS.FDA are set to 1. The bit FLXAnFROTS.FIS can be used as an interrupt source. The bit FLXAnFROTS.FDA indicates that the FIFO is not empty.

Up to FLXAnFROTS.FTM output structures configured in the FLXAnFROTC register can be queued.

The transfer to the extended FIFO buffer structure is controlled by index pointers. This put index is controlled by the FIFO transfer handler and is incremented after transferring a message to the output data structure.

The FIFO reception handler also maintains a get index which is flagged in FLXAnFROTS.FGIDX. The value of this get index is known by the application by either reading the status or maintaining a software variable. The get index (the value after a reset is zero) is incremented by one when the application releases the oldest entry of the FIFO queue by writing 1 to FLXAnFROTS.FDA. By comparing the put index and the get index the FIFO handler knows about the current fill level of the queued buffer structure.

The current FIFO fill level is flagged in FLXAnFROTS.FFL. When FLXAnFROTS.FDA is 1, there is at least one entry in the FIFO queue.

In case the queued buffer structure in the Local RAM/Global RAM is full (FLXAnFROTS.FFL = FLXAnFROTC.FTM+1), no further transfers are initialised, new messages remain in the FlexRay internal FIFO and the FIFO transfer warning interrupt status flag (FLXAnFROTS.FWIS) is set to 1.

In case the FlexRay internal FIFO structure becomes full, messages in the FlexRay internal FIFO structure may get overwritten. The related status flags and configuration registers of the FlexRay core module can be used to generate desired warning notifications.

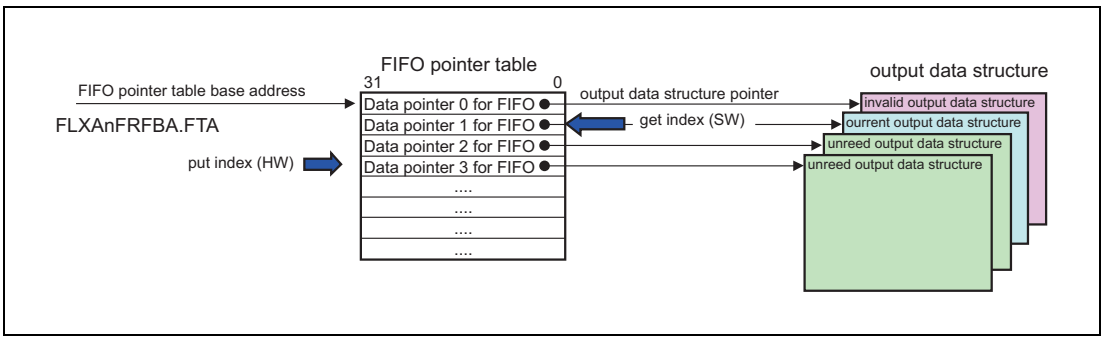

**Figure 20.30 FIFO Pointer Table**

### (7) Transfer function of user output transfer requests

To use this transfer function the output transfer has to be activated (see **Section 20.3.16.1 (1), Activation and deactivation**). The activation process requires to setup the output pointer table (see **Section 20.3.16.2 (3), Output pointer table**) in order to specify the location in the Local RAM/ Global RAM reserved for the transfer of the data (output data structures).

The application is capable, by using FLXAnFRUOR.UMBNR, to request a transfer of dedicated message buffer to an output data structure. Except in CONFIG state, message buffers which are part of the FlexRay internal FIFO should not be requested.

The header section is always transferred to the output data structure. The transfer of the data section can be enabled by setting FLXAnFRUOR.URDS to 1. The selected message buffer content is stored in the output data structure location determined by the pointers in the output pointer table.

The data available status and transfer blocking by the DA bits in the FLXAnFRDAi register is also used for the user requested transfers. Therefore the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) should be released before making the transfer request.

After writing to FLXAnFRUOR.UMBNR, the bit FLXAnFROTS.UORP is set to 1 to indicate that there is a pending user transfer request. When the transfer has been processed the bit FLXAnFROTS.UORP is set to 0, the bit FLXAnFROTS.OTIS is set to 1 and the DA bit in the FLXAnFRDAi register related to the requested buffer number (FLXAnFRUOR.UMBNR) is set to 1.

User output transfer requests cannot be queued. The application should check the bit FLXAnFROTS.UORP before writing to FLXAnFRUOR.UMBNR.

User output transfer requests should not be made for message buffers which are pending in the input transfer queue.

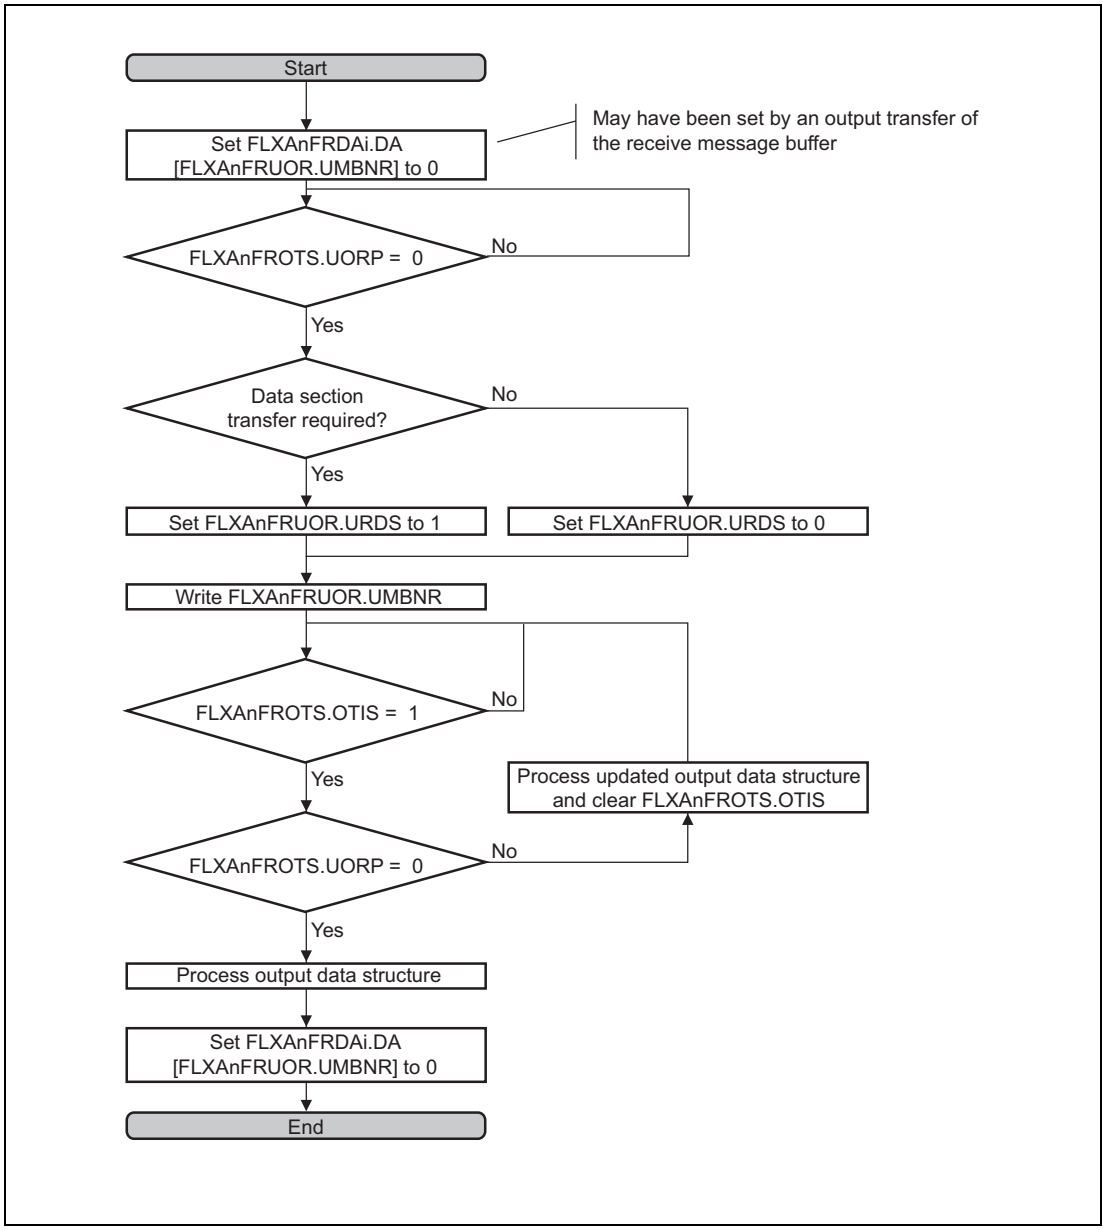

**Figure 20.31 User Output Transfer Request Flow**

Note that it may be possible that the data structure addressed by a user request is being updated due to a receive message buffer update (which causes the bit DA in the FLXAnFRDAi register being set). This set DA flags inhibits the user output transfer request. Therefore polling FLXAnFROTS.UORP is not a secure method to identify when the transfer of a requested message buffer has been completed. The bits FLXAnFROTS.OTIS or the DA bit in the FLXAnFRDAi register can be used instead. The exact flow depends on the software architecture.

### 20.3.16.3 Data Structure Transfer Scheduling

Cyclically the different types of transfer requests are checked. In order to guarantee a certain transfer time the different types of transfers have different priorities.

Use requested input transfers have highest priority followed by the transfer of data structures committed into the active input transfer queue. No new output transfer will be started as long as there is a pending input transfer request.

The three output transfer request types are checked in a specific order:

#### (1) All dedicated message buffers in ascending order

When FLXAnFROTC.OTCS is set to 0, set flags in the FLXAnFRNDATi register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

When FLXAnFROTC.OTCS is set to 1, set flags in the FLXAnFRNDATi register or set flags in the FLXAnFRMBSCn register are causing a transfer of the message buffer to the output data structure if the destination area is free (DA bit in the FLXAnFRDAi register is 0).

#### (2) FlexRay internal FIFO

When the FlexRay internal FIFO is not empty and there is a free destination area, one FIFO message is transferred into the output data structure addressed by the FIFO pointer table.

#### (3) User output request

If there is a pending user output transfer request, one message buffer is transferred into the corresponding output data structure.

The check sequence is suspended when an input transfer occurs.

### 20.3.16.4 Behavior in Case of Data Transfer Access Error

The memory areas accessed by the data transfer function may be protected by a memory protection unit (MPU). When the MPU flags an access to a protected address caused by an input or output transfer, an access error event is generated and the related bit in the FLXAnFRAES register is set.

The ongoing transfer is immediately terminated but succeeding transfers are processed and may generate further access errors. Any following access errors are only flagged in FLXAnFRAES.MAE. The other status flags are not updated.

#### (1) Access error during input transfer

When an access error occurs during an input transfer:

- The ongoing transfer is immediately terminated. The FlexRay internal message RAM will not be updated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.IAE is set to 1
- The input pointer table index is flagged in FLXAnFRAES.EIDX
- In case of an normal input transfer the to the transfer related DA flag in the FLXAnFRDAi register is set to 0
- In case of an user input transfer request FLXAnFRITS.UIRP is set to 0

With the given status information the application is able to identify and correct the faulty data structure.

In addition the application needs to clear the input access error flag (FLXAnFRAES.IAE).

### (2) Access error during output transfer

When an access error occurs during an output transfer:

- The ongoing transfer is immediately terminated but the update of the data structure may have started.
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.OAE is set to 1
- The output pointer table index is flagged in FLXAnFRAES.EIDX
- In case of an normal output transfer the to the transfer related DA flag in the FLXAnFRDAi register remains 0 and no output transfer interrupt is generated
- In case of an user output transfer request FLXAnFROTS.UORP is set to 0

With the given status information the application is able to identify and correct the faulty data structure. The data structure in the Local RAM/Global RAM cannot be treated as valid.

In addition the application needs to clear the output access error flag (FLXAnFRAES.OAE).

The FlexRay module internal transfer of the message buffer is completed before the Local RAM/ Global RAM access error is detected. The output transfer will not be re-initiated. To avoid loss of data, the application can perform a user output transfer request of this message buffer to a correct Local RAM/Global RAM location.

### (3) Access error during FIFO transfer

When an access error occurs during an FIFO transfer:

- The ongoing transfer is immediately terminated
- The address, the FlexRay module wanted to access to, is captured in the FLXAnFRAEA register
- FLXAnFRAES.FAE is set to 1
- The FIFO pointer table index is flagged in FLXAnFRAES.EIDX
- The FIFO index pointer are not changed and hence the FIFO status flags are unchanged

With the given status information the application is able to identify and correct the faulty data structure.

In addition the application needs to clear the FIFO access error flag (FLXAnFRAES.FAE).

The data in the Local RAM/Global RAM cannot be treated as valid and is not released to the application. The message cannot be recovered.

### 20.3.16.5 Behaviors in Case of RAM Read Errors

The FlexRay internal message RAM has an ECC checking mechanism. In case an uncorrectable RAM read error occurs, the application has to analyze the status in the FLXAnFRMHDS register and react as described in **Section 20.3.16.3, Data Structure Transfer Scheduling**. The input and output transfer handler reacts also on these errors detected in the message RAM when the error is related to an active transfer.

In addition, the Temporary Buffer RAM A and Temporary Buffer RAM B have an ECC checking mechanism as well. An uncorrectable RAM read errors does not impact the data transfer functionality but have to be handled as described in **Section 20.3.13.1 (4), Message Buffer Status FLXAnFRMBS (word 3)**.

In all cases, data causing a read error is never transferred to the Local RAM/Global RAM. If there is no recovery available in the application, the message is lost.

#### (1) Read error during transfer from TBF to MBF

This internal transfer is done for each valid FlexRay message received.

A read error can only occur when reading the header section in the FlexRay Message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

For dedicated receive message buffers, the related ND flag in the FLXAnFRNDAT register will not get set. Consequently the affected message buffer will not be transferred to the output data structure.

For the FlexRay internal FIFO buffers, the ND flag in the FLXAnFRNDAT register is not set but the FlexRay internal FIFO put index is incremented. Due to this, a transfer procedure from the FlexRay internal FIFO buffer to the output buffer is started. However, if the read error is still present in the header section, updating of the output data structure will not start (see **Section 20.3.16.5 (2), Read error during transfer from MBF to OBF**); thus the data in the Local RAM/Global RAM remains correct.

Note that the correction or any other reconfiguration of FIFO related to message buffers while there are pending FIFO transfers may result in incorrect data in the Local RAM/Global RAM. It is strongly recommended to deactivate the output data transfer before starting the reconfiguration and flush the FlexRay internal FIFO before reactivation of the output data transfer.

#### (2) Read error during transfer from MBF to OBF

This internal transfer is done for every output data transfer (dedicated reception, FIFO, user requested).

A read error can occur in the header and data section (see read error flags in FLXAnFRMHDS). In both cases the message gets lost. If the error is located in the header section, the message buffer needs to be re-configured. If the error is located in the data section, the error is corrected with the next data section update.

When a read error occurs during the transfer from the message RAM to the output buffer, the output data structure will not be updated and the data available will not be set to 1. The FIFO put index and the FIFO fill level are not changed also.

In case of user output transfer request, FLXAnFROTS.UORP is set to 0 even if there was no update of the output data structure.

#### (3) Read error during transfer from IBF to MBF

This internal transfer is done for every input data transfer.

A read error can occur only when there is no update of the header section requested (the bit LHS in FLXAnFRWRHS4 is set to 0) due to the reading of the header section from the message RAM (see read error flags in FLXAnFRMHDS). In this case, the message buffer needs to be re-configured.

When a read error occurs during the input data transfer, the actually transferred message in the input queue gets lost.

#### (4) Message RAM read errors

Read errors when reading the header section are flagged in the FLXAnFRMHDS register.

Depending on the buffer type and set buffer protection, a reconfiguration of the message buffer may not be possible.

The input transfer function cannot be used to reconfigure a locked message buffer using the method described in **Section 20.3.13.4 (3), Temporary Unlocking of Header Section**.

Before reconfiguring a locked buffer, the user should disable the input transfer function and the output transfer function.

## 20.3.17 Byte Alignment

The alignment of the bytes received by the FlexRay protocol and the alignment of the bytes required by the application may be different. The FlexRay module provides with FLXAnFROC.BEC a byte alignment function to support different byte ordering styles.

**Figure 20.32** shows the payload byte alignment in a FlexRay frame.

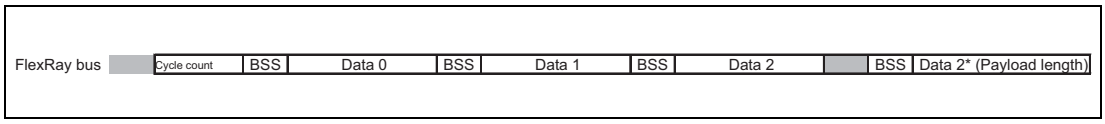

**Figure 20.32 Byte Alignment on the FlexRay Bus**

### 20.3.17.1 Little Endian Alignment

When FLXAnFROC.BEC is 0, the byte alignment is set to Little Endian.

#### (1) FLXAnFRNMVm (m = 1 to 3)

The byte alignment of the NMV bytes is as below.

| Bit | 31 30 29 28 27 26 25 24 | 23 22 21 20 19 18 17 16 | 15 14 13 12 11 10 9 8 | 7 6 5 4 3 2 1 0 |
|---|---|---|---|---|
| FLXAnFRNMV1 | Data 3 | Data 2 | Data 1 | Data 0 |
| FLXAnFRNMV2 | Data 7 | Data 6 | Data 5 | Data 4 |
| FLXAnFRNMV3 | Data 11 | Data 10 | Data 9 | Data 8 |

#### (2) FLXAnFRWRDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.

FLXAnFRWRDSxMD[7:0] = $Data_{4x-4}$

FLXAnFRWRDSxMD[15:8] = $Data_{4x-3}$

FLXAnFRWRDSxMD[23:16] =$Data_{4x-2}$

FLXAnFRWRDSxMD[31:24] = $Data_{4x-1}$

Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[7:0], FLXAnFRWRDSx.MD [15:8], FLXAnFRWRDSx.MD [23:16], FLXAnFRWRDSx.MD [31:24] with the most significant bit (MSB) transmitted first.

#### (3) FLXAnFRRDDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.

FLXAnFRRDDSxMD[7:0] = $Data_{4x-4}$

FLXAnFRRDDSxMD[15:8] = $Data_{4x-3}$

FLXAnFRRDDSxMD[23:16] =$Data_{4x-2}$

FLXAnFRRDDSxMD[31:24] = $Data_{4x-1}$

Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[7:0], FLXAnFRRDDSx.MD [15:8], FLXAnFRRDDSx.MD [23:16], FLXAnFRRDDSx.MD [31:24] with the most significant bit (MSB) received first.

### 20.3.17.2 Big Endian Alignment

When FLXAnFROC.BEC is 1, the byte alignment is set to Big Endian.

#### (1) FLXAnFRNMVm (m = 1 to 3)

The byte alignment of the NMV bytes is as below.

| Bit | 31 30 29 28 27 26 25 24 | 23 22 21 20 19 18 17 16 | 15 14 13 12 11 10 9 8 | 7 6 5 4 3 2 1 0 |
|---|---|---|---|---|
| FLXAnFRNMV1 | Data 0 | Data 1 | Data 2 | Data 3 |
| FLXAnFRNMV2 | Data 4 | Data 5 | Data 6 | Data 7 |
| FLXAnFRNMV3 | Data 8 | Data 9 | Data 10 | Data 11 |

#### (2) FLXAnFRWRDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay input buffer and the input data structure is as below.

FLXAnFRWRDSxMD[7:0] = $Data_{4x-1}$

FLXAnFRWRDSxMD[15:8] = $Data_{4x-2}$

FLXAnFRWRDSxMD[23:16] = $Data_{4x-3}$

FLXAnFRWRDSxMD[31:24] = $Data_{4x-4}$

Transmission order on the FlexRay bus is FLXAnFRWRDSx.MD[7:0], FLXAnFRWRDSx.MD [15:8], FLXAnFRWRDSx.MD [23:16], FLXAnFRWRDSx.MD [31:24] with the most significant bit (MSB) transmitted first.

#### (3) FLXAnFRRDDSx (x = 1 to 64)

The byte alignment for the message payload in the FlexRay output buffer and the output data structure is as below.

FLXAnFRRDDSxMD[7:0] = $Data_{4x-1}$

FLXAnFRRDDSxMD[15:8] = $Data_{4x-2}$

FLXAnFRRDDSxMD[23:16] = $Data_{4x-3}$

FLXAnFRRDDSxMD[31:24] = $Data_{4x-4}$

Reception order on the FlexRay bus is FLXAnFRRDDSx.MD[7:0], FLXAnFRRDDSx.MD [15:8], FLXAnFRRDDSx.MD [23:16], FLXAnFRRDDSx.MD [31:24] with the most significant bit (MSB) received first.

### 20.3.18 FlexRay NTU supervision

In case of normal operating condition the FlexRay is sending NTU (Network Timing Unit) HW triggers to the System timer, which enables SW to synchronize the drivers job list processing with very low effort.

For keeping SW driver synchronization (e.g. Autosar) while FlexRay communication is not working properly or is temporarily not available (e.g. loss of NTU trigger), the system timer can support SW synchronization by emulating the FlexRay NTU trigger with a configurable frequency.

To support NTU supervision the E-Ray IP is providing a dedicated output signal, which is connected to the NTU Clock Selector. This selector provides an input signal for STM0 (in case there are two STM timers, only the first one is connected to NTU Tick). The frequency of the NTU clock signal and of the Backup clock, derived from the low jitter PLL used for FlexRay communication, are continuously compared by the NTU loss monitor.

The NTU clock of the FlexRay IP is equal to a macrotick (MT) or cycle tick (CT). The backup clock can be configured to the same frequency. Additionally the eray_sclk and the PLL clock used for NTU loss monitor are the same signal. The frequency of the backup clock has to be configured during initialisation phase and cannot be changed during normal operation.

#### 20.3.18.1 Window function

The user can configure a “NTU loss” window. If the monitored NTU tick is not detected during the open window, an error is generated:

The NTU loss monitor operation:

- NPRS, NBPRS and NCPRS divider blocks for each input clock. Dividing factor is based on the setting in the respective registers
- 12bit compare unit
- The counter inside compare unit counts number of NTU signal’s rising edges during 16 clock periods of base clock
- If the counted NTU ticks value is outside of the threshold values set in the respective registers (upper and lower) an INTC signal occurs.
- After that user can change the selected NTU source

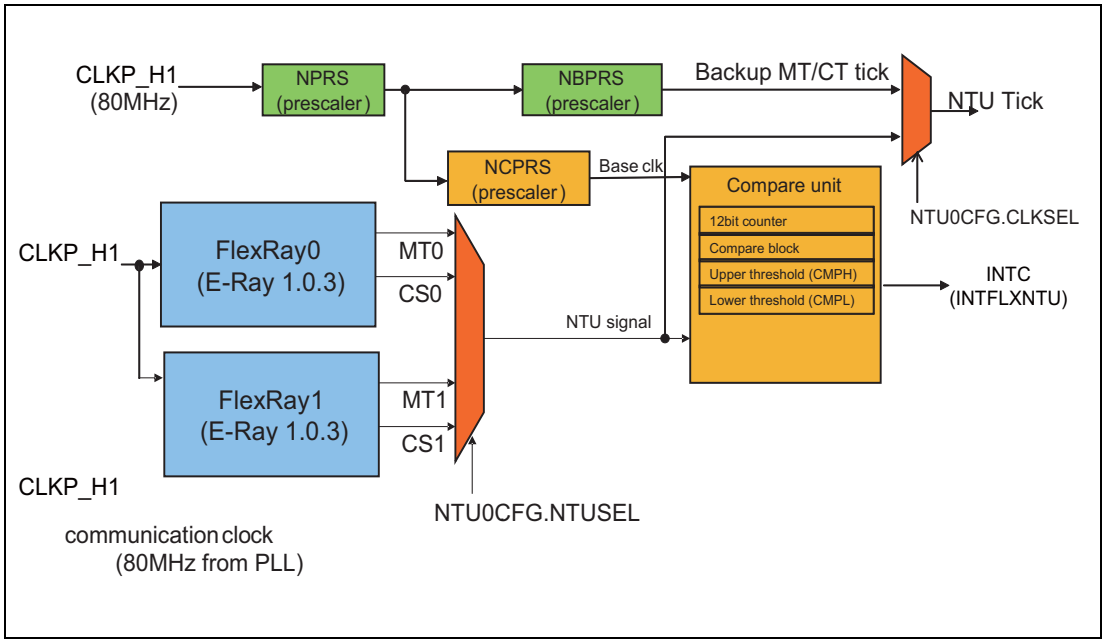

**Figure 20.33 Block diagram of NTU generation for STM**

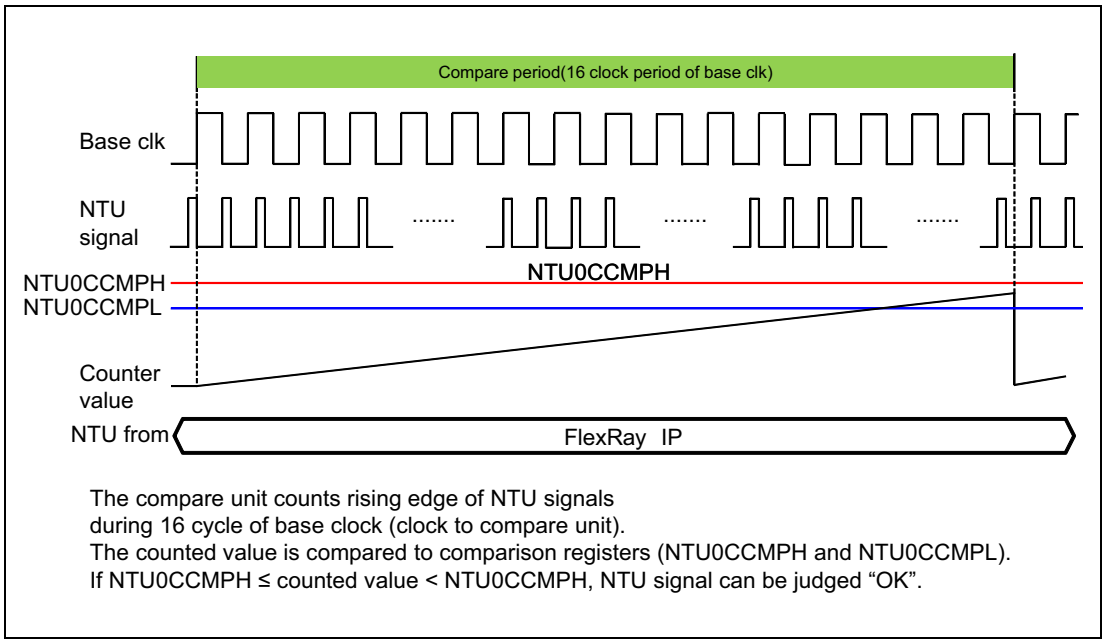

**Figure 20.34 The NTU loss monitor operation in compare unit (in case of OK)**

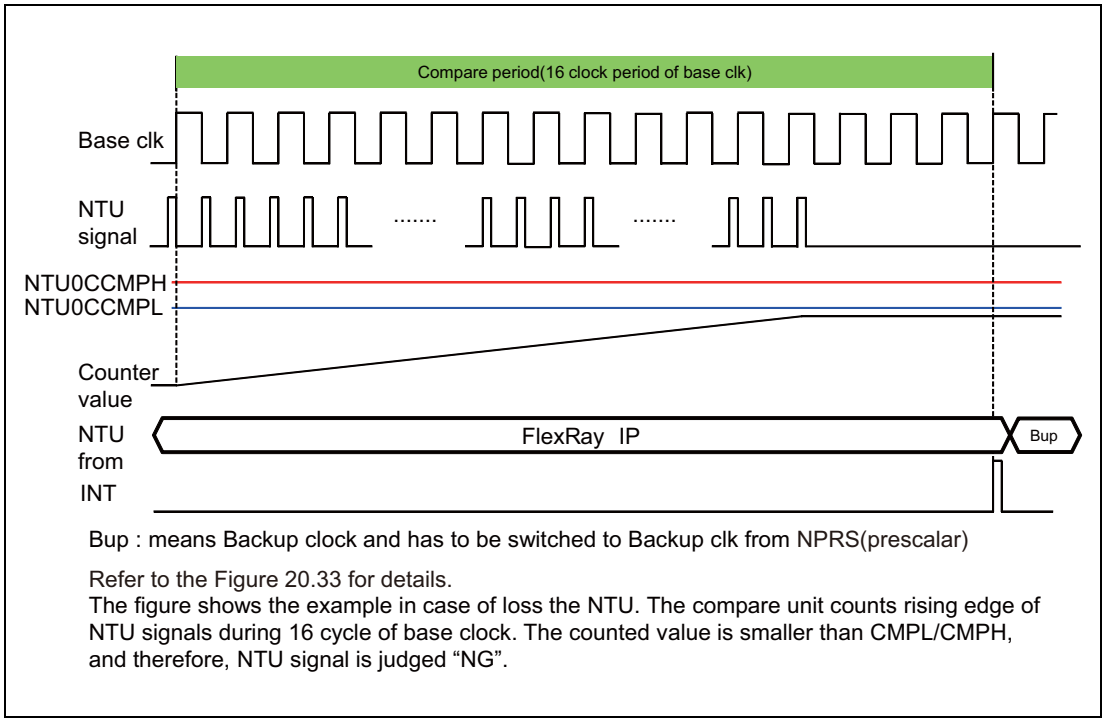
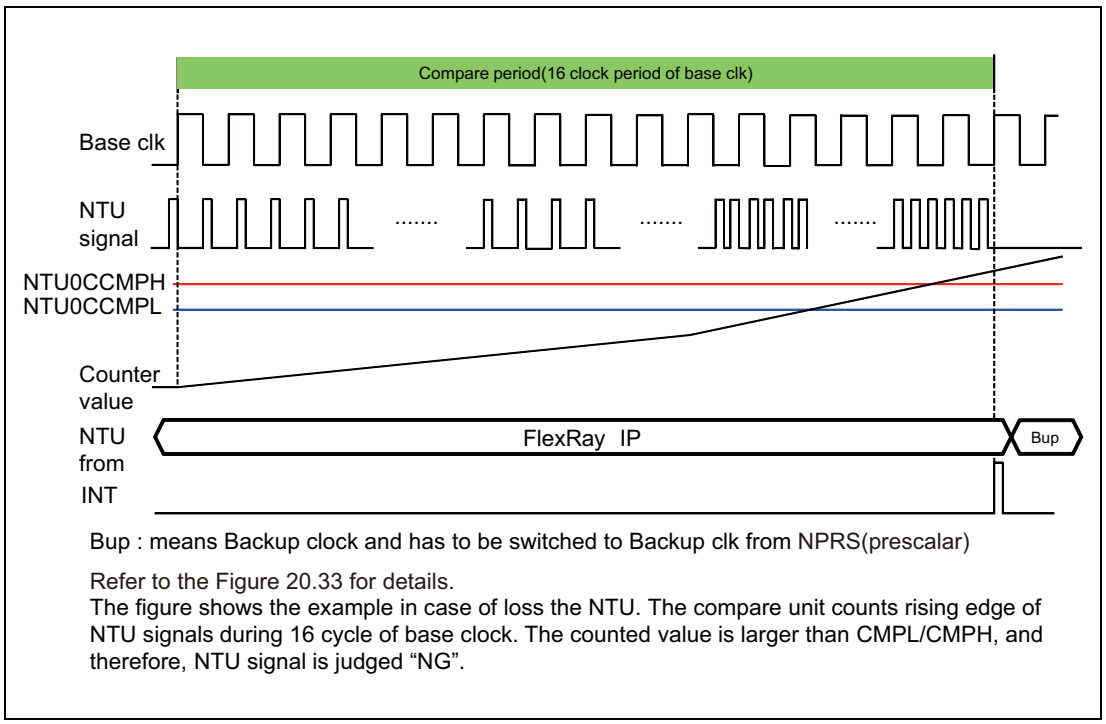


Bup : means Backup clock and has to be switched to Backup clk from NPRS(prescalar)

Refer to the Figure 20.33 for details.
The figure shows the example in case of loss the NTU. The compare unit counts rising edge of NTU signals during 16 cycle of base clock. The counted value is smaller than CMPL/CMPH, and therefore, NTU signal is judged “NG”.

**Figure 20.35 The NTU loss monitor operation in compare unit (in case of loss 1)**



Bup : means Backup clock and has to be switched to Backup clk from NPRS(prescalar)

Refer to the Figure 20.33 for details.
The figure shows the example in case of loss the NTU. The compare unit counts rising edge of NTU signals during 16 cycle of base clock. The counted value is larger than CMPL/CMPH, and therefore, NTU signal is judged “NG”.

**Figure 20.36 The NTU loss monitor operation in compare unit (in case of loss 2)**

### 20.3.19 Port sharing between FlexRay IP and RLIN

FlexRay 0 channel A pins will be shared with RLIN30 module.

In detail, see **Section 2, Pin Functions**.

### 20.3.20 Wakeup capability

To provide a wake up capability in the FlexRay IP, detecting a falling edge of bus signal can be used as a trigger for interrupt controller. After receiving this trigger, the interrupt controller will be able to run SW to wake up the FlexRay IP.

For this functionality it is necessary to connect FLXnRXDA and FLXAnRXDB pins (n = 0, 1) with an external interrupt input (INTP), therefore port sharing between INTP and FLXnRXDA and FLXAnRXDB pins (n = 0, 1) of FlexRay IP will be implemented.

### 20.3.21 Limited Reset and Module stand-by

The FlexRay can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. Software must ensure that FlexRay is halted. (See **Section 20.3.1.2, FlexRay Module Disable)**

The FlexRay clock can be disabled by the SYSCTRL module stand-by function. Software must ensure that FlexRay is halted if module stand-by enable.

## 20.4 CAUTION

| No. | Outline |
|---|---|
| ID1 | A sequence of received WUS may generate redundant FLXAnFRSIR.WUPA/B events. |
| ID2 | Erroneous cycle offset during startup after abort of startup or normal operation by a READY or FREEZE command |
| ID3 | First WUS following received valid WUP may be ignored. |
| ID4 | READY command accepted in READY state. |
| ID5 | Slot Status vPOC!SlotMode is reset immediately when entering HALT state (CCSV.SLM[1:0] = "00"). |

| | | |
|---|---|---|
| ID1 | | A sequence of received WUS may generate redundant FLXAnFRSIR.WUPA/B events. |
| | Description | If a sequence of wakeup symbols (WUS) is received, all separated by appropriate idle phases, a valid wakeup pattern (WUP) should be detected after every second WUS. The FlexRay IP detects a valid wakeup pattern after the second WUS and then after each following WUS. |
| | Scope | The erratum is limited to the case where the application program frequently resets the appropriate FLXAnFRSIR.WUPA/B bits |
| | Effects | In the described case there are more FLXAnFRSIR.WUPA/B events seen than expected |
| | Workaround | Ignore redundant FLXAnFRSIR.WUPA/B events |
| ID2 | | Erroneous cycle offset during startup after abort of startup or normal operation by a READY or FREEZE command |
| | Description | An abort of startup or normal operation by a READY or FREEZE command near the macrotick border may lead to the effect that the state INITIALIZE_SCHEDULE is one macrotick too short during the first following integration attempt. This leads to an early cycle start in state INTEGRATION_COLDSTART_CHECK or INTEGRATION_CONSISTENCY_CHECK.<br>As a result the integrating node calculates a cycle offset of one macrotick at the end of the first even/odd cycle pair in the states INTEGRATION_COLDSTART_CHECK or INTEGRATION_CONSISTENCY_CHECK and tries to correct this offset.<br>If the node is able to correct the offset of one macrotick (pOffsetCorrectionOut >> gdMacrotick), the node enters NORMAL_ACTIVE with the first startup attempt.<br>If the node is not able to correct the offset error because pOffsetCorrectionOut is too small (pOffsetCorrectionOut ≤ gdMacrotick), the node enters ABORT_STARTUP and is ready to try startup again. The next (second) startup attempt is not affected by this erratum. |
| | Scope | The erratum is limited to applications where READY or FREEZE command is used to leave STARTUP, NORMAL_ACTIVE, or NORMAL_PASSIVE state |
| | Effects | In the described case the integrating node tries to correct an erroneous cycle offset of one macrotick during startup. |
| | Workaround | With a configuration of pOffsetCorrectionOut >> gdMacrotick • (1+cClockDeviationMax)<br>the node will be able to correct the offset and therefore also be able to successfully integrate. |
| ID3 | | First WUS following received valid WUP may be ignored. |
| | Description | When the protocol engine is in state WAKEUP_LISTEN and receives a valid wakeup pattern (WUP), it transfers into state READY and updates the wakeup status vector FLXAnFRCCSV.WSV[2:0] as well as the status interrupt flags SIR.WST and FLXAnFRSIR.WUPA/B. If the received wakeup pattern continues, the protocol engine may ignore the first wakeup symbol (WUS) following the state transition and signals the next FLXAnFRSIR.WUPA/B at the third instead of the second WUS. |
| | Scope | The erratum is limited to the reception of redundant wakeup patterns. |
| | Effects | Delayed setting of status interrupt flags FLXAnFRSIR.WUPA/B for redundant wakeup patterns |
| | Workaround | None needed. |

| | | |
|---|---|---|
| ID4 | | READY command accepted in READY state. |
| | Description | The FlexRay module does not ignore a READY command while in READY state. |
| | Scope | The erratum is limited to the READY state. |
| | Effects | Flag FLXAnFRCCSV.CSI is set. Cold starting needs to be enabled by POC command ALLOW_COLDSTART (FLXAnFRSUCC1.CMD = "1001"). |
| | Workaround | None needed. |
| ID5 | Description | When the protocol engine is in the states NORMAL_ACTIVE or NORMAL_PASSIVE, a HALT or FREEZE command issued by the Host resets vPOC!SlotMode immediately to SINGLE slot mode (FLXAnFRCCSV.SLM[1:0] = "00"). According to the FlexRay protocol specification, the slot mode should not be reset to SINGLE slot mode before the following state transition from HALT to DEFAULT_CONFIG state. |
| | Scope | The erratum is limited to the HALT state |
| | Effects | The slot status vPOC!SlotMode is reset to SINGLE when entering HALT state. |
| | Workaround | None needed. |

## 20.5 Difference among P1M-C, P1H-C and P1H-CE

| Instance Name | RH850/P1x-C | | | |
|---|---|---|---|---|
| | P1M-C, P1H-C (4MB, BGA-156) | P1H-C (4MB, BGA-292) | P1H-C (8MB) | P1H-CE |
| FLXA0 | √ | √ | √ | √ |
| FLXA1 | — | √ | √ | √ |

# Section 21 Ethernet Controller (ETNA)

This section describes the Ethernet Controller (ETNA) module.

The first subsection describes all the characteristics specific to the RH850/P1x-C such as channels, register base addresses, and input/output signal names.
The second and subsequent subsections describe characteristics of Ethernet.

## 21.1 Feature Overview of RH850/P1x-C Ethernet Controller

### 21.1.1 Number of Channels and Ports

The RH850/P1x-C includes one physical channel. This physical channel serves two MAC layer interface ports (hereafter referred to as port 0 and port 1), both of which can be made to perform transmission and reception independently.

**Table 21.1 Ethernet Channels**

| Ethernet | P1M-C, P1H-C (4MB, BGA-156) | P1H-C (4MB, BGA-292) and P1H-CE |
|---|---|---|
| Number of Channels | 1 | 1 |
| Name | ETNA0 | ETNA0 |
| Number of Ports per Channel | 1 | 2 |

#### Index n and m

This section identifies each Ethernet channel by “n” (n = 0) and port by m (m = 0, 1). For example, the E-DMAC Start Register is described as ETNAnEDSRm.

### 21.1.2 Register Addresses

Ethernet register addresses are represented by an offset from the base address <ETNAn_base>.

The following table shows the base address <ETNAn_base> of each Ethernet module.

**Table 21.2 Register Base Address <ETNAn_base>**

| Ethernetn Channel | <ETNAn_base> Address |
|---|---|
| ETNA0 | $1002\ 4000_H$ |

### 21.1.3 Clock Supply

The following clock input is supplied for the Ethernet module.

**Table 21.3 Ethernet Clock Source**

| Clock | explanation | specification |
|---|---|---|
| HCLK_0 | H-bus interface clock*1 | CLK_HSB |
| HCLK_1 | H-bus interface clock*1 | CLK_HSB |
| ETH0TXCLK | MII TX CLK for ETNA0 port 0 | External clock |
| ETH1TXCLK | MII TX CLK for ETNA0 port 1 | External clock |
| ETH0RXCLK | MII RX CLK for ETNA0 port 0 | External clock |
| ETH1RXCLK | MII RX CLK for ETNA0 port 1 | External clock |
| ETH0REF50CK | RMII reference clock for ETNA0 port 0 | External clock |
| ETH1REF50CK | RMII reference clock for ETNA0 port 1 | External clock |

Note 1. The input frequnecy must be in the rage of 60MHz to 80MHz

### 21.1.4 Interrupts and DMA/DTS

The Ethernet module can generate the following interrupt requests.

**Table 21.4 Interrupt Requests**

| Unit Interrupt Name | Outline | Interrupt Number | DMA Trigger Number | DTS Trigger Number |
|---|---|---|---|---|
| **ETNA0** | | | | |
| INTETNA0 | Ethernet interrupt for Port 0 (HINT_0) | 184 | — | — |
| INTETNA1 | Ethernet interrupt for Port 1 (HINT_1) | 185 | — | — |

### 21.1.5 Difference table of P1M-C, P1H-C, P1H-CE product

Table 21.5 Difference of number of macro

| Macro | Device | | | | |
|---|---|---|---|---|---|
| | P1M-C | P1H-C (4MB, BGA-156) | P1H-C (4MB, BGA-292) | P1H-C (8MB) | P1H-CE |
| ETNA0 port 0 | 1 | 1 | 1 | 1 | 1 |
| ETNA0 port 1 | — | — | 1 | 1 | 1 |

### 21.1.6 External Input/Output Signals

The following table shows the Ethernet input/output signals.

Table 21.6 Ethernet External Input / Output Signals

| Pin Name | I/O | Function | MII | RMII |
|---|---|---|---|---|
| ETHmTXCLK | Input | Transmission clock | √ | |
| ETHmRXCLK | Input | Reception clock | √ | |
| ETHmREF50CK | Input | RMII reference clock | | √ |
| ETHmTXEN | Output | Transmission data enable | √ | √ |
| ETHmTXD3 | Output | Transmission data 3 | √ | |
| ETHmTXD2 | Output | Transmission data 2 | √ | |
| ETHmTXD1 | Output | Transmission data 1 | √ | √ |
| ETHmTXD0 | Output | Transmission data 0 | √ | √ |
| ETHmTXER | Output | Transmission data error | √ | |
| ETHmRXDV | Input | Reception data valid | √ | |
| ETHmRXD3 | Input | Reception data 3 | √ | |
| ETHmRXD2 | Input | Reception data 2 | √ | |
| ETHmRXD1 | Input | Reception data 1 | √ | √ |
| ETHmRXD0 | Input | Reception data 0 | √ | √ |
| ETHmRXER | Input | Reception data error | √ | √ |
| ETHmCRS | Input | Carrier detection signal | v | √ |
| ETHmCOL | Input | Collision detection signal | √ | |
| ETHmMDC | Output | Serial management interface transfer clock | √ | √ |
| ETHmMDIO | Input/ Output | Serial management interface data input / output<br>Input pin ETHmMDI<br>Output pin ETHmMDO | √ | √ |
| ETHmLINKSTA | Input | Link status from PHY | √ | √ |
| ETHmWOL | Output | Wake on LAN signal (magic packet detection) | √ | √ |

Note 1. In this device, ETHmTXER is unused and fixed to low.

Note 2. The minimum pulse width of ETHmRXER in RMII mode is depend on transfer speed mode. When operating mode is RMII mode with 10Mbps transfer speed, the minimum pulse of ETHmRXER need to be at least 1 clock of ETHmREF50CK (200ns) against RMII standard.

Note 3. ETH0LINKSTA pin is not supported by P1M-C (BGA-156) and P1H-C (4MB, BGA-156).

## 21.2 Overview

The Ethernet Controller (ETNA) conforms to the IEEE802.3 MAC (Media Access Control) layer standard. Connecting to an IEEE802.3 compliant physical layer device (PHY) enables the ETNA to transmit and receive Ethernet frames. The ETNA is equipped with MII (Media Independent Interface) and RMII (Reduced Media Independent Interface) and connected to the Ethernet Direct Memory Access Controller (EDMAC), which carries out high-speed data transfer (10M/100Mbps) to and from the system memory.

### 21.2.1 Functional Overview

**Table 21.7 Outline of Ethernet function**

| Item | Specification |
|---|---|
| MAC (Media Access Controller) | • 100Mbps or 10Mbps data transfer<br>• Full or half-duplex mode<br>• PHY interface: MII, RMII |
| MAC port number | Implements 2 ports |
| DMA transfer function | • Each port implements the AHB master function and transfers the received/transmitted data from/to the RAM memory area.<br>• Supports the 8 times of the 32-bit burst transfer.<br>• Descriptor management system used by EDMAC (Data transfer without CPU intervention)<br>• Single-frame/single-descriptor and single-frame/multi-descriptor operation.<br>• Transmission/reception status indication in descriptor. |
| Address filter function | • Performs address filtering based on the destination address.<br>• Up to 32 different addresses can be configured individually.<br>• Supports the storm filter for broadcast frames.<br>• Supports the mode enable/disable function for broadcast frames by using CAM entry table. |
| Others | Supports following features:<br>• Magic packet detection and Wake-On-LAN signal output<br>• Flow conforms to IEEE802.3<br>• PAUSE control frame format<br>• CRC calculation for RX/TX frames<br>• Configurable address filtering function (CAM function).<br>• Integrated transmit/receive FIFO (TX = 2 KB, RX = 2 KB)<br>• Interrupts for configurable error and status conditions<br>• Internal loopback function (external loopback function can be realized with PHY interface)<br>• MAC management counters |

### 21.2.2 Block Diagram

The following **Figure 21.1** shows a block diagram of the Ethernet module.

The ETNA can transfer the transmitted or received Ethernet frame data to and from the transmit/ receive buffer in the memory at high speed using a dedicated direct memory access controller (E-DMAC).

The ETNA also has an on-chip TSU (Transfer Switching Unit) for CAM processing.

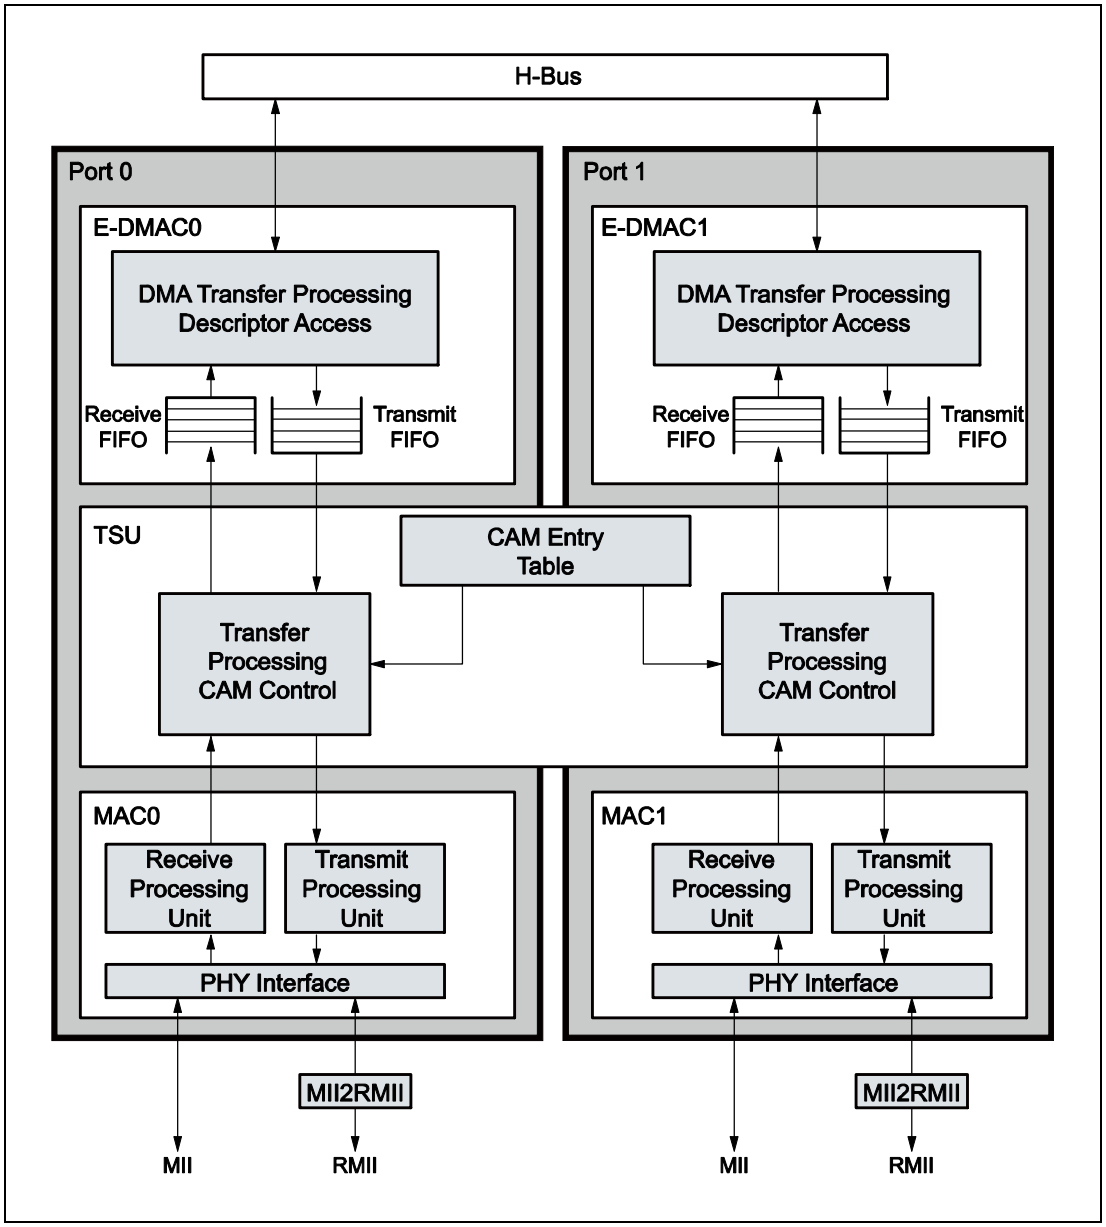


Figure 21.1 Block Diagram of Ethernet

# 21.3 Registers

## 21.3.1 Overview of Register

Ethernet is controlled and operated by the following registers.

**Table 21.8 Overview of Ethernet Registers (1/8)**

| Description | Register Name | Access Width | Address | Access Protection | |
|---|---|---|---|---|---|
| | | | | HBG | Other |
| E-DMAC Start Register 0 | ETNAnEDSR0 | 32 | <ETNAn_base> + $0000_H$ | HBG.Ethernet n*1 | — |
| Transmit Descriptor List Start Address Register 0 | ETNAnTDLAR0 | 32 | <ETNAn_base> + $0010_H$ | HBG.Ethernet n*1 | — |
| Transmit Descriptor Fetch Address Register 0 | ETNAnTDFAR0 | 32 | <ETNAn_base> + $0014_H$ | HBG.Ethernet n*1 | — |
| Transmit Descriptor Finished Address Register 0 | ETNAnTDFXR0 | 32 | <ETNAn_base> + $0018_H$ | HBG.Ethernet n*1 | — |
| Transmit Descriptor Final Flag Register 0 | ETNAnTDFFR0 | 32 | <ETNAn_base> + $001C_H$ | HBG.Ethernet n*1 | — |
| Receive Descriptor List Start Address Register 0 | ETNAnRDLAR0 | 32 | <ETNAn_base> + $0030_H$ | HBG.Ethernet n*1 | — |
| Receive Descriptor Fetch Address Register 0 | ETNAnRDFAR0 | 32 | <ETNAn_base> + $0034_H$ | HBG.Ethernet n*1 | — |
| Receive Descriptor Finished Address Register 0 | ETNAnRDFXR0 | 32 | <ETNAn_base> + $0038_H$ | HBG.Ethernet n*1 | — |
| Receive Descriptor Final Flag Register 0 | ETNAnRDFFR0 | 32 | <ETNAn_base> + $003C_H$ | HBG.Ethernet n*1 | — |
| E-DMAC Mode Register 0 | ETNAnEDMR0 | 32 | <ETNAn_base> + $0400_H$ | HBG.Ethernet n*1 | — |
| E-DMAC Transmit Request Register 0 | ETNAnEDTRR0 | 32 | <ETNAn_base> + $0408_H$ | HBG.Ethernet n*1 | — |
| E-DMAC Receive Request Register 0 | ETNAnEDRRR0 | 32 | <ETNAn_base> + $0410_H$ | HBG.Ethernet n*1 | — |
| E-MAC/E-DMAC Status Register 0 | ETNAnEESR0 | 32 | <ETNAn_base> + $0428_H$ | HBG.Ethernet n*1 | — |
| E-MAC/E-DMAC Status Interrupt Permission Register 0 | ETNAnEESIPR0 | 32 | <ETNAn_base> + $0430_H$ | HBG.Ethernet n*1 | — |
| Transmit/Receive Status Copy Enable Register 0 | ETNAnTRSCER0 | 32 | <ETNAn_base> + $0438_H$ | HBG.Ethernet n*1 | — |
| Receive Missed-Frame Counter Register 0 | ETNAnRMFCR0 | 32 | <ETNAn_base> + $0440_H$ | HBG.Ethernet n*1 | — |
| FIFO Depth Register 0 | ETNAnFDR0 | 32 | <ETNAn_base> + $0450_H$ | HBG.Ethernet n*1 | — |
| Receiving Method Control Register 0 | ETNAnRMCR0 | 32 | <ETNAn_base> + $0458_H$ | HBG.Ethernet n*1 | — |
| Receive Data Padding Insert Register 0 | ETNAnRPADIR0 | 32 | <ETNAn_base> + $0460_H$ | HBG.Ethernet n*1 | — |
| Overflow Alert FIFO Threshold Register 0 | ETNAnFCFTR0 | 32 | <ETNAn_base> + $0468_H$ | HBG.Ethernet n*1 | — |
| Transmit FIFO Status Register 0 | ETNAnTFSR0 | 32 | <ETNAn_base> + $0480_H$ | HBG.Ethernet n*1 | — |
| Receive FIFO Status Register 0 | ETNAnRFSR0 | 32 | <ETNAn_base> + $0488_H$ | HBG.Ethernet n*1 | — |

Table 21.8 Overview of Ethernet Registers (2/8)

| Description | Register Name | Access Width | Address | Access Protection | |
|---|---|---|---|---|---|
| | | | | HBG | Other |
| E-MAC Mode Register 0 | ETNAnECMR0 | 32 | <ETNAn_base> + $0500_H$ | HBG.Ethernet n*[1] | — |
| Receive Frame Length Register 0 | ETNAnRFLR0 | 32 | <ETNAn_base> + $0508_H$ | HBG.Ethernet n*[1] | — |

Note 1. In the case of
n = 0 HBG.Ethernet0
n = 1 HBG.Ethernet1

**<ETNAn_base>**

The base address <ETNAn_base> of Ethernet is defined by the keywords in **Table 21.2, Register Base Address <ETNAn_base>**.

**Table 21.9 Register Reset Condition**

| Register Name | Reset Condition | | | | |
|---|---|---|---|---|---|
| | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 | Limited Reset |
| All registers | √ | √ | √ | √ | √ |

### 21.3.2 ETNAnHDMMDRm — HDMAC Operation Mode Register m

ETNAnHDMMDRm is a 32-bit readable/writable register that specifies the operating mode of the E-DMACm.

The setting must not be changed after transmission/reception has started.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnHDMMDR0: <ETNAn_base> + $0C04_H$
ETNAnHDMMDR1: <ETNAn_base> + $1C04_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 10 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 9 | DTOm | DMA TM OUT<br>0: If the HREADY signal which respond to DMA request is not asserted within 15 cycles, the DMA cycle is aborted by the timeout condition.<br>1: The DMA timeout is not detected and the DMA cycle is not aborted<br>**CAUTION**<br>DMA timeout function can avoid a detection of the timeout condtion only when a transfer request to GRAM from HDMAC is operated under the condition of no aribtration with other masters. When such condition is not expected on use case, set DTOm bit into 1. |
| 8 | ITOm | I/O TM OUT<br>0: If the response signal which respond to I/O access request is not asserted within 15 cycles, the I/O cycle is aborted by the timeout condition.<br>1: The I/O timeout is not detected and the I/O cycle is not aborted. |
| 7 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

### 21.3.3 ETNAnHDMISRm — HDMAC Interrupt Status Register m

ETNAnHDMISRm is a 32-bit readable/writable register that shows the interrupt status of the E-DMACm.

Each bit of this register is cleared by writing 1. HDISm is cleared by clearing all bits in ETNAnEESRm register.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnHDMISR0: <ETNAn_base> + $0C10_H$
ETNAnHDMISR1: <ETNAn_base> + $1C10_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 0 | HDISm | HDMAC Interrupt<br>1: HDMAC interrupt is detected. |

### 21.3.4 ETNAnHDMIERm — HDMAC Interrupt Enable Register m

ETNAnHDMIERm is a 32-bit readable/writable register that enables the interrupt output of the E-DMACm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnHDMIER0: <ETNAn_base> + $0C14_H$
ETNAnHDMIER1: <ETNAn_base> + $1C14_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.12 ETNAnHDMIERm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 23 | DTOEm | DMA access Time Out Interrupt Enable<br>1: A timeout is detected during DMA access. |
| 22 to 19 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 18 | MSE2m | 1cycle Retry or Split Response Interrupt Enable<br>1: While a DMA access, the Retry or Split Response is detected only 1 cycle. The DMA behavior is the same as normal retry. |
| 17, 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 | ITOEm | I/O access Time Out Interrupt Enable<br>1: A timeout is detected during I/O access to HDMAC or M-Port.. |
| 14 to 12 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 11 | SLE3m | I/O access is Seq or Busy Interrupt Enable<br>1: I/O access is Seq or Busy access. |
| 10 | SLE2m | I/O access is Burst Interrupt Enable<br>1: I/O access is burst access. |
| 9 | SLE1m | I/O access is not 32 bit Interrupt Enable<br>1: I/O access is not 32 bit. |
| 8 | SLE0m | I/O access is not 4 byte boundary Interrupt Enable<br>1: I/O access is not 4 byte boundary. |
| 7 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | HDIEm | HDMAC Interrupt Enable<br>1: HDMAC interrupt is enabled.<br>**Note:** This bit masks also masks any interrupt arriving from E-MAC0 (= any of events enabled in ETNAnEESIPRm like PHY link status change). |

### 21.3.5 ETNAnARSTR — Software Reset Register

ETNAnARSTR resets only TSU block in the ETNA. By writing 1 to the ARST bit in this register, a software reset is issued to TSU block of the ETNA (for 512 cycles of the HCLK). The ARST bit is always read as 0. While a software reset is issued, register access to all blocks of the ETNA is prohibited.

**Access:** This register can be read/written in 32-bit units.

**Address:** <ETNAn_base> + $0800_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ARST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 21.13 ETNAnARSTR register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | ARST | Software Reset<br>When 1 is written to this bit, a software reset is issued to TSU block of the ETNA (for 512 cycles of the peripheral clock). Writing 0 does not affect this bit. This bit is always read as 0. While a software reset is issued, register access to all blocks of the ETNA is prohibited. The following registers are not initialized by a software reset.<br>ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31, ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31 |

### 21.3.6 ETNAnECMRm — E-MAC Mode Register m

ETNAnECMRm is a 32-bit readable/writable register that specifies the operating mode of the MACm. The settings in this register are normally made in the initialization process following a reset.

The operating mode setting must not be changed while the transmitting and receiving functions are enabled. To switch the operating mode, return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnECMR0: <ETNAn_base> + $0500_H$
ETNAnECMR1: <ETNAn_base> + $1500_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 16 | TXFm | Operating Mode for Transmitting Port Flow Control<br>0: Flow control for the transmitting port is disabled (Automatic PAUSE frame is not transmitted)<br>1: Flow control for the transmitting port is enabled (Automatic PAUSE frame is transmitted as required) |
| 15, 14 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 13 | MCTm | Multicast Address Frame Receive Mode<br>0: Frames other than the multicast address set by the CAM entry table 0 to 31 (H/L) registers are received. However, if the on-chip CAM entry table reference is disabled, all multicast address frames are received.<br>1: Only the multicast address set by the CAM entry table 0 to 31 (H/L) registers is received. |
| 12 to 10 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 9 | MPDEm | Magic Packet Detection Enable<br>Enables or disables Magic Packet detection by hardware to allow activation from the Ethernet.<br>0: Magic Packet detection is not enabled<br>1: Magic Packet detection is enabled |
| 8, 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 | REm | Reception Enable<br>If a switch is made from receiving function enabled (RE = 1) to disabled (RE = 0) while a frame is being received, the receiving function will be enabled until reception of the corresponding frame is completed.<br>0: Receiving function is disabled<br>1: Receiving function is enabled |
| 5 | TEm | Transmission Enable<br>If a switch is made from transmitting function enabled (TE0 = 1) to disabled (TE0 = 0) while a frame is being transmitted, the transmitting function will be enabled until transmission of the corresponding frame is completed.<br>0: Transmitting function is disabled<br>1: Transmitting function is enabled |
| 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

**Table 21.14 ETNAnECMRm register contents (3/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 | ILBm | Internal Loop Back Mode<br>Specifies loopback mode in the ETNA.<br>0: Normal data transmission/reception is performed<br>1: Data loopback is performed inside the MAC0 in the ETNA when DM0 = 1 |
| 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1 | DMm | Duplex Mode<br>Specifies the ETNA transfer method.<br>0: Half-duplex transfer is specified<br>1: Full-duplex transfer is specified |
| 0 | PRMm | Promiscuous Mode<br>Setting this bit enables all Ethernet frames to be received. All Ethernet frames means all receivable frames, irrespective of differences or enabled/disabled status (destination address, broadcast address, multicast bit, etc.).<br>0: ETNA performs normal operation<br>1: ETNA performs promiscuous mode operation |

**Note:** All bits, except for TEm and REm, should be changed while the transmitting function is disabled (TEm = 0) and the receiving function is disabled (REm = 0).

## 21.3.7 ETNAnECSRm — MAC Status Register m

ETNAnECSRm is a 32-bit readable/writable register that indicates the status in the MACm. This status can be notified to the CPU by interrupts. When 1 is written to any bits of this register, the corresponding flags can be cleared. Writing 0 does not affect the flag. For bits that generate interrupts, the interrupt can be enabled or disabled by the corresponding bit in ETNAnECSIPRm.

The interrupts generated due to this status register are indicated in each ECIm bit in ETNAnEESRm of the E-DMACm for port m.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnECSR0: <ETNAn_base> + $0510_H$
ETNAnECSR1: <ETNAn_base> + $1510_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.15 ETNAnECSRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 5 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 4 | PFROIm | PAUSE Frame Retransmit Retry Over<br>Indicates whether the retransmit count for retransmitting a PAUSE frame when flow control is enabled has exceeded the retransmit upper-limit set in the automatic PAUSE frame retransmit count register (ETNAnTPAUSERm).<br>0: PAUSE frame retransmit count has not exceeded the upper limit<br>1: PAUSE frame retransmit count has exceeded the upper limit<br><br>For clearing this bit to 0, please refer the following procedures.<br>(1) Read TPFRCRm for clearing TPFRCR0.<br>(2) Write 1 to this bit. |
| 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 | LINKIm | ETHmLINKSTA Signal Change<br>0: ETHmLINKSTA is not changed<br>1: ETHmLINKSTA is changed |
| 1 | MPDm | Magic Packet Detection<br>Indicates that a Magic Packet has been detected on the line.<br>0: Magic Packet has not been detected<br>1: Magic Packet has been detected |
| 0 | ICDm | Illegal Carrier Detection<br>Indicates that the PHY-LSI has detected an illegal carrier on the line. If a change in the signal input from the PHY-LSI occurs in a period shorter than the software recognition period, the correct information may not be obtained. Refer to the timing specification for the PHY-LSI used.<br>0: PHY-LSI has not detected an illegal carrier on the line<br>1: PHY-LSI has detected an illegal carrier on the line |

**Note:** ETH0LINKSTA pin is not supported by P1M-C (BGA-156) and P1H-C (4MB, BGA-156).

### 21.3.8 ETNAnECSIPRm — E-MAC Interrupt Permission Register m

ETNAnECSIPRm is a 32-bit readable/writable register that enables or disables the interrupt sources indicated by ETNAnECSRm. Each bit can disable or enable interrupts corresponding to the bits in ETNAnECSRm in combination with ECImIP bit in ETNAnEESIPRm and HDIEm bit in ETNAnHDMIERm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnECSIPR0: <ETNAn_base> + $0518_H$
ETNAnECSIPR1: <ETNAn_base> + $1518_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 21.3.9 ETNAnPIRm — PHY Interface Register m

ETNAnPIRm is a 32-bit readable/writable register that provides a means of accessing the PHY-LSI internal registers via the MDIO.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnPIR0: <ETNAn_base> + $0520_H$
ETNAnPIR1: <ETNAn_base> + $1520_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R/W | R | R | R | R | R | R/W | R/W | R/W |

**Table 21.17 ETNAnPIRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 | MDIm | Management Data-In<br>Indicates the level of the ET_MDIO pin. |
| 2 | MDOm | Management Data-Out<br>Outputs the value set in this bit from the ET_MDIO pin when the MMD bit is 1. |
| 1 | MMDm | Management Mode Direction<br>Specifies the data read/write direction.<br>0: Read direction is specified<br>1: Write direction is specified |
| 0 | MDCm | Management Data Clock<br>Outputs the value set in this bit from the ET_MDC pin, and supplies the MII with the management data clock. |

## 21.3.10 ETNAnPLSRm — PHY link status Register m

ETNAnPLSRm is a 32-bit register that monitors the ETHmLINKSTA signal status.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnPLSR0: <ETNAn_base> + $0528_H$
ETNAnPLSR1: <ETNAn_base> + $1528_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 21.18 ETNAnPLSRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is read. |
| 0 | LINKm | ETHmLINKSTA Status<br>For P1M-C (BGA-156) and P1H-C (4MB, BGA-156):<br>0: Channel m ETHmLINKSTA signal is “0”<br>For other products:<br>0: Channel m ETHmLINKSTA signal is “0”<br>1: Channel m ETHmLINKSTA signal is “1” |

**Note:** ETH0LINKSTA pin is not supported by P1M-C (BGA-156) and P1H-C (4MB, BGA-156).

## 21.3.11 ETNAnPIPRm — PHY interrupt polarity register m

ETNAnPIPRm is a 32-bit readable/writable register that specifies the polarity of the PHY interrupt.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnPIPR0: <ETNAn_base> + $052C_H$
ETNAnPIPR1: <ETNAn_base> + $152C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | PHYILm |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 21.19 ETNAnPIPRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | PHYILm | Port m PHY interrupt Polarity<br>0: Active level is Low-level<br>1: Active level is High-level |

### 21.3.12 ETNAnMAHRm — MAC Address High Register m

ETNAnMAHRm is a 32-bit readable/writable register that specifies the upper 32 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnMAHR0: <ETNAn_base> + $05C0_H$
ETNAnMAHR1: <ETNAn_base> + $15C0_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MAm[47:32] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MAm[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.20 ETNAnMAHRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | MAm[47:16] | MAC Address Bits 47 to 16<br>These bits are used to set the upper 32 bits of the MAC address.<br>If the MAC address is 01-23-45-67-89-AB (hexadecimal), set $01234567_H$ in this register. |

### 21.3.13 ETNAnMALRm — MAC Address Low Register m

ETNAnMALRm is a 32-bit readable/writable register that specifies the lower 16 bits of the 48-bit MAC address. The settings in this register are normally made in the initialization process after a reset. The MAC address setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnMALR0: <ETNAn_base> + $05C8_H$
ETNAnMALR1: <ETNAn_base> + $15C8_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MAm[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.21 ETNAnMALRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | MAm[15:0] | MAC Address Bits 15 to 0<br>These bits are used to set the lower 16 bits of the MAC address.<br>If the MAC address is 01-23-45-67-89-AB (hexadecimal), set $0000\ 89AB_H$ in this register. |

## 21.3.14 ETNAnRFLRm — Receive Frame Length Register m

ETNAnRFLRm is a 32-bit readable/writable register that specifies the maximum frame length (in bytes) that can be received. The settings in this register must not be changed while the receiving function is enabled.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRFLR0: <ETNAn_base> + $0508_H$
ETNAnRFLR1: <ETNAn_base> + $1508_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.22 ETNAnRFLRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 18 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 17 to 0 | RFLm[17:0] | Receive Frame Length<br>The frame data described here refers to all fields from the destination address up to the CRC data. Frame contents from the destination address up to the data are actually transferred to memory. CRC data is not included in the transfer. When data that exceeds the specified value is received, the part of data that exceeds the specified value is discarded.<br>$00000_H$ to $005EE_H$: 1,518 bytes<br>$005EF_H$: 1,519 bytes<br>$005F0_H$: 1,520 bytes<br>: :<br>$007FF_H$: 2,047 bytes<br>$00800_H$: 2,048 bytes<br>: :<br>$01000_H$: 4,096 bytes<br>: :<br>$10000_H$: 65,536 bytes<br>: :<br>20000 to $3FFFF_H$: 131,072 bytes |

### 21.3.15 ETNAnTROCRm — Transmit Retry Over Counter Register m

ETNAnTROCRm is a 16-bit counter that indicates the number of frames that were unable to be transmitted in 16 transmission attempts including the retransfer. When 16 transmission attempts have failed, this register is incremented by 1. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to TROCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTROCR0: <ETNAn_base> + $0700_H$
ETNAnTROCR1: <ETNAn_base> + $1700_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TROCm[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.23 ETNAnTROCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | TROCm[15:0] | Transmit Retry Over Count<br>These bits indicate the number of frames that were unable to be transmitted in 16 transmission attempts including the retransfer. |

### 21.3.16 ETNAnCDCRm — Delayed Collision Detect Counter Register m

ETNAnCDCRm is a 16-bit counter that indicates the number of all delayed collisions that occurred on the line after the start of data transmission. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to COSDCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnCDCR0: <ETNAn_base> + $0708_H$
ETNAnCDCR1: <ETNAn_base> + $1708_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.24 ETNAnCDCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | COSDCm[15:0] | Delayed Collision Detect Count<br>These bits indicate the number of all delayed collisions after the start of data transmission. |

## 21.3.17 ETNAnLCCRm — Lost Carrier Counter Register m

ETNAnLCCRm is a 16-bit counter that indicates the number of times the carrier was lost during data transmission. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to LCCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnLCCR0: <ETNAn_base> + $0710_H$
ETNAnLCCR1: <ETNAn_base> + $1710_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.25 ETNAnLCCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | LCCm[15:0] | Lost Carrier Count<br>These bits indicate the number of times the carrier was lost during data transmission. |

## 21.3.18 ETNAnCEFCRm — CRC Error Frame Receive Counter Register m

ETNAnCEFCRm is a 16-bit counter that indicates the number of times a frame with a CRC error was received. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to CEFCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnCEFCR0: <ETNAn_base> + $0740_H$
ETNAnCEFCR1: <ETNAn_base> + $1740_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 21.26 ETNAnCEFCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | CEFCm[15:0] | CRC Error Frame Count<br>These bits indicate the number of CRC error frames received. |

### 21.3.19 ETNAnFRECRm — Frame Receive Error Counter Register m

ETNAnFRECRm is a 16-bit counter that indicates the number of frames for which a receive error was generated by the signal ETNAmRXER input from the PHY-LSI. ETNAnFRECRm is incremented each time the signal ETNAmRXER becomes active. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to FRECm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnFRECR0: <ETNAn_base> + $0748_H$
ETNAnFRECR1: <ETNAn_base> + $1748_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | FRECm[15:0] | Frame Receive Error Count<br>These bits indicate the number of errors during frame reception. |

## 21.3.20 ETNAnTSFRCRm — Too-Short Frame Receive Counter Register m

ETNAnTSFRCRm is a 16-bit counter that indicates the number of frames received with a length fewer than 64 bytes. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to TSFCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSFRCR0: <ETNAn_base> + $0750_H$
ETNAnTSFRCR1: <ETNAn_base> + $1750_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.28 ETNAnTSFRCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | TSFCm[15:0] | Too-Short Frame Receive Count<br>These bits indicate the number of frames received with a length of less than 64 bytes. |

### 21.3.21 ETNAnTLFRCRm — Too-Long Frame Receive Counter Register m

ETNAnTLFRCRm is a 16-bit counter that indicates the number of frames received with a length exceeding the value specified by the receive frame length register (ETNAnRFLRm). When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is not incremented when a frame containing residual bits is received. In this case, the reception of the frame is indicated in the residual-bit frame receive counter register (ETNAnRFCRm). This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to TLFCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTLFRCR0: <ETNAn_base> + $0758_H$
ETNAnTLFRCR1: <ETNAn_base> + $1758_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | TLFCm[15:0] | Too-Long Frame Receive Count<br>These bits indicate the number of frames received with a length exceeding the value in ETNAnRFLRm. |

## 21.3.22 ETNAnRFCRm — Residual-Bit Frame Receive Counter Register m

ETNAnRFCRm is a 16-bit counter that indicates the number of frames received containing residual bits (less than an 8-bit unit). When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to RFCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRFCR0: <ETNAn_base> + $0760_H$
ETNAnRFCR1: <ETNAn_base> + $1760_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | RFCm[15:0] | Residual-Bit Frame Receive Count<br>These bits indicate the number of frames received containing residual bits. |

### 21.3.23 ETNAnMAFCRm — Multicast Address Frame Receive Counter Register m

ETNAnMAFCRm is a 16-bit counter that indicates the number of frames received with a specified multicast address. When the value in this register reaches 0000 $FFFF_H$, count-up is halted. This register is cleared to 0 when it is read with the TRCCMm bit in ETNAnECMRm set to 1. When the TRCCMm bit in ETNAnECMRm is 0, this register is cleared to 0 by writing any value to MAFCm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnMAFCR0: <ETNAn_base> + $0778_H$
ETNAnMAFCR1: <ETNAn_base> + $1778_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 15 to 0 | MAFCm[15:0] | Multicast Address Frame Count<br>These bits indicate the number of multicast frames received. |

### 21.3.24 ETNAnAPRm — Automatic PAUSE Frame Register m

ETNAnAPRm is used to set the TIME parameter value of an automatic PAUSE frame. When an automatic PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnAPR0: <ETNAn_base> + $0554_H$
ETNAnAPR1: <ETNAn_base> + $1554_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | APm[15:0] | Automatic PAUSE<br>These bits set the TIME parameter value of an automatic PAUSE frame. One bit is equivalent to 512 bit-time.<br>When flow control is enabled in transmission (PAUSE frame transmission) (TXFm bit in ETNAnECMRm = 1), set a value other than $0000_H$ in these bits.<br>$0000_H$: —<br>$0001_H$: 512 × 1 bit-time<br>$0002_H$: 512 × 2 bit-time<br>: :<br>$FFFF_H$: 512 × 65,535 bit-time<br>Note: The bit-time becomes as follows according to the transfer speed.<br>100 Mbps: 1 bit-time = 10 ns<br>10 Mbps: 1 bit-time = 100 ns |

## 21.3.25 ETNAnMPRm — Manual PAUSE Frame Register m

ETNAnMPRm is used to set the TIME parameter value of a manual PAUSE frame. When writing the Timer value to this register, manual PAUSE frame transmission is started. When a manual PAUSE frame is transmitted, the value set in this register is used as the TIME parameter of the PAUSE frame.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnMPR0: <ETNAn_base> + $0558_H$
ETNAnMPR1: <ETNAn_base> + $1558_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

### 21.3.26 ETNAnTPAUSERm — Automatic PAUSE Frame Retransmit Count Register m

ETNAnTPAUSERm is used to set the upper limit for the number of times to retransmit an automatic PAUSE frame. The settings in this register must not be changed while the transmitting function is enabled.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTPAUSER0: <ETNAn_base> + $0564_H$
ETNAnTPAUSER1: <ETNAn_base> + $1564_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.27 ETNAnTPFRCRm — Automatic PAUSE Frame Retransmit Counter Register m

ETNAnTPFRCRm is a 16-bit counter that indicates the number of times to retransmit an automatic PAUSE frame. This register is cleared to 0 when it is read or the E-HDMAC entered busy condition.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTPFRCR0: <ETNAn_base> + $0568_H$
ETNAnTPFRCR1: <ETNAn_base> + $1568_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. |
| 15 to 0 | PFRTCm[15:0] | Pause Frame Retry Counter<br>The number of times to retransmit an automatic PAUSE frame between the start of a busy condition and its end. |

## 21.3.28 ETNAnPFTCRm — PAUSE Frame Transmit Counter Register m

ETNAnPFTCRm is a 16-bit counter that indicates the number of times a PAUSE frame is transmitted. This register is cleared to 0 when it is read.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnPFTCR0: <ETNAn_base> + $055C_H$
ETNAnPFTCR1: <ETNAn_base> + $155C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.36 ETNAnPFTCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. |
| 15 to 0 | PFTXCm[15:0] | PAUSE Frame Transmit Count<br>These bits indicate the total number of automatic PAUSE frames and manual PAUSE frames transmitted. |

## 21.3.29 ETNAnPFRCRm — PAUSE Frame Receive Counter Register m

ETNAnPFRCRm is a 16-bit counter that indicates the number of times a PAUSE frame is received. This register is cleared to 0 when it is read.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnPFRCR0: <ETNAn_base> + $0560_H$
ETNAnPFRCR1: <ETNAn_base> + $1560_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. |
| 15 to 0 | PFRXCm[15:0] | PAUSE Frame Receive Count<br>These bits indicate the number of PAUSE frames received when flow control is enabled in reception (RXFm bit in ETNAnECMRm = 1). |

## 21.3.30 ETNAnEMRm — ETNA Mode Register m

ETNAnEMRm is used to set the operating mode of the ETNA.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEMR0: <ETNAn_base> + $05B0_H$
ETNAnEMR1: <ETNAn_base> + $15B0_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 1, 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

### 21.3.31 ETNAnBCFRRm — Broadcast Frame Receive Count Set Register m

ETNAnBCFRRm is a register that sets the number of times broadcast frames are received consecutively.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnBCFRR0: <ETNAn_base> + $056C_H$
ETNAnBCFRR1: <ETNAn_base> + $156C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.39 ETNAnBCFRRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | BCFm[15:0] | Consecutive Broadcast Frame Reception Count Setting<br>ETNA can receive frames with the broadcast address consecutively until the number of receptions reaches the value set in these bits. If the number of consecutive broadcast frame reception exceeds BCFm configuration, the subsequent broadcast frames are discarded.<br>$0000_H$: No limitation on the number of receptions<br>$0001_H$: Receive one frame<br>: :<br>$FFFF_H$: Receive 65535 frames |

## 21.3.32 ETNAnCRBCFRRm — Count Reset of BCFRR m

ETNAnCRBCFRRm counts the number of times that consecutive broadcast frame reception exceeds the times defined by ETNAnBCFRRm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnCRBCFRR0: <ETNAn_base> + $0570_H$
ETNAnCRBCFRR1: <ETNAn_base> + $1570_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 21.40 ETNAnCRBCFRRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | CNTm[15:0] | Reset number counter of ETNAnBCFRRm<br>CNTm is incremented only when the number of times that consecutive broadcast frame reception exceeds ETNAnBCFRRm configuration. If CNTm become $FFFF_H$, count-up is halted.<br>In case the final reception frame is the broadcast frame, CNTm is not incremented until non broadcast frame is received. |

### 21.3.33 ETNAnTSU_CTRST — TSU Counter Reset Register

ETNAnTSU_CTRST clears the transmit and receive frame counters to 0.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_CTRST: <ETNAn_base> + $0804_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.41 ETNAnTSU_CTRST register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 8 | CTRST | TSU Counter Reset<br>When 1 is written to this bit, the values of registers ETNAnTXNLCR0/ ETNAnTXNLCR1, ETNAnTXALCR0/ETNAnTXALCR1, ETNAnRXNLCR0/ ETNAnRXNLCR1, ETNAnRXALCR0/ETNAnRXALCR1 are cleared to 0. Writing 0 does not affect this bit. This bit is always read as 0. |
| 7 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

## 21.3.34 ETNAnTSU_FWSLm — Receive Function Set Register

ETNAnTSU_FWSLm sets the processing method of each frame in port m reception.
This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_FWSL0: <ETNAn_base> + $0830_H$
ETNAnTSU_FWSL1: <ETNAn_base> + $0834_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| SA (source address) is not existed in the entry table | | Received |

### 21.3.35 ETNAnTSU_FWSLC — TSU Function Set Register (Common)

When the CAM is used, the referred area in the CAM entry table (partially or wholly) can be specified by the ETNAnTSU_POST1 to ETNAnTSU_POST4 registers. ETNAnTSU_FWSLC enables settings by the ETNAnTSU_POST1 to ETNAnTSU_POST4 registers. This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_FWSLC: <ETNAn_base> + $0838_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.43 ETNAnTSU_FWSLC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 13 | POSTENU | Enables the settings of the POST field of CAM entry tables 0 to 15 (settings by the ETNAnTSU_POST1 and ETNAnTSU_POST2 registers).<br>0: Disables the settings of the POST field. (The CAM entry table is referred to only in port 0 reception.)<br>1: Enables the settings of the POST field. (The CAM entry table reference conditions follow the POST field settings.) |
| 12 | POSTENL | Enables the settings of the POST field of CAM entry tables 16 to 31 (settings by the ETNAnTSU_POST3 and ETNAnTSU_POST4 registers).<br>0: Disables the settings of the POST field. (The CAM entry table is referred to only in port 1 reception.)<br>1: Enables the settings of the POST field. (The CAM entry table reference conditions follow the POST field settings.) |
| 11 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

## 21.3.36 ETNAnTSU_FWSR — TSU Status Register

ETNAnTSU_FWSR is a 32-bit readable/writable register that indicates the status during TSU operations.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_FWSR: <ETNAn_base> + $0850_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 16 | RINT10 | MAC0 CRC Error Frame Receive<br>Set to 1 when a receive frame results in a CRC error in the MAC0. |
| 15 to 5 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 4 | RINT51 | MAC1 Residual-Bit Frame Receive<br>Set to 1 when a frame containing residual bits (less than an 8-bit unit) is received in the MAC1. |
| 3 | RINT41 | MAC1 Too-Long Frame Receive<br>Set to 1 when a frame exceeding the value set by ETNAnRFLR1 is received in the MAC1. |
| 2 | RINT31 | MAC1 Too-Short Frame Receive<br>Set to 1 when a frame with a length of less than 64 bytes is received in the MAC1. |
| 1 | RINT21 | MAC1 Frame Receive Error<br>Set to 1 when a receive error is detected on the signal RX_ER from the PHY-LSI (ETNAmRXER) in the MAC1. |
| 0 | RINT11 | MAC1 CRC Error Frame Receive<br>Set to 1 when a receive frame results in a CRC error in the MAC1. |

## 21.3.37 ETNAnTSU_FWINMK — TSU Status Interrupt Mask Register

ETNAnTSU_FWINMK is a 32-bit readable/writable register that sets the interrupt mask for status bits in ETNAnTSU_FWSR.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_FWINMK: <ETNAn_base> + $0854_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.38 ETNAnTSU_VTAGm — VLANtag Set Register

ETNAnTSU_VTAGm enables or disables the frame receive/discard evaluation function based on the VLAN number in port m receive operations, and also sets the VLAN number. This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_VTAG0: <ETNAn_base> + $0858_H$
ETNAnTSU_VTAG1: <ETNAn_base> + $085C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.39 ETNAnTSU_ADSBSY — CAM Entry Table Busy Register

When CAM entry table registers (ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31) are set by register writing, the ADSBSY bit in this register is set to 1 (when the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, the ADSBSY bit is automatically restored to 0).

Access to ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31 is prohibited, while the ADSBSY bit in this register is set to 1. This register is a read-only status register, which must not be written to.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnTSU_ADSBSY: <ETNAn_base> + $0860_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is read. |
| 0 | ADSBSY | CAM Entry Table Setting Busy<br>When ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31 are set by register writing during the MAC0/1 are receiving any frame, this bit is set to 1. When the process of reflecting the contents of the CAM entry table registers in the CAM controller is completed inside the TSU, this bit is automatically restored to 0. Access to ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31 is prohibited, while this bit is set to 1. Writing to this register is also prohibited. |

## 21.3.40 ETNAnTSU_TEN — CAM Entry Table Enable Register

ETNAnTSU_TEN enables or disables the settings of ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_TEN: <ETNAn_base> + $0864_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.41 ETNAnTSU_POST1 — CAM Entry Table POST1 Register

When using the CAM, the conditions for referring to each CAM entry table can be specified by using the ETNAnTSU_POST1 to ETNAnTSU_POST4 registers. ETNAnTSU_POST1 specifies the conditions for referring to ETNAnTSU_ADRH0 to ETNAnTSU_ADRH7 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL7. The settings of this register are valid when the POSTENU bit in ETNAnTSU_FWSLC is set to 1.

This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_POST1: <ETNAn_base> + $0870_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.42 ETNAnTSU_POST2 — CAM Entry Table POST2 Register

When using the CAM, the conditions for referring to each CAM entry table can be specified by using the ETNAnTSU_POST1 to ETNAnTSU_POST4 registers. ETNAnTSU_POST2 specifies the conditions for referring to ETNAnTSU_ADRH8 to ETNAnTSU_ADRH15 and ETNAnTSU_ADRL8 to ETNAnTSU_ADRL15. The settings of this register are valid when the POSTENU bit in ETNAnTSU_FWSLC is set to 1.

This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_POST2: <ETNAn_base> + $0874_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.43 ETNAnTSU_POST3 — CAM Entry Table POST3 Register

When using the CAM, the conditions for referring to each CAM entry table can be specified by using the ETNAnTSU_POST1 to ETNAnTSU_POST4 registers. ETNAnTSU_POST3 specifies the conditions for referring to ETNAnTSU_ADRH16 to ETNAnTSU_ADRH23 and ETNAnTSU_ADRL16 to ETNAnTSU_ADRL23. The settings of this register are valid when the POSTENL bit in ETNAnTSU_FWSLC is set to 1.

This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_POST3: <ETNAn_base> + $0878_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.44 ETNAnTSU_POST4 — CAM Entry Table POST4 Register

When using the CAM, the conditions for referring to each CAM entry table can be specified by using the ETNAnTSU_POST1 to ETNAnTSU_POST4 registers. ETNAnTSU_POST4 specifies the conditions for referring to ETNAnTSU_ADRH24 to ETNAnTSU_ADRH31 and ETNAnTSU_ADRL24 to ETNAnTSU_ADRL31. The settings of this register are valid when the POSTENL bit in ETNAnTSU_FWSLC is set to 1.

This register setting must not be changed while the transmitting and receiving functions are enabled. Return the MACm and E-DMACm to their initial states by means of the SWRTm and SWRRm bits in ETNAnEDMRm before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTSU_POST4: <ETNAn_base> + $087C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.45 ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 — CAM Entry Table 0H to 31H Registers

ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31 are entry tables referred to by the CAM in reception. Each of these registers sets the upper 32 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered. The CAM entry rable setting must not be changed while the transmitting and receiving functions are enabled. ETNAnTSU_ADRHm is written at the same time with ETNAnTSU_ADRLm writing which is given after ETNAnTSU_ADRHm writing.

**Access:** This register can be read/written in 32-bit units.

**Address:**

| | |
|---|---|
| ETNAnTSU_ADRH0: <ETNAn_base> + $0900_H$ | ETNAnTSU_ADRH1: <ETNAn_base> + $0908_H$ |

| 31 to 0 | ADRH i [31:0]<br>(i: 0 to 31) | MAC Address Bits<br>These bits set the upper 32 bits of the MAC address.<br>When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set $01234567_H$ in this register. |

**Note:** Set the CAM entry tables following the procedure below.
1. Check that the ADSBSY bit in ETNAnTSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31.

## 21.3.46 ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31 — CAM Entry Table 0L to 31L Registers

ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31 are entry tables referred to by the CAM in reception. Each of these registers sets the lower 16 bits of the 48-bit MAC address. Maximum 32 entries of MAC addresses can be registered. The CAM entry table setting must not be changed while the transmitting and receiving functions are enabled.

**Access:** This register can be read/written in 32-bit units.

**Address:**

| | |
|---|---|
| ETNAnTSU_ADRL0: <ETNAn_base> + $0904_H$ | ETNAnTSU_ADRL1: <ETNAn_base> + $090C_H$ |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 15 to 0 | ADRL i[15:0]<br>(i = 0 to 31) | MAC Address Bits<br>These bits set the lower 16 bits of the MAC address.<br>When the MAC address is 01-23-45-67-89-AB (displayed in hexadecimal), set $0000\ 89AB_H$ in this register. |

**Note:** Set the CAM entry tables following the procedure below.
1. Check that the ADSBSY bit in ETNAnTSU_ADSBSY is cleared to 0.
2. Set the upper 32 bits of the MAC addresses by ETNAnTSU_ADRH0 to ETNAnTSU_ADRH31.
3. Set the lower 16 bits of the MAC addresses by ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31.

### 21.3.47 ETNAnTXNLCRm — Transmit Frame Counter Register (Port m) (Normal Transmission Only)

ETNAnTXNLCRm is a 32-bit counter indicating the number of frames successfully transmitted in the MACm. When the value in this register reaches FFFF $FFFF_H$, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnTXNLCR0: <ETNAn_base> + $0880_H$
ETNAnTXNLCR1: <ETNAn_base> + $08A0_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

### 21.3.48 ETNAnTXALCRm — Transmit Frame Counter Register (Port m) (Normal and Erroneous Transmission)

ETNAnTXALCRm is a 32-bit counter indicating the number of frames transmitted in the MACm, including the number of frames erroneously transmitted. When the value in this register reaches FFFF FFFF$_H$, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnTXALCR0: <ETNAn_base> + 0884$_H$
ETNAnTXALCR1: <ETNAn_base> + 08A4$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 21.3.49 ETNAnRXNLCRm — Receive Frame Counter Register (Port m) (Normal Reception Only)

ETNAnRXNLCRm is a 32-bit counter indicating the number of frames successfully received in the MACm. When the value in this register reaches FFFF $FFFF_H$, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to. If a frame is discarded in the TSU block by the comparison with the CAM entry, it is not counted.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnRXNLCR0: <ETNAn_base> + $0888_H$
ETNAnRXNLCR1: <ETNAn_base> + $08A8_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

### 21.3.50 ETNAnRXALCRm — Receive Frame Counter Register (Port m) (Normal and Erroneous Reception)

ETNAnRXALCRm is a 32-bit counter indicating the number of frames received in the MACm, including the number of frames erroneously received. When the value in this register reaches FFFF $FFFF_H$, count-up is halted. The counter is cleared to 0 by reading from this register. This register cannot be written to. If a frame is discarded in the TSU block by the comparison with the CAM entry, it is not counted.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnRXALCR0: <ETNAn_base> + $088C_H$
ETNAnRXALCR1: <ETNAn_base> + $08AC_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.51 ETNAnEDSRm — E-DMAC Start Register m

ETNAnEDSRm specifies activation of the transmitting unit and receiving unit of the E-DMACm. ENTm and ENRm can only be written to 1. The method to clear ENTm and ENRm is reset only.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEDSR0: <ETNAn_base> + $0000_H$
ETNAnEDSR1: <ETNAn_base> + $1000_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

### 21.3.52 ETNAnEDMRm — E-DMAC Mode Register m

ETNAnEDMRm is a 32-bit readable/writable register that specifies E-DMACm resetting and the transmit/receive descriptor length. This register is to be set before the transmitting or receiving function is enabled (before the TRm[1:0] bit in ETNAnEDTRRm or the RRm bit in ETNAnEDRRRm is set to 1). However, the SWRRm and SWRTm bits can be written to even after the transmitting or receiving function is enabled. If a software reset is executed with this register during data transmission, abnormal data may be transmitted on the line. Execute a software reset with this register before specifying the transmit/receive descriptor length or modifying the settings of ETNAnTDLARm, ETNAnRDLARm, and so forth, the setting of ETNAnECMRm (MACm mode register), and the settings of registers related to the E-DMACm and MACm operation.

To execute a software reset with this register, 1 must be written to both the SWRTm and SWRRm bits simultaneously. Writing 1 to the SWRTm and SWRRm bits initializes the MACm registers and E-DMACm registers, except for ETNAnTDLARm, ETNAnRDLARm, and ETNAnRMFCRm of the E-DMACm. The TSU registers (registers whose names are prefixed with ETNAnTSU_) are not initialized. Writing 1 to the SWRTm and SWRRm bits in ETNAnEDMRm initializes the registers related to the E-DMACm and MACm, whereas, writing 1 to the SWRTm and SWRRm bits in ETNAnEDMRm initializes the registers related to the E-DMACm and MACm. Note that during the period a software reset is issued (for 1200 cycles of the HCLK), accesses to all Ethernet-related registers are prohibited.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEDMR0: <ETNAn_base> + $0400_H$
ETNAnEDMR1: <ETNAn_base> + $1400_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.53 ETNAnEDTRRm — E-DMACm Transmit Request Register m

ETNAnEDTRRm is a 32-bit readable/writable register that issues transmit directives to the E-DMACm. After writing 11 to bits TRm[1:0] in this register, the E-DMACm reads the transmit descriptor at the address specified by ETNAnTDLARm. If the TACT bit of this transmit descriptor is set to 1 (valid), transmit DMA transfer by the E-DMACm starts. When DMA transfer based on the first transmit descriptor is completed, the E-DMACm reads the next transmit descriptor. If the TACT bit of that transmit descriptor is set to 1 (valid), the E-DMACm continues transmit DMA operation. If the TACT bit of a transmit descriptor is cleared to 0 (invalid), the E-DMACm clears bits TRm[1:0] and stops transmit DMA operation.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEDTRR0: <ETNAn_base> + $0408_H$
ETNAnEDTRR1: <ETNAn_base> + $1408_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1, 0 | TRm[1:0] | Transmit Request<br>00, 01, 10: Transmission-halted state<br>If 00, 01, or 10 is written to these bits, the E-DMACm stops DMA transfer of the currently processed transmit descriptor, reads the next transmit descriptor, and then clears these bits. (Write-back is completed for the valid transmit descriptors that have been detected up till then.)<br>The E-DMACm clears these bits when transmit descriptor empty occurs, or transmission of a transmit descriptor has completed. (Write-back is completed for the valid transmit descriptors that have been detected up till then.)<br>11: Transmit DMA operation by E-DMACm<br>After writing 11 to these bits, the E-DMACm starts reading a transmit descriptor. |

## 21.3.54 ETNAnEDRRRm — E-DMACm Receive Request Register m

ETNAnEDRRRm is a 32-bit readable/writable register that issues receive directives to the E-DMACm. After writing 1 to the RRm bit in this register, the E-DMACm reads the receive descriptor at the address specified by ETNAnRDLARm. If the RACT bit of this receive descriptor is set to 1 (valid), and the receive FIFO holds a receive frame, the E-DMACm starts receive DMA transfer. When DMA transfer based on the first receive descriptor is completed, the E-DMACm reads the next receive descriptor. If the RACT bit of that receive descriptor is set to 1 (valid), the E-DMACm continues receive DMA operation. However, if the receive FIFO holds no receive data, the E-DMACm places receive DMA operation in the standby state. If the RACT bit of the receive descriptor is cleared to 0 (invalid), the E-DMACm clears the RRm bit and stops receive DMAC operation.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEDRRR0: <ETNAn_base> + $0410_H$
ETNAnEDRRR1: <ETNAn_base> + $1410_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RRm |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 21.62 ETNAnEDTRRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | RRm | Receive Request<br>0: Receiving function is disabled[*1]<br>If 0 is written to this bit, the E-DMACm stops receive operation after DMA transfer of one frame has completed and then clears this bit.<br>The E-DMACm clears this bit when receive descriptor empty occurs.<br>1: Receive descriptor is read, and the E-DMACm is ready to receive |

Note 1. If the receiving function is disabled during frame reception, write-back is not performed successfully to the receive descriptor. Following pointers to read a receive descriptor become abnormal and the E-DMACm cannot operate successfully. In this case, to make E-DMACm reception enabled again, execute a software reset by the SWRTm and SWRRm bits in ETNAnEDMRm. To disable the E-DMACm receiving function without executing a software reset, specify the REm bit in ETNAnECMRm. Next, after the E-DMACm has completed the reception and write-back to the receive descriptor has been confirmed, disable the receiving function using this register.

## 21.3.55 ETNAnTDLARm — Transmit Descriptor List Start Address Register m

ETNAnTDLARm is a 32-bit readable/writable register that specifies the start address of the transmit descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DLm[1:0] bits in ETNAnEDMRm. This register must not be modified during transmission. Modifications to this register should only be made in the transmission-halted state specified by bits TRm[1:0] (= 00) in the E-DMACm transmit request register (ETNAnEDTRRm).

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTDLAR0: <ETNAn_base> + $0010_H$
ETNAnTDLAR1: <ETNAn_base> + $1010_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 21.3.56 ETNAnRDLARm — Receive Descriptor List Start Address Register m

ETNAnRDLARm is a 32-bit readable/writable register that specifies the start address of the receive descriptor list. Descriptors have a boundary configuration in accordance with the descriptor length indicated by the DLm[1:0] bits in ETNAnEDMRm. This register must not be modified during reception. Modifications to this register should only be made while reception is disabled by the RRm bit (= 0) in the E-DMACm receive request register (ETNAnEDRRRm).

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRDLAR0: <ETNAn_base> + $0030_H$
ETNAnRDLAR1: <ETNAn_base> + $1030_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.57 ETNAnEESRm — E-MAC/E-DMAC Status Register m

ETNAnEESRm is a 32-bit readable/writable register that shows communications status information on the E-DMACm in combination with the MACm. The information in this register is reported in the form of interrupt sources. Individual bits are cleared by writing 1 (however, bit 22 (ECIm) is a read-only bit that is not cleared by writing 1) and are not affected by writing 0. Each interrupt source can also be masked by means of the corresponding bit in the MACm/E-DMAC status interrupt permission register (ETNAnEESIPRm).

The interrupts generated by this status register are HINT_0 for port 0 and HINT_1 for port 1. For interrupt priorities, see **Section 6, Interrupt Controller (INTC).**

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEESR0: <ETNAn_base> + $0428_H$
ETNAnEESR1: <ETNAn_base> + $1428_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.65 ETNAnEESRm register contents (1/3)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | TWBm[1:0] | Write-Back Complete<br>Indicates that write-back from the E-DMACm to the corresponding descriptor after frame transmission has completed. This operation is enabled only when the TWBI bit in the transmit descriptor that includes the end of the transmit frame is set to 1.<br>00: Write-back has not completed, or no transmission directive<br>11: Write-back has completed<br>Others: Setting disabled |
| 29 | TCm[1] | Frame Transmission Complete<br>Indicates, in combination with the TCm[0] bit, that all the data specified by the transmit descriptor has been transmitted from the MACm. This bit is set to 1 on assuming the completion of transmission. This is when transmission of one frame is completed and the transmit descriptor valid bit (TACT) of the next transmit descriptor not being set in single-frame/single-descriptor operation or when the last data of a frame has been transmitted and the transmit descriptor valid bit (TACT) of the next descriptor not being set in multi-buffer frame processing based on single-frame/multi-descriptor operation. After frame transmission has completed, the E-DMACm writes the transmission status back to the relevant descriptor.<br>TCm[1:0]<br>00: Transmission has not completed, or no transmission directive<br>11: Transmission has completed<br>Others: Setting disabled |
| 28 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 27 | ROCm | Receive Overflow Frame Write-Back Complete<br>0: Write-back has not completed for the frame causing receive overflow<br>1: Write-back has completed for the frame causing receive overflow |

Table 21.65 ETNAnEESRm register contents (2/3)

| Bit Position | Bit Name | Function |
|---|---|---|
| 26 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 25 | RABTm | Receive Abort Detect<br>Indicates that the MACm aborts receiving a frame because of failures during frame reception.<br>0: Frame reception has not been aborted or no reception directive<br>1: Frame reception has been aborted |
| 24 | RFCOFm | Receive Frame Counter Overflow<br>Indicates that the frame counter in the receive FIFO has overflowed.<br>0: Receive frame counter has not overflowed<br>1: Receive frame counter has overflowed |
| 23 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 22 | ECIm | MACm Status Register Source<br>This bit is a read-only bit. When the source of an ETNAnECSRm interrupt is cleared, this bit is also cleared.<br>0: MACm status interrupt source has not been detected<br>1: MACm status interrupt source has been detected |
| 21 | TCm[0] | Frame Transmission Complete<br>Indicates, in combination with the TCm[1] bit, that all the data specified by the transmit descriptor has been transmitted from the MACm. For details, see the description of the TCm[1] bit. |
| 20 | TDEm | Transmit Descriptor Empty<br>Indicates that the transmit descriptor valid bit (TACT) of a transmit descriptor read by the E-DMACm is not set if the previous descriptor does not represent the end of a frame in multi-buffer frame processing based on single-frame/multi-descriptor operation. As a result, an incomplete frame may be sent.<br>0: Transmit descriptor active bit TACT = 1 detected<br>1: Transmit descriptor active bit TACT = 0 detected<br>When transmit descriptor empty (TDE = 1) occurs, execute a software reset and initiate transmission. In this case, transmission starts from the address that is stored in the transmit descriptor list start address register (ETNAnTDLARm). |
| 19 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 18 | FRm | Frame Reception<br>Indicates that a frame has been received and the receive descriptor has been updated. This bit is set to 1 each time a frame is received.<br>0: Frame has not been received<br>1: Frame has been received |
| 17 | RDEm | Receive Descriptor Empty<br>Indicates that the RACT bit of a receive descriptor read by the E-DMACm for receive DMA operation is cleared to 0 (invalid).<br>When receive descriptor empty (RDE = 1) occurs, reception can be resumed by setting the RACT bit (cleared to 0) of the receive descriptor to 1 and then writing 1 to the RRm bit in ETNAnEDRRRm.<br>0: Receive descriptor active bit RACT = 1 detected<br>1: Receive descriptor active bit RACT = 0 detected |
| 16 | RFOFm | Receive FIFO Overflow<br>Indicates that the receive FIFO has overflowed during frame reception.<br>0: Overflow has not occurred<br>1: Overflow has occurred |
| 15 to 11 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 10 | DLCm | Detect Loss of Carrier<br>Indicates that loss of the carrier has been detected during frame transmission.<br>0: Loss of carrier has not been detected<br>1: Loss of carrier has been detected |

Table 21.65 ETNAnEESRm register contents (3/3)

| Bit Position | Bit Name | Function |
|---|---|---|
| 9 | CDm | Delayed Collision Detect<br>Indicates that a delayed collision has been detected during frame transmission.<br>0: Delayed collision has not been detected<br>1: Delayed collision has been detected |
| 8 | TROm | Transmit Retry Over<br>Indicates that a retry-over condition has occurred during frame transmission. Total 16 transmission retries including 15 retries based on the back-off algorithm have failed after the MACm transmission starts.<br>0: Transmit retry-over condition not detected<br>1: Transmit retry-over condition detected |
| 7 | RMAFm | Receive Multicast Address Frame<br>0: Multicast address frame has not been received<br>1: Multicast address frame has been received |
| 6, 5 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 4 | RRFm | Receive Residual-Bit Frame<br>0: Residual-bit frame has not been received<br>1: Residual-bit frame has been received |
| 3 | RTLFm | Receive Too-Long Frame<br>Indicates that a frame whose byte size exceeds the upper limit for the receive frame length set by ETNAnRFLRm has been received.<br>0: Too-long frame has not been received<br>1: Too-long frame has been received |
| 2 | RTSFm | Receive Too-Short Frame<br>Indicates that a frame of fewer than 64 bytes has been received.<br>0: Too-short frame has not been received<br>1: Too-short frame has been received |
| 1 | PREm | PHY-LSI Receive Error(ETNAmRXER)<br>0: PHY-LSI receive error or carrier extension error has not been detected<br>1: PHY-LSI receive error or carrier extension error has been detected |

## 21.3.58 ETNAnEESIPRm — E-MAC/E-DMAC Status Interrupt Permission Register m

ETNAnEESIPRm is a 32-bit readable/writable register that enables interrupts corresponding to individual bits in the MACm/E-DMACm status register (ETNAnEESRm) in combination with HDIEm bit in ETNAnHDMIERm. An interrupt is enabled by writing 1 to the corresponding bit.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnEESIPR0: <ETNAn_base> + $0430_H$
ETNAnEESIPR1: <ETNAn_base> + $1430_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.59 ETNAnTRSCERm — Transmit/Receive Status Copy Enable Register m

ETNAnTRSCERm specifies whether the information for the transmit and receive state reported by bits 25, and 7 and 4 to 0 in the MACm/E-DMACm status register (ETNAnEESRm) is to be reflected in the RFE bit of the corresponding descriptor. The bits in this register correspond to bits 25, 7 and bit 4 to 0 in ETNAnEESRm. When a bit is cleared to 0, and the receive status (bits 25, 7 and 5 to 0 in ETNAnEESRm) is reflected in the RFE bit of the receive descriptor. In this case, the state of a status bit set to 1 is reflected as the RFE bit set to 1. When a bit is set to 1, the occurrence of the corresponding source is not reflected in the descriptor. After this Ethernet module is reset, all bits are cleared to 0.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTRSCER0: <ETNAn_base> + $0438_H$
ETNAnTRSCER1: <ETNAn_base> + $1438_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.60 ETNAnRMFCRm — Receive Missed-Frame Counter Register m

ETNAnRMFCRm is a 16-bit counter that indicates the number of frames that could not be saved in the receive buffer and so were discarded during reception. When the receive FIFO overflows, the receive frames in the FIFO are discarded. The number of frames discarded at this time is counted. When the value in this register reaches $FFFF_H$, count-up is halted. Clear the counter by writing $0000_H$ in this register.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRMFCR0: <ETNAn_base> + $0440_H$
ETNAnRMFCR1: <ETNAn_base> + $1440_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

| 15 to 0 | MFCm[15:0] | Missed-Frame Counter<br>These bits indicate the number of frames that are discarded and not transferred to the receive buffer during reception. |

## 21.3.61 ETNAnFDRm — FIFO Depth Register m

ETNAnFDRm is a 32-bit readable/writable register that specifies the sizes of the transmit and receive FIFOs.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnFDR0: <ETNAn_base> + $0450_H$
ETNAnFDR1: <ETNAn_base> + $1450_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.69 ETNAnFDRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 12 to 8 | TFDm[4:0] | Transmit FIFO Size<br>Specifies 256 bytes to 2 Kbytes in 256-byte units as the size of the transmit FIFO whose maximum size is 8 Kbytes. The setting must not be changed after transmission/reception has started.<br>$00_H$: 256 bytes<br>$01_H$: 512 bytes<br>: :<br>$07_H$: 2048 bytes<br>Settings from $08_H$ to $FF_H$ are prohibited. |
| 7 to 0 | RFDm[7:0] | Receive FIFO Size<br>Specifies 256 bytes to 12 Kbytes in 256-byte units as the size of the receive FIFO whose maximum size is 64 Kbytes. The setting must not be changed after transmission/reception has started.<br>$00_H$: 256 bytes<br>$01_H$: 512 bytes<br>$02_H$: 768 bytes<br>$03_H$:1024 bytes<br>$04_H$: 1280 bytes<br>: :<br>$07_H$: 2048 bytes<br>Settings from $08_H$ to $FF_H$ are prohibited. |

**NOTE**

The transmit frame which has the size beyond TFDm configuration can not be transmitted. TFDm must be specified for the size larger than or equal to maximum frame size to transmit.

## 21.3.62 ETNAnRMCRm — Receiving Method Control Register m

ETNAnRMCRm is a 32-bit readable/writable register that specifies the control method for the REm bit in ETNAnECMRm while a frame is received. This register must be set during the receiving-halted state.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRMCR0: <ETNAn_base> + $0458_H$
ETNAnRMCR1: <ETNAn_base> + $1458_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 21.70 ETNAnRMCRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 0 | RNCm | Receive Enable Control<br>Sets whether to continue frame reception.<br>0: Upon completion of reception of one frame, the E-DMACm writes the receive status to the descriptor and clears the RRm bit in ETNAnEDRRRm to 0.<br>1: Upon completion of reception of one frame, the E-DMACm writes (writes back) the receive status to the descriptor. In addition, the E-DMACm reads the next descriptor and prepares for reception of the next frame. |

### 21.3.63 ETNAnRDFARm — Receive Descriptor Fetch Address Register m

ETNAnRDFARm stores the descriptor start address that is required when the E-DMACm fetches descriptor information from the receive descriptor. Which receive descriptor information is used for processing by the E-DMACm can be recognized by monitoring addresses displayed in this register. The address from which the E-DMACm is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the receive descriptor at which receive processing is to be started.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRDFAR0: <ETNAn_base> + $0034_H$
ETNAnRDFAR1: <ETNAn_base> + $1034_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 21.3.64 ETNAnRDFXRm — Receive Descriptor Finished Address Register m

ETNAnRDFXRm stores the start address of the receive descriptor for which the E-DMACm has just completed the write-back processing. Up to which receive descriptor has been processed by the E-DMACm can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the descriptor immediately before the descriptor that is pointed to by the address in ETNAnRDFARm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRDFXR0: <ETNAn_base> + $0038_H$
ETNAnRDFXR1: <ETNAn_base> + $1038_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

## 21.3.65 ETNAnRDFFRm — Receive Descriptor Final Flag Register m

ETNAnRDFFRm indicates whether the receive descriptor for which the E-DMACm has just completed the write-back processing and whose start address is stored in ETNAnRDFXRm is at the end of the receive descriptor queue (descriptor list).

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRDFFR0: <ETNAn_base> + $003C_H$
ETNAnRDFFR1: <ETNAn_base> + $103C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

### 21.3.66 ETNAnTDFARm — Transmit Descriptor Fetch Address Register m

ETNAnTDFARm stores the descriptor start address that is required when the E-DMACm fetches descriptor information from the transmit descriptor. Which transmit descriptor information is used for processing by the E-DMACm can be recognized by monitoring addresses displayed in this register. The address from which the E-DMACm is actually fetching a descriptor may be different from the value read from this register. In the initial setting, set the address of the transmit descriptor at which transmit processing is to be started.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTDFAR0: <ETNAn_base> + $0014_H$
ETNAnTDFAR1: <ETNAn_base> + $1014_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.67 ETNAnTDFXRm — Transmit Descriptor Finished Address Register m

ETNAnTDFXRm stores the start address of the transmit descriptor for which the E-DMACm has just completed the write-back processing. Up to which transmit descriptor has been processed by the E-DMACm can be recognized by monitoring addresses displayed in this register. In the initial setting, set the address of the transmit descriptor immediately before the descriptor that is pointed to by the address in ETNAnTDFARm.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnTDFXR0: <ETNAn_base> + $0018_H$
ETNAnTDFXR1: <ETNAn_base> + $1018_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.69 ETNAnFCFTRm — Overflow Alert FIFO Threshold Register m

ETNAnFCFTRm is a 32-bit readable/writable register that sets the flow control of the MACm. The threshold can be set by the size of the receive FIFO data (bits RFDm[7:0]) and the number of receive frames (bits RFFm[4:0]).

If the same receive FIFO size as set by the FIFO depth register (ETNAnFDRm) is set when flow control is turned on according to the RFDm setting condition, flow control is turned on with (FIFO data size – 64) bytes. For instance, when the RFDm bits in ETNAnFDRm = 7 and the RFSm bits in this register = 7, flow control is turned on when (2,048 to 64) bytes of data is stored in the receive FIFO. The value set in the RFSm bits in this register should be equal to or less than that set in the RFDm bits in ETNAnFDRm.

Flow control is turned on when either of the setting conditions of bits RFFm[4:0] and bits RFSm[7:0] is satisfied. Flow control is turned off when neither of the conditions is satisfied (release).

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnFCFTR0: <ETNAn_base> + $0468_H$
ETNAnFCFTR1: <ETNAn_base> + $1468_H$

**Value after reset:** 0017 $00FF_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 21.3.70 ETNAnTFSRm — Transmit FIFO Status Register m

ETNAnTFSRm is a 32-bit read only register that shows the status of the transmit FIFO.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnTFSR0: <ETNAn_base> + $0480_H$
ETNAnTFSR1: <ETNAn_base> + $1480_H$

**Value after reset:** $0200\ 0000_H$ This register is initialized by system reset.

## 21.3.71 ETNAnRFSRm — Receive FIFO Status Register m

ETNAnRFSRm is a 32-bit read only register that shows the status of the receive FIFO.

**Access:** This register can be read in 32-bit units.

**Address:** ETNAnRFSR0: <ETNAn_base> + $0488_H$
ETNAnRFSR1: <ETNAn_base> + $1488_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 8 to 0 | RDAMm | Receive FIFO used size |

## 21.3.72 ETNAnRPADIRm — Receive Data Padding Insert Register m

ETNAnRPADIRm is a 32-bit readable/writable register that inserts padding in receive data. When changing the settings of this register, execute a software reset by means of the SWRTm and SWRRm bits in the E-DMACm mode register (ETNAnEDMRm) before making settings again.

**Access:** This register can be read/written in 32-bit units.

**Address:** ETNAnRPADIR0: <ETNAn_base> + $0460_H$
ETNAnRPADIR1: <ETNAn_base> + $1460_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by system reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 21.80 ETNAnRPADIRm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 21 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 20 to 16 | PADSm[4:0] | Padding Size<br>$00_H$: No padding insertion<br>$01_H$: 1-byte insertion<br>: :<br>$1F_H$: 31-byte insertion |
| 15 to 0 | PADRm[15:0] | Padding Slot<br>$0000_H$: Inserts specified size of padding at the first byte<br>$0001_H$: Inserts specified size of padding at the second byte<br>: :<br>$FFFF_H$: Inserts specified size of padding at the 64K byte |

**NOTE**

When PADRm[15:0] is not $0000_H$, the sum of PADRm[1:0] and PADSm[1:0] must be $100_B$ or $000_B$

# 21.4 Operation

## 21.4.1 Limited Reset and Module Stop

As for this module, Limited Reset and Module Stop are possible.
After enforcement of Termination Procedure, please carry out Limited Reset and Module Stop.
There is no enforcement condition of Limited Reset and Module Stop if you carry out Termination Procedure.
See **Section 21.4.38** for Termination Procedure.

## 21.4.2 Basic Frame

The basic frame format defined in IEEE 802.3 consists of the preamble (PA), start frame delimiter (SFD), destination address (DA), source address (SA), type/length field (TYPE/LEN), data field (DATA) and frame check sequence field FCS).

The defined packet size is from 64 bytes (minimum) to 1518 bytes (maximum) excluding the PA and the SFD.

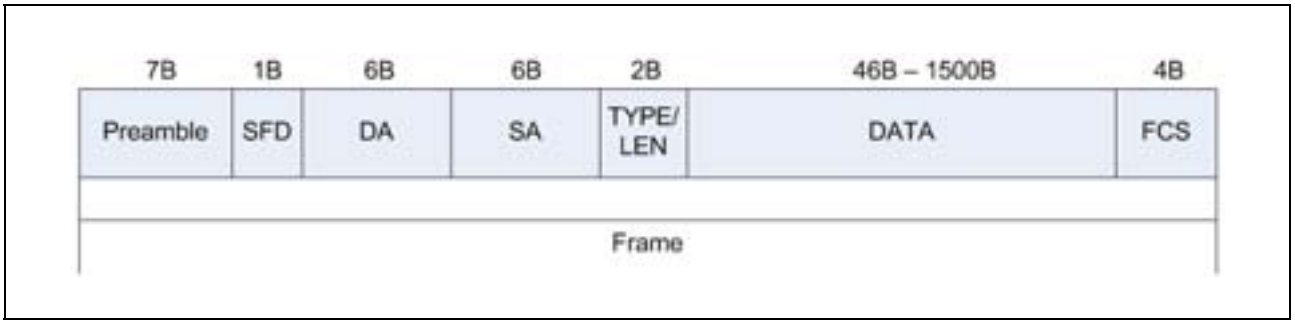

**Figure 21.2 Basic frame structure**

### (1) Preamble and SFD

The preamble and SFD fields consist of a repetition of "$10_B$" for 62 bits followed by "$11_B$" at the end. They represent the start of an Ethernet frame.

### (2) Destination address (DA)

The destination address field indicates the destination MAC address that may be a unicast address, a multicast address or a broadcast address.

### (3) Source address (SA)

The source address field contains the source MAC address.

### (4) Frame type and length (TYPE/LEN)

An Ethernet frame uses this field to specify the protocol type. An IEEE802.3 frame uses this field to indicate the length of the data field.

#### (5) Payload data (DATA)

The payload data field contains the data up to 1500 bytes. The Ethernet controller uses the data in this field for CRC (Cyclic Redundancy Check) calculation for the FCS.

#### (6) Frame check sequence (FCS)

The frame check sequence field is used to write a 32-bit CRC to check the payload data.

### 21.4.3 PAUSE Control Frame

A pause control frame contains 64-byte in a special format . The DA field is fixed to “01-80-C2-00-00-01H”. The Type/Length field contains “$8808_H$” which indicates a control frame. The OP code contains “$0001_H$” which indicates pause control. The parameter field is specified with the time parameter. The unused area following the parameter field is filled with PAD data consisting of zeros.

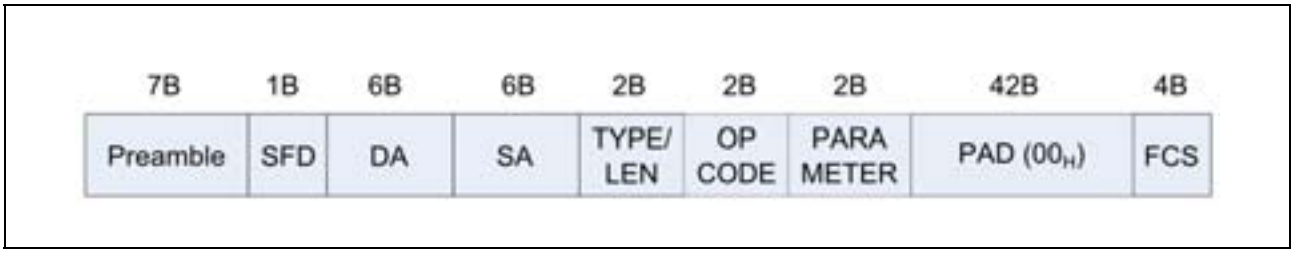

Figure 21.3 Pause control frame structure

### 21.4.4 Magic Packet™

The magic packet™ is a broadcast frame that contains anywhere in the payload 6 times “0xFF” followed by the MAC address of target device repeated 16 times.

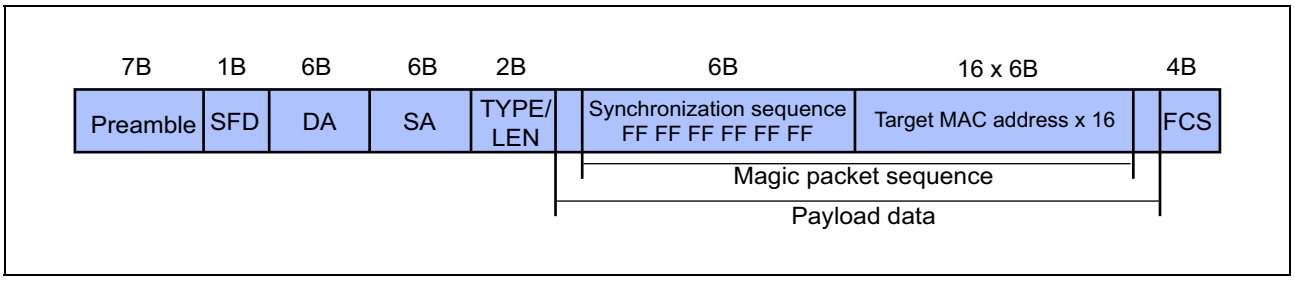

Figure 21.4 Magic packet structure

### 21.4.5 Transmission

The transmission function of the ETNA creates a frame as defined in IEEE802.3 from the data stored in the transmission FIFO through EDMAC transfer and outputs the frame to a PHY device. Upon collision detection, the frame is retransmitted using the back-off algorithm.

### 21.4.6 Transmission Clock

The transmission of ETNA is synchronized with the external transmission clock (ETHmTXCLK).

### 21.4.7 Collision Detection and Retransmission

In half-duplex mode, if a collision within the collision window (512 bits data) is detected before the maximum allowable number of collisions (default = 15) is not exceeded, the ETNA gets the transmission to wait using the random back-off algorithm and retransmits the data.

### 21.4.8 CRC Function

The CRC function generates a CRC code and appends it to the FCS field when ETNA is sending a frame.

### 21.4.9 Transmission Frame Data Padding Function

The specified minimal frame length is 64 bytes. If the data field in a frame is shorter than 46 bytes, padding data (0x00) is added to the data to meet the minimal frame size.

### 21.4.10 Full-/half-duplex Communication

The ETNA supports both full- and half-duplex communication modes. In full-duplex mode, the carrier (CRS) and collisions (COL) are not detected.

### 21.4.11 Inter-packet Gap (IPG)

The inter-packet gap (prescribed in IEEE802.3 standard) between transmit frames can be changed. When changing the IPG setting, adequately check that the respective devices can operate smoothly.

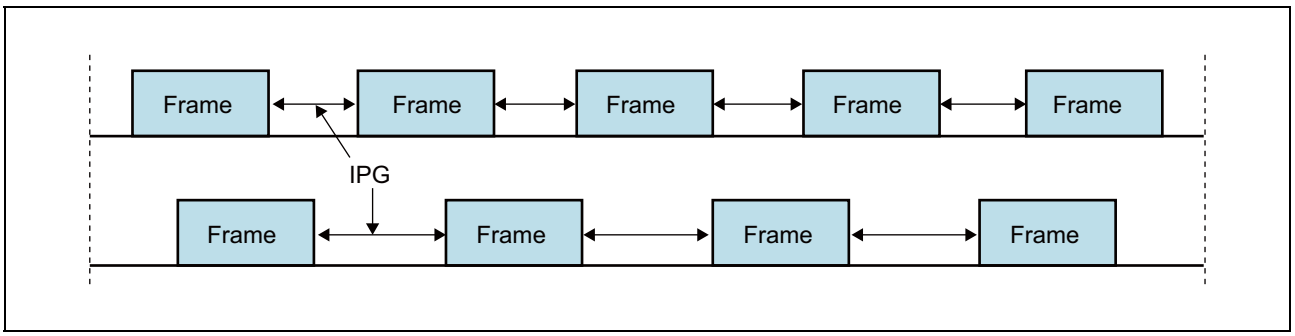

Figure 21.5 Changing IPG and transmission efficiency

### 21.4.12 Reception

The ETNA creates a reception frame by performing SFD detection, destination address check, frame length check, CRC check, etc. on the received data via MII.

### 21.4.13 Reception Clock

The ETNA receives data in synchronization with the reception clock (ETHmRXCLK).

### 21.4.14 Detection of Preamble and SFD

After detection of a preamble and SFD the ETNA starts with the frame reception.

### 21.4.15 CRC Function

The ETNA calculates a 4-byte CRC and compares it with the FCS field of the received frame. The check result is indicated as a status flag in the descriptor after the frame data has been written to the memory. The reception controller reports an error status if a CRC error occurs.

### 21.4.16 Promiscuous Mode

The promiscuous mode can be en/disabled in the ETNA. In promiscuous mode all incoming frames from MII are received. In non-promiscuous mode only the frames that address to the device MAC address, multicast and broadcast frames can be received.

### 21.4.17 Magic Packet Detection

The Magic Packet detection function provides a Wake-On-LAN feature that activates peripheral device connected to a LAN from a host device or other sources. With a Magic Packet reception is performed regardless of the destination address in the frame header. Only in case the 16 times duplicated destination address contained in the Magic Packet Sequence matches the MAC address specified in the device, the CPU will be informed by the Magic Packet detection interrupt and the Wake-On-LAN (ETHmWOL) signal notifies that a Magic Packet has been detected.

### 21.4.18 Flow Control

The flow control function in the ETNA is in compliance with IEEE802.3. The flow control can be applied to both receive and transmit operation.

### 21.4.19 PAUSE Frame Transmission

In full-duplex mode two types of PAUSE frame transmission are available for the flow control:

1. Automatic PAUSE frame transmission
   For receiving frames, PAUSE frames are automatically transmitted when the volume of data written to the reception FIFO reaches the threshold value. The TIME parameter included in the PAUSE frame is set by APR register. The automatic PAUSE frame transmission is repeated until the number of data in the receive FIFO becomes less than the value set in FCFTR register.
2. Manual PAUSE frame transmission
   PAUSE frame can also be transmitted by software instructions. When writing the timer value to MPR register, PAUSE frame transmission is started. With this method, PAUSE frame is transmitted only once.

### 21.4.20 PAUSE Frame Reception

If the PAUSE frame reception function is enabled, after a PAUSE frame is received, the next frame is not transmitted until the time indicated by the timer value of the PAUSE frame elapses. However, the on-going transmission of a frame continues when a PAUSE frame has been received.

### 21.4.21 Loopback Function

When the IBL bit in ECMR register is set to 1 and the full-duplex mode is enabled, the MII transmission data stream is looped back as MII reception data stream inside the MAC.

### 21.4.22 MAC Management Counters

Following MAC layer management counters are supported in ETNA:

- Transmit retry over counter: number of frames that were unable to be transmitted in 16 attempts
- PAUSE frame transmit counter: number of transmitted PAUSE frames
- Delayed collision detect counter: number of all delayed collisions after start of data transmission
- Lost carrier counter: number of times the carrier was lost during data transmission
- Frame transmit OK counter: number of frames successfully transmitted
- Frame transmit counter: number of frames successfully and erroneously transmitted
- Checksum error frame receive counter: number of received frames with a checksum error
- Frame receive error counter: number of receive error caused by RX_ER signal during reception
- Too short frame receive counter: number of received frames with a length of less than 64 bytes
- Too long frame receive counter: number of received frames with a length exceeding the value in RFLR register
- Residual bit frame receive counter: number of received frames containing residual bits
- Carrier extension lost counter: number of received frames with carrier extension lost
- Carrier extension error counter: number of received frames with an illegal carrier extension
- Multicast frame received counter: number of received multicast frames
- PAUSE frame receive counter: number of received PAUSE frames
- Frame receive OK counter: number of frames successfully received
- Frame receive counter: number of frames successfully and erroneously received

### 21.4.23 ETNA Operation

The ETNA consists of the following three function units:

- DMA transfer controller (E-DMAC):
  DMA transfer between the transmit/receive buffer in the memory and the transmit/receive FIFO
- MAC controller (MAC):
  Transmission/reception processing between the transmit/receive FIFO and the MII
- Transfer Switching Unit (TSU):
  CAM processing

Using its direct memory access (DMA) function, the E-DMAC performs DMA transfer of frame data between a user-specified Ethernet frame transmission/reception data storage destination (accessible memory space: transmit buffer/receive buffer) and the transmit/receive FIFO in the E-DMAC. The user cannot read and write data from and to the transmit/receive FIFO using the register.
To enable the E-DMAC to perform DMA transfer, information (data) including a transmit/receive data storage address and so forth, referred to as a descriptor, is required. The E-DMAC reads transmit data from the transmit buffer or writes receive data to the receive buffer according to the descriptor information. By arranging multiple descriptors as a descriptor row (list) (to be placed in a readable/writable memory space), multiple Ethernet frames can be transmitted or received continuously.
The E-DMAC consists of two systems: one for port 0 and the other for port 1, and both operate independently for transmission and reception.

The E-MAC constructs an Ethernet frame using the data written to the transmit FIFO and transmits the frame to the MII. It also performs a CRC check of an Ethernet frame received from the MII and deconstructs the frame to write to the receive FIFO.
The E-MAC consists of two controllers: E-MAC0 for port 0 and E-MAC1 for port 1, which correspond to E-DMAC0 and E-DMAC1, respectively.

The TSU, which is placed between the E-DMAC and MAC, references the CAM entry table to select one of the following tasks according to the Ethernet frame destination address (DA) input to the MAC.

- Receives data and writes to the receive FIFO.
- Discards data.

**Note:** **Figure 21.6, ETNA Data Path and Various Settings** shows the frame data path and an overview of each setting.

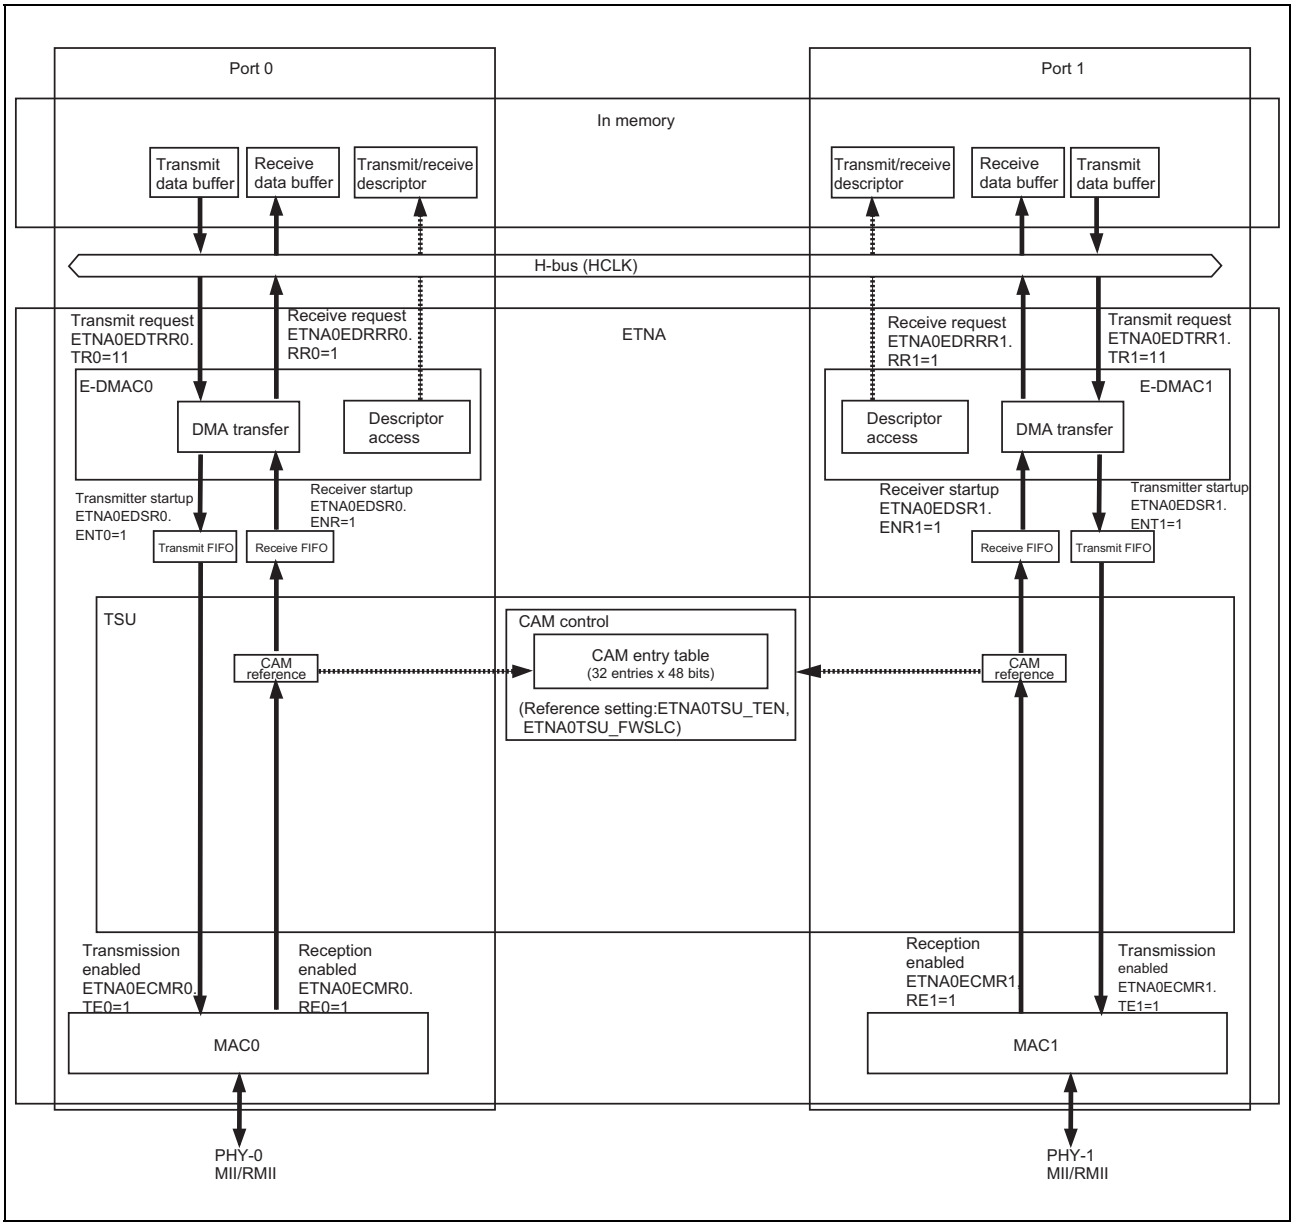

**Figure 21.6 ETNA Data Path and Various Settings**

### 21.4.24 Descriptors and Descriptor List

The E-DMAC performs DMA transfer according to the information (data), referred to as a descriptor, written in memory space. There are two types of descriptors: transmit descriptors and receive descriptors. Before a DMA transfer, DMA transfer information including a transmit/receive frame data storage address must be set by software.

The E-DMAC automatically starts reading a transmit/receive descriptor when the TRm[1:0] bits in ETNAnEDTRRm are set to 11 or the RRm bit in ETNAnEDRRRm is set to 1, and performs DMA transfer of frame data between the transmit/receive buffer and transmit/receive FIFO according to the information stored in the descriptor. After completion of Ethernet frame transmission/reception, the E-DMAC disables the descriptor valid/invalid bit and reflects the result of transmission/reception in the status bits.

Descriptors are placed in a readable/writable memory space. The address of the start descriptor (descriptor to be read first by the E-DMAC) is set in ETNAnTDLARm/ETNAnRDLARm. When multiple descriptors are prepared as a descriptor row (descriptor list), the descriptors are placed in continuous addresses (memory) according to the descriptor length set in the DLm0 and DLm1 bits in ETNAnEDMRm.

The E-DMAC consists of two systems: one for port 0 and the other for port 1. The DMAC for transmission and the DMAC for reception operate independently, and the DMAC for port 0 and the DMAC for port 1 operate independently. Place descriptors for transmission and reception and descriptors for port 0 and port 1 in those address spaces that do not overlap. If addresses are overlapped, E-DMAC does not successfully operate.

### 21.4.25 Transmit Descriptor

**Figure 21.7** shows the configuration of a transmit descriptor and the relationship with a transmit buffer.

The data of a transmit descriptor consists of TD0, TD1, TD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DLm0 and DLm1 bits in ETNAnEDMRm.

TD0 indicates whether the transmit descriptor is valid or invalid, and information about the descriptor configuration and status. TD1 indicates the length of data in a transmit buffer to be transferred (TDL) as specified by the descriptor. TD2 indicates the start address of a transmit buffer that holds data to be transferred (TBA).

Depending on the descriptor specification, one transmit descriptor can specify all transmit data of one frame (single-frame/single-buffer) or multiple descriptors can specify the transmit data of one frame (single-frame/multi-buffer). As an example of single-frame/multi-buffer operation, the data portion that is used in a fixed manner in each Ethernet frame transmission can be referenced by multiple descriptors. For example, multiple descriptors can share the destination address and transmit source address in an Ethernet frame, and the remaining data can be stored in each separate buffer.

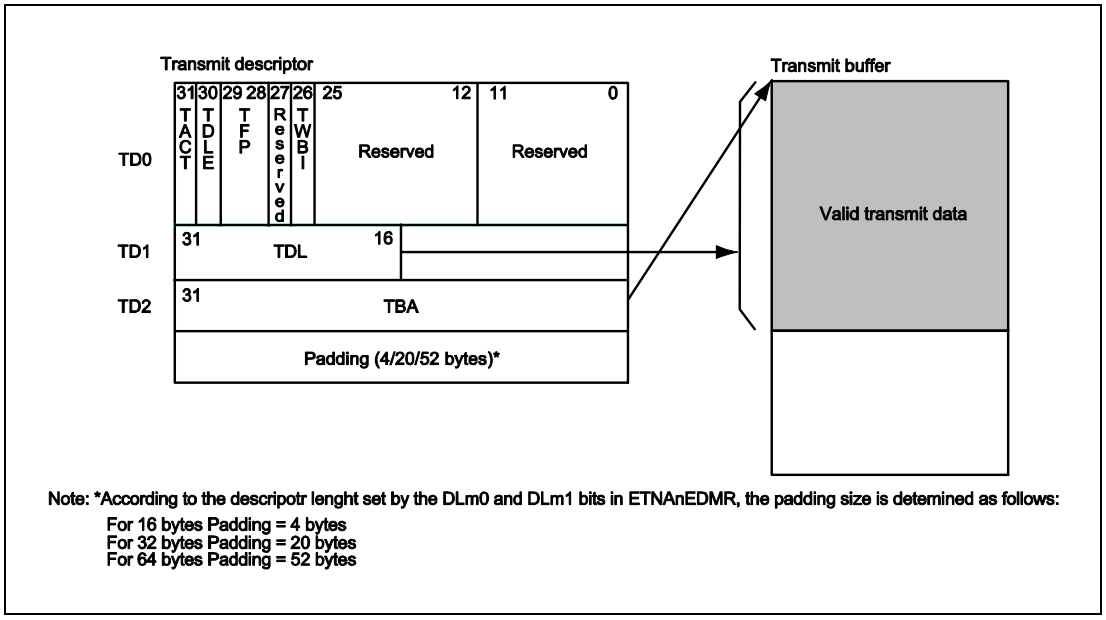

**Figure 21.7 Relationship between Transmit Descriptor and Transmit Buffer**

**Note:** Transmit descriptor ring has to be prepared at least five buffers. If transmit descriptor ring is set to less than five buffers, the descriptor ring may be looped two times by one transmit request. Because fetching all descriptors in the ring finishes before the write back process of the first buffers transmission completion.

### (1) Transmit Descriptor 0 (TD0)

Before the TRm[1:0] bits in ETNAnEDTRRm are set to 11, the user sets whether the bits of the descriptor are valid or invalid bit and sets other descriptor configuration. After Ethernet frame transmission, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.

When using TD0, the user should write desired values to bits 31 to 28 and 26 according to the descriptor configuration. Bits 27 and 25 to 0 should be cleared to 0.

**Table 21.81 TD0 description (1/2)**

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 31 | TACT | 0 | R/W | Transmit Descriptor Valid/Invalid<br>Indicates whether the corresponding descriptor is valid or invalid. To make this bit valid, store transmit data in a transmit buffer (user-specified transmit data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer.<br>0: Indicates that this transmit descriptor is invalid<br>Indicates the initial setting state, the state after 0 is written, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed.<br>If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the TRm[1:0] bits in ETNAnEDTRRm to 0, and halts transfer operation related to transmission by the E-DMAC.<br>1: Indicates that this transmit descriptor is valid<br>After the user writes 1 to this bit, this bit indicates that data is not transferred yet or data is being transferred.<br>When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid. |
| 30 | TDLE | 0 | R/W | Transmit Descriptor List End<br>Indicates whether the corresponding descriptor is the last descriptor of the descriptor row (descriptor list).<br>0: Not last descriptor<br>After transfer of the corresponding descriptor, the E-DMAC reads the next one in the list of continuous descriptors.<br>1: Last descriptor<br>After transfer of the corresponding descriptor, the E-DMAC reads the descriptor placed at the address indicated by ETNAnTDLARm. |

Table 21.81 TD0 description (2/2)

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 29, 28 | TFP[1:0] | 00 | R/W | Transmit Frame Position<br>These bits indicate whether information of this descriptor represents information about the start, middle, or end of the transmit frame.<br>00: The information of the descriptor represents information about the middle of the frame.<br>01: The information of the descriptor represents information about the end of the frame.<br>10: The information of the descriptor represents information about the start of the frame.<br>11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer)).<br>Reference<br>When one frame is divided for use, the method of specifying this bit for a descriptor row according to the number of divisions is described below.<br>• For single-frame/single-descriptor operation<br>First descriptor: TFP[1:0] = 11<br>• For single-frame/two-descriptor operation<br>First descriptor: TFP[1:0] = 10<br>Second descriptor: TFP[1:0] = 01<br>• For single-frame/three-descriptor operation<br>First descriptor: TFP[1:0] = 10<br>Second descriptor: TFP[1:0] = 00<br>Third descriptor: TFP[1:0] = 01<br>When the number of divisions is large, a descriptor row is configured by adding intermediate descriptors with TFP[1:0] = 00. |
| 27 | — | All 0 | — | Reserved<br>This bit is always read as 0. The write value should always be 0. |
| 26 | TWBI | 0 | R/W | Write-Back Completion Interrupt Notification<br>0: Does not notify of a write-back completion interrupt<br>1: After a write-back operation to this descriptor is complete, this bit sets the TWBm and TWBm bits in ETNAnEESRm to 11 and notifies the CPU of a write-back completion interrupt.<br>This bit is valid only for the descriptor including the end of transmit frame (TFP = 01 or 11). This bit is cleared to 0 by the E-DMAC write-back operation. |
| 25 to 0 | — | All 0 | — | Reserved<br>These bits are always read as 0. The write value should always be 0. |

### (2) Transmit Descriptor 1 (TD1)

TD1 indicates the data length of the transmit buffer used by the corresponding descriptor.

The user should set TD1 before the start of a read by the E-DMAC.

Table 21.82 TD1 description

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | TDL | All 0 | R/W | Transmit Buffer Data Length (in bytes)<br>These bits indicate the data length of the corresponding transmit buffer in bytes. The maximum length is 64 Kbytes to 32 bytes ($FFE0_H$). |
| 15 to 0 | — | All 0 | — | Reserved<br>These bits are always read as 0. The write value should always be 0. |

### (3) Transmit Descriptor 2 (TD2)

TD2 indicates the start address of the corresponding 32-bit width transmit buffer. An address value should be specified in a longword boundary.

**Table 21.83 TD2 description**

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | TBA | All 0 | R/W | Transmit Buffer Start Address<br>These bits set the start address of the corresponding transmit buffer in a 4-byte boundary. |

If descriptors are set below, the E-DMAC does not return to normal operation until a system reset is performed.

- TFP (transmit frame position) is not logically correct
  Example: The TFP bits are set to 11 in a descriptor (descriptor A) and the TFP bits are set to 01 in the next descriptor (descriptor B). This specification means that there is no descriptor indicating the start of the transmit frame specified by descriptor B.
- TBL (transmit buffer length) is set to 0

When one transmit frame is divided into three parts or more with transmit descriptors, the E-DMAC performs the following write-back operation:

- A write-back operation is performed for a transmit descriptor including information for the start of the transmit frame (TFP = 10 or 11) and for a transmit descriptor including information for the end of the frame (TFP = 01 or 11).
- A write-back operation is not performed for a transmit descriptor for the middle of the frame (TFP = 00).

Before changing a transmit descriptor with the software, make sure that a write-back operation has been performed (TACT = 0) for the transmit descriptor including information for the end of the frame (TFP = 01 or 11) to avoid overwriting (re-setting) an unprocessed transmit descriptor.

### 21.4.26 Receive Descriptor

**Figure 21.8** shows the relationship between a receive descriptor and receive buffer.

The data of a receive descriptor consists of RD0, RD1, RD2, and padding data in groups of 32 bits from top to end. The length of padding data is determined according to the descriptor length specified by the DLm0 and DLm1 bits in ETNAnEDMRm.

RD0 indicates whether the receive descriptor is valid or invalid, and information about descriptor configuration and status. RD1 indicates the length of data that can be received in the receive buffer specified by the descriptor (RBL) and the length of the received frame data (RDL). RD2 indicates the start address of the receive buffer for storing receive data (RBA).

Depending on the descriptor specification, one receive descriptor can specify the storing of all receive data of one frame in a receive buffer (single-frame/single-buffer) or multiple descriptors can specify the storing of the receive data of one frame in receive buffers (single-frame/multi-buffer). As an example of single-frame/multi-buffer operation, suppose that a row of multiple descriptors (descriptor list) is prepared, RBL of each descriptor is 480 bytes, and a 1514-byte Ethernet frame is received. In such a case, the received Ethernet frame is transferred sequentially to buffers, 480 bytes for each buffer, starting with the first descriptor. Only the last 74 bytes are transferred to the fourth buffer. When a frame longer than RBL of a descriptor is received, the E-DMAC transfers the remaining data to the receive buffer by using the subsequent descriptors. As an example of efficient single-frame/multi-buffer operation, information items on different processing layers in an Ethernet frame can be separated from each other by using different buffers. For example, the destination address, transmit source address, type field data in an Ethernet frame, and 18 bytes padding can be stored in buffer 1 (set RBL to 32 bytes) and the remaining data can be stored in buffer 2 (set RBL to 1504 bytes). All receive frames, of course, can be stored in a single buffer if multiple descriptors are prepared and RBL of each descriptor is set to more than 1514 bytes (maximum Ethernet frame length).

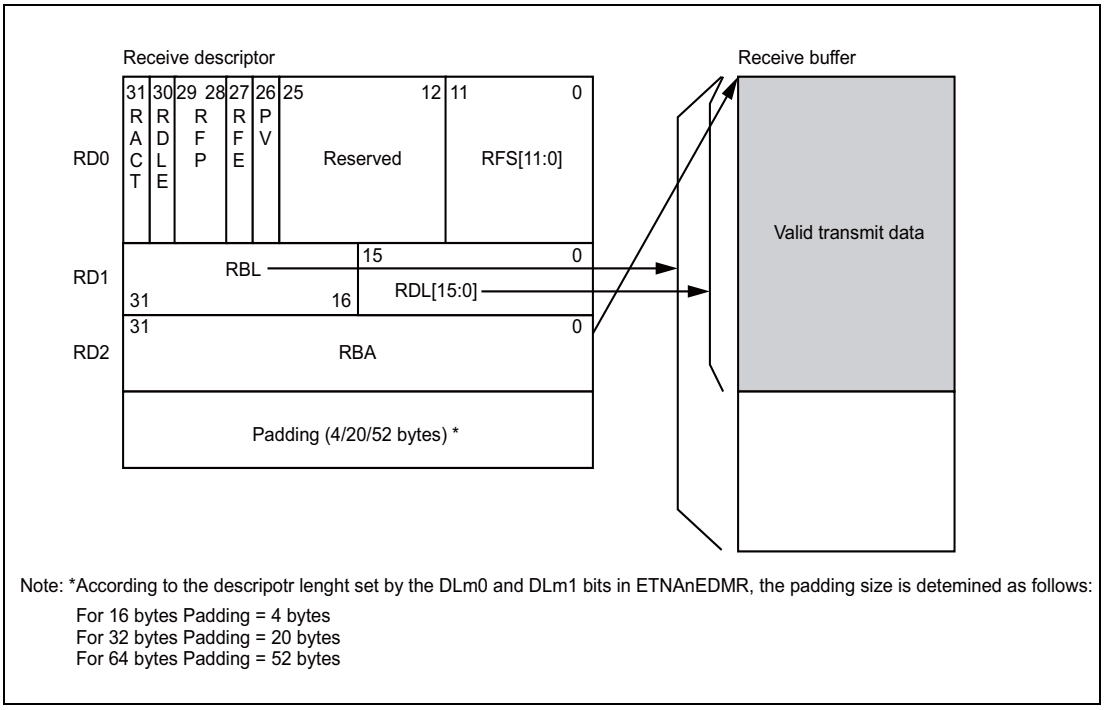

**Figure 21.8 Relationship between Receive Descriptor and Receive Buffer**

### (1) Receive Descriptor 0 (RD0)

The user sets whether the bits of the descriptor are valid or invalid and whether the descriptor represents the end of the descriptor list in RD0 before the RRm bit in ETNAnEDRRRm is set to 1 and the start of a read by the E-DMAC. After receive DMA transfer of an Ethernet frame by the E-DMAC, the E-DMAC disables the valid/invalid bits of the descriptor and writes status information. This operation is referred to as write-back.

When using RD0, the user should write desired values to bits 31 and 30 according to the descriptor configuration. Bits 29 to 0 should be cleared to 0.

**Table 21.84 RD0 description (1/3)**

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 31 | RACT | 0 | R/W | Receive Descriptor Valid/Invalid<br>Indicates whether this descriptor is valid or invalid. To make this bit valid, prepare a receive buffer (user-specified receive data storage destination) beforehand, then write 1 to this bit. The E-DMAC clears this bit to 0 after data transfer or when a receive error has occured.<br>0: Indicates that this receive descriptor is invalid<br>Indicates the initial setting state, the state after 0 is written to, or (in case the user writes 1 to this bit) that this bit is cleared to 0 because the E-DMAC data transfer processing is completed<br>If this state is recognized when the E-DMAC reads a descriptor, the E-DMAC clears the RRm bit in ETNAnEDRRRm to 0, and halts transfer operation related to reception by the E-DMAC<br>1: Indicates that this receive descriptor is valid<br>Indicates that data is not transferred yet after the user writes 1 to this bit, or that data is being transferred<br>When there is a descriptor row (descriptor list) consisting of multiple continuous descriptors, the E-DMAC can continue operation when this bit of the next descriptor is valid |
| 30 | RDLE | 0 | R/W | Receive Descriptor List End<br>Indicates whether this descriptor is the last descriptor of the descriptor row (descriptor list).<br>0: Not last descriptor<br>After transfer of this descriptor, the E-DMAC reads the next one in the list of continuous descriptors<br>1: Last descriptor<br>After transfer of this descriptor, the E-DMAC reads the descriptor placed at the address indicated by ETNAnRDLARm |

Table 21.84 RD0 description (2/3)

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 29, 28 | RFP[1:0] | 00 | R/W | Receive Frame Position 1, 0<br>The E-DMAC indicates by write-back operation whether information of the corresponding descriptor represents information about the start, middle, or end of the receive frame.<br>00: The information of the descriptor represents information about the middle of the frame<br>01: The information of the descriptor represents information about the end of the frame<br>10: The information of the descriptor represents information about the start of the frame<br>11: The information of the descriptor represents all information about the frame (single-frame/single-descriptor (single-buffer))<br>Reference<br>The relationship between a frame after reception of one frame and a descriptor is described below.<br>• For single-frame/single-descriptor operation<br>First descriptor: RFP[1:0] = 11<br>• For single-frame/two-descriptor operation<br>First descriptor: RFP[1:0] = 10<br>Second descriptor: RFP[1:0] = 01<br>• For single-frame/three-descriptor operation<br>First descriptor: RFP[1:0] = 10<br>Second descriptor: RFP[1:0] = 00<br>Third descriptor: RFP[1:0] = 01<br>When the number of divisions is large, a descriptor row is configured by adding intermediate descriptors with RFP[1:0] = 00. |

RFS11 to RFS9 cannot be masked.<br>This bit is set by the E-DMAC write-back operation. |
| 26 | PV | 0 | R/W | Padding Insertion<br>Indicates whether the padding specified by ETNAnRPADIRm was inserted in the receive frame processed with this descriptor or not.<br>0: No padding inserted<br>1: Padding inserted<br>This bit can be changed by the E-DMAC write-back processing. |
| 25 to 12 | — | All 0 | — | Reserved<br>These bits are always read as 0. The write value should always be 0. |

Table 21.84 RD0 description (3/3)

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 11 to 0 | RFS[11:0] | All 0 | R/W | Receive Frame Status<br>Indicate the status of the corresponding frame. A bit below, when set to 1, indicates the occurrence of the corresponding event. If an event indicated by any of RFS9 to RFS0 occurs, the frame is not received completely.<br>RFS[11:10]: Reserved<br>RFS[9]: Receive FIFO overflow (corresponding to the RFOF bit in ETNAnEESRm)<br>RFS[8]: Detection of reception abort (Corresponding to the RABT bit in ETNAnEESRm)<br>RFS[7]: Multicast address frame received (corresponding to the RMAF bit in ETNAnEESRm)<br>RFS[6]: Reserved<br>RFS[5]: Reserved<br>RFS[4]: Residual-bit frame receive error (corresponding to the RRF bit in ETNAnEESRm)<br>RFS[3]: Long frame receive error (corresponding to the RTLF bit in ETNAnEESRm)<br>RFS[2]: Short frame receive error (corresponding to the RTSF bit in ETNAnEESRm)<br>RFS[1]: PHY-LSI receive error (corresponding to the PRE bit in ETNAnEESRm)<br>RFS[0]: CRC error on receive frame (corresponding to the CERF bit in ETNAnEESRm) |

### (2) Receive Descriptor 1 (RD1)

In RD1, the user specifies the data length of a receive buffer usable by the corresponding descriptor. After reception of a frame, RD1 indicates the length of a frame received by the E-DMAC.

The user should set RD1 before the start of a read by the E-DMAC.

**Table 21.85 RD1 description**

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 31 to 16 | RBL | All 0 | R/W | Receive Buffer Data Length (in bytes, to be specified with a 32-byte boundary)<br>These bits set the length of data that can be received by the corresponding receive buffer with an integral multiple of 32 bytes.<br>The maximum receive buffer data length is<br><br>64 Kbytes – 32 bytes ($FFE0_H$). |
| 15 to 0 | RDL | All 0 | R | Receive Data Length<br>These bits indicate the data length of a receive frame stored in the receive buffer.<br>Receive data transferred to the receive buffer does not include CRC data (4 bytes) placed at the end of a frame. As a receive frame length, the number of bytes (valid data bytes) not including CRC data are reported.<br>In single-frame/multi-buffer (descriptor) operation, only the receive data length of the last descriptor is valid. The receive data length of an intermediate descriptor has no meaning.<br>The padding size set by ETNAnRPADIRm is not included. |

### (3) Receive Descriptor 2 (RD2)

RD2 indicates the start address of the corresponding receive buffer. Set the start address of a receive buffer with a 32-byte boundary.

**Table 21.86 RD1 description**

| Bit | Bit name | Value after reset | R/W | Description |
|---|---|---|---|---|
| 31 to 0 | RBA | All 0 | R/W | Receive Buffer Start Address<br>These bits set the start address of the corresponding receive buffer with a 32-byte boundary. |

The E-DMAC performs DMA transfer for a receive frame from the address specified by RBA (receive buffer address) to the receive buffer in 32-byte units. RBL (receive buffer length) must be set to be an integral multiple of 32 bytes.

If data to be transferred is less than 32 bytes, invalid data will be written to memory.

[Example]

When the receive frame length is 170 bytes and the required receive buffer capacity is 192 bytes (32 bytes × 6), the sixth DMA-transfer causes invalid data to be written to the receive buffer (In the 32-byte DMA data, the former 10 bytes are valid and the latter 22 bytes are invalid).

Padding of the value 0 can be inserted into only one position in the receive frame by setting ETNAnRPADIRm. The padding size can be selected from 1 byte to 31 bytes in byte units. When padding is inserted into a receive frame, a receive buffer area equal to the total of “receive frame length and padding size”is required. ETNAnRPADIRm setting is valid for all receive frames.

RFE (receive frame error occurrence), PV (padding insertion), RFS (receive frame status) and RFL (receive frame length) are only set in the receive descriptor including information for the end of the frame (RFP = 01 or 11) by a write-back operation.

Before re-setting a receive descriptor with the software, completion of a write-back operation for the receive descriptor (RACT = 0) must be confirmed to avoid rewriting to (and re-setting) an unprocessed receive descriptor.

## 21.4.27 Descriptor and Transmit/Receive Buffer

### (1) Transmission

Each transmit descriptor specifies one transmit buffer. The E-DMAC transfers a transmit frame stored in a transmit buffer specified by a transmit descriptor to the transmit FIFO. Multiple transmit frames stored in transmit buffers specified by multiple descriptors can be connected into one transmit frame and transferred to the transmit FIFO.

**Figure 21.9** shows the relationship between the transmit descriptors and transmit buffers.

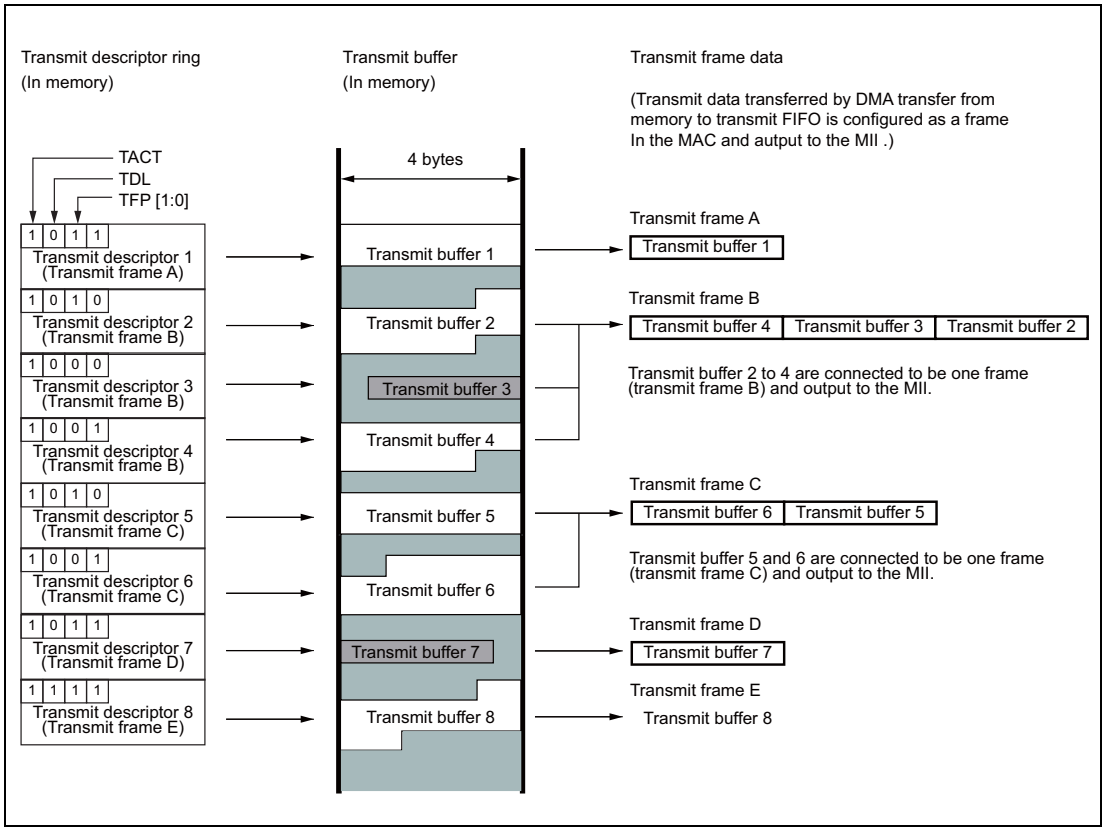

**Figure 21.9 Relationship between Transmit Descriptor and Transmit Buffer**

**Note:** Transmit descriptor ring has to be prepared at least five buffers. If transmit descriptor ring is set to less than five buffers, the descriptor ring may be looped two times by one transmit request. Because fetching all descriptors in the ring finishes before the write back process of the first buffers transmission completion

### (2) Reception

Each receive descriptor specifies one receive buffer. The E-DMAC receives a receive frame from the receive FIFO and stores it in a receive buffer specified by a receive descriptor. If the receive frame size exceeds the receive buffer size, the remaining data of the receive frame can be stored in a different receive buffer specified by a different receive descriptor. Thus, one receive frame can be stored in multiple receive buffers.

**Figure 21.10, Relationship between Receive Descriptor and Receive Buffer** shows the relationship between the receive descriptors and receive buffers.

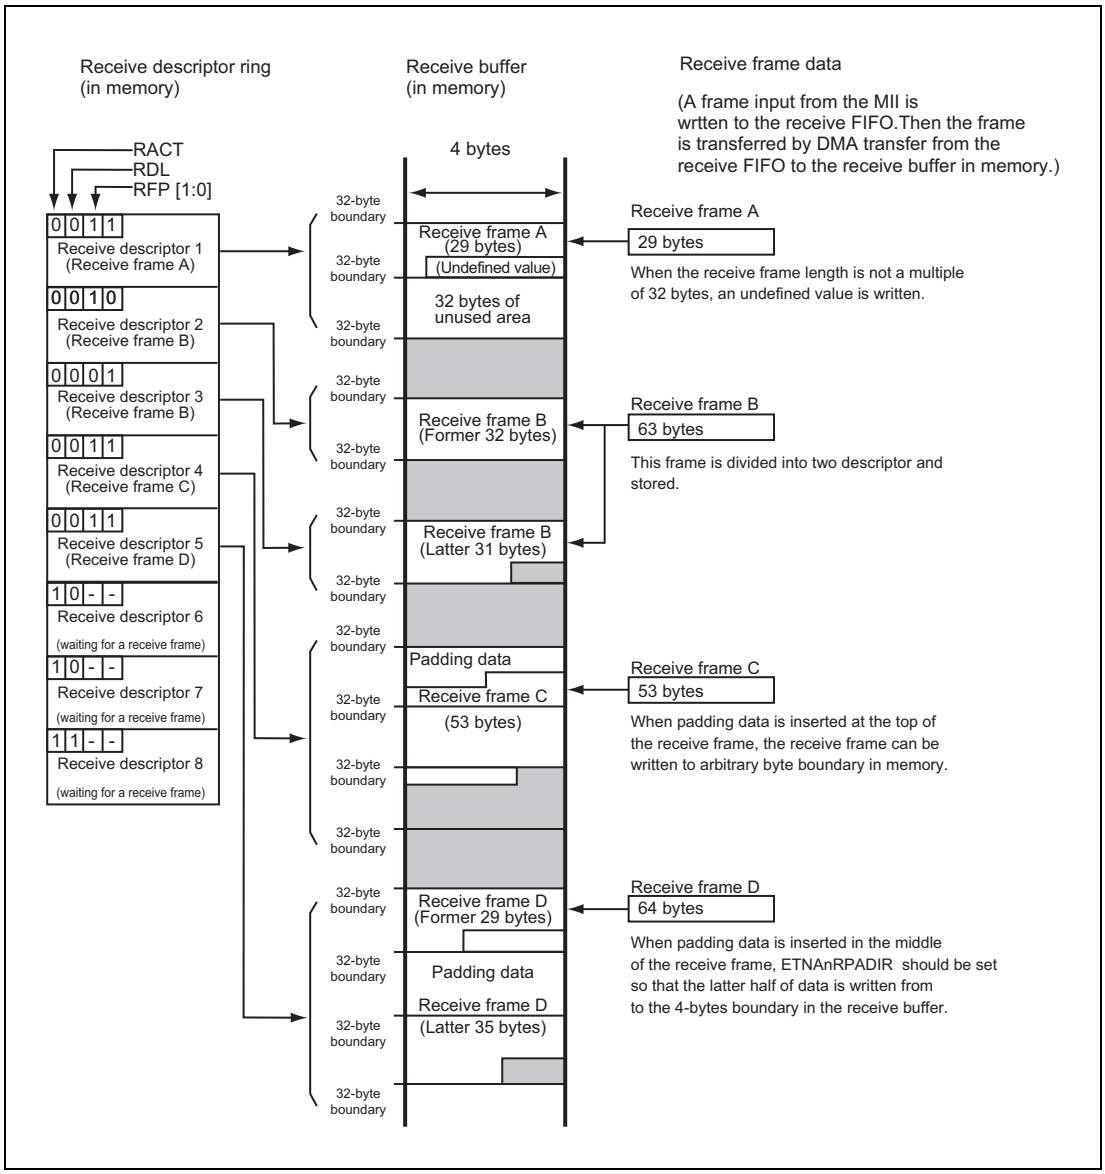

**Figure 21.10 Relationship between Receive Descriptor and Receive Buffer**

### 21.4.28 Descriptor Pointer

The E-DMACm controls the transmit and receive descriptor addresses in memory and the processing priority by using the following registers.

(1) Registers related to a transmit descriptor

- ETNAnTDLARm: Address of the start descriptor in a list of transmit descriptors.
- ETNAnTDFARm: Address of the transmit descriptor to be processed
- ETNAnTDFXRm: Address of the transmit descriptor that finished processing (set by a write-back operation) last
- ETNAnTDFFRm: Indicates whether the transmit descriptor for which the E-DMACm has just completed the write-back processing and whose start address is stored in ETNAnTDFXRm is at the end of the transmit descriptor queue (descriptor list).

(2) Registers related to receive descriptor:

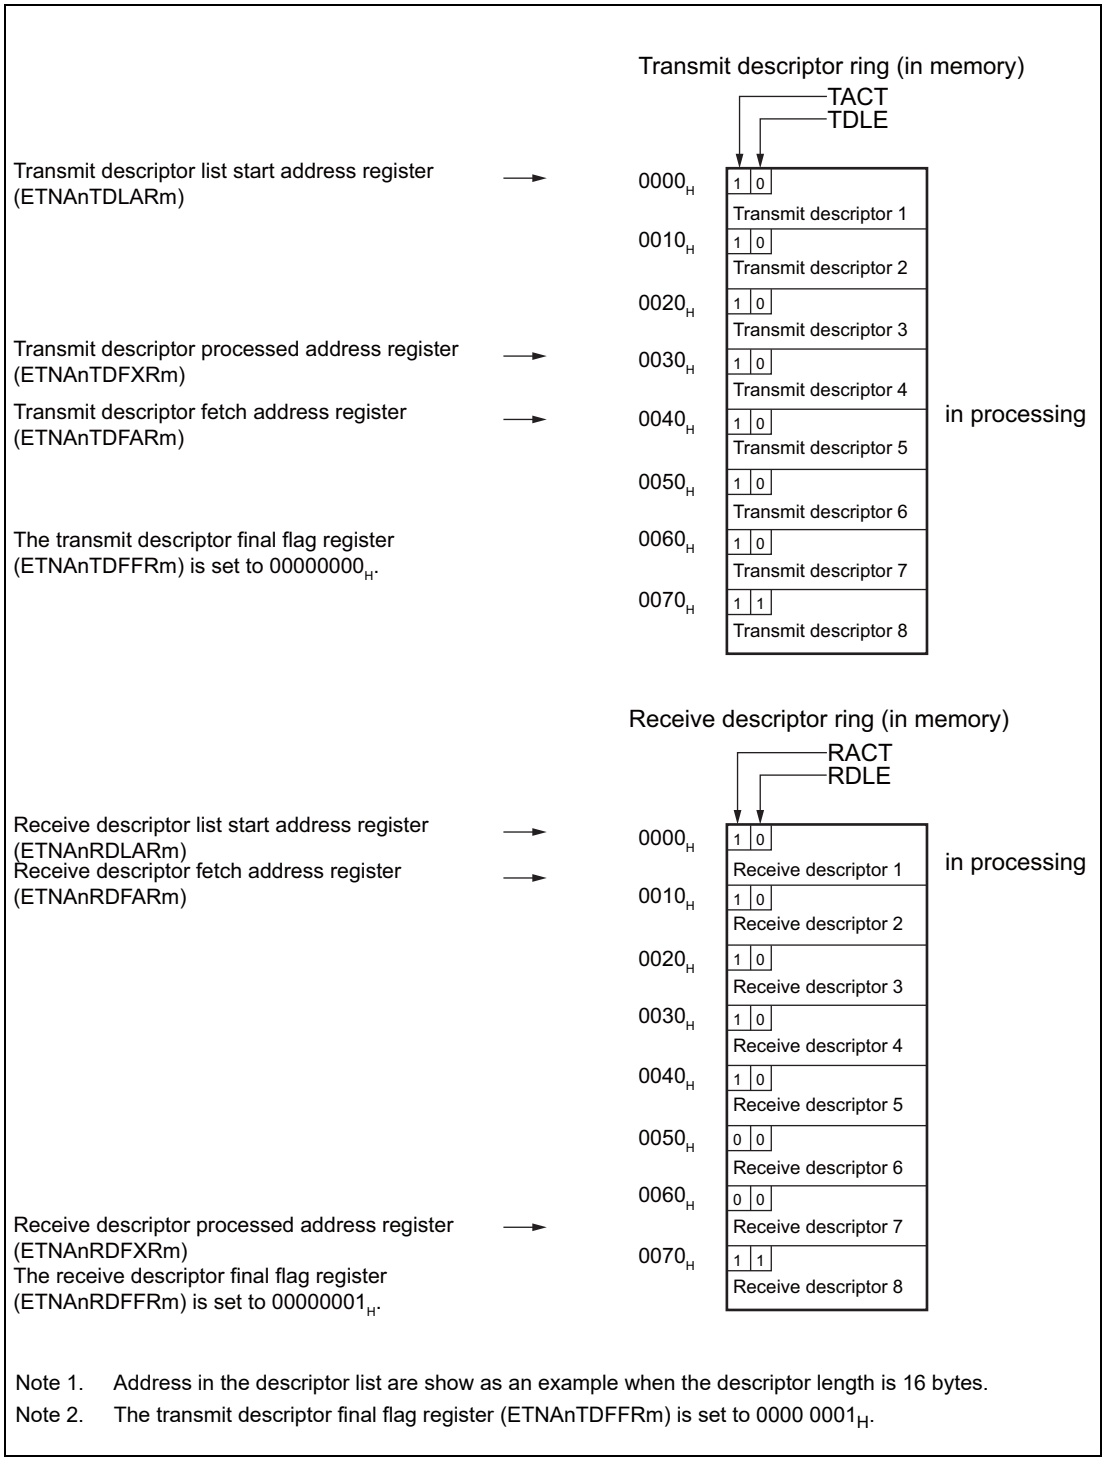
- ETNAnRDLARm: Address of the start descriptor in a list of receive descriptors.
- ETNAnRDFARm: Address of the receive descriptor to be processed
- ETNAnRDFXRm: Address of the receive descriptor that finished processing (set by a write-back operation) last
- ETNAnRDFFRm: Indicates whether the receive descriptor for which the E-DMACm has just completed the write-back processing and whose start address is stored in ETNAnRDFXRm is at the end of the receive descriptor queue (descriptor list).

Transmit descriptors and receive descriptors have a ring structure. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 0, the next descriptor will be processed. The next descriptor is the transmit (receive) descriptor at the address obtained by adding the processed transmit (receive) descriptor address to the descriptor length specified by the DLm[1:0] bit in ETNAnEDMRm. When the TDLE (RDLE) value of the processed transmit (receive) descriptor is 1, the transmit descriptor indicated by ETNAnTDLARm (ETNAnRDLARm) will be processed next. **Figure 21.11** shows the relationship between the transmit/receive descriptor ring and read pointer.

The transmit descriptor list must be large enough to point to five or more transmit frames. If four or less transmit frames are pointed to in a list, E-DMACm operation is not guaranteed. Accordingly, do not set that all the transmit descriptors in a ring are used by four or less descriptors. The receive descriptor list does not have this restriction. For example, one receive frame can use all receive descriptors in a list.

In the initial setting, the start address of a descriptor list must be set to ETNAnTDLARm (ETNAnRDLARm) and ETNAnTDFARm (ETNAnRDFARm), and the end descriptor address of the descriptor list to ETNAnTDFXRm (ETNAnRDFXRm) by the software.

The E-DMAC updates ETNAnTDFARm (ETNAnRDFARm), ETNAnTDFXRm (ETNAnRDFXRm) and the DLm[1:0] bit in ETNAnTDFFRm (DLm[1:0] bit in ETNAnRDFFRm) each time a descriptor is processed.



Note 1. Address in the descriptor list are show as an example when the descriptor length is 16 bytes.

Note 2. The transmit descriptor final flag register (ETNAnTDFFRm) is set to 0000 0001H.

**Figure 21.11 Relationship between Transmit/Receive Descriptor and Descriptor Pointing Registers**

### 21.4.29 Transmission Procedure and Processing Flow

When 11 is written to the TRm[1:0] bits in ETNAnEDTRRm with the TEm bit in ETNAnECMRm set to 1 and there is empty space of 32 bytes or more in the transmit FIFO, the E-DMAC reads the descriptor following the previously used descriptor from the transmit descriptor list (or the descriptor indicated by ETNAnTDLARm at the initial startup).

If the TACT bit of the read descriptor is set to 1 (valid), the E-DMAC sequentially reads transmit frame data from the transmit buffer start address specified by TD2 and transfers the data to the transmit FIFO. The E-DMAC configures a transmit frame and starts transmission to the MII. After DMA transfer of data equivalent to the buffer length specified in the descriptor, the following processing is carried out according to the TFP value.

- TFP = 10 (start of a frame)
  Descriptor write-back (writing 0 to the TACT bit) is performed after completion of DMA transfer.
- TFP = 01 or 11 (end of a frame)
  Descriptor write-back (writing 0 to the TACT bit and writing status) is performed after completion of frame transmission.
- TFP = 00 (frame continued)
  Descriptor write-back is not performed. The TACT bit retains the value 1.

As long as the TACT bit of a read descriptor is set to 1 (valid), the reading of E-DMAC descriptors and the transmission of frames continue.

When a descriptor with the TACT bit cleared to 0 (invalid) is read, the E-DMAC performs the following processing and completes transmit processing.

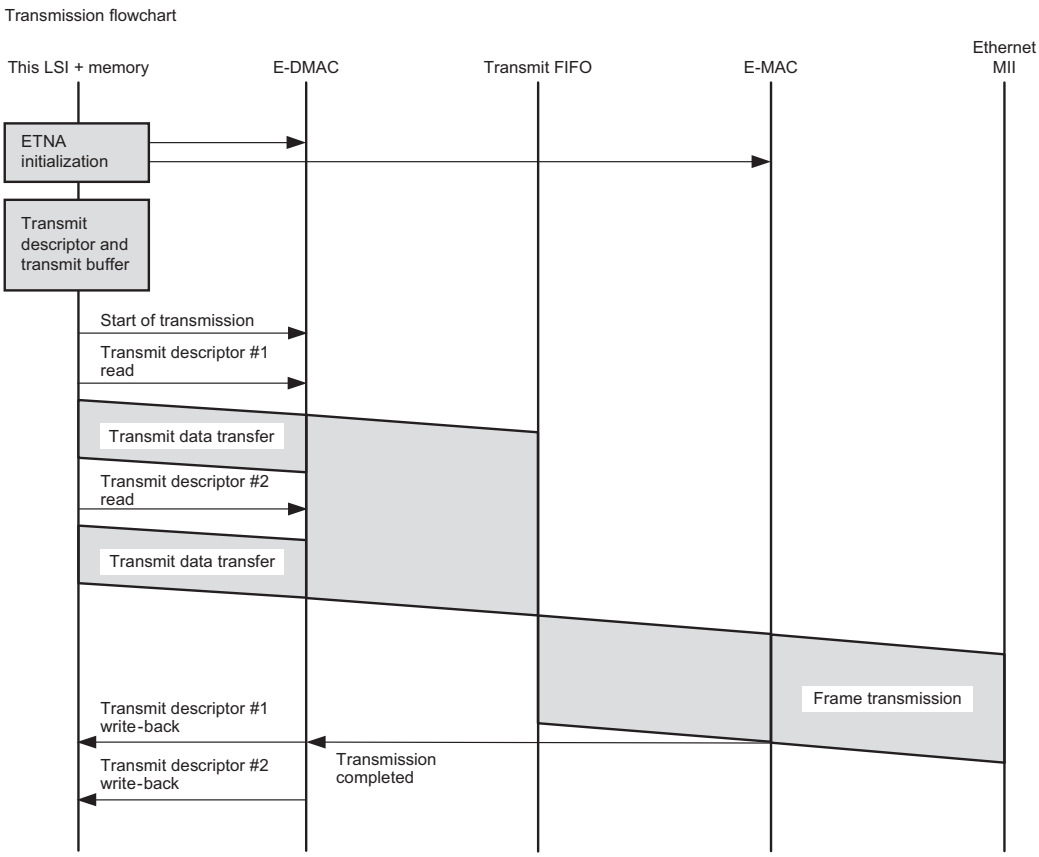
- Clears the TRm[1:0] bits in ETNAnEDTRRm to 00.
- Writes the TCm bits in ETNAnEESRm to 11 and generates an interrupt.

The E-DMAC can store up to four frames of data in the transmit FIFO.

When one of the following conditions is met, the MAC transmit processing unit reads the data from the transmit FIFO to configure a frame and sends it to the MII.

- One or more frame of data is stored in the transmit FIFO.
- Transmit FIFO full.

**Figure 21.12** shows an example of transmission flow.



[Legend]

ETNA initialization: Executes a software reset with the SWR bit in EDMR set to 1.
Transmit descriptor and transmit setting: Sets transmit descriptors and transmit buffers, and sets E-MAC and E-DMAC registers, then writes 11 to the TE bit in ECMR and the TR bit in EDTRR.
Start of transmission: Occurs when 1 is written to the TE bit in ECMR and 11 is written to the TR bit in EDTRR.
Transmit descriptor read: The E-DMAC reads a transmit descriptor.
Transmit data transfer: Writes transmit data to the transmit FIFO by using DMA transfer by the E-DMAC.
Transmit descriptor write-back: The E-DMAC writes 0 to the TACT bit.

**Figure 21.12 Sample Transmission Flowchart (Single-Frame/Two-Description in store and forward mode)**

**Figure 21.13** shows the status change of the MAC transmitter. This operation is common among port 0 and port 1.

1. When the TEn bit in ETNAnECMRm is set, the transmitter enters the transmit idle state.
2. When a transmit request is issued by the transmit E-DMAC, the MAC sends the preamble to MII after a transmission delay caused by the carrier detection and frame interval time. If full-duplex transfer is selected, which does not require carrier detection, the preamble is sent as soon as a transmit request is issued by the E-DMAC.
3. The transmitter sends the SFD, data, and CRC sequentially. At the end of transmission, the transmit E-DMAC generates a transmission complete interrupt (TC). If a collision or the carrier-not-detected state occurs during data transmission, these are reported as interrupt sources.
4. After waiting for the frame interval time, the transmitter enters the idle state, and if there is more transmit data, continues transmitting.

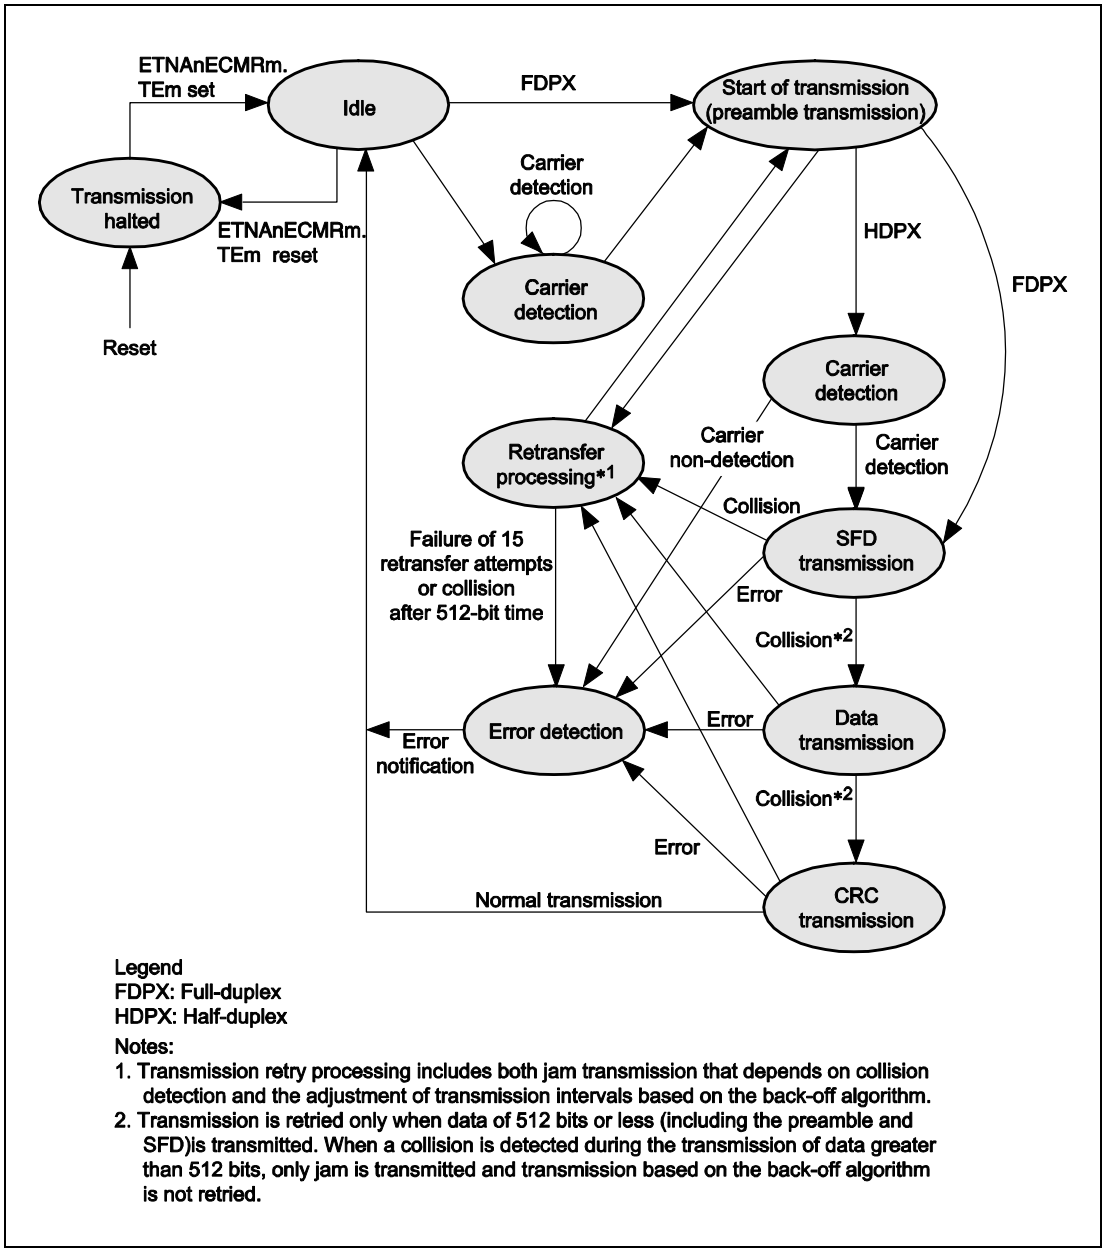


Figure 21.13 MAC Transmitter State Transitions

## 21.4.30 Transmission Error Processing

### (1) Transmit Descriptor Empty

When the TFP bits of the descriptor previously processed are set to 00 or 10 and the TACT bit of the read transmit descriptor is set to 0 (invalid), a transmit descriptor empty state is determined and 1 is written to the TDE bit in ETNAnEESRm, and then an interrupt is issued.

When a transmit descriptor state is empty, start transmission processing after a software reset.

## 21.4.31 Reception Procedure and Processing Flow

The MAC receiver separates the frame from the MII into preamble, SFD, data and CRC, and transfers the fields from DA (destination address) to the data to the receive FIFO. Up to 24 frames can be written in the receive FIFO. **Figure 21.14** shows the status change of the MAC receiver. This operation is common among port 0 and port 1.

1. When the REm bit in ETNAnECMRm is set to 1, the receiver enters the receive idle state.
2. When an SFD (start frame delimiter) is detected after a receive packet preamble, the receiver starts receive processing. A frame with an invalid pattern is discarded.
3. In normal mode, the receiver starts data reception if the destination address of the frame specifies the one that the product has or broadcast or multicast. In promiscuous mode, data reception starts regardless of the frame type.
4. Following data reception from the MII, the receiver carries out a CRC check. The result is indicated as a status bit in the descriptor after the frame data has been written to the receive FIFO. Reports an error status in the case of an abnormality.

After one frame has been received, if the REm bit in ETNAnECMRm is set to 1, the receiver prepares to receive the next frame.

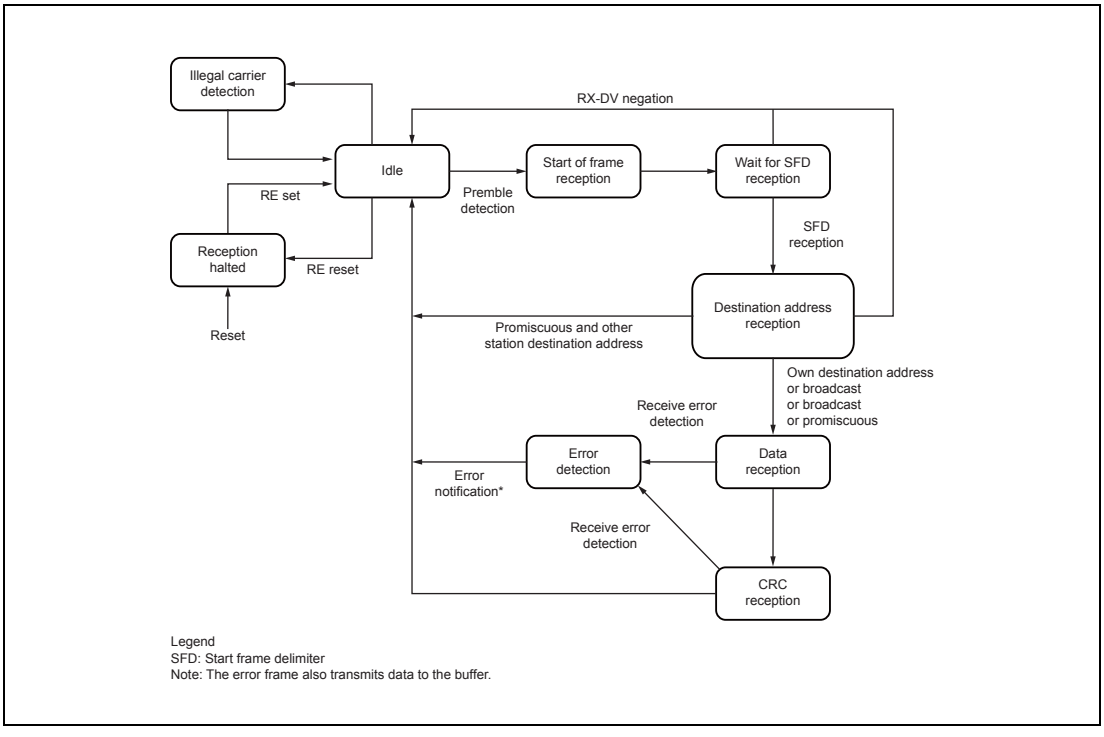

**Figure 21.14 MAC Receiver State Transitions**

CAM evaluation can be referenced during frame processing in reception (for details on the CAM function, see **Section 21.4.33, CAM Function**).

When 1 is written to the RRm bit in ETNAnEDRRRm while the REm bit in ETNAnECMRm is set to 1, the E-DMAC reads the descriptor following the previously used descriptor from the receive descriptor list (or the descriptor indicated by ETNAnRDLARm at the initial startup) then enters the receive wait state. If 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the E-DMAC transfers receive FIFO data to the receive buffer specified by RD2 according to the receive descriptor with the RACT bit set to 1 (valid).

If the data length of a received frame is longer than the buffer length specified by RD1, the E-DMAC performs a write-back operation to the descriptor (set RFP to 10 or 00) when the buffer is full, then reads the next descriptor. The E-DMAC then continues to transfer data to the receive buffer specified by the new RD2.

When the following conditions are satisfied, a write-back operation is performed for the descriptor (RFP = 11 or 01), 11 is written to the FR bits in ETNAnEESRm, and an interrupt is issued.

- The receive buffer has been full during DMA transfer.
- DMA transfer to the receive buffer of the last byte of the receive frame has been completed.

After the reception processing of the frame, the next descriptor reading standby state begins. At this time, if 32 bytes or more of data or the last byte of the receive frame is stored in the receive FIFO, the next receive descriptor process is performed continuously.

When the RACT bit of the read receive descriptor is 0 (invalid), the receive descriptor empty state is determined and the RDE bit in ETNAnEESRm is written to 1, and then an interrupt is issued.

To receive frames continuously, set the RNC bit in ETNAnRMCRm to 1. The value after reset is 0.

**Figure 21.15** shows an example of reception flow.

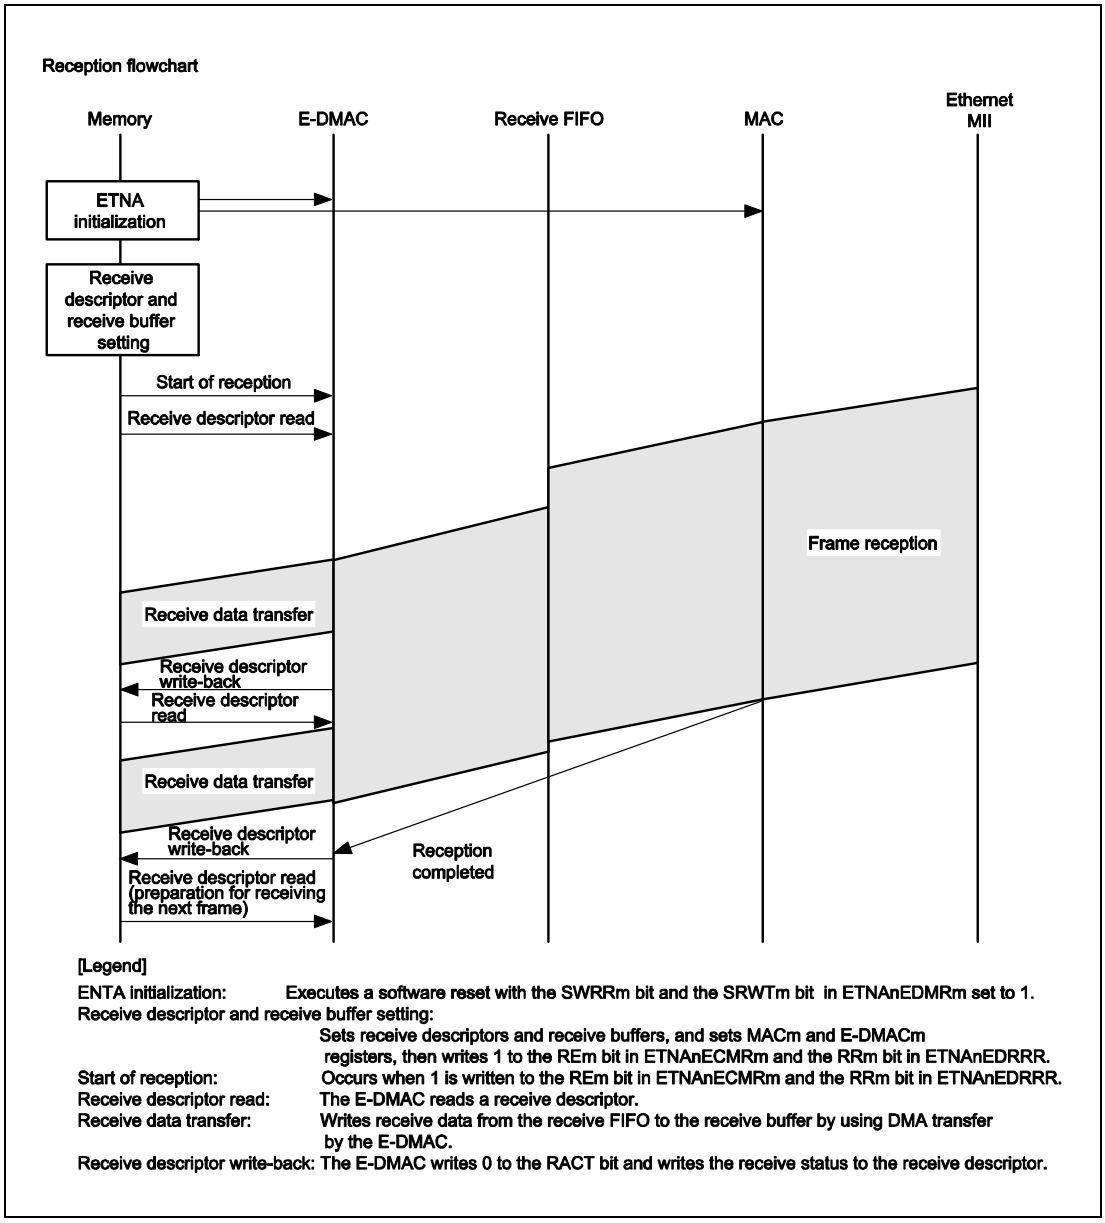

**Figure 21.15 Sample Reception Flowchart (Single-Frame/Two-Descriptor)**

## 21.4.32 Reception Error Processing

### (1) Reception Error

When a reception error occurs, the FR and RABT bits in ETNAnEESRm are set to 1 and an interrupt is issued after a write-back operation for the receive descriptor related to the reception error frame.

If a reception error occurs when the length of the frame received from the MII is less than 32 bytes, DMA transfer to the receive buffer for the frame is not performed. At this time, the receive frame is discarded in the E-DMAC (flush function). However, if padding is inserted in the receive frame by ETNAnRPADIRm, the flush function is performed when the frame length including the padding bytes is less than 32 bytes.

### (2) Receive FIFO Overflow

In any of the following cases, the MAC cannot receive frames from the MII because it has no space to store receive frames, and all the receive frames that have been transferred to the MAC will be discarded in the MAC (receive FIFO overflow).

- Receive FIFO is full of data waiting for DMA transfer (the receive FIFO has no space).
- The number of receive frames waiting for DMA transfer is 24 in total (the receive frame information managing area has no empty space; up to 24 frames can be managed).

If an overflow occurs due to the former case, the RFE bit in ETNAnEESRm is set to 1 and an interrupt is generated. If an overflow occurs due to the latter case, the RFCOF bit in ETNAnEESRm is set to 1 and an interrupt is generated. Each time a receive frame is discarded due to an overflow, ETNAnRMFCRm is incremented. However, ETNAnRMFCRm is not incremented for a receive frame that is cut off due to insufficient receive FIFO space. If a receive frame is cut off due to insufficient receive FIFO space (the frame is partially stored in the receive FIFO), the E-DMAC performs the following operation:

- Performs DMA transfers for the cut-off frame stored in the receive FIFO to the receive buffer.
- After the DMA transfer, performs a write-back operation on the receive descriptor.
- After the write-back operation, sets the ROC bit in ETNAnEESRm to 1 and generates an interrupt.

When the receive FIFO is full of data waiting for DMA transfer, frame reception from the MII can be resumed if DMA transfer is performed from the receive FIFO to the receive buffer and 32 bytes or more of empty space is generated in the receive FIFO. When the number of receive frames waiting for DMA transfer is 24 in total, frame reception from the MII can be resumed if one or more frame has been DMA transferred from the receive FIFO to the receive buffer. For restarting frame reception from the MII, when the E-DMAC resumes frame reception from the MII, it only accepts from the start of the frame.

### (3) Flow Control

When the amount of receive data or the number of receive frames in the receive FIFO leads to one of the following conditions, the E-DMAC notifies the MAC to control MAC writing to the receive FIFO.

- When the space used in the receive FIFO exceeds the data amount specified by ETNAnFCFTRm
- When the number of receive frames in the receive FIFO exceeds the value specified by ETNAnFCFTRm

The threshold of the receive data amount can be set in a range from 256 to 65536 bytes in 256-byte units.

The threshold of receive frames can be set in a range from 1 to 24 frames (by the frame) in frame units.

### (4) Receive Descriptor Empty

When the RACT bit of the read descriptor is 0 (invalid), the receive descriptor empty state is determined and DMA transfer is stopped. Then the following operation is performed.

- Writes the RRm bit in ETNAnEDRRRm to 0
- Sets the RDE bit in ETNAnEESRm to 1 and generates an interrupt to the CPU.

To resume the DMA transfer to the receive buffer, the interrupt source needs to be cleared by software, the receive descriptor needs to be re-set and the RRm bit in ETNAnEDRRRm should be set to 1.

Even if receive descriptor is empty, frame reception from the MII to the receive FIFO is continued if there is empty space left in the receive FIFO and receive frame information management area. Therefore, even if a receive descriptor empty state is determined, the DMA transfer can be performed without discarding the frames received from the MII if DMA transfer to the receive buffer can be resumed before an overflow occurs.

### 21.4.33 CAM Function

Frames input to the MAC are grouped into the following four types; unicast for the product, broadcast, multicast, and unicast to other destinations. The MAC addresses of unicast for the product and broadcast are fixed, and determined only by register settings. Consequently, only multicast and unicast to other destinations determine whether to receive or not and whether to transfer or not by using the CAM (unicast frames whose destination MAC addresses match the product are called unicast frames to the product, and those that do not are called unicast frames to other destinations).

Furthermore, the evaluation of receive of unicast to other destinations and multicast frames by using CAM are performed by referencing the registered MAC addresses of the CAM entry table in the TSU. By using this function, receive FIFO overflow can be prevented caused by accumulation of frame data not required for reception, and CPU processing for determining receive can be reduced.

Each entry in the CAM table can be assigned to port 0, port 1 or both of them by using POST registers (ETNAnTSU_POST1 to 4). When the corresponding bit is set to 1, the CAM evaluation results are used for determining receive. In other words, when the corresponding bit of the POST table is cleared to 0, receive evaluation will be the same as when CAM is not used shown in **Table 21.87 Receive Frame Processing**

The on-chip CAM has entry tables which can register the MAC address of 32 entries, the details of which can be set by ETNAnTSU_ADRH0 to ENATnTSU_ADRH31 and ETNAnTSU_ADRL0 to ETNAnTSU_ADRL31. The setting to enable/disable referencing of the on-chip CAM entry table is performed by the CAM entry table enable setting register which sets whether to perform CAM evaluation or not, and the CAM entry table POST setting register for setting whether to use the CAM determination results for determining receive. When on-chip CAM entry table referencing during receive is enabled, the destination address in the frame and MAC address registered in the CAM entry table are compared, and it is determined whether to transfer the frames input to the MAC to E-DMAC (have E-DMAC receive the frames) or discard the frames. **Table 21.87 Receive Frame Processing** shows the processing method of frames (receive or discard) in reception from MAC0 to E-DMAC0 or that from MAC1 to E-DMAC1,

**Table 21.87 Receive Frame Processing**

| CAM Entry Table Referencing Results | Types of Frame | PRMm = 0 (Normal mode) | | PRMm = 1 (Promiscuous Mode) | |
|---|---|---|---|---|---|
| | | MCTm = 0 | MCTm = 1 | MCTm = 0 | MCTm = 1 |
| CAM hit | unicast for the product | Discarded | | Discarded | |
| | Broadcast | Discarded | | Discarded | |
| | Multicast | Discarded | Received | Discarded | Received |
| | unicast to other product | Received | | Discarded | |
| CAM mishit | unicast for the product | Received | | Received | |
| | Broadcast | Received | | Received | |
| | Multicast | Received | Discarded | Received | Discarded |
| | unicast to other product | Discarded | | Received | |
| CAM disable | unicast for the product | Same as CAM mishit | | | |
| | Broadcast | | | | |
| | Multicast | | | | |
| | unicast to other product | | | | |

[Legend]
PRMm (Bit 0 in ETNAnECMRm): Promiscuous Mode
(0: Normal mode, 1: Promiscuous Mode)
MCTm (Bit 13 in ETNAnECMRm):Multicast receive mode
(0: Receive when CAM mishit, 1: Receive when CAM hit)

## 21.4.34 Transmit/Receive Processing of Multi-Buffer Frame (Single-Frame/Multi-Descriptor)

### (1) Multi-Buffer Frame Transmit Processing in store and forward mode

During multi-buffer frame transmission, the processing shown in **Figure 21.16** is carried out by the E-DMAC.

In the figure the transmit descriptor is shown as active (TACT bit = 1), in case either buffer data has already been transmitted successfully or not. After all descriptors of multi-buffer frame are processed, frame transmission is started. If transmission complete interrupts are enabled in ENTAnEESIPRm, an interrupt is generated immediately after the final descriptor write-back at the end of frame transmission.

E-DMAC does descriptor write-back only to the first and last descriptors

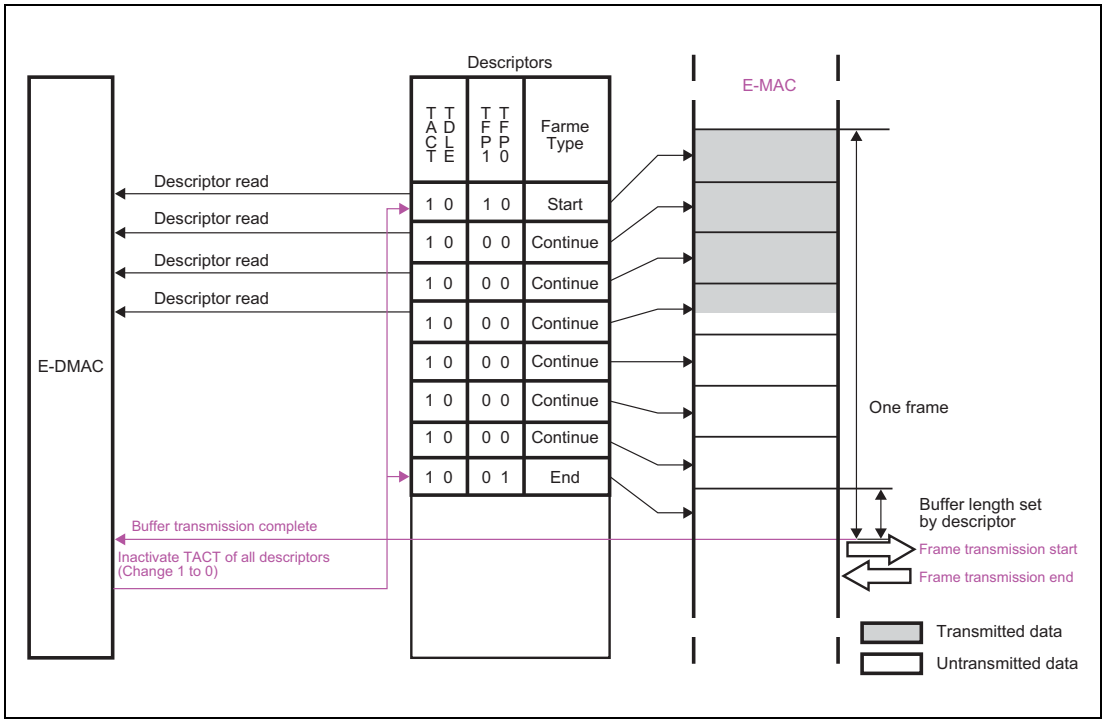

**Figure 21.16 E-DMAC Operation of multi-buffer frame transmission in store and forward mode**

### (2) Receive Processing in the Case of Multi-Buffer Frame

If an error occurs during reception in the case of a multi-buffer frame where a receive frame is divided for storage in multiple buffers, the E-DMAC performs the processing shown in **Figure 21.17, E-DMAC Operation after Receive Error**.

In the figure, the invalid receive descriptors (with the RACT bit cleared to 0) represent the successful reception of data to be stored in buffers, and the valid receive descriptors (with the RACT bit set to 1) represent unreceived buffers. If a frame receive error occurs with a descriptor shown in the figure, the status is written back to the corresponding descriptor.

If error interrupts are enabled in ETNAnEESIPRm, an interrupt is generated immediately after the write-back. If there is a new frame receive request, reception is continued from the buffer after that in which the error occurred.

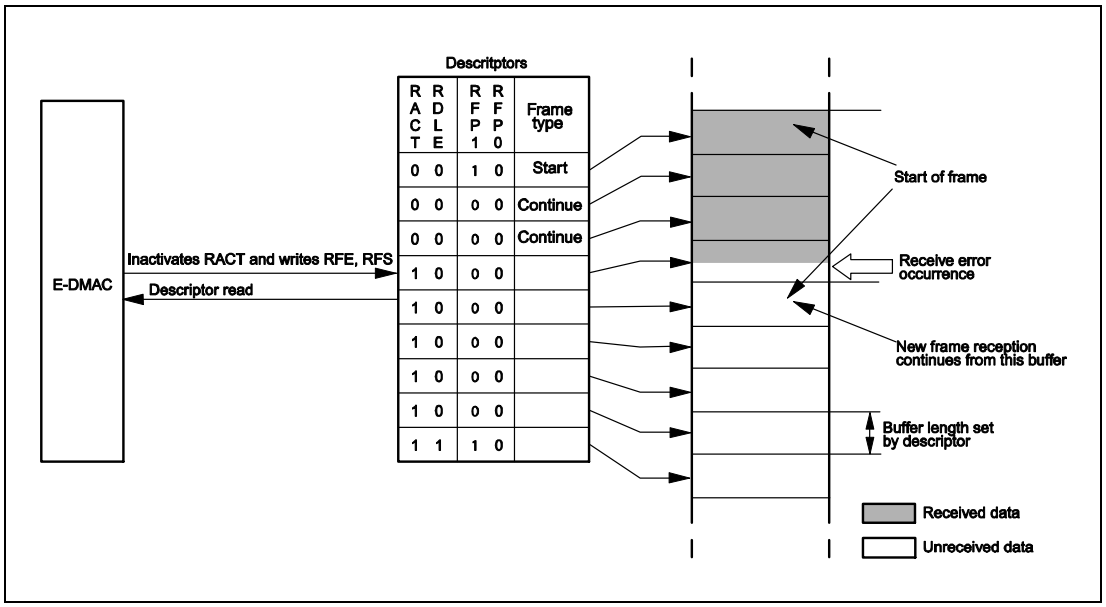

**Figure 21.17 E-DMAC Operation after Receive Error**

### 21.4.35 Padding Insertion in Receive Data

In the E-DMAC, 1 to 31 bytes of padding can be inserted in any byte position of receive data to improve software handling capability. By using this function, for instance, inserting 2-byte padding after the MAC header (14 bytes) of Ethernet frame enables data following the MAC header to set in 4-byte boundary.

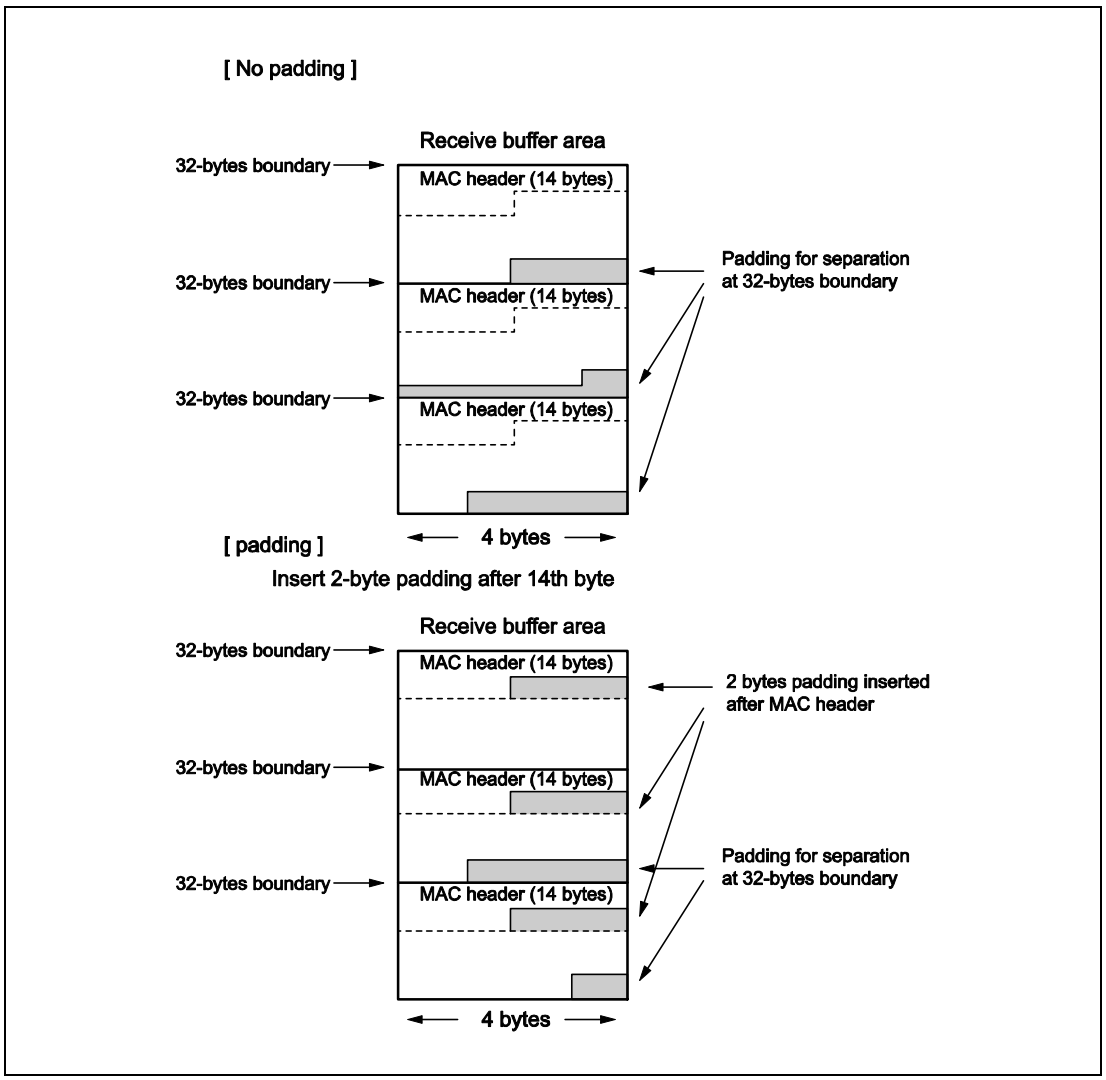

**Figure 21.18 Padding Insertion in Receive Data**

### 21.4.36 Interrupt Sources

The ETNA issues three types of interrupts: receive/transmit interrupts for port 0 (INTETNA0), receive/transmit interrupts for port 1 (INTETNA1) and detected status with transfer for TSU. **Table 21.88, List of ETNA Interrupts and detected statuses** shows these three interrupts, the interrupt sources, interrupt status registers/bits set at interrupt occurrence, and interrupt generation timing.

INTETNA0 or INTETNA1 interrupts are generated in correspondence with the port 0 or port 1 transmit/receive operation. When an interrupt source is generated, it is set in ETNAnEESR0 or ETNAnEESR1 and an interrupt is issued. For some interrupt sources, the ETNAnEESR0/ETNAnEESR1 setting and an interrupt are performed after a write-back operation to a descriptor is completed, not immediately after the interrupt source is detected. Interrupt sources other than the MAC status register source (ECIm bit) are cleared by writing a 1 to the corresponding source bit. The MAC status register source (ECIm bit) is cleared by writing a 1 to the corresponding source bit in ETNAnECSRm. Interrupt source bits retain the values until they are cleared. INTETNAn port 0 or port 1 interrupt source is allowed to issue interrupts by setting the corresponding bit in ETNAnEESIPR0 or ETNAnEESIPR1. Each MAC state register source (ECI bit) is allowed to issue an interrupt by setting the corresponding bit in ETNAnECSIPRm. In the value after reset, interrupts are disabled. Interrupt events generated inside E-MAC (e.g. link layer status) will be routed through E-DMAC, so that masking E-DMAC interrupt by HDIEm bit of ETNAnHDMIERm also masks any E-MAC interrupt event enabled in ETNAnECSIPRm.

**Table 21.88, List of ETNA Interrupts and detected statuses** shows these three interrupts, interrupt sources, interrupt status registers and bits set at interrupt occurrence and interrupt generation timing.

Table 21.88 List of ETNA Interrupts and detected statuses (1/3)

| Interrupt/ Status | Interrupt Source/Status | Register and Bit | Generation Timing |
|---|---|---|---|
| Transmit/ receive interrupt for port 0 (INTETNA0) | Write-back completed | ETNAnEESR0.TWB0 | After write-back |
| | Receive overflow frame write-back completed | ETNAnEESR0.ROC0 | After write-back |
| | Reception abort detection | ETNAnEESR0.RABT0 | After write-back |
| | Receive frame counter overflow | ETNAnEESR0.RFCOF0 | When the interrupt source is detected |
| | MAC status register source | ETNAnEESR0.ECI0 | When the interrupt source is detected |
| | Frame transmission completed | ETNAnEESR0.TC0 | After write-back |
| | Transmit descriptor empty | ETNAnEESR0.TDE0 | When the interrupt source is detected |
| | Frame reception | ETNAnEESR0.FR0 | After write-back |
| | Receive descriptor empty | ETNAnEESR0.RDE0 | When the interrupt source is detected |
| | Receive FIFO overflow | ETNAnEESR0.RFOF0 | When the interrupt source is detected |
| | Detect Loss of Carrier | ETNAnEESR0.DLC0 | When the interrupt source is detected |
| | Delayed Collision Detect | ETNAnEESR0.CD0 | When the interrupt source is detected |
| | Transmit Retry Over | ETNAnEESR0.TRO0 | When the interrupt source is detected |

Table 21.88 List of ETNA Interrupts and detected statuses (2/3)

| Interrupt/ Status | Interrupt Source/Status | Register and Bit | Generation Timing |
|---|---|---|---|
| Transmit/ receive interrupt for port 0 (INTETNA0) | Receive Multicast Address Frame | ETNAnEESR0.RMAF0 | After write-back |
| | Receive Residual-Bit Frame | ETNAnEESR0.RRF0 | After write-back |
| | Receive Too-Long Frame | ETNAnEESR0.RTLF0 | After write-back |
| | Receive Too-Short Frame | ETNAnEESR0.RTSF0 | After write-back |
| | PHY-LSI Receive Error | ETNAnEESR0.PRE0 | After write-back |
| | CRC Error on Received Frame | ETNAnEESR0.CERF0 | After write-back |
| Transmit/ receive interrupt for port 1 (INTETNA1) | Write-Back Completed | ETNAnEESR1.TWB1 | After write-back |
| | Receive Overflow Frame Write-Back Completed | ETNAnEESR1.ROC1 | After write-back |
| | Receive Abort Detect | ETNAnEESR1.RABT1 | After write-back |
| | Receive Frame Counter Overflow | ETNAnEESR1.RFCOF1 | When the interrupt source is detected |
| | MAC1 Status Register Source | ETNAnEESR1.ECI1 | When the interrupt source is detected |
| | Frame Transmission Completed | ETNAnEESR1.TC1 | After write-back |
| | Transmit Descriptor Empty | ETNAnEESR1.TDE1 | When the interrupt source is detected |
| | Frame Reception | ETNAnEESR1.FR1 | After write-back |
| | Receive Descriptor Empty | ETNAnEESR1.RDE1 | When the interrupt source is detected |

| | MAC1 CRC Error Frame Receive | ETNAnTSU_FWSR.RINT11 | When the interrupt source is detected |

## 21.4.37 Activation Procedure

This Ethernet module should be activated by the following procedure:

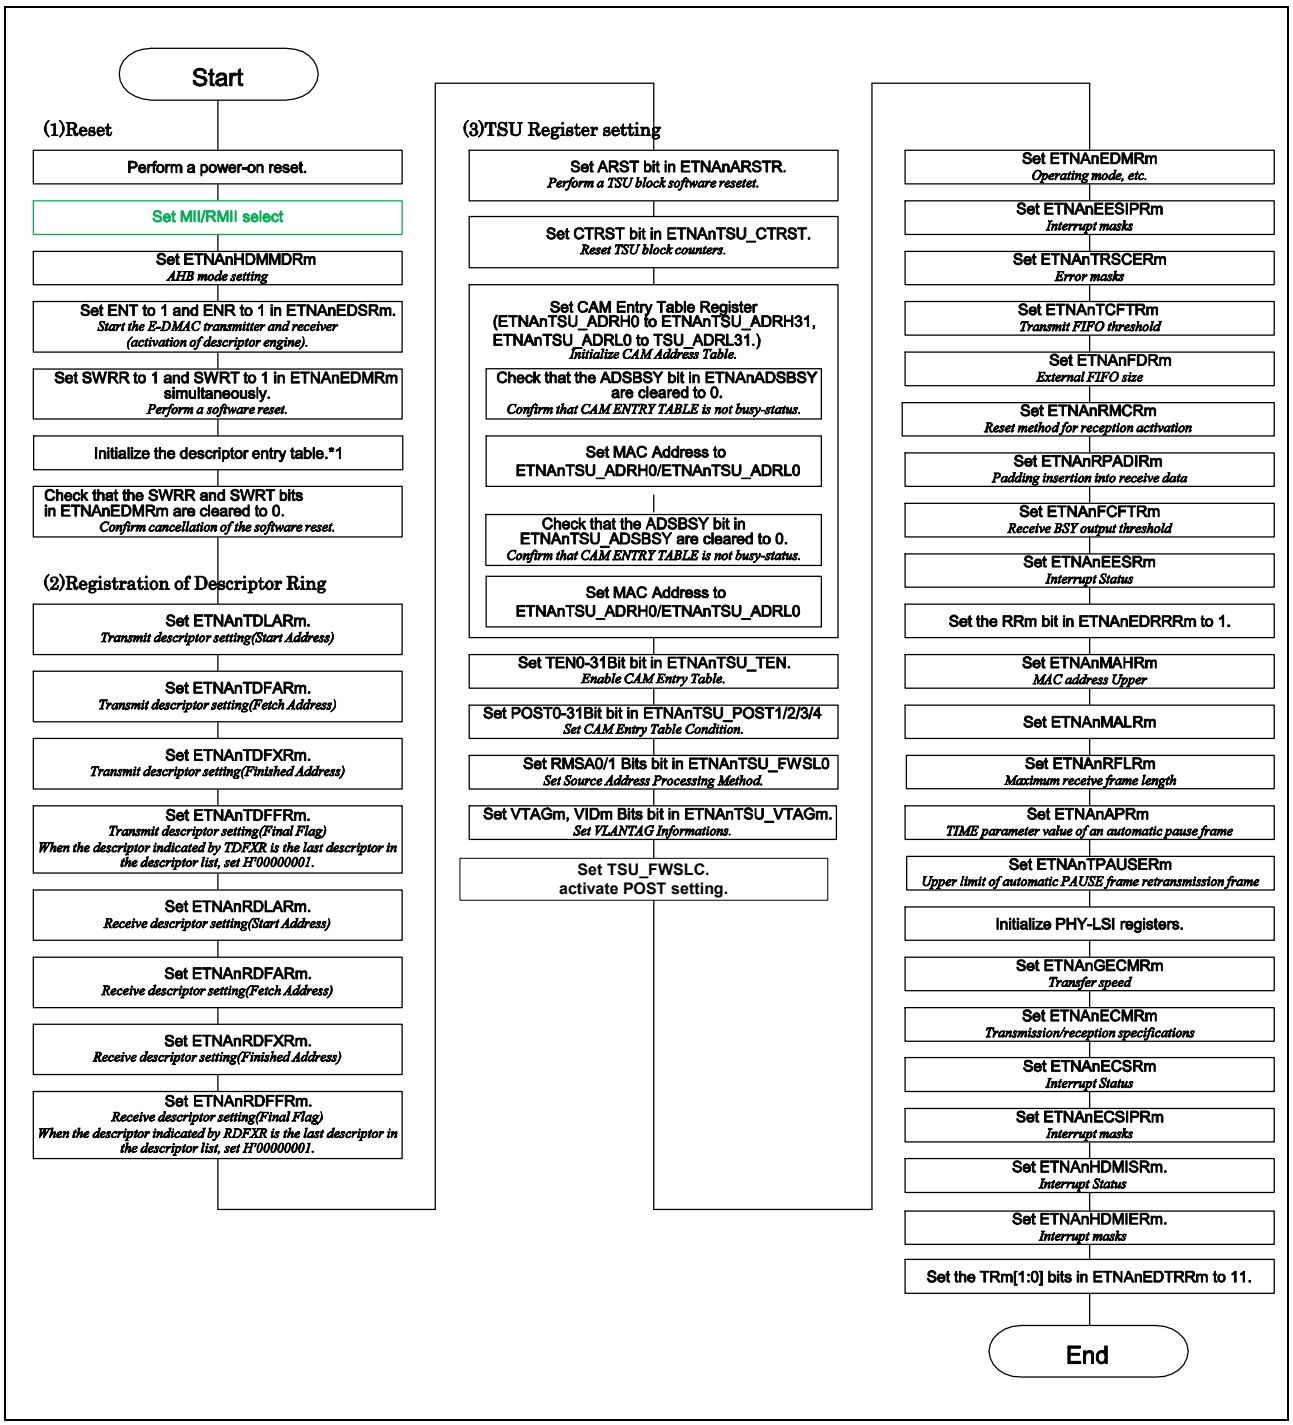

Figure 21.19 Transmit/Receive Start Procedure

**Note 1.** If the termination procedure which written in the next page is not conformed, the descriptor ring may be stopped halfway by unexpected write back which is caused by the transmission or the reception before the termination procedure.

## 21.4.38 Termination Procedure

The figure below shows the transmit/receive stop procedure.

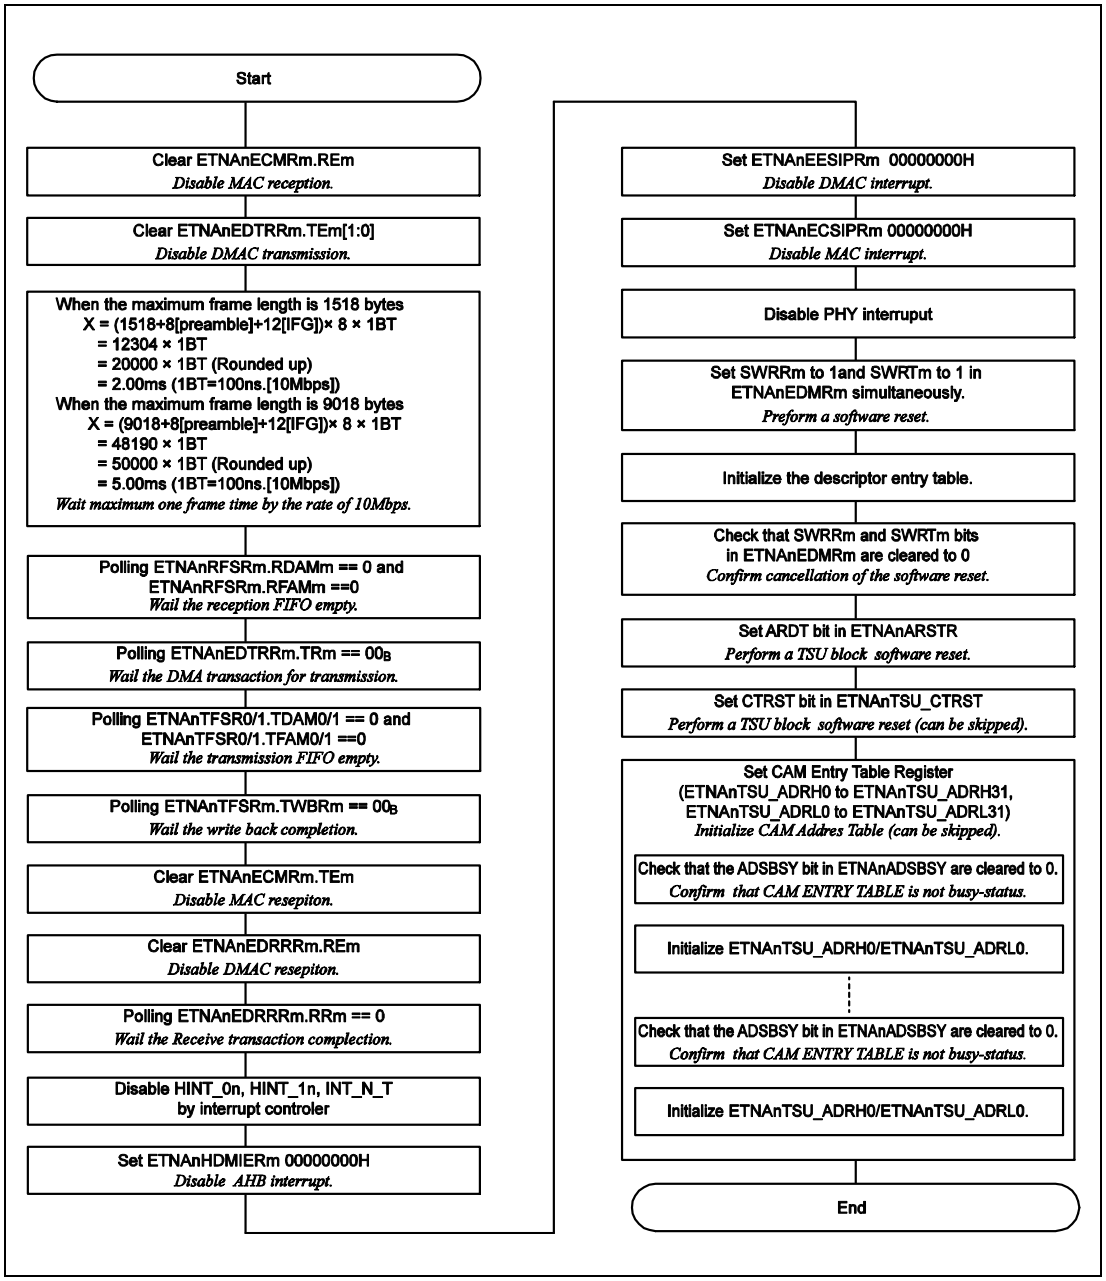

**Figure 21.20 Transmit Stop Procedure**

Even when a software reset for DMA transfer controller (E-DMAC) is issued, stop the transmission/ reception according to the procedure described above.

### 21.4.39 Flow Control

This Ethernet module supports flow control functions conforming to IEEE802.3x for full-duplex operation. The flow control can be applied to both receive and transmit operations. When transmitting PAUSE frames, flow control can be performed by the following two procedures.

### 21.4.40 Automatic PAUSE Frame Transmission

For receive frames, PAUSE frames are automatically transmitted when the number of data written to the receive FIFO reaches the value set in ETNAnFCFTRm. The TIME parameter included in the PAUSE frame is set by ETNAnAPRm. The automatic PAUSE frame transmission is repeated until the number of data in the receive FIFO becomes less than the value set in ETNAnFCFTRm as the receive data is read from the FIFO. Using ETNAnTPAUSERm, the upper limit of retransmission counts of the PAUSE frames can also be set in the range from 1 to 65535. In this case, PAUSE frame transmission is repeated until the number of receive FIFO data becomes less than the ETNAnFCFTRm value, or the number of transmits reaches the value set by ETNAnTPAUSERm. The transmission counter is cleared to 0 when the next PAUSE frame is transmitted after the number of data in the receive FIFO becomes less than the ETNAnFCFTRm value.

The automatic PAUSE frame transmission is enabled when the TXFm bit in ETNAnECMRm is 1.

### 21.4.41 Manual PAUSE Frame Transmission

PAUSE frames are transmitted by directives from the software. When writing the Timer value to ETNAnMPRm, manual PAUSE frame transmission is started. With this method, PAUSE frame transmission is carried out only once.

### 21.4.42 PAUSE Frame Reception

The next frame is not transmitted until the time indicated by the Timer value elapses after receiving a PAUSE frame. However, the transmission of the current frame is continued. A received PAUSE frame is valid only when the RXFm bit in ETNAnECMRm is set to 1. The number of times of PAUSE frame receptions is counted.

### 21.4.43 0-Time PAUSE Frame Control

Flow control is performed using a PAUSE frame with the TIME parameter value set to 0. The PAUSE frame with the TIME parameter set to 0 can be enabled or disabled by the ZPFm bit in ETNAnECMRm.

- When PAUSE frame control with the TIME parameter value set to 0 is enabled
  A PAUSE frame with the TIME parameter value set to 0 is transmitted when the number of data in the receive FIFO is less than the ETNAnFCFTRm value before the time indicated by the TIME parameter value has not elapsed. When a PAUSE frame with the time indicated by the TIME parameter value set to 0 is received, the transmit standby state is canceled.
- When PAUSE frame control with the TIME parameter value set to 0 is disabled
  A PAUSE frame with the TIME parameter value set to 0 is not transmitted. When a PAUSE frame with the TIME parameter value set to 0 is received, the PAUSE frame is discarded.

### 21.4.44 Back-Pressure Flow Control

Back-pressure mode is supported in half-duplex mode. In this mode, when the receive FIFO is full and can not be stored new frames, the following reception frame is forced to retry by the collision which is caused by dummy transmission of the Back Pressure.

### 21.4.45 Magic Packet Detection

This Ethernet module supports the Magic Packet format like shown below:

| DESTINATION (6byte) | SOURCE (6byte) | MISC (2byte~) | FF FF FF FF FF FF | MAC_ADDR×16 (ETNAnMAHRm/LRm) | MISC (0byte~) | CRC (4byte) |
|---|---|---|---|---|---|---|

This Ethernet module has a Magic Packet detection function. This function provides a Wake-On-LAN (WOL) facility that starts each peripheral device connected to a LAN from the host device or other source. This enables to construct a system in which a peripheral device receives a Magic Packet sent from the host device or other source, and starts itself. When the Magic Packet is detected, data is stored in the FIFO by the broadcast packet that has received data previously and the MAC is notified of the receiving status. To return to normal operation , the MAC, TSU and E-DMAC must be initialized by using ARSTm bit in ETNAnARSTR.

With a Magic Packet reception is performed regardless of the destination address in the frame header. Only in case the 16 times duplicated destination address contained in the Magic Packet Sequence matches the MAC address specified in the device, the CPU will be informed by the Magic Packet detection interrupt and the Wake-On-LAN (ETHmWOL) signal notifies that a Magic Packet has been detected. Further information on Magic Packets can be found in the technical documentation published by AMD Corporation.

The procedure for using the WOL function with this LSI is as follows.

1. Disable interrupt source output by means of the various interrupt enable/mask registers.
2. Set the MPDEm bit in ETNAnECMRm.
3. Set the MPDIP bit in ETNAnECSIPRm to the enable setting.
4. If necessary, set the chip operating mode to sleep mode or set peripheral modules to module standby mode.

When a Magic Packet is detected, an interrupt is sent to the system.

# 21.5 Connection to PHY-LSI

## 21.5.1 Accessing MII Registers

MII registers in the PHY-LSI are accessed via ETNAnPIRm. ETNAnPIRm is used as a serial interface conforming to the MII frame format specified in IEEE802.3u.

## 21.5.2 MII Management Frame Format

**Figure 21.21** shows the format of an MII management frame. To access an MII register, a management frame is implemented by the program in accordance with the procedures shown in MII Register Access Procedure.

| Access Type | MII Management Frame | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE |
| Bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | – |
| Read | 1..1 | 01 | 10 | 00001 | RRRRR | Z0 | D...D | – |
| Write | 1..1 | 01 | 01 | 00001 | RRRRR | 10 | D...D | X |

[Legend]
PRE: 32 consecutive 1
ST: Write of 01 indicating start of frame
OP: Write of code indicating access type
PHYAD: Write of 00001 when the PHY-LSI address is 1 (sequential write starting with the MSB)
The PHYAD bits vary with the PHY-LSI address.
REGAD: Write of 00001 when the register address is 1 (Sequential write starting with the MSB)
The REGAD bits vary with the PHY-LSI register address.
TA: Time for switching data transmission source on the MII interface
(a) Write: 10 written
(b) Read: Bus release [notation: Z0] performed
DATA: 16-bit data. Sequential write or read starting with the MSB
(a) Write: 16-bit data write
(b) Read: 16-bit data read
IDLE: Wait time until next MII management format input
(a) Write: Independent bus release [notation: X] performed
(b) Read: Bus already released at TA (control unnecessary)

**Figure 21.21 MII Management Frame Format**

### 21.5.3 MII Register Access Procedure

The program accesses MII registers via ETNAnPIRm. Access is implemented by a combination of 1-bit-unit data write, 1-bit-unit data read, bus release, and independent bus release. **Figure 21.22** shows the MII register access timing. The timing will differ depending on the PHY-LSI type.

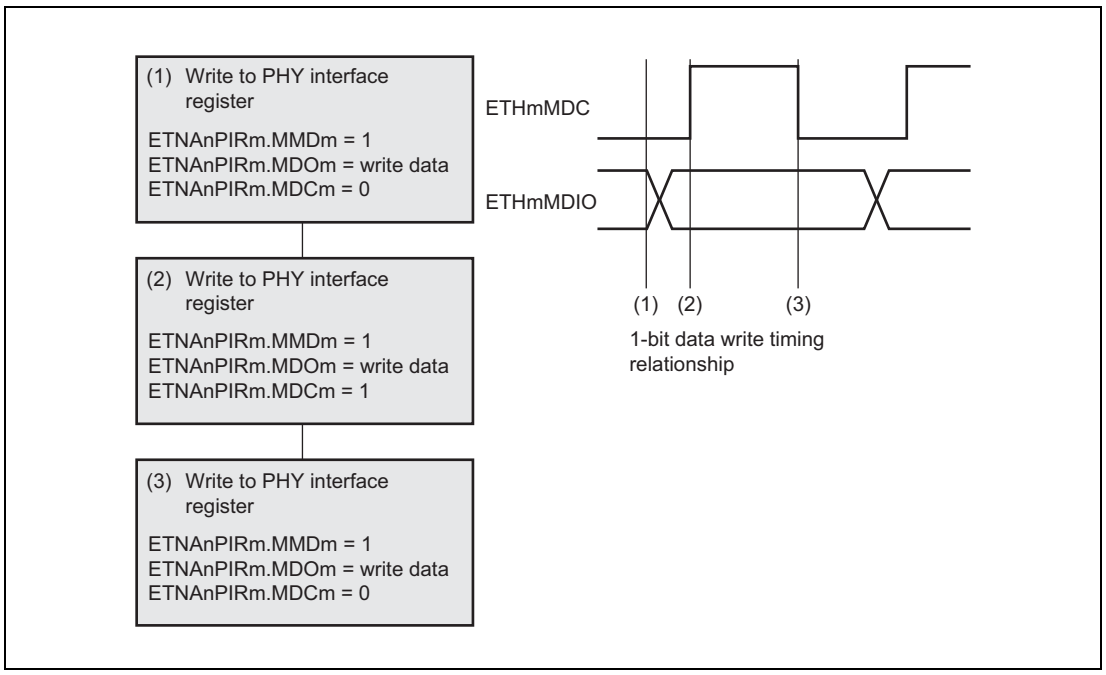

**Figure 21.22 1-Bit Data Write Flowchart**

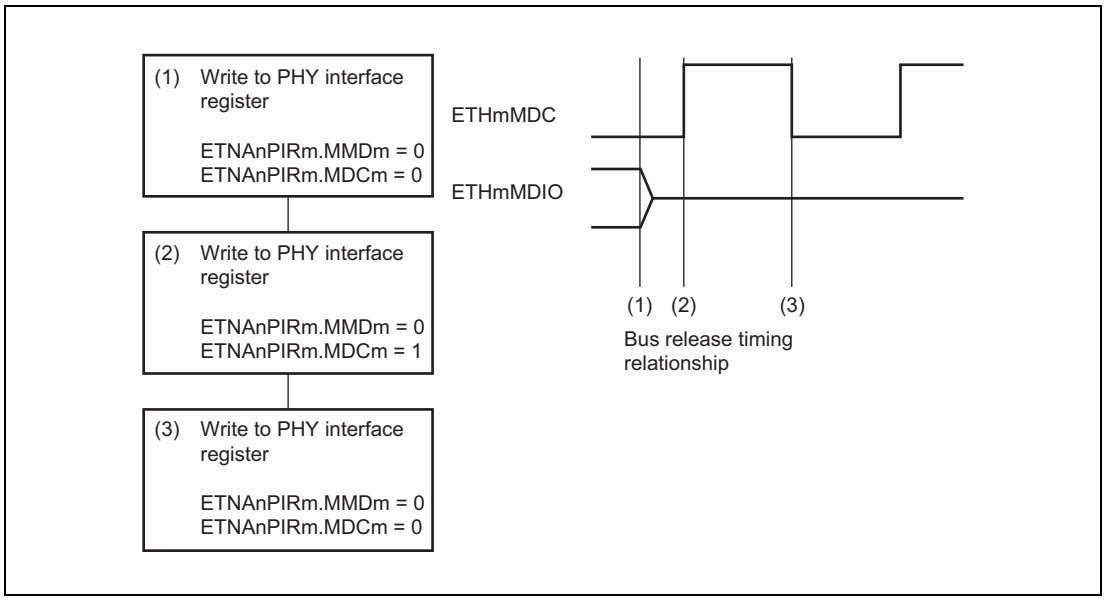

**Figure 21.23 Bus Release Flowchart (TA in Read in Figure 21.21)**

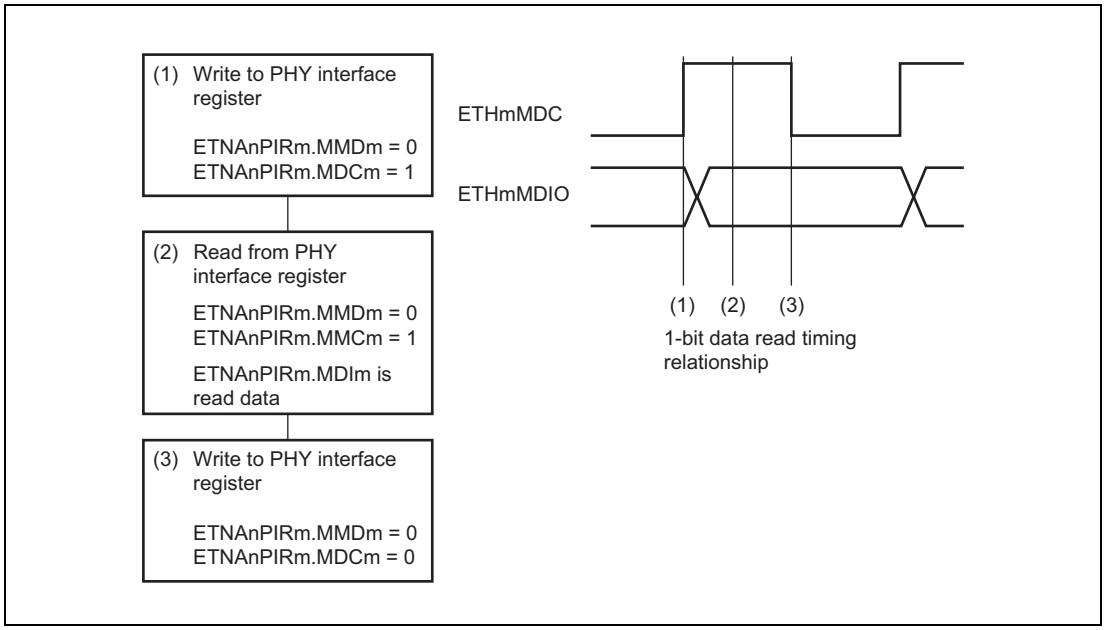

**Figure 21.24 1-Bit Data Read Flowchart**

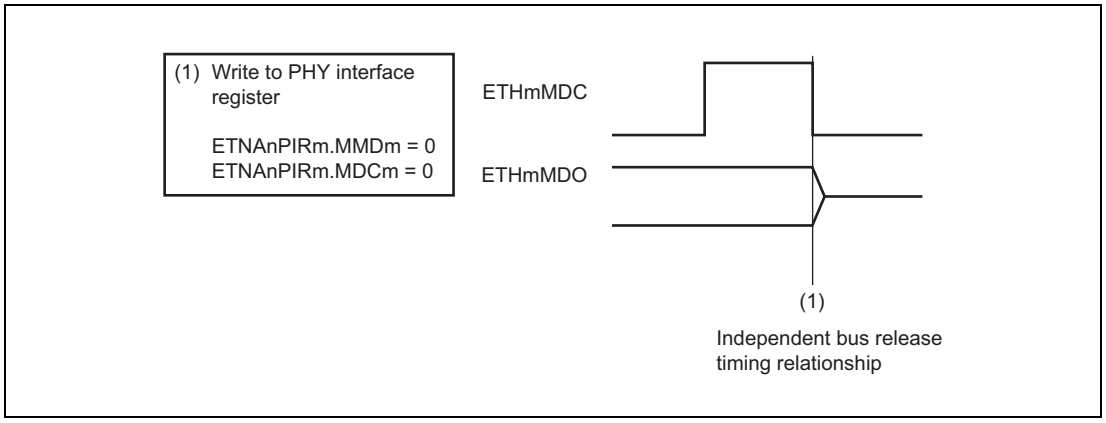

**Figure 21.25 Independent Bus Release Flowchart (IDLE in Write in Figure 21.21)**

## 21.6 Usage Notes

### 21.6.1 Checksum Calculation of Ethernet Frames

This LSI is capable of calculating the checksum data of the received frames. Only the data fields of the Ethernet frames are subject to calculation. Specifically, a data field follows the length/type field and is followed by the CRC field. Calculation involves 16-bit addition only; it does not involve bit reversal.

**NOTE**

Also for the frames with VLANTag inserted, the 15th byte from the top and the following bytes before the CRC field are subject to calculation.

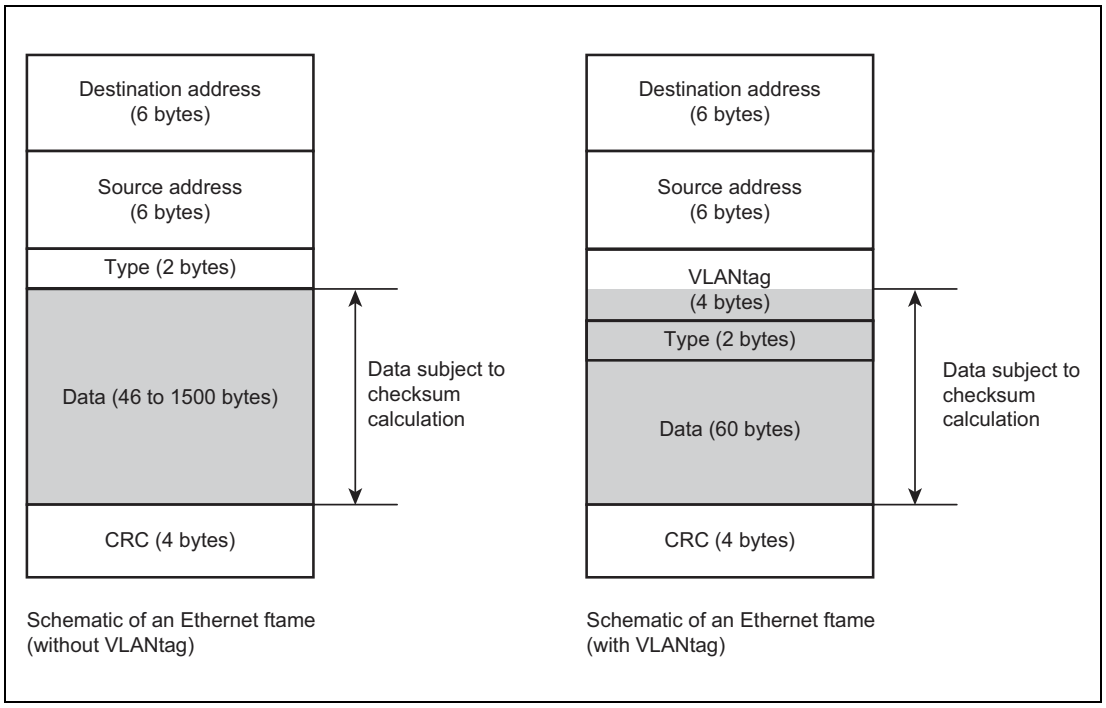

**Figure 21.26 Data Subject to Checksum Calculation**

## 21.7 Configuration of MII/RMII Mode

The bridge function of MII-to-RMII and RMII-to-MII is realized by converting the receive signal from RMII to MII and the transmit signal from MII to RMII by the MII2RMII block. The operation is performed in multiple different communication modes depending on the setting of the mode signal. **Table 21.89** lists the mode setting in each communication mode.

**Table 21.89 Operation State in Each Communication Mode**

| Communication mode | I/F specifications | MII | RMII | RMII | RMII | RMII |
|---|---|---|---|---|---|---|
| | Communication rate | 10 M/100 M | 10 Mbps | 10 Mbps | 100 Mbps | 100 Mbps |
| | Communication system | Full/half duplex | Half duplex | Full duiplex | Half duplex | Full duiplex |
| Register setting | ETNAnEDSRm.GPOm bit | 0 | 1 | | | |
| | ETNAnEMRm.SPEEDm1 bit | — | 0 | | 1 | |
| | ETNAnECMRm.DMm bit | — | 0 | 1 | 0 | 1 |

# Section 22 Single Edge Nibble Transmission (SENT)

This section describes the Renesas single edge nibble transmission (RSENT) module.

The first subsection describes all the characteristics specific to the RH850/P1x-C such as channels, register base addresses, and input/output signal names.
The second and subsequent subsections describe characteristics common to of SENT.

## 22.1 RH850/P1x-C SENT Overview

### 22.1.1 Number of Channels

The RH850/P1x-C includes up to ten SENT channels.

**Table 22.1 SENT Channels**

| | SENT |
|---|---|
| Number of Channels | n |
| Name | RSENTn |

#### Index n

This section identifies each RSENT channel by “n” (n = 0 to 9). For example, the RSENT timestamp register is described as RSENTnTSPC.

**Table 22.2 The number of channels in each product**

| Channel index | P1M-C (QFP, BGA-292) | P1M-C (BGA-156) | P1H-C (4MB, BGA-292) | P1H-C (4MB, BGA-156) | P1H-C (8MB) | P1H-CE |
|---|---|---|---|---|---|---|
| Channel number(n) | 6 (0 to 5) | 4 (0 to 3) | 8 (0 to 7) | 4 (0 to 3) | 8 (0 to 7) | 10 (0 to 9) |

### 22.1.2 Register Addresses

RSENT register addresses are represented by an offset from the base address <RSENTn_base>.

The following table shows the base address <RSENTn_base> of each RSENT module.

**Table 22.3 Register Base Address <RSENTn_base>**

| RSENTn Channel | <RSENTn_base> Address | P1M-C (QFP, BGA-292) | P1M-C (BGA-156) | P1H-C (4MB, BGA-292) | P1H-C (4MB, BGA-156) | P1H-C (8MB) | P1H-CE |
|---|---|---|---|---|---|---|---|
| RSENT0 | FFCD C000$_H$ | √ | √ | √ | √ | √ | √ |
| RSENT1 | FFCD C100$_H$ | √ | √ | √ | √ | √ | √ |
| RSENT2 | FFCD C200$_H$ | √ | √ | √ | √ | √ | √ |
| RSENT3 | FFCD C300$_H$ | √ | √ | √ | √ | √ | √ |
| RSENT4 | FFCD C400$_H$ | √ | — | √ | — | √ | √ |
| RSENT5 | FFCD C500$_H$ | √ | — | √ | — | √ | √ |
| RSENT6 | FFCD C600$_H$ | — | — | √ | — | √ | √ |
| RSENT7 | FFCD C700$_H$ | — | — | √ | — | √ | √ |
| RSENT8 | FFCD C800$_H$ | — | — | — | — | — | √ |
| RSENT9 | FFCD C900$_H$ | — | — | — | — | — | √ |

### 22.1.3 Clock Supply

The following clock input is supplied for the RSENT module.

**Table 22.4 Clock Supply**

| Unit Name | Clock for the Unit | Supply Clock Name |
|---|---|---|
| RSENTn | P-Bus interface clock (PCLK) | CLK_LSB |
| | RSENT communication clock(CLKC) | CLKP_H1 |

**Note:** CLK_LSB frequency can be in the range of 16MHz to 40MHz.
CLKP_H1 frequency can be either 16MHz or in the range of 32MHz to 80MHz.

For detail of clock supply, see **Section 12, Clock Controller**.

### 22.1.4 Interrupts and DMA requests

The RSENT module can generate the following interrupt requests.

**Table 22.5 Interrupt Requests (1/2)**

| Unit Interrupt Name | Outline | Interrupt Number | DMA Trigger Number | DTS Trigger Number |
|---|---|---|---|---|
| **RSENT0** | | | | |
| INTSENT0SI | RSENT status interrupt | 208 | — | — |
| INTSENT0RI | RSENT receive interrupt | 209 | 98 | 108 |
| **RSENT1** | | | | |
| INTSENT1SI | RSENT status interrupt | 210 | — | — |
| INTSENT1RI | RSENT receive interrupt | 211 | 99 | 109 |
| **RSENT2** | | | | |
| INTSENT2SI | RSENT status interrupt | 212 | — | — |
| INTSENT2RI | RSENT receive interrupt | 213 | 100 | 110 |
| **RSENT3** | | | | |
| INTSENT3SI | RSENT status interrupt | 214 | — | — |
| INTSENT3RI | RSENT receive interrupt | 215 | 101 | 111 |
| **RSENT4** | | | | |
| INTSENT4SI | RSENT status interrupt | 216 | — | — |
| INTSENT4RI | RSENT receive interrupt | 217 | 102 | 112 |
| **RSENT5** | | | | |
| INTSENT5SI | RSENT status interrupt | 218 | — | — |
| INTSENT5RI | RSENT receive interrupt | 219 | 103 | 113 |
| **RSENT6** | | | | |
| INTSENT6SI | RSENT status interrupt | 220 | — | — |
| INTSENT6RI | RSENT receive interrupt | 221 | 104 | 114 |
| **RSENT7** | | | | |
| INTSENT7SI | RSENT status interrupt | 222 | — | — |
| INTSENT7RI | RSENT receive interrupt | 223 | 105 | 115 |
| **RSENT8** | | | | |
| INTSENT8SI | RSENT status interrupt | 224 | — | — |
| INTSENT8RI | RSENT receive interrupt | 225 | 106 | 116 |

Table 22.5 Interrupt Requests (2/2)

| Unit Interrupt Name | Outline | Interrupt Number | DMA Trigger Number | DTS Trigger Number |
|---|---|---|---|---|
| **RSENT9** | | | | |
| INTSENT9SI | RSENT status interrupt | 226 | — | — |
| INTSENT9RI | RSENT receive interrupt | 227 | 107 | 117 |

## 22.1.5 RSENT Hardware Reset

The RSENT module and its registers are initialized by the following reset signal.

Table 22.6 Register Reset Condition

| Unit Name | Register Name | Reset Condition | | | | |
|---|---|---|---|---|---|---|
| | | Power On Reset | System Reset 1 | System Reset 2 | Application Reset 1 | Limited Reset |
| RSENTn | All registers | √ | √ | √ | √ | √ |

**Note:** See **Section 8, Reset Controller**.
And RSENTn have RESET mode, see **Section 22.4.1.1, RESET Mode**.

### 22.1.6 External Input/Output Signals

The following table shows the RSENT input/output signals.

**Table 22.7 RSENTn Input/Output Signals**

| RSENTn Signal | Function | Connected to |
|---|---|---|
| **RSENT0** | | |
| sent_rx | RSENT data input | Port SENT0RX |
| sent_spc | RSENT SPC extension output | Port SENT0SPCO |
| **RSENT1** | | |
| sent_rx | RSENT data input | Port SENT1RX |
| sent_spc | RSENT SPC extension output | Port SENT1SPCO |
| **RSENT2** | | |
| sent_rx | RSENT data input | Port SENT2RX |
| sent_spc | RSENT SPC extension output | Port SENT2SPCO |
| **RSENT3** | | |
| sent_rx | RSENT data input | Port SENT3RX |
| sent_spc | RSENT SPC extension output | Port SENT3SPCO |
| **RSENT4** | | |
| sent_rx | RSENT data input | Port SENT4RX |
| sent_spc | RSENT SPC extension output | Port SENT4SPCO |
| **RSENT5** | | |
| sent_rx | RSENT data input | Port SENT5RX |
| sent_spc | RSENT SPC extension output | Port SENT5SPCO |
| **RSENT6** | | |
| sent_rx | RSENT data input | Port SENT6RX |
| sent_spc | RSENT SPC extension output | Port SENT6SPCO |
| **RSENT7** | | |
| sent_rx | RSENT data input | Port SENT7RX |
| sent_spc | RSENT SPC extension output | Port SENT7SPCO |
| **RSENT8** | | |
| sent_rx | RSENT data input | Port SENT8RX |
| sent_spc | RSENT SPC extension output | Port SENT8SPCO |
| **RSENT9** | | |
| sent_rx | RSENT data input | Port SENT9RX |
| sent_spc | RSENT SPC extension output | Port SENT9SPCO |

## 22.2 Overview

### Overview of Functions

The RSENT interface supports the following standard specification (SAE J2716 version JAN2010) functions:

- Triple speed expansion Tick Time: Clock cycle (1 µs to 90 µs)
- Variable data transmission rate
  - 24.7 kbps to 64.9 kbps: 3 µs clock rate 6 nibble data
  - 74.1 kbps to 194.8 kbps: 1 µs clock rate 6 nibble data
- Unidirectional communication: Between the sensor and MCU
- Bidirectional communication: Between the sensor and MCU (supported in SPC mode)
- Single edge data transmission: Coded by the temporal distance of two serially-detected falling edges on a data line
- Transmission frame with up to 6 data nibbles and additional status and communication nibble
- Data transmission protected with CRC is available.
  - CRC data can be read with the RSENTnSRXD.SCRC and RSENTnFRXD.FCRC bits.
- Calibration phase in each data frame (RSENTnCPL.CPLV bits)
- Multiple sensors can be connected to one RSENT channel by means of the SPC function.
- Interrupt functions: Receive interrupt and status interrupt.
- DMA function: Receive interrupt is used for DMA trigger
  (DMA line is same as receive interrupt line.)
- The timestamp function: Master or slave can be selected for the RSENT module. (RSENTnTSPC.TMS bit)

Each RSENT macro consists of one RSENT channel.

Each time stamp counter of the macros can run independently, or in order to synchronise the timestamp across multiple channels, one instance can be set as master and reset the configured consecutive time stamp counters. Depending on the total number of instances, more than one master-slave(s) pairs can be configured.

Each RSENT macro supports below requirements in addition to SAE J2716 specification of JAN2010:

R1: 32-Bit-Register for serial sensor data (24Bit + CRC6 + READ-Bit)

R2: Includes comparator for sensor data evaluation

R3: CRC check of received sensor data implemented but CRC code transparent

R4: 32-Bit counter for time stamp (resolution: 1µs)

R5: clock ticks down to 1µs

R6: SPC (Short PWM Code) extension

- Enables bidirectional communication channel
- Master can pull down the signal to initiate SENT message

- The RSENT circuit consists of the following functions:
  - Data receive part
  - Clock recovery
  - Register group

### 22.2.1 Block Diagram

The following figure shows a block diagram of the RSENT module.

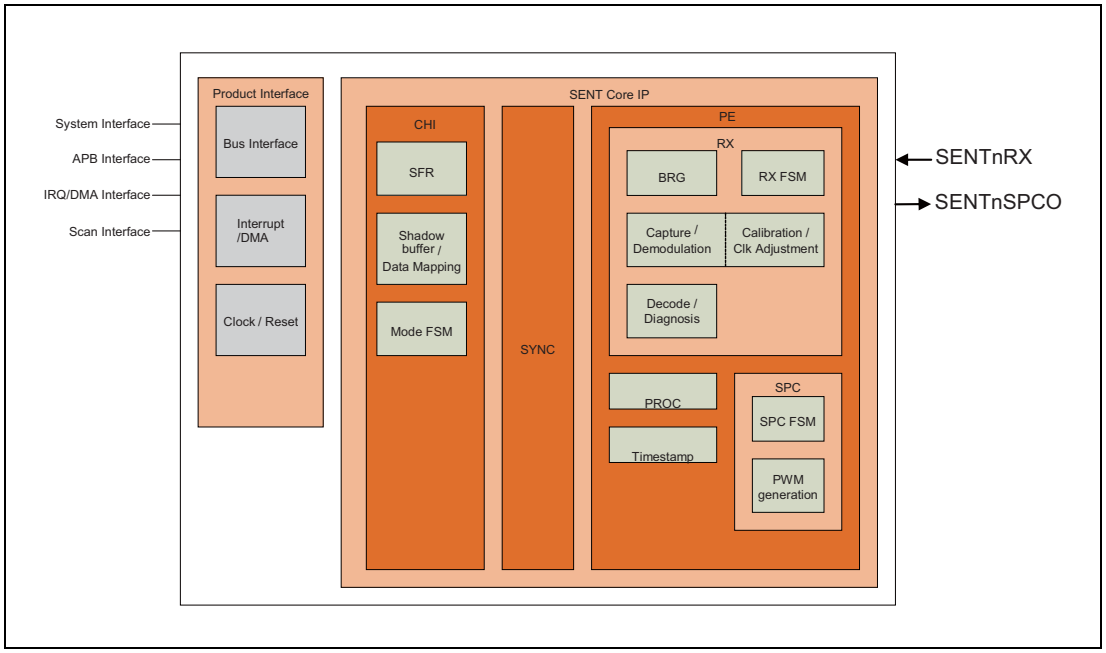

**Figure 22.1 Block Diagram of RSENT**

## 22.3 Registers

RSENTn is controlled and operated by the following registers.

**Table 22.8 Overview of RSENTn Registers**

| Register Name | Abbreviation | Address | Access Protection | |
|---|---|---|---|---|
| | | | PBG | Other |
| RSENT timestamp register | RSENTnTSPC | <RSENTn_base> + $0000_H$ | PBG4#1.PG4-SENT | — |
| RSENT timestamp counter | RSENTnTSC | <RSENTn_base> + $0004_H$ | PBG4#1.PG4-SENT | — |
| RSENT communication configuration register | RSENTnCC | <RSENTn_base> + $0010_H$ | PBG4#1.PG4-SENT | — |
| RSENT baud rate prescaler register | RSENTnBRP | <RSENTn_base> + $0014_H$ | PBG4#1.PG4-SENT | — |
| RSENT interrupt/DMA enable register | RSENTnIDE | <RSENTn_base> + $0018_H$ | PBG4#1.PG4-SENT | — |
| RSENT mode control register | RSENTnMDC | <RSENTn_base> + $001C_H$ | PBG4#1.PG4-SENT | — |
| RSENT SPC transmission register | RSENTnSPCT | <RSENTn_base> + $0020_H$ | PBG4#1.PG4-SENT | — |
| RSENT mode status register | RSENTnMST | <RSENTn_base> + $0024_H$ | PBG4#1.PG4-SENT | — |
| RSENT communication status register | RSENTnCS | <RSENTn_base> + $0028_H$ | PBG4#1.PG4-SENT | — |
| RSENT communication status clear register | RSENTnCSC | <RSENTn_base> + $002C_H$ | PBG4#1.PG4-SENT | — |
| RSENT slow channel receive timestamp register | RSENTnSRTS | <RSENTn_base> + $0030_H$ | PBG4#1.PG4-SENT | — |
| RSENT slow channel receive data register | RSENTnSRXD | <RSENTn_base> + $0034_H$ | PBG4#1.PG4-SENT | — |
| RSENT calibration pulse length register | RSENTnCPL | <RSENTn_base> + $0038_H$ | PBG4#1.PG4-SENT | — |
| RSENT message length register | RSENTnML | <RSENTn_base> + $003C_H$ | PBG4#1.PG4-SENT | — |
| RSENT fast channel receive timestamp register | RSENTnFRTS | <RSENTn_base> + $0040_H$ | PBG4#1.PG4-SENT | — |
| RSENT fast channel receive data register | RSENTnFRXD | <RSENTn_base> + $0044_H$ | PBG4#1.PG4-SENT | — |
| RSENT0 timestamp mode selection register | RSENT0TSSEL | $FFCDCF00_H$ | PBG4#1.PG4-SENT | — |
| RSENT1 timestamp mode selection register | RSENT1TSSEL | $FFCDCF04_H$ | PBG4#1.PG4-SENT | — |
| RSENT2 timestamp mode selection register | RSENT2TSSEL | $FFCDCF08_H$ | PBG4#1.PG4-SENT | — |
| RSENT3 timestamp mode selection register | RSENT3TSSEL | $FFCDCF0C_H$ | PBG4#1.PG4-SENT | — |
| RSENT4 timestamp mode selection register | RSENT4TSSEL | $FFCDCF10_H$ | PBG4#1.PG4-SENT | — |
| RSENT5 timestamp mode selection register | RSENT5TSSEL | $FFCDCF14_H$ | PBG4#1.PG4-SENT | — |
| RSENT6 timestamp mode selection register | RSENT6TSSEL | $FFCDCF18_H$ | PBG4#1.PG4-SENT | — |
| RSENT7 timestamp mode selection register | RSENT7TSSEL | $FFCDCF1C_H$ | PBG4#1.PG4-SENT | — |
| RSENT8 timestamp mode selection register | RSENT8TSSEL | $FFCDCF20_H$ | PBG4#1.PG4-SENT | — |
| RSENT9 timestamp mode selection register | RSENT9TSSEL | $FFCDCF24_H$ | PBG4#1.PG4-SENT | — |

**<RSENTn_base>**

The base address <RSENTn_base> of RSENTn is defined by the keywords in **Table 22.3, Register Base Address <RSENTn_base>**.

### 22.3.1 RSENTnTSPC — RSENT Timestamp Register

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $0000_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | TMS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | TTM[6:0] | | | | | | | — | TTPV[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 22.9 RSENTnTSPC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 17 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 16 | TMS | Timestamp Mode Selection<br>0: Master mode<br>1: Slave mode |
| 15 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 14 to 8 | TTM[6:0] | Timestamp Tick Multiplier<br>$0000000_B$: 1<br>$0000001_B$: 2<br>$0000010_B$: 3<br>:<br>$1111111_B$: 128 |
| 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | TTPV[6:0] | Timestamp Tick Prescaler Value<br>$0000000_B$: 1<br>$0000001_B$: 2<br>$0000010_B$: 3<br>:<br>$1111111_B$: 128 |

#### RSENTnTSPC.TMS (Timestamp Mode Selection)

This bit defines the timestamp counter synchronization mode.

For information about the timestamp clock settings, see **Section 22.4.2.1, Timestamp**.

When this bit is set to 0, the timestamp counter operates in master mode.

When writing $0000\ 0000_H$ to RSENTnTSC, the timestamp counter is cleared. In addition all RSENT timestamp counters operating as slave of RSENT are also cleared. For master-slave interconnection, see **Section 22.4.2.1(2), Timestamp Counter Operation**.

When this bit is set to 1, the timestamp counter operates in slave mode.

The timestamp counter is only cleared when writing $0000\ 0000_H$ to the timestamp counter of RSENT module that operates in master mode.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as the RSENT module that operates in master mode.

The CPU should not set this bit to 1 for RSENT module that operates in master mode.

#### RSENTnTSPC.TTM (Timestamp Tick Multiplier)

These bits define the multiplication value of the 1-µs time tick used for the timestamp counter.

For timestamp clock configuration, see **Section 22.4.2.1, Timestamp**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

#### RSENTnTSPC.TTPV (Timestamp Tick Prescaler Value)

These bits define the prescaler value to generate a 1-µs clock tick.

For timestamp clock configuration, see **Section 22.4.2.1, Timestamp**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

The CPU should configure this value in such a way that, based on the supplied communication clock, a 1-µs clock tick is generated.

## 22.3.2 RSENTnTSC — RSENT Timestamp Counter

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $0004_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 22.10 RSENTnTSC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | TS[31:0] | Timestamp counter value |

### RSENTnTSC.TS (Timestamp)

These bits indicate the current timestamp counter value.

The CPU can write to these bits values other than $0000\ 0000_H$ only if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).Even if any value is written in these bits, these bits are initialized.

When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS = 1), writing to this register has no effect when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either 011 or 101).

The timestamp counter is incremented on every timestamp counter tick (as configured in the RSENTnTSPC.TTPV and RSENTnTSPC.TTM bits) when the RSENT module is in either of the OPERATION IDLE or OPERATION ACTIVE modes (the RSENTnMST.OMS bits are either 011 or 101).

When the timestamp counter is configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU writes $0000\ 0000_H$ to these bits and RSENTnTSC.TS is set to $0000\ 0000_H$.

When the timestamp counter is configured to operate in slave mode (RSENTnTSPC.TMS = 1), the CPU writes $0000\ 0000_H$ to the RSENTnTSC.TS bits of RSENT module that operates in master mode and the RSENTnTSC.TS bits are set to $0000\ 0000_H$.

### 22.3.3 RSENTnCC — RSENT Communication Configuration Register

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $0010_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

Table 22.11 RSENTnCC register contents (2/2)

| Bit Position | Bit Name | Function |
|---|---|---|
| 0 | SPEC | SPC Mode Enable<br>0: SPC mode disabled<br>1: SPC mode enabled |

### RSENTnCC.SOPC (SPC Output Polarity Control)

When this bit is set to 0, the SPC pulse is sent as an active high signal. The default output value is low level.

When this bit is set to 1, the SPC pulse is sent as an active low signal. The default output value is high level.

For SPC operation, see also **Section 22.4.4, SPC Function**.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

**NOTE**

Any change to this bit from the default value becomes effective on the output value when entering the OPERATION_ACTIVE mode (MST.OMS is 3'b101). When entering RESET mode (MST.OMS is 3'b000), the output level is set to the default value (low level).

### RSENTnCC.FCM (Frame Check Method)

When this bit is set to 0, the current calibration pulse is compared to the next received calibration pulse.

The buffer update mechanism is operating according to the preferred option as described in SAE J2716 2010.

When this bit is set to 1, the current calibration pulse is compared to the previously received calibration pulse.

The buffer update mechanism is operating according to the second option as described in SAE J2716 2010 which should be only used if extra latency to process the second calibration pulse cannot be tolerated.

For buffer update timings, see also **Section 22.4.3.2(3), Fast Channel Message Reception**.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

### RSENTnCC.SCCD (Slow Channel CRC Check Disable)

When this bit is set to 1, the CRC check for the slow channel is disabled. In this case, messages are stored in the slow channel message buffer with the received CRC.

When this bit is set to 1, the RSENTnCS.SCS bit is not set.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

### RSENTnCC.FCCD (Fast Channel CRC Check Disable)

When this bit is set to 1, the CRC check for the fast channel is disabled. In this case, messages are stored in the fast channel message buffer with the received CRC.

When this bit is set to 1, the RSENTnCS.FCS bit is not set.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

#### RSENTnCC.DCF (Data nibble CRC Format)

This bit selects between the SAE J2716 2010 data nibble CRC format and the legacy format.

When this bit is set to 0 the recommended CRC implementation according to SAE J2716 2010 section 5.4.2.2 is selected.

When this bit is set to 1 the legacy CRC implementation according to SAE J2716 2008 is selected.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (RSENTnMST.OMS = $001_B$)

#### RSENTnCC.SMF (Serial Message Format)

These bits define the serial message format expected to be received for automatic extraction.

When these bits are set to 00, no serial message is extracted and the status and communication nibble are provided in the RSENTnSRXD register.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are 001).

The CPU shall set these bits to 00 when RSENTnCC.SPCE is set to 1 and more than one sensor is connected to the RSENT module.

#### RSENTnCC.PPTC (Pause Pulse Type Configuration)

This bit defines the pause pulse type.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

The CPU should not set this bit to 1 when the RSENTnCC.PPC bit is set to 0.

#### RSENTnCC.PPC (Pause Pulse Configuration)

This bit defines the presence or absence of the pause pulse.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

#### RSENTnCC.NDN (Number of Data Nibbles)

These bits define the number of data nibbles included in an SENT message.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

#### RSENTnCC.SPCE (SPC Mode Enable)

This bit enables the SPC mode.

For details about SPC mode operation, see also **Section 22.4.4, SPC Function**.

The CPU can only write to this bit if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

### 22.3.4 RSENTnBRP — RSENT Baud Rate Prescaler Register

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $0014_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | TTF[3:0] | | | | — | TTI[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R/W | R/W | R/W | R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |

| 15 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 14 to 8 | SCDV[6:0] | Sample Clock Division Value<br>0000100: 5<br>Other than above: Setting prohibited |
| 7 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | SCMV[3:0] | Sample Clock Multiplication Value<br>0000: 1<br>Other than above: Setting prohibited |

#### RSENTnBRP.TTF (Time Tick Fraction)

These bits define the fractional part of the tick length in 0.1-µs granularity.

For tick length configuration, see **Section 22.4.2.2(2) RX and SPC Tick Settings**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

#### RSENTnBRP.TTI (Time Tick Integer)

These bits define the integer part of the tick length.

For tick length configuration, see **Section 22.4.2.2(2) RX and SPC Tick Settings**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

#### RSENTnBRP.SCDV (Sample Clock Division Value)

These bits define the division value for the sample clock generation logic.

For RSENTnBRP settings, see **Section 22.4.2.2(1) RX BRP Setting**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

#### RSENTnBRP.SCMV (Sample Clock Multiplication Value)

These bits define the multiplication value for the sample clock generation logic.

For RSENTnBRP settings, see **Section 22.4.2.2(1) RX BRP Setting**.

The CPU can only write to these bits if the RSENT module is in the CONFIGURATION mode (the RSENTnMST.OMS bits are $001_B$).

### 22.3.5 RSENTnIDE — RSENT Interrupt/DMA Enable Register

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $0018_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 22.13 RSENTnIDE register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 10 | SEIE | Slow Channel Encoding Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 9 | SMIE | Slow Channel Message Lost Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 8 | SCIE | Slow Channel CRC Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 7 | NRIE | No Response Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 6 | CVIE | Calibration Pulse Length Variation Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 5 | CLIE | Calibration Pulse Length Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 4 | FNIE | Fast Channel Nibble Count Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 3 | FEIE | Fast Channel Nibble Encoding Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 2 | FMIE | Fast Channel Message Lost Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 1 | FCIE | Fast Channel CRC Error Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |
| 0 | FRIE | Fast Channel Receive Interrupt Control<br>0: Interrupt disabled<br>1: Interrupt enabled |

#### RSENTnIDE.SEIE (Slow Channel Encoding Error Interrupt Control)

This bit enables the generation of the slow channel encoding error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.SMIE (Slow Channel Message Lost Interrupt Control)

This bit enables the generation of the slow channel message lost interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.SCIE (Slow Channel CRC Error Interrupt Control)

This bit enables the generation of the slow channel CRC error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.NRIE (No Response Error Interrupt Control)

This bit enables the generation of the no response error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

The CPU should not set this bit when the SPC mode is disabled (RSENTnCC.SPCE set to 0).

#### RSENTnIDE.CVIE (Calibration Pulse Length Variation Error Interrupt Control)

This bit enables the generation of the calibration pulse length variation error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.CLIE (Calibration Pulse Length Error Interrupt Control)

This bit enables the generation of the calibration pulse length error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the SENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.FNIE (Fast Channel Nibble Count Error Interrupt Control)

This bit enables the generation of the fast channel nibble count error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.FEIE (Fast Channel Nibble Encoding Error Interrupt Control)

This bit enables the generation of the fast channel nibble encoding error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the SENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.FMIE (Fast Channel Message Lost Interrupt Control)

This bit enables the generation of the fast channel message lost interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the SENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.FCIE (Fast Channel CRC Error Interrupt Control)

This bit enables the generation of the fast channel CRC error interrupt.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

#### RSENTnIDE.FRIE (Fast Channel Receive Interrupt Control)

This bit enables the generation of the fast channel receive interrupt.

The fast channel receive interrupt can be also used to notify a DMA request.

The CPU cannot write to this bit if the RSENT module is in the RESET mode (the RSENTnMST.OMS bits are $000_B$).

## 22.3.6 RSENTnMDC — RSENT Mode Control Register

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $001C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | OMC[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W |

**Table 22.14 RSENTnMDC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 2 to 0 | OMC[2:0] | Operation Mode Control<br>000: RESET<br>001: CONFIGURATION<br>011: OPERATION IDLE<br>101: OPERATION ACTIVE<br>Other than above: Setting prohibited |

### RSENTnMDC.OMC (Operation Mode Control)

These bits are used to control the operation mode of the RSENT module.

- 000: RESET

  In RESET mode, the mode can only be changed to CONFIGURATION mode.

- 001: CONFIGURATION

  In CONFIGURATION mode, the mode can only be changed to RESET mode or OPERATION ACTIVE mode.

- 011: OPERATION IDLE

  In OPERATION IDLE mode, the mode can be changed to OPERATION ACTIVE mode, CONFIGURATION mode, or RESET mode.

- 101: OPERATION ACTIVE

  In OPERATION ACTIVE mode, the mode can be changed to OPERATION IDLE mode, CONFIGURATION mode, or RESET mode. However, it is recommended to process to the OPERATION IDLE mode first.

  For the recommended methods to change between operation modes, see **Section 22.4.3.1, Changing Operation Modes**.

- Other than above: Setting prohibited

The CPU should not write any other value than listed above into this register.
The CPU should follow the mode change flows as shown in section **Section 22.4.3.1, Changing Operation Modes**.

**NOTE**

When the CPU is requesting a not supported mode change, writing to this register has no effect.

## 22.3.7 RSENTnSPCT — RSENT SPC Transmission Register

**Access:** This register can be read/written in 32-bit units.

**Address:** <RSENTn_base> + $0020_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | TLL[6:0] | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 22.15 RSENTnSPCT register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 0 | TLL[6:0] | Length of the Trigger Low Phase in Ticks<br>0000000: 1 tick<br>0000001: 2 ticks<br>0000010: 3 ticks<br>:<br>1111110: 127 ticks<br>1111111: 128 ticks |

### RSENTnSPCT.TLL (Trigger Low Length)

These bits define the length of the SPC trigger pulse.

When the CPU writes to these bits, an SPC trigger pulse with the configured length is sent starting from the next SPC trigger tick. In case RSENTnCS.NRS is set by the RSENT module following a write to these bits, noSPC trigger pulse is sent..

For details about SPC communication, see **Section 22.4.4, SPC Function**.

The CPU can only write to these bits if the RSENT module is in the OPERATION ACTIVE mode (the RSENTnMST.OMS bits are $101_B$) and SPC communication is enabled (RSENTnCC.SPCE is $1_B$).

It is important to note that two consecutive write access might not cause a no response error as the previous request might not have started yet.

After writing to this register, the CPU should wait for at least one SPC trigger tick before writing again to this register.

### 22.3.8 RSENTnMST — RSENT Mode Status Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0024_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | OMS[2:0] | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.16 RSENTnMST register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 3 | Reserved | When read, the value after reset is read. |
| 2 to 0 | OMS[2:0] | Operation Mode Status<br>000: RESET<br>001: CONFIGURATION<br>011: OPERATION IDLE<br>101: OPERATION ACTIVE<br>Other than above: Reserved |

#### RSENTnMST.OMS (Operation Mode Status)

These bits indicate the current operation mode.

These bits are read only.

These bits are updated after a mode change request is made in the RSENTnMDC.OMC register.

- 000: RESET mode

  When in RESET mode, all registers are set to their reset values and write access to all registers except the RSENTnMDC register is disabled.
  When in RESET mode, RSENT communication is disabled.

- 001: CONFIGURATION mode

  When in CONFIGURATION mode, write access to the timestamp registers (RSENTnTSPC and RSENTnTSC register), configuration registers (RSENTnCC and RSENTnBRP register), RSENTnIDE register, and mode control register (RSENTnMDC.OMC) is enabled.
  When in CONFIGURATION mode, RSENT communication is disabled.
  When entering CONFIGURATION mode, all status registers and receive buffer registers are set to their reset values.

- 011: OPERATION IDLE mode

  In OPERATION IDLE mode, no reception or SPC trigger transmission is possible.
  When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

- 101: OPERATION ACTIVE mode

  In OPERATION ACTIVE mode, reception and SPC trigger transmission are possible.

- Other than above: Reserved

### 22.3.9 RSENTnCS — RSENT Communication Status Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0028_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SES | SMS | SCS | NRS | CVS | CLS | FNS | FES | FMS | FCS | FRS |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.17 RSENTnCS register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is read. |
| 10 | SES | Slow channel Encoding Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 9 | SMS | Slow Channel Message Lost Interrupt Status<br>0: Not detected<br>1: Detected |
| 8 | SCS | Slow Channel CRC Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 7 | NRS | No Response Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 6 | CVS | Calibration Pulse Length Variation Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 5 | CLS | Calibration Pulse Length Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 4 | FNS | Fast Channel Nibble Count Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 3 | FES | Fast Channel Nibble Encoding Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 2 | FMS | Fast Channel Message Lost Interrupt Status<br>0: Not detected<br>1: Detected |
| 1 | FCS | Fast Channel CRC Error Interrupt Status<br>0: Not detected<br>1: Detected |
| 0 | FRS | Fast Channel Receive Interrupt Status<br>0: Not detected<br>1: Detected |

#### RSENTnCS.SES (Slow Channel Encoding Error Status)

This bit represents the slow channel encoding error status.

This bit is read only.

In the short serial message format (RSENTnCC.SMF = 01), this bit is set when the sequence on serial start bit (bit #3) is different from “1000000000000000” (a single 1 and 15 0s).

In the enhanced serial message format (RSENTnCC.SMF = 10), this bit is set when following the reception of a start sequence (“01111110”) on the serial data bit 3, bit 13 or bit 18 are not received as ‘0’.

This bit is cleared when writing 1 to RSENTnCSC.SEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.SMS (Slow Channel Message Lost Status)

This bit represents the slow channel message lost status.

This bit is read only.

This bit is set when there is an attempt to update the slow channel message buffer, but the previous message has not been read yet.

This bit is cleared when writing 1 to RSENTnCSC.SMC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.SCS (Slow Channel CRC Error Status)

This bit represents the slow channel CRC error status.

This bit is read only.

This bit is set when a CRC error is detected on the slow channel and the slow channel CRC detection is enabled (RSENTnCC.SCCD is set to 0).

This bit is cleared when writing 1 to RSENTnCSC.SCC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.NRS (No Response Error Status)

This bit represents the no response error status.

This bit is read only.

This bit is set when

- the CPU writes to the RSENTnSPCT.TLL bits and
- SPC mode enabled (RSENTnCC.SPCE set to 1) and
- no complete response was received from the sensor for the previous SPC trigger.

This bit is cleared when writing 1 to RSENTnCSC.NRC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.CVS (Calibration Pulse Length Variation Error Status)

This bit represents the calibration pulse length variation error status.

This bit is read only.

When RSENTnCC.PPTC is 0, then this bit is set when two successive calibration pulses differ by more than 1.5625%.

When RSENTnCC.PPTC is 1, this bit is never set. In this mode (pause pulse with fixed message length), the CPU needs to check the variation of the ratio of calibration pulse to message length by reading the RSENTnCPL and RSENTnML registers.

This bit is cleared when writing 1 to RSENTnCSC.CVC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.CLS (Calibration Pulse Length Error Status)

This bit represents the calibration pulse length error status.

This bit is read only.

This bit is set when the measured calibration pulse length is less than 42 clock ticks or more than 70 clock ticks (deviation of 25% from nominal length).

This bit is cleared when writing 1 to RSENTnCSC.CLC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.FNS (Fast Channel Nibble Count Error Status)

This bit represents the fast channel nibble count error status.

This bit is read only.

This bit is set when there is an unexpected number of falling edges after the detection of a calibration pulse or between two calibration pulses.

This bit is cleared when writing 1 to RSENTnCSC.FNC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.FES (Fast Channel Nibble Encoding Error Status)

This bit represents the fast channel nibble encoding error status.

This bit is read only.

This bit is set when on the fast channel a measured nibble period is less than 12 clock ticks or more than 27 clock ticks.

This bit is cleared when writing 1 to RSENTnCSC.FEC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.FMS (Fast Channel Message Lost Status)

This bit represents the fast channel message lost status.

This bit is read only.

This bit is set when the fast channel message buffer is updated, but the previous messages in the foreground and background buffer have not been read yet.

This bit is cleared when writing 1 to RSENTnCSC.FMC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.FCS (Fast Channel CRC Error Status)

This bit represents the fast channel CRC error status.

This bit is read only.

This bit is set when a CRC error is detected on the fast channel and the fast channel CRC detection is enabled (RSENTnCC.FCCD is set to 0).

This bit is cleared when writing 1 to RSENTnCSC.FCC.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

#### RSENTnCS.FRS (Fast Channel Receive Status)

This bit represents the fast channel receive status.

This bit is read only.

This bit is set when the fast channel receive message buffer was updated.

This bit is cleared when the CPU reads the RSENTnFRXD.FND bit.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

If the set condition occurs simultaneously with the clear condition, the bit is set.

### 22.3.10 RSENTnCSC — RSENT Communication Status Clear Register

**Access:** This register can be written in 32-bit units.

**Address:** <RSENTn_base> + $002C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | SEC | SMC | SCC | NRC | CVC | CLC | FNC | FEC | FMC | FCC | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R |

**Table 22.18 RSENTnCSC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 11 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 10 | SEC | Slow Channel Encoding Error Clear<br>0: —<br>1: Clear |
| 9 | SMC | Slow Channel Message Lost Clear<br>0:—<br>1: Clear |
| 8 | SCC | Slow Channel CRC Error Clear<br>0: —<br>1: Clear |
| 7 | NRC | No Response Error Clear<br>0: —<br>1: Clear |
| 6 | CVC | Calibration Pulse Length Variation Error Clear<br>0: —<br>1: Clear |
| 5 | CLC | Calibration Pulse Length Error Clear<br>0: —<br>1: Clear |
| 4 | FNC | Fast Channel Nibble Count Error Clear<br>0: —<br>1: Clear |
| 3 | FEC | Fast Channel Nibble Encoding Error Clear<br>0: —<br>1: Clear |
| 2 | FMC | Fast Channel Message Lost Clear<br>0: —<br>1: Clear |
| 1 | FCC | Fast Channel CRC Error Clear<br>0: —<br>1: Clear |
| 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

**RSENTnCSC.SEC (Slow channel Encoding error Clear)**

Writing 1 sets RSENTnCS.SES to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.SMC (Slow Channel Message Lost Clear)**

Writing 1 sets RSENTnCS.SMS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.SCC (Slow Channel CRC Error Clear)**

Writing 1 sets RSENTnCS.SCS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.NRC (No Response Error Clear)**

Writing 1 sets RSENTnCS.NRS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.CVC (Calibration Pulse Length Variation Error Clear)**

Writing 1 sets RSENTnCS.CVS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.CLC (Calibration Pulse Length Error Clear)**

Writing 1 sets RSENTnCS.CLS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.FNC (Fast Channel Nibble Count Error Clear)**

Writing 1 sets RSENTnCS.FNS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.FEC (Fast Channel Nibble Encoding Error Clear)**

Writing 1 sets RSENTnCS.FES to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.FMC (Fast Channel Message Lost Clear)**

Writing 1 sets RSENTnCS.FMS to 0.

Writing 0 has no effect.

This bit is always read as 0.

**RSENTnCSC.FCC (Fast Channel CRC Error Clear)**

Writing 1 sets RSENTnCS.FCS to 0.

Writing 0 has no effect.

This bit is always read as 0.

## 22.3.11 RSENTnSRTS — RSENT Slow Channel Receive Timestamp Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0030_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | STS[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | STS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.19 RSENTnSRTS register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | STS | Slow Channel Receive Timestamp |

### RSENTnSRTS.STS (Slow Channel Timestamp)

These bits are read only.

These bits are updated when the slow channel receive buffer is updated with the timestamp counter value of the last frame provided to the slow channel message.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## 22.3.12 RSENTnSRXD — RSENT Slow Channel Receive Data Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0034_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | SND | — | SCRC[5:0] | | | | | | — | — | — | SMGC | IDD[19:16] | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | IDD[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.20 RSENTnSRXD register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | SND | Slow Channel New Data<br>0: Slow channel frame data is not updated since last read.<br>1: Slow channel frame data is updated since last read. |
| 30 | Reserved | When read, the value after reset is read. |
| 29 to 24 | SCRC[5:0] | Slow Channel CRC Data |
| 23 to 21 | Reserved | When read, the value after reset is read. |
| 20 | SMGC | Slow Channel Message Configuration<br>0: —<br>1: The slow channel receive message buffer is updated. |
| 19 to 0 | IDD[19:0] | Slow Channel Data / ID Information |

### RSENTnSRXD.SND (Slow Channel New Data)

This bit indicates that the slow channel message buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel receive message buffer is updated.

This bit is cleared automatically whenever it is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### RSENTnSRXD.SCRC (Slow Channel CRC)

These bits are representing the slow channel CRC data.

These bits are read only.

These bits are updated when the slow channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### RSENTnSRXD.SMGC (Slow Channel Message Configuration)

This bit represents the slow channel message configuration bit.

This bit is read only.

This bit is updated when the slow channel receive message buffer is updated.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

**RSENTnSRXD.IDD (ID/ Data)**

These bits are representing the slow channel data and ID information.

The alignment within this register depends on the message format. For details, see **Section 22.4.3.2(5), Slow Channel Message Reception**.

These bits are read only.

These bits are updated when the slow channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## 22.3.13 RSENTnCPL — RSENT Calibration Pulse Length Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0038_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | CPLV16 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CPLV[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.21 RSENTnCPL register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 17 | Reserved | When read, the value after reset is read. |
| 16 to 0 | CPLV[16:0] | Calibration Pulse Length Value of Received Message |

### RSENTnCPL.CPLV (Calibration Pulse Length Value)

These bits are used by the CPU to calculate the ratio of two consecutive calibration pulses or the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.

These bits are read only.

These bits are updated with the measured calibration pulse length in sample clock ticks when the fast channel receive message buffer is updated.

In modes other than pause pulse with fixed message length (CC.PPTC = 1'b1) or SPC mode (CC.SPCE = 1'b1), these bits are invalid and should not be used.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## 22.3.14 RSENTnML — RSENT Message Length Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $003C_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | MLV[20:16] | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MLV[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.22 RSENTnML register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 21 | Reserved | When read, the value after reset is read. |
| 20 to 0 | MLV[20:0] | Message Length Value of Received Message |

### RSENTnML.MLV (Message Length Value)

These bits are used by the CPU to calculate the ratio of the calibration pulse to message length in pause pulse with fixed message length mode for message diagnostics.

These bits are read only.

These bits are updated with the measured message length in sample clock ticks when the fast channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

In modes other than pause pulse with fixed message length, these bits are invalid and should not be used.

## 22.3.15 RSENTnFRTS — RSENT Fast Channel Receive Timestamp Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0040_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FTS[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | FTS[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 22.23 RSENTnFRTS register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | FTS[31:0] | Fast Channel Receive Timestamp |

### RSENTnFRTS.FTS (Fast Channel Timestamp)

These bits are read only.

These bits are updated when the fast channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

## 22.3.16 RSENTnFRXD — RSENT Fast Channel Receive Data Register

**Access:** This register is read-only in 32-bit units.

**Address:** <RSENTn_base> + $0044_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

**Table 22.24 RSENTnFRXD register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | SNDM | Slow Channel New Data Mirror<br>0: Slow channel frame data is not updated since last read.<br>1: Slow channel frame data is updated since last read. |
| 30 | FND | Fast Channel New Data<br>0: Fast channel frame data is not updated since last read.<br>1: Fast channel frame data is updated since last read. |
| 29, 28 | FCCN[1:0] | Fast Channel Communication Nibble |
| 27 to 24 | FCRC[3:0] | Fast Channel CRC Data |
| 23 to 0 | ND[23:0] | Fast Channel Nibble Data |

### RSENTnFRXD.SNDM (Slow Channel New Data Mirror)

This bit indicates that the slow channel message buffer is holding data that has not been read.

This bit is read only.

This bit is set when the slow channel receive message buffer is updated.

This bit is cleared automatically whenever the slow channel new data bit (RSENTnSRXD.SND) is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### RSENTnFRXD.FND (Fast Channel New Data)

This bit indicates that the fast channel message buffer is holding data that has not been read.

This bit is read only.

This bit is set when the fast channel receive message buffer is updated.

This bit is cleared automatically whenever it is read.

This bit is cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

**RSENTnFRXD.FCCN (Fast Channel Communication Nibble)**

These bits are representing the fast channel communication nibble bits [1:0].

These bits are read only.

These bits are updated when the fast channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

**RSENTnFRXD.FCRC (Fast Channel CRC)**

These bits are representing the fast channel CRC data.

These bits are read only.

These bits are updated when the fast channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

**RSENTnFRXD.ND (Nibble Data)**

These bits are representing the fast channel nibble data.

The alignment of the nibble data depends on nibble count. For details, see **Section 22.4.3.2(3), Fast Channel Message Reception**.

These bits are read only.

These bits are updated when the fast channel receive message buffer is updated.

These bits are cleared when the RSENTnMST.OMS bits are changed to 001 (CONFIGURATION).

### 22.3.17 RSENT0TSSEL — RSENT0 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF00$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 22.3.18 RSENT1TSSEL — RSENT1 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF04$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 22.3.19 RSENT2TSSEL — RSENT2 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF08$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | MSSEL2[3:0] | Master Selection for RSENT2<br>0000: No master or RSENT2 is master.<br>0001: RSENT0 is the master of RSENT2.<br>0010: RSENT1 is the master of RSENT2.<br>0011: No master or RSENT2 is master.<br>0100: RSENT3 is the master of RSENT2.<br>0101: RSENT4 is the master of RSENT2.<br>0110: RSENT5 is the master of RSENT2.<br>0111: RSENT6 is the master of RSENT2.<br>1000: RSENT7 is the master of RSENT2.<br>1001: RSENT8 is the master of RSENT2.<br>1010: RSENT9 is the master of RSENT2<br>Other than above: Setting prohibited |

### 22.3.20 RSENT3TSSEL — RSENT3 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF0C$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | MSSEL3[3:0] | Master Selection for RSENT3<br>0000: No master or RSENT3 is master.<br>0001: RSENT0 is the master of RSENT3.<br>0010: RSENT1 is the master of RSENT3.<br>0011: RSENT2 is the master of RSENT3.<br>0100: No master or RSENT3 is master.<br>0101: RSENT4 is the master of RSENT3.<br>0110: RSENT5 is the master of RSENT3.<br>0111: RSENT6 is the master of RSENT3.<br>1000: RSENT7 is the master of RSENT3.<br>1001: RSENT8 is the master of RSENT3.<br>1010: RSENT9 is the master of RSENT3.<br>Other than above: Setting prohibited |

### 22.3.21 RSENT4TSSEL — RSENT4 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF10$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | MSSEL4[3:0] | Master Selection for SENT4<br>0000: No master or RSENT4 is master.<br>0001: RSENT0 is the master of RSENT4.<br>0010: RSENT1 is the master of RSENT4.<br>0011: RSENT2 is the master of RSENT4.<br>0100: RSENT3 is the master of RSENT4.<br>0101: No master or RSENT4 is master.<br>0110: RSENT5 is the master of RSENT4.<br>0111: RSENT6 is the master of RSENT4.<br>1000: RSENT7 is the master of RSENT4.<br>1001: RSENT8 is the master of RSENT4.<br>1010: RSENT9 is the master of RSENT4.<br>Other than above: Setting prohibited |

## 22.3.22 RSENT5TSSEL — RSENT5 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF14$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | MSSEL5[3:0] | Master Selection for RSENT5<br>0000: No master or RSENT5 is master.<br>0001: RSENT0 is the master of RSENT5.<br>0010: RSENT1 is the master of RSENT5.<br>0011: RSENT2 is the master of RSENT5.<br>0100: RSENT3 is the master of RSENT5.<br>0101: RSENT4 is the master of RSENT5.<br>0110: No master or RSENT5 is master.<br>0111: RSENT6 is the master of RSENT5.<br>1000: RSENT7 is the master of RSENT5.<br>1001: RSENT8 is the master of RSENT5.<br>1010: RSENT9 is the master of RSENT5.<br>Other than above: Setting prohibited |

### 22.3.23 RSENT6TSSEL — RSENT6 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF18$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | MSSEL6[3:0] | Master Selection for RSENT6<br>0000: No master or RSENT6 is master.<br>0001: RSENT0 is the master of RSENT6.<br>0010: RSENT1 is the master of RSENT6.<br>0011: RSENT2 is the master of RSENT6.<br>0100: RSENT3 is the master of RSENT6.<br>0101: RSENT4 is the master of RSENT6.<br>0110: RSENT5 is the master of RSENT6.<br>0111: No master or RSENT6 is master.<br>1000: RSENT7 is the master of RSENT6.<br>1001: RSENT8 is the master of RSENT6.<br>1010: RSENT9 is the master of RSENT6.<br>Other than above: Setting prohibited |

### 22.3.24 RSENT7TSSEL — RSENT7 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF1C$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 22.3.25 RSENT8TSSEL — RSENT8 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF20$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

### 22.3.26 RSENT9TSSEL — RSENT9 Timestamp Mode Selection Register

This register controls the master channel of the RSENT module.

Writing to this register is only allowed when the RSENT module is in the CONFIGURATION mode (RSENTMST.OMS[2:0] = 001), or in the RESET mode (RSENTMST.OMS[2:0] = 000).

**Access:** This register can be read/written in 32-bit units.

**Address:** FFCD CF24$_H$

**Value after reset:** 0000 0000$_H$ This register is initialized by various types of reset.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 22.4 Operation

### 22.4.1 Modes of Operation

The RSENT module can be in one of the following modes:

- RESET mode
- CONFIGURATION mode
- OPERATION IDLE mode
- OPERATION ACTIVE mode

**Figure 22.2** shows the possible transitions between the channel modes:

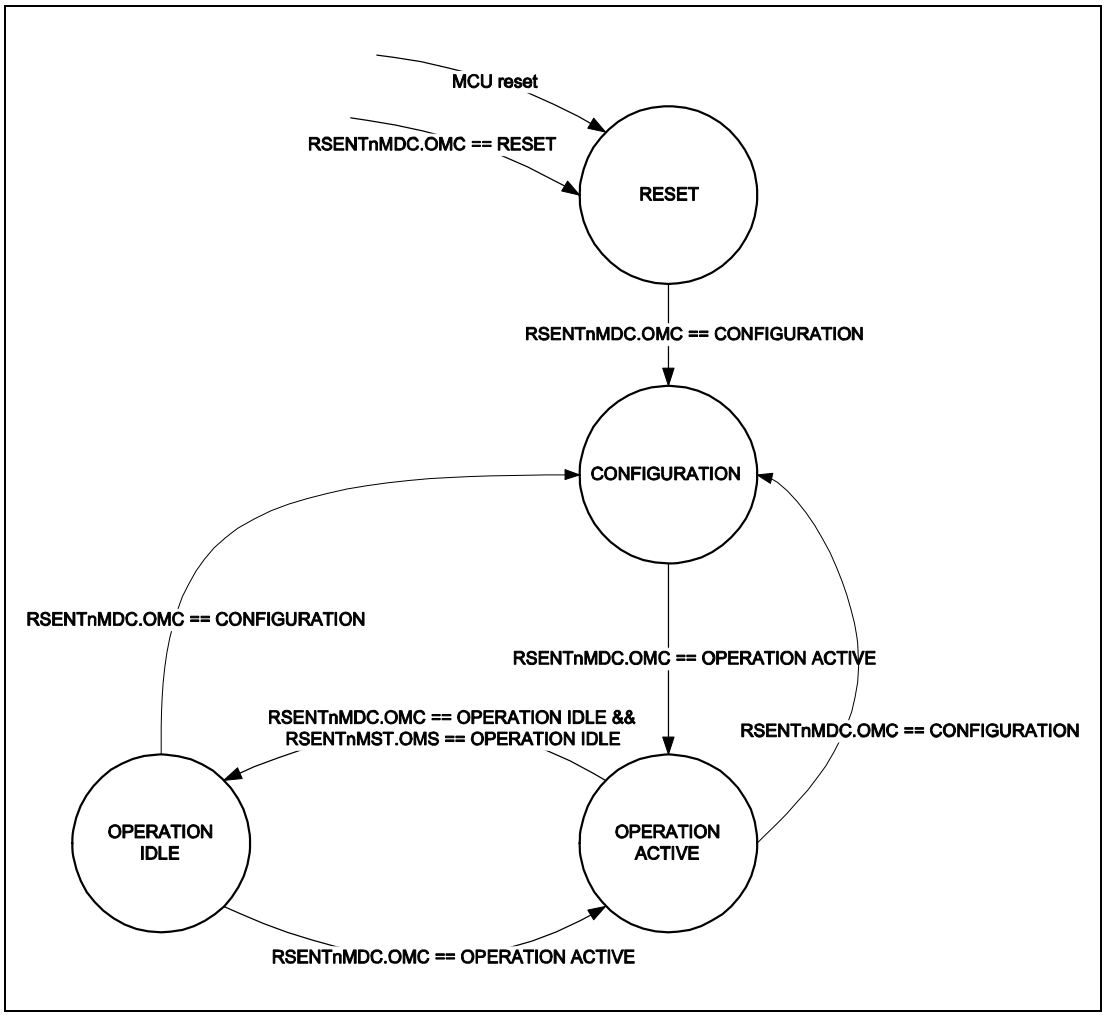

**Figure 22.2 Transition between Operation Modes**

The current operation mode status can be seen in the RSENTnMST.OMS bits.

#### 22.4.1.1 RESET Mode

This mode is the initial mode that the RSENT module automatically enters after the hardware reset (MCU reset) is cleared. Its purpose is to provide a clean reset of the registers in the RSENT module.

The RESET mode is also entered after the RSENTnMDC.OMC bits have been set to $000_B$. In this state, all, configuration, control (except RSENTnMDC.OMC bits), and status registers are set to their reset value. Any on-going transmission or reception process is stopped immediately and the interface pins of the RSENT module are set to their default values.

Read access to all registers is possible in this state. Write access is limited to the RSENTnMDC register.

#### 22.4.1.2 CONFIGURATION Mode

The CONFIGURATION mode is entered after the RSENTnMDC.OMC bits have been set to $001_B$.

Any on-going transmission or reception process is stopped immediately and the interface pins of the RSENT module are set to their default values.

In this state, all status registers (RSENTnCS) and the receive buffer registers (RSENTnSRTS, RSENTnSRXD, RSENTnCPL, RSENTnML, RSENTnFRTS, and RSENTnFRXD) are set to their default value.

Read access to all registers is possible in this state.

Write access is limited to both timestamp registers (TSCP and RSENTnTSC) and configuration registers (RSENTnCC, RSENTnBRP, RSENTnIDE, and RSENTnMDC).

#### 22.4.1.3 OPERATION IDLE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to $011_B$.

In OPERATION IDLE mode, no reception and transmission are done.

When entering OPERATION IDLE mode, frames in the receive buffer can be analyzed as in OPERATION ACTIVE mode, but no new frames are received.

Read access to all registers is possible in this state.

Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, and RSENTnCSC.

#### 22.4.1.4 OPERATION ACTIVE Mode

This mode is entered after the RSENTnMDC.OMC bits have been set to $101_B$.

In OPERATION ACTIVE mode, transmission and reception can take place.

Read access to all registers is possible in this state.

Write access is granted only to RSENTnTSC, RSENTnIDE, RSENTnMDC, RSENTnSPCT, and RSENTnCSC.

### 22.4.1.5 Register Behavior in Operation Modes

**Table 22.35** shows the register behavior when the RSENT module transitions to the indicated operation modes. The table also gives an overview about the access restriction in each operation mode.

**Table 22.35 Register Behavior in Operation Modes**

| | | MCU Reset | RESET | | CONFIGURATION | | OPERATION IDLE | | OPERATION ACTIVE | |
|---|---|---|---|---|---|---|---|---|---|---|
| **Register Name** | **Symbol** | **Change** | **Change** | **R/W** | **Change** | **R/W** | **Change** | **R/W** | **Change** | **R/W** |
| Timestamp prescaler configuration register | RSENTnTSPC | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R/W | Unchanged | R | Unchanged | R |
| Timestamp counter register | RSENTnTSC | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R/W | Unchanged | R/W *1 | Unchanged | R/W *1 |
| Communication configuration register | RSENTnCC | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R/W | Unchanged | R | Unchanged | R |
| Baud rate prescaler register | RSENTnBRP | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R/W | Unchanged | R | Unchanged | R |
| Interrupt/DMA enable register | RSENTnIDE | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R/W | Unchanged | R/W | Unchanged | R/W |
| Mode control register | RSENTnMDC | $0000\ 0000_H$ | $0000\ 0000_H$ | R/W | Unchanged | R/W | Unchanged | R/W | Unchanged | R/W |
| SPC transmission register | RSENTnSPCT | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R | Unchanged | R/W |
| Mode status register | RSENTnMST | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0001_H$ | R | $0000\ 0003_H$ | R | $0000\ 0005_H$ | R |
| Communication status register | RSENTnCS | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |
| Communication status clear register | RSENTnCSC | $0000\ 0000_H$ | $0000\ 0000_H$ | R | Unchanged | R/W | Unchanged | R/W | Unchanged | R/W |
| Slow channel receive timestamp register | RSENTnSRTS | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |
| Slow channel receive data register | RSENTnSRXD | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |
| Calibration pulse length register | RSENTnCPL | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |
| Message length register | RSENTnML | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |
| Fast channel receive timestamp register | RSENTnFRTS | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |
| Fast channel receive data register | RSENTnFRXD | $0000\ 0000_H$ | $0000\ 0000_H$ | R | $0000\ 0000_H$ | R | Unchanged | R | Unchanged | R |

Note 1. Means write restriction exists.

## 22.4.2 Clock Configuration

### 22.4.2.1 Timestamp

#### (1) Timestamp Clock Configuration

RSENT incorporates the timestamp counter.

The minimum required resolution of the timestamp is 1 µs. Depending on the applied communication frequency, the user should configure the RSENTnTSPC.TTPV bits to achieve the 1-µs resolution. The input frequency is divided by the configured timestamp prescaler value RSENTnTSPC.TTPV.

Depending on the configured tick lengths, the resolution can be decreased by configuring the RSENTnTSPC.TTM bits. The already divided input frequency is divided further by the value of the TSPC.TTM bits.

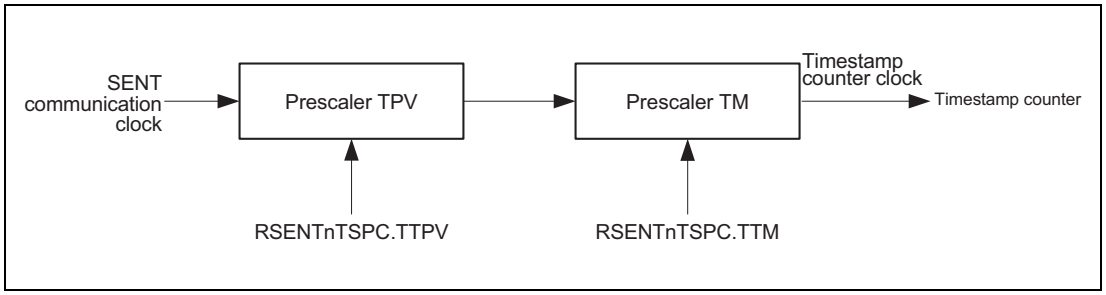

**Figure 22.3 Timestamp Counter Clock Generation**

#### (2) Timestamp Counter Operation

The timestamp counter value can be initialized to any value by writing to the RSENTnTSC.TS bits only when the RSENT module is in CONFIGURATION mode.

When timestamp counters are configured to operate in master mode (RSENTnTSPC.TMS = 0), the CPU can reset the timestamp counter by writing 0000 $0000_H$ to the RSENTnTSC.TS bits when the RSENT module is in OPERATION_IDLE or OPERATION_ACTIVE mode.

When timestamp counters are configured to operate in slave mode (RSENTnTSPC.TMS = 1), the timestamp counter is cleared when the CPU writes 0000 $0000_H$ to the RSENTnTSC.TS bits of master RSENT module when the RSENT module is in OPERATION_IDLE or OPERATION_ACTIVE mode. The RSENT module operating in slave mode should have the same timestamp counter prescaler settings as master RSENT module. When timestamp counter synchronization occurs, the internal timestamp counter prescalers are also synchronized.

The current timestamp counter value can be read from the RSENTnTSC.TS bits.

When the RSENT module is in OPERATION ACTIVE mode, each received message is stored with its related timestamp. Timestamp values are taken for fast channel and slow channel data.

The timestamp value is captured when the calibration pulse is detected.

The timestamp value for the fast channel is stored in the RSENTnFRTS.STS bits when the fast channel receive message buffer is updated.

The timestamp value for the slow channel is stored in the RSENTnSRTS.STS bits. The timestamp value for the slow channel is identical to the timestamp value of the last fast channel message contributing to the slow channel message.

In case timestamp counter synchronization is required, the following flow should be used.

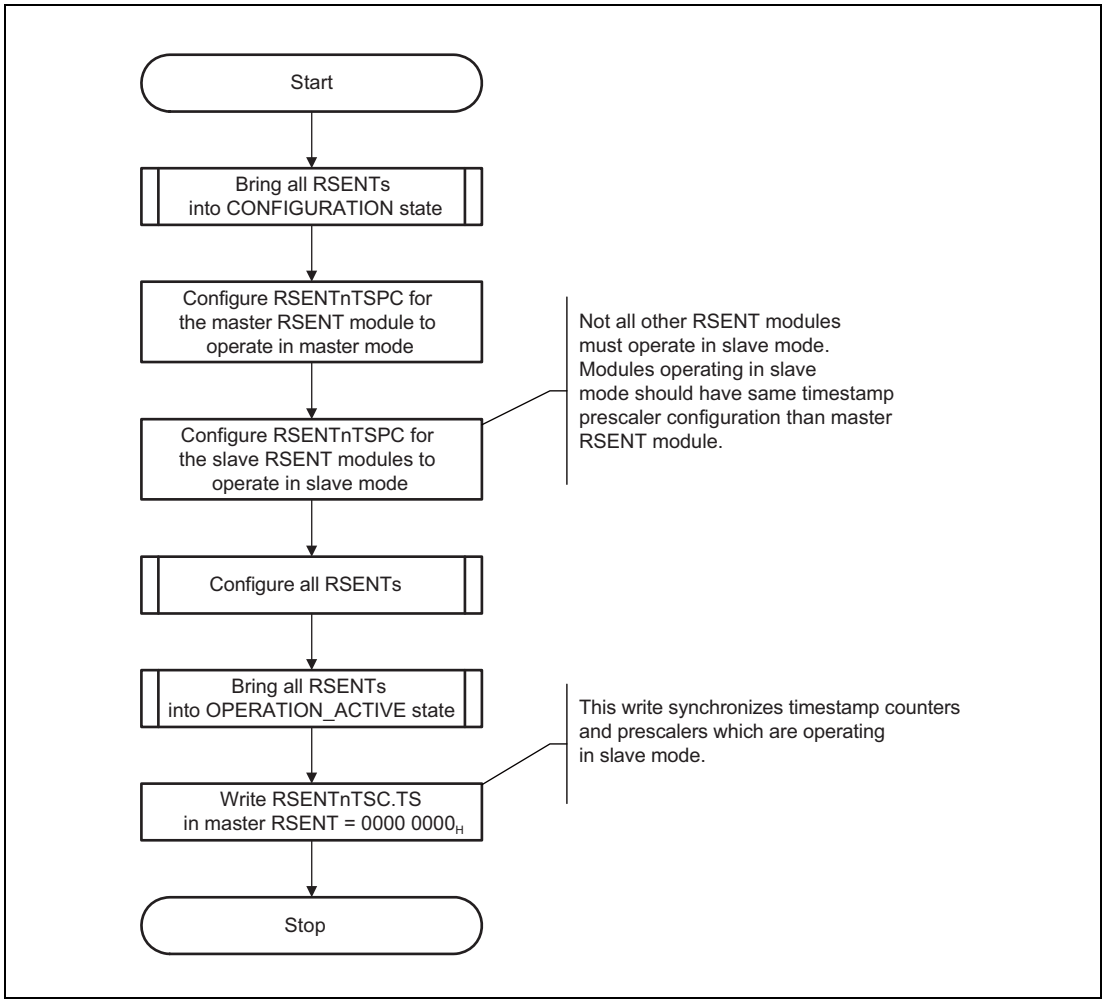

**Figure 22.4 Timestamp Counter Synchronization**

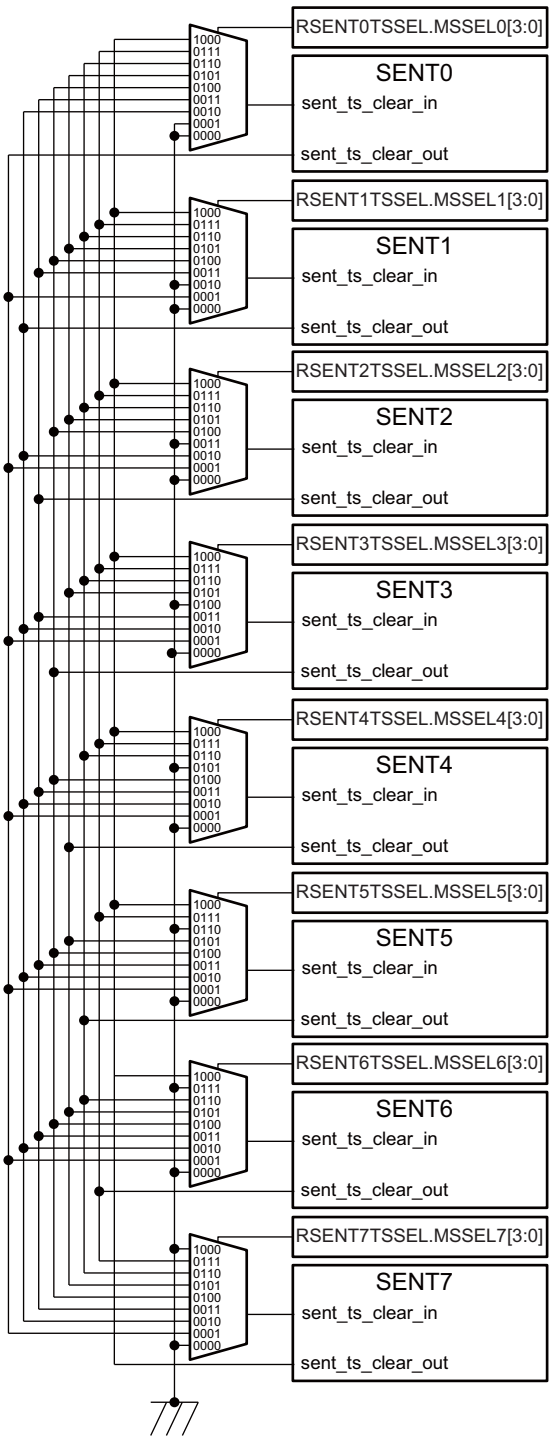
Further synchronization can be done as long as master RSENT module is in either OPERATION_ACTIVE or OPERATION_IDLE state.

In order to realize the specified timestamp counter synchronization the RSENT modules are interconnected as shown **Figure 22.5**.



**Note:** Only P1H-CE has SENT8 and SENT9.

**Figure 22.5 Timestamp Signal Connection among Channels**

### 22.4.2.2 Communication Clock Configuration

#### (1) RX BRP Setting

Depending on the applied “RSENT communication clock” frequency the RSENTnBRP.SCDV and RSENTnBRP.SCMV registers must be configured to achieve the required sample frequency ($f_{SAMPLE}$) of 16MHz.

The values should be selected according to the following formula, in such a way that the lowest terms (e.g. 2/3 instead of 4/6) is generated.

Divide the communication clock (RSENT communication clock) and select the values of RSENTnBRP.SCMV and RSENTnBRP.SCDV to achieve $f_{SAMPLE}$ of 16MHz.

fSAMPLE = 16MHz = $f_{COMUNICATION}$ × (RSENTnBRP.SCMV/RSENTnBRP.SCDV)

The communication clock is selected frequency within the range of 32MHz to 80MHz or equal to 16MHz

$$f_{SAMPLE} = 16MHz = f_{COMUNICATION} \times \frac{RSENTnBRP.SCMV}{RSENTnBRP.SCDV}$$

#### (2) RX and SPC Tick Settings

The used tick length in RX and SPC function can be configured with the RSENTnBRP.TTI and RSENTnBRP.TTF bits. Tick lengths from 1.0 µs to 90.0 µs with a resolution of 0.1 µs can be configured.

The RSENTnBRP.TTI holds the integer part of the tick length and the RSENTnBRP.TTF bits hold the fractional part of the tick length. The tick length is then calculated by:

$$T_{TICK} = T_{RSENTnBRP.TTI} + T_{RSENTnBRP.TTF}$$

**NOTE**

Set Tick lengths more than 10us when clkc frequency set less than 32MHz.

## 22.4.3 RSENT Operation

### 22.4.3.1 Changing Operation Modes

Once initialization has been completed in CONFIGURATION mode, operation can be enabled by entering OPERATION ACTIVE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION ACTIVE and waiting for the RSENTnMST.OMS to transition to OPERATION ACTIVE.

Once in OPERATION ACTIVE mode the RSENT module begins to receive messages or SPC communication can be started depending on the configuration.

**Figure 22.6** shows the communication enabled flow assuming that the RSENT module is in RESET mode:

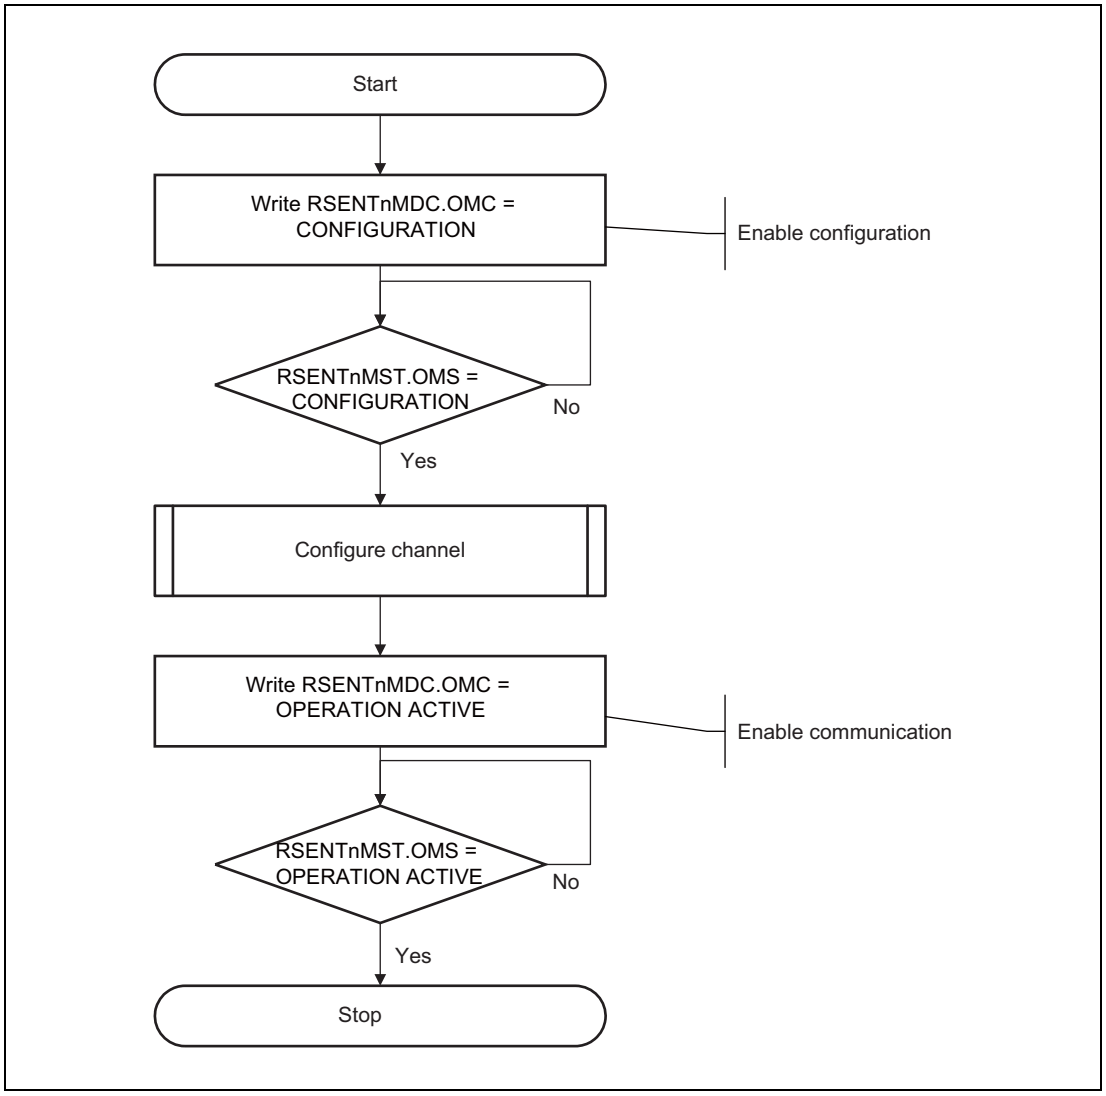


**Figure 22.6 Communication Enable Flow**

To leave OPERATION ACTIVE mode, communication should be disabled first by transitioning to OPERATION IDLE mode. This is done by setting the RSENTnMDC.OMC bits to OPERATION IDLE and waiting for the RSENTnMST.OMS bits to transition to OPERATION IDLE.

The transition between OPERATION ACTIVE and OPERATION IDLE depends on the setting of the RSENTnCC.SPCE bit.

**(1) RSENTnCC.SPCE = 0**

In case a reception is currently ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the receive buffer was updated (see **Section 22.4.3.2(3), Fast Channel Message Reception**).

In case no reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place immediately.

**(2) RSENTnCC.SPCE = 1**

In case a reception is ongoing, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

In case a no response error is flagged, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place at the same time as the error flagging.

The mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the sequence of making a SPC trigger and receiving the response has been completed. This means when a response was already received, the transition takes place immediately. When the response is still pending, the mode change from OPERATION ACTIVE to OPERATION IDLE takes place when the falling edge of the end pulse is received.

CONFIGURATION mode can be entered at any time by writing CONFIGURATION to the RSENTnMDC.OMC bits and waiting for the RSENTnMST.OMS to transition to CONFIGURATION.

Once CONFIGURATION mode is entered, the remaining status and message information stored in the RSENT module is lost since status and message information is cleared in CONFIGURATION mode.

**Figure 22.7** shows the communication disable flow assuming that the RSENT module is in OPERATION ACTIVE mode.

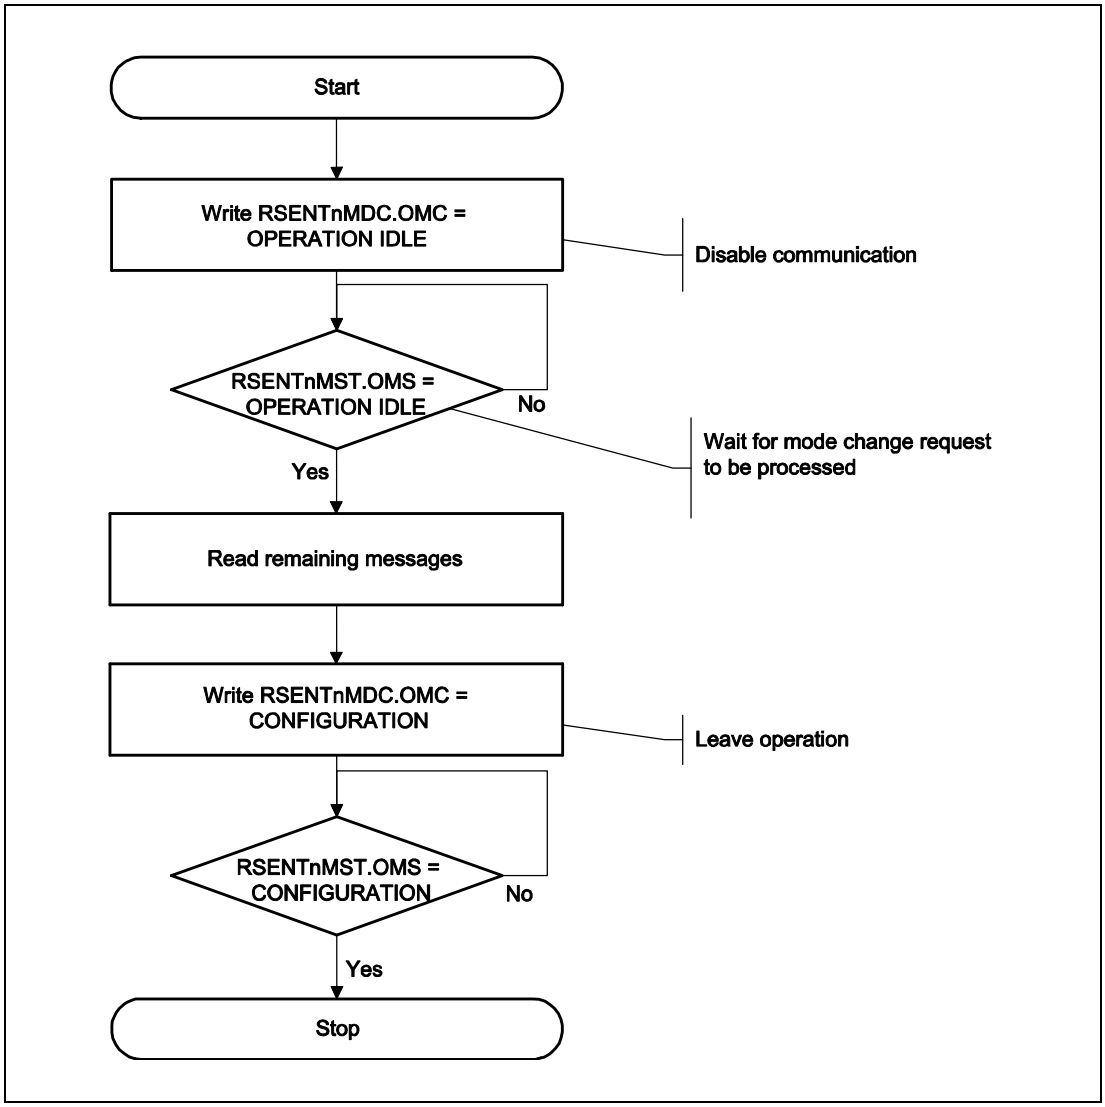

**Figure 22.7 Communication Disable Flow**

**Table 22.36 Transition time from each mode**

| Transition | Condition | Transition Time |
|---|---|---|
| RESET to CONFIGURATION | | 5 PCLK + 3 CLKC |
| CONFIGURATION to OPERATION ACTIVE | | 5 PCLK + 6 CLKC |
| OPERATION ACTIVE to OPERATION IDLE | | Falling edge of next frame sync nibble + 5 sample clocks + 4 CLKC + 4 PCLK |
| | In case frame reception has not started | 5 PCLK + 1 sample clock + 7 CLKC |
| OPERATION IDLE to CONFIGURATION | | 4 PCLK + 4 CLKC |
| OPERATION ACTIVE to CONFIGURATION | | 5 PCLK + 7 CLKC + 1 sample clock |
| OPERATION IDLE to OPERATION ACTIVE | | 5 PCLK + 6 CLKC |

### 22.4.3.2 Message Reception

RSENT message reception is composed of the calibration pulse reception followed by the data nibble pulse reception.

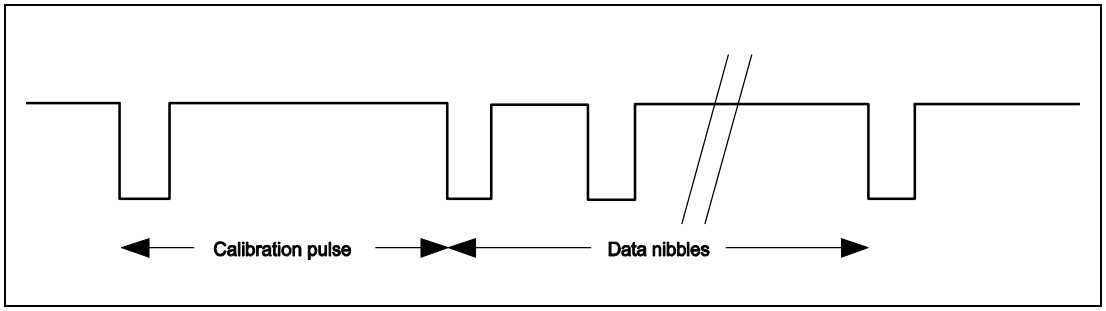

Figure 22.8 RSENT Received Message Structure

#### (1) Calibration Pulse Reception

Within the calibration pulse reception phase the internally generated clock tick is adjusted to the transmit clock speed.

In addition, the calibration pulse is used to end the previous message and perform message diagnostics. The RSENT module supports automatic calibration pulse length diagnostics in variable message length modes (RSENTnCC.PPTC = 0). In case the calibration pulse ratio check fails, the calibration pulse length variation error flag (RSENTnCS.CVS) is set to 1.

#### (2) Data Nibble Reception

The receive function of the RSENT module is a capture and compare function. The RSENT module receives sensor information encoded by the temporal distance of two consecutive falling edges on the data line. The temporal distance (in # of clock ticks) is captured and compared against a set of values to determine the actual nibble value. The data encoding is illustrated in **Table 22.37** below.

Table 22.37 Data Nibble Encoding

| Nibble Period (# Clock Ticks) | Nibble Value (Binary) |
|---|---|
| 12 | $0000_B$ |
| 13 | $0001_B$ |
| 14 | $0010_B$ |
| 15 | $0011_B$ |
| 16 | $0100_B$ |
| 17 | $0101_B$ |
| 18 | $0110_B$ |
| 19 | $0111_B$ |
| 20 | $1000_B$ |
| 21 | $1001_B$ |
| 22 | $1010_B$ |
| 23 | $1011_B$ |
| 24 | $1100_B$ |
| 25 | $1101_B$ |
| 26 | $1110_B$ |
| 27 | $1111_B$ |

The received data nibbles are composed into an RSENT message which is then stored in the fast channel receive message buffer.

Any other received nibble period during the reception of data nibbles will cause a fast channel nibble encoding error.

### (3) Fast Channel Message Reception

Messages received on the fast message channel are stored in a receive buffer.

A fast channel receive buffer is composed of the calibration pulse length register (RSENTnCPL), the message length register (RSENTnML), the fast channel receive timestamp register (RSENTnFRTS), and the fast channel receive data register (RSENTnFRXD).

All registers are placed on successive addresses that allows transferring the register content into memory using DMA.

The RSENT module is equipped with a double receive buffer structure that allows the storage of two complete RSENT messages including the related timestamp and message length information. Message decoding and assembling are done in a separate register stage.

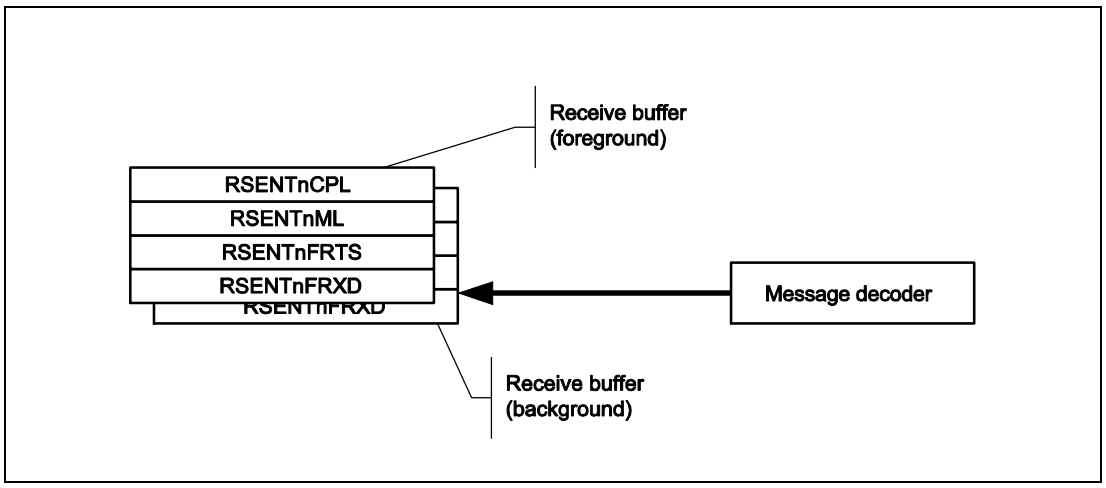

**Figure 22.9 Fast Channel Receive Message Buffer**

The first received message is placed into the message buffer that can be accessed by the CPU. This buffer (except the RSENTnFRXD.SNDM bit) is not updated any more until the RSENTnFRXD.FND bit was read.

When a new message is placed into a receive buffer, the RSENTnFRXD.FND bit is set. At the same time, the RSENTnCS.FRS bit is set and, if enabled, a receive interrupt request is generated.

When the foreground receive buffer is holding an unprocessed message (the RSENTnFRXD.FND bit is 1), any further incoming message is placed in the background buffer. The background buffer is updated with any further incoming messages. In case an unprocessed background message buffer message is overwritten, the RSENTnCS.FMS bit is set to 1.

When the CPU reads the RSENTnFRXD.FND bit and there is valid data in the background buffer, the data previously located in the background buffer becomes available in the receive buffer and is accessible by the CPU. If enabled, a new interrupt request for fast channel data is generated and RSENTnCS.FRS is set.

When the RSENTnFRXD.FND/ RSENTnCS.FRS bit is not set, the data in the receive buffer is not defined and the CPU should not access the receive buffer.

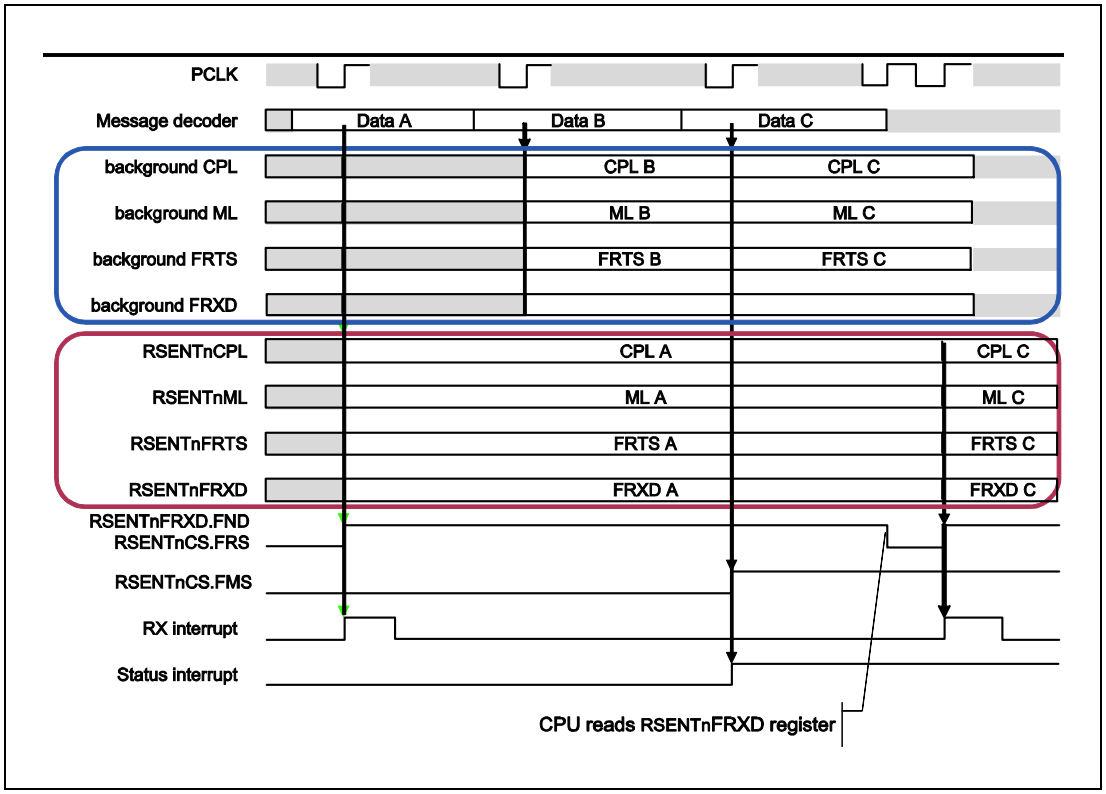

**Figure 22.10 Fast Channel Receive Buffer Update Timing**

The update timing of the receive buffer depends on the applied configuration as depicted in **Figure 22.11** to **Figure 22.14**.

The data alignment in the RSENTnFRXD register depends on the nibble data count (RSENTnCC.NDN).

**Table 22.38 Data Nibble Alignment in RSENTnFRXD Register**

| RSENTnCC.NDN | 23:20 | 19:16 | 15:12 | 11:8 | 7:4 | 3:0 |
|---|---|---|---|---|---|---|
| $000_B$ | Undefined | Undefined | Undefined | Undefined | Undefined | Nibble 1 |
| $001_B$ | Undefined | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 |
| $010_B$ | Undefined | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 |
| $011_B$ | Undefined | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 |
| $100_B$ | Undefined | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 |
| $101_B$ | Nibble 1 | Nibble 2 | Nibble 3 | Nibble 4 | Nibble 5 | Nibble 6 |

1. SAE operation with variable message length and preferred check method (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 0)

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the preferred option in the J2716 2010 specification. In this mode, message diagnostics is done after the calibration pulse was received following a message.

If this check is passed, the receive message buffer is updated.

If this check is not passed, the receive message buffer is not updated and RSENTnCS.CVS is set to 1.

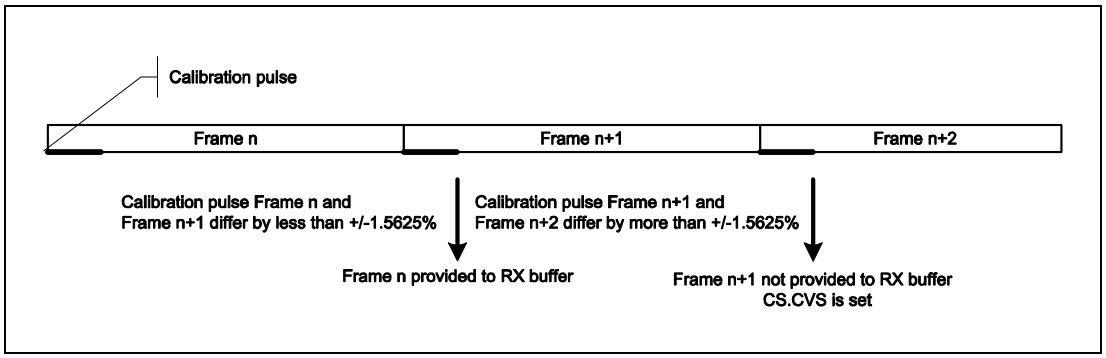

**Figure 22.11 Buffer Update in Variable Message Length Mode and Preferred Check Method**

2. SAE operation with variable message length and optional check method (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 0, RSENTnCC.FCM = 1)

In this operation mode, the RSENT module automatically performs the check for successive calibration pulse variation according to the optional frame check method as described in the J2716 2010 specification. In this mode, the calibration pulse of the current frame is compared to the calibration pulse of the last valid preceding frame.

If this check is passed, the receive message buffer is updated.

If this check is not passed, the receive message buffer is not updated and RSENTnCS.CVS is set to 1.

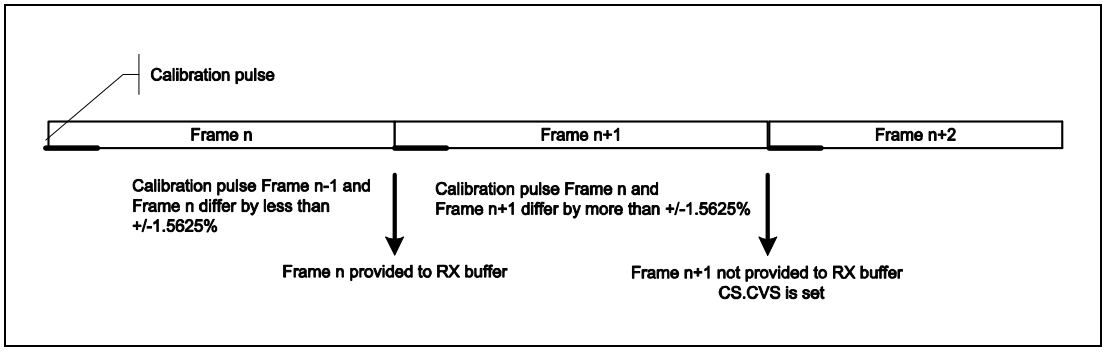

**Figure 22.12 Buffer Update in Variable Message Length Mode and Optional Check Method**

3. SAE operation with fixed message length (RSENTnCC.SPCE = 0, RSENTnCC.PPTC = 1)

In this mode, the RSENT module does not perform the check for calibration pulse and message length ratio according to the preferred option in the J2716 2010 specification. In this mode, the RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples.

The message buffer is updated at the beginning of the following calibration pulse irrespective of the values in the RSENTnCPL and RSENTnML registers. The CPU needs to calculate the ratio and either accept or discard the message.

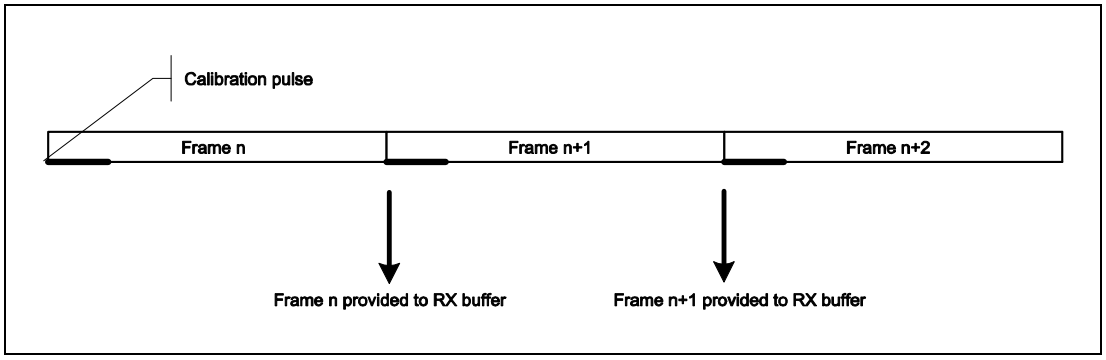

**Figure 22.13 Buffer Update in Fixed Message Length Mode**

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

4. SPC operation (RSENTnCC.SPCE = 1)

In this operation mode, sensor data transmission is done following a SPC master trigger pulse. Within SAE RSENT communication, the calibration pulse or pause pulse is terminating the previous message. In SPC communication, the sensor is only sending data following a SPC trigger request. An end pulse sent by the sensor is terminating the message. The message buffer is updated at the beginning of the end pulse.

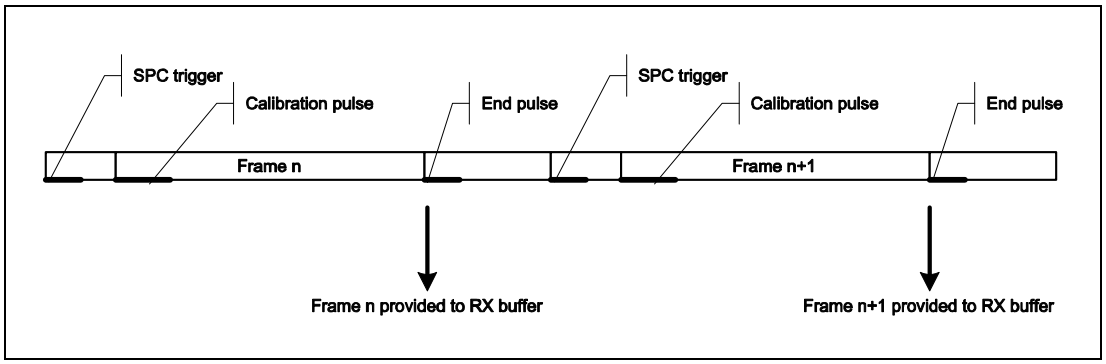

**Figure 22.14 Buffer Update in SPC Mode**

The RSENTnCS.CVS (calibration pulse width variation error status) bit is never set in this mode.

The RSENT module provides the calibration pulse length in the RSENTnCPL register and the message length information in the RSENTnML register. The numbers provided are based on samples. The CPU needs to calculate the ratio of calibration pulses and/or message length and either accept or discard the message.

In case of variable message length mode, the RSENT module cannot perform this check because the receive timing of the next calibration pulse depends on the next SPC trigger timing.

### (4) Fast Channel Reception Flow

In **Figure 22.15**, the recommended reception flow for the fast channel receive buffer is shown.

When using a polling or event driven method, the CPU should only read the setting of the RSENTnCS.FRS bit to check the availability of new fast channel data.

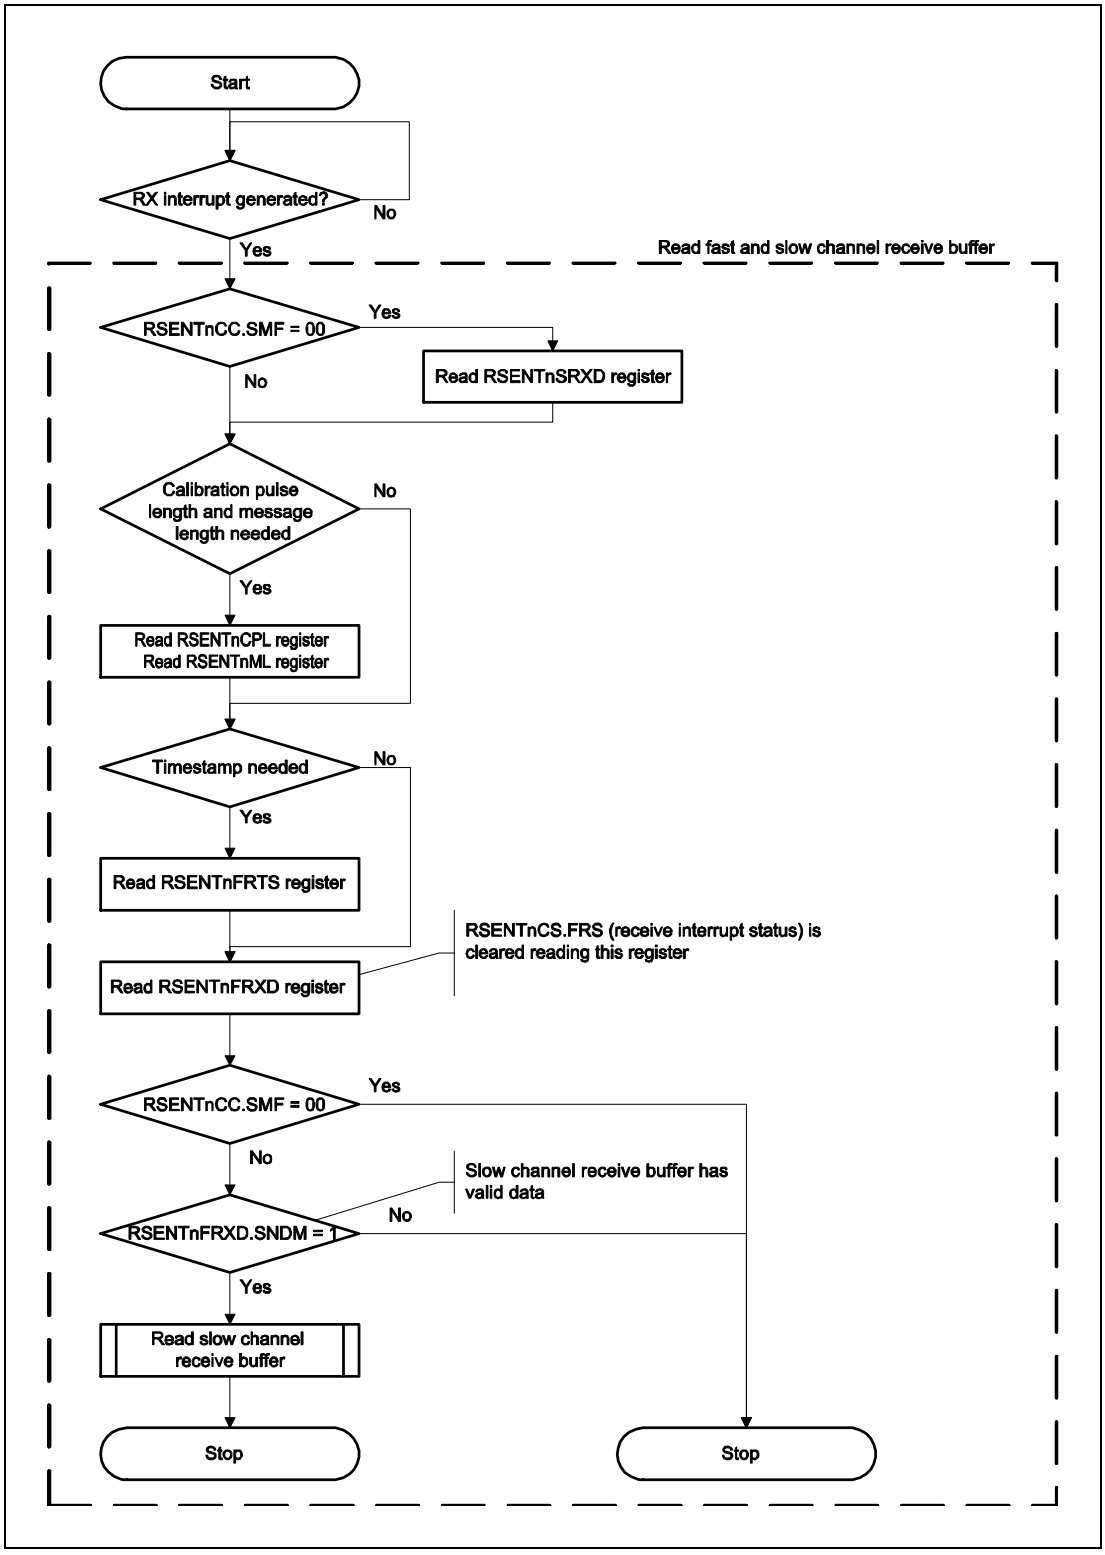

**Figure 22.15 Fast Channel Reception Flow**

In any case, the CPU should keep the order in reading the receive buffer registers as shown in the flow. The RSENTnFRXD register should be the last register to be accessed.

The handling of the slow channel receive buffer is described in **(6) Slow Channel Reception Flow**.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

### (5) Slow Channel Message Reception

The RSENT module supports extraction of the slow message out of the fast channel messages by using the bits 3 and 2 out of the status and communication nibble. In order to enable the slow channel extraction, the CPU should set the RSENTnCC.SMF bits to the expected serial message format.

When no serial message extraction is selected (RSENTnCC.SMF = 00), the RSENTnSRXD register becomes part of the fast channel receive buffer structure (including background buffer) and RSENTnSRTS register should be ignored. The status and communication nibble is placed in the RSENTnSRXD.IDD bits. Furthermore no slow channel new data and slow channel message lost flags are generated.

In order to receive the slow channel serial message, all fast channel serial messages contributing to a slow channel serial message must be received successfully and the received slow channel serial message must comply with the selected serial message format.

A message lost on the fast channel does not impact the reception on the slow channel.

A slow channel receive buffer is composed of the slow channel receive timestamp register (RSENTnSRTS) and the slow channel receive data register (RSENTnSRXD).

In opposite to the fast channel receive buffer, the slow channel receive buffer does not support a double receive buffer structure; only a single receive buffer structure is available.

Message decoding and assembling is done in a separate register stage.

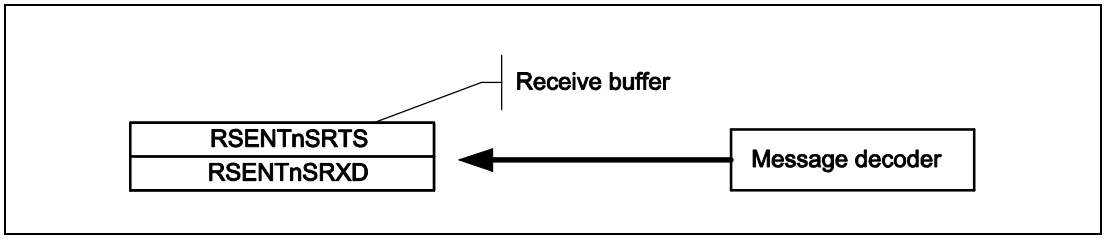

**Figure 22.16 Slow Channel Receive Message Buffer**

The slow channel receive buffer is updated at the same time as the fast channel receive buffer that holds the last status and communication nibble required for the slow channel message. The RSENTnSRXD.SND bit is set to 1 at the same time.

Further updates to the buffer are not carried out until after the RSENTnSRXD.SND bit has been read.

When the receive buffer is holding an unprocessed message (RSENTnSRXD.SND is 1), any further incoming message is lost (the slow channel receive buffer is not updated) and RSENTnCS.SMS is set to 1.

When the CPU reads the RSENTnSRXD register, RSENTnSRXD.SND is automatically cleared.

The RSENTnSRTS register is updated with the current timestamp counter register value of the last frame contributing to the slow channel message.

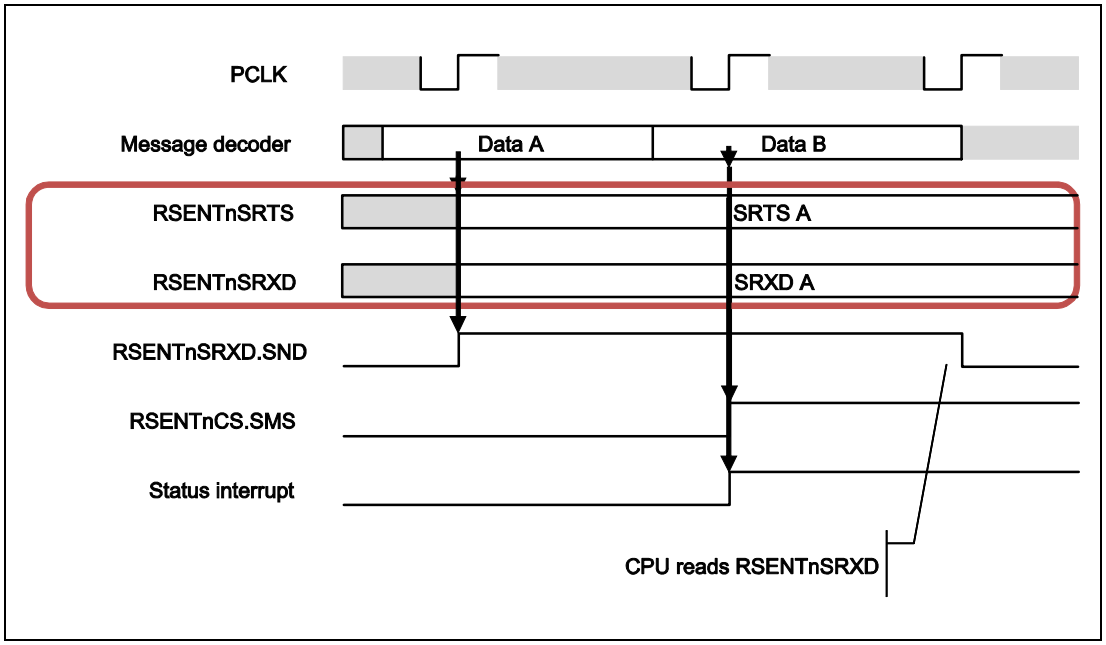

**Figure 22.17 Slow Channel Receive Buffer Update Timing**

The data alignment in the RSENTnSRXD register depends on the slow channel message format (RSENTnCC.SMF) and the received configuration bit.

**Table 22.39 Data Alignment in RSENTnSRXD Register**

| RSENTnCC.SMF | RSENTnSRXD.SMGC | RSENTnSRXD.IDD[19:16] | RSENTnSRXD.IDD[15:12] | RSENTnSRXD.IDD[11:8] | RSENTnSRXD.IDD[7:4] | RSENTnSRXD.IDD[3:0] |
|---|---|---|---|---|---|---|
| $00_B$ | Undefined | Undefined | Undefined | Undefined | Undefined | Status and communication nibble |
| $01_B$ | Undefined | Undefined | Undefined | Message ID[3:0] | DATA[7:4] | DATA[3:0] |
| $10_B$ | 0 | Message ID[7:4] | Message ID[3:0] | DATA[11:8] | DATA[7:4] | DATA[3:0] |
| $10_B$ | 1 | Message ID[3:0] | DATA[15:12] | DATA[11:8] | DATA[7:4] | DATA[3:0] |

### (6) Slow Channel Reception Flow

In **Figure 22.18**, the recommended reception flow for the slow channel receive buffer is shown. When the slow channel receive data is required, this process should be executed as part of the fast channel reception flow.

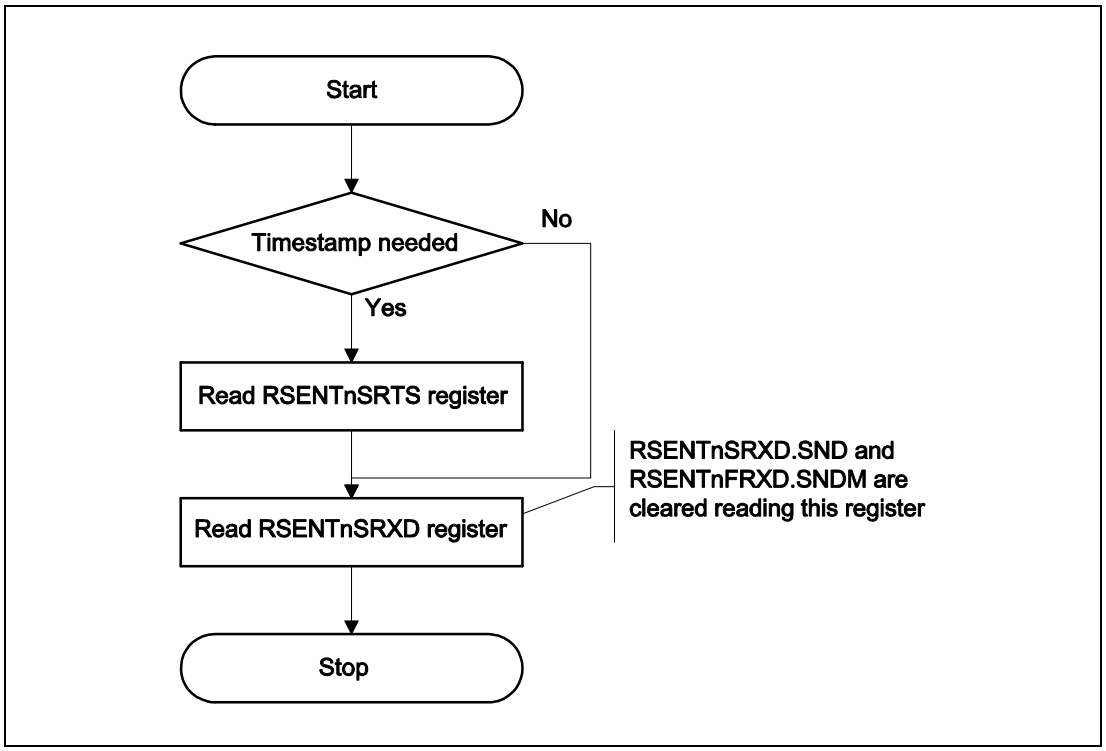

Figure 22.18 Slow Channel Reception Flow

In any case, the CPU should keep the order in reading the slow channel receive buffer registers as shown in the flow. The RSENTnSRXD.SND bit should be accessed as last.

### (7) DMA Flow

In case of DMA usage, the start address for the DMA usage and the number of transfers define which part of the receive buffer will be transferred. The RSENTnFRXD register should be the last register to be accessed using a 32 bit access method.

In case of SAE communication with pause pulse and fixed message length, the flow must be extended by checking of the ratio of the calibration pulse to message length. This variation check must be performed by the CPU. In case the variation check fails, the CPU must discard the received message.

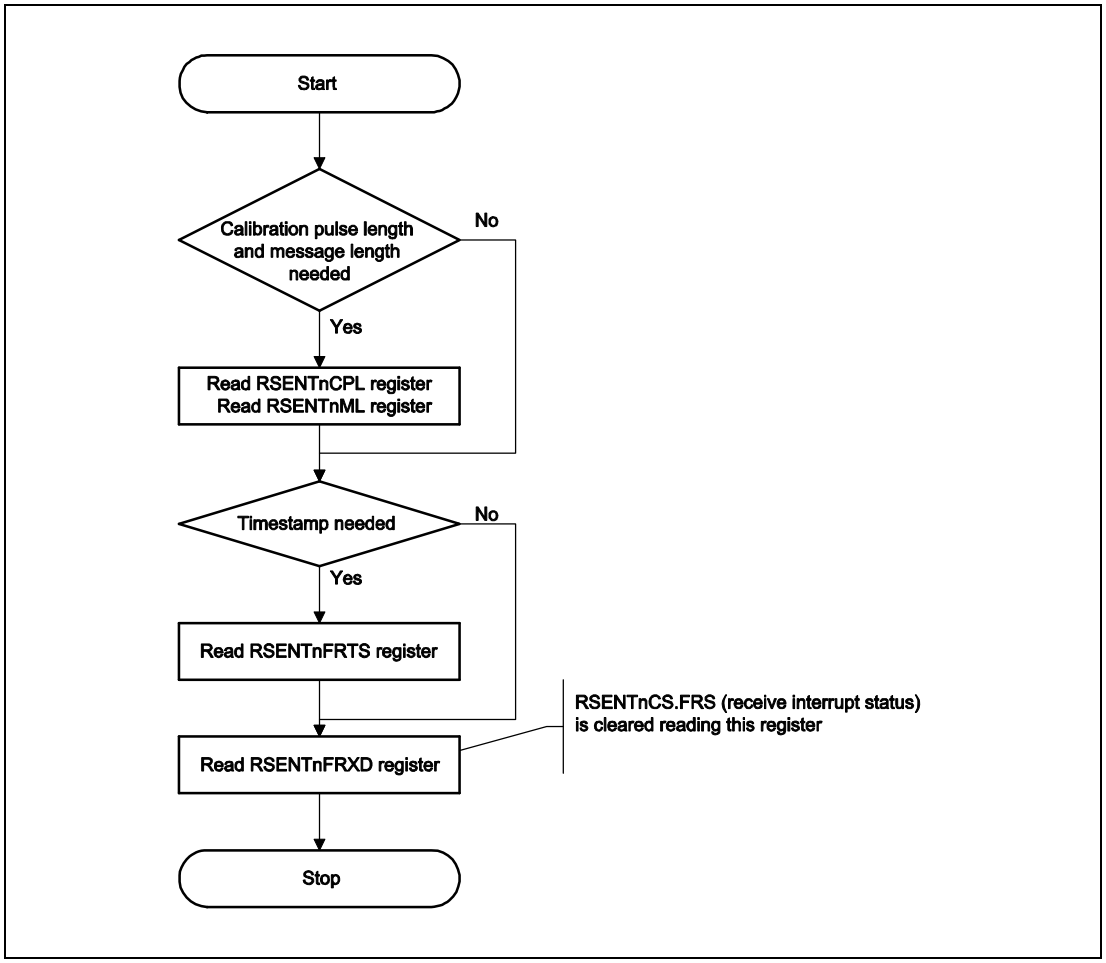

**Figure 22.19 DMA Reception Flow**

In the software processing, when the transferred data set, the CPU should check the status of the transferred RSENTnFRXD.SNDM bit. If this bit is set to 1, then the user needs to read the slow channel receive buffer if needed.

### (8) Error Flagging

Message lost errors (shown in RSENTnCS.SMS, RSENTnCS.FMS) are flagged when a new message was decoded and all message diagnostics passed.

The SPC communication error (shown in RSENTnCS.NRS) is flagged when the CPU writes to RSENTnSPCT.TLL before/during response reception.

The update timings for fast channel reception errors (RSENTnCS.CVS, RSENTnCS.CLS, RSENTnCS.FNS, RSENTnCS.FES and RSENTnCS.FCS) and slow channel reception errors (RSENTnCS.SCS and RSENTnCS.SES) depends on the configuration of RSENTnCC.SPCE, RSENTnCC.FCM, RSENTnCC.PPC and RSENTnCC.PPTC. The update timings for each configuration are shown in **Table 22.40** and **Table 22.41**.

In case a nibble encoding error or calibration pulse length error is detected, message reception is terminated immediately. No further error flagging for this message is done. Message decoding starts again after a calibration pulse without calibration length error (RSENTnCS.CLS) is detected.

**Table 22.40 Error flag set timing when CC.SPCE = 0**

| **RSENTnCC.SPCE** | **0** | **0** | **0** | **0** | **0** | **0** | **0** | **0** |

| RSENTnCS.CVS | — | X | — | — | — | X | — | — |

EC: End of calibration pulse
IM: Immediately when detected
—: Not set
X: Invalid configuration

**NOTE**

In case the sensor stops communication, no buffer update or status update for last message takes place. The SW should take care of this by timeout checks.

When a transition to OPERATION IDLE is configured in RSENTnMDC.OMC and an error is detected in the message in which the mode transition was requested, the error is not flagged and the message is aborted.

In case of a fast channel encoding error or a calibration pulse length error the OPERATION IDLE mode is entered immediately.

In case of a fast channel nibble count error, fast channel CRC error, or fast channel calibration pulse variation error the OPERATION IDLE state is entered at the end of the next STATUS/COM nibble.

RERSENTnCS.FNS is only set after a valid calibration pulse was detected and all following nibbles have a valid length (≥12 ticks and ≤27 ticks) or no nibble was received between two valid calibration pulses.

RSENTnCS.FES is only set if the nibble with an encoding error occurred in the communication and status nibble, CRC nibble or in one of the expected data nibbles.

If SPC is enabled (RSENTnCC.SPCE = 1), RSENTnCS.CLS is set if a calibration pulse was expected but the pulse length does not meet the calibration pulse range. If SPC is disabled (RSENTnCC.SPCE = 0), RSENTnCS.CLS is set only after a valid calibration pulse has been received and a calibration pulse was expected but the pulse length does not meet the calibration pulse range.

During re-synchronisation additional error flags might be set which is not affecting the reception of the following frame

### 22.4.4 SPC Function

The RSENT module supports an extension of the J2716 specification known as SPC. The user can enable or disable the SPC extension by setting the RSENTnCC.SPCE bit.

In SPC mode the RX line will be driven low to initiate RSENT message transmission. In the RH850/P1x-C this can be realized by controlling an external transistor by the RSENTnSPCO pin.

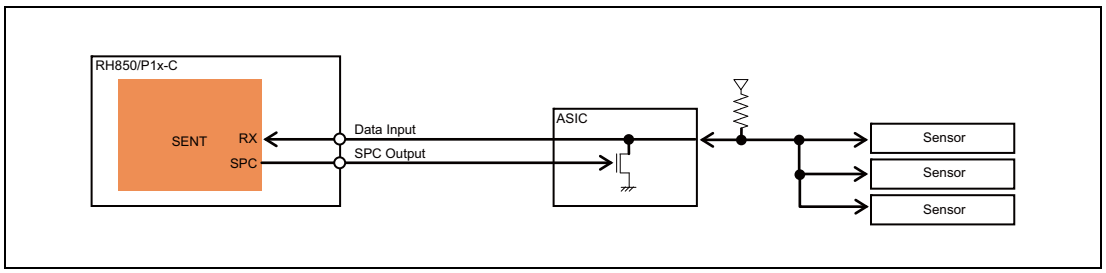

**Figure 22.20 Sample Circuit of External Transistor**

The user can configure the polarity of the Port RSENTnSPCO.

The text below describes the behavior of the RSENTnSPCO port with the default settings of RSENTnCC.SOPC. When the default value of RSENTnCC.SOPC is changed, the polarity is inverted.

RX line will be held low for a configured length of tick time specified in the RSENTnSPCT.TLL bits.The Tick time is configured with the RSENTnBRP.TTI bits and the RSENTnBRP.TTF bits which are equal to the transmission tick time. For details, see **Section 22.4.2.2(2), RX and SPC Tick Settings**.

In a single sensor system, this function can be used to trigger data transmission from the sensor. Further data can be sent to the sensor by varying the trigger pulse length. In a multi sensor system, this function can be used to address a dedicated sensor and request a data transmission.

Once RSENT SPC initialization is complete, transmission can be triggered by writing the trigger pulse width to the RSENTnSPCT.TLL register. When a transmission is triggered, the trigger pulse with the configured length is sent. Then a frame reception is expected. After frame reception was done, a new trigger pulse can be sent.

Writing to RSENTnSPCT.TLL requests a SPC trigger transmission. After writing to RSENTnSPCT.TLL, the CPU should read RSENTnCS.NRS to check whether the previous request was completed or not.

In case RSENTnCS.NRS is set, no SPC trigger is sent and any potentially ongoing reception at this time is aborted. The CPU should clear RSENTnCS.NRS by writing 1 to RSENTnCSC.NRC. The CPU can write again to RSENTnSPCT.TLL to request a SPC trigger transmission.

In case RSENTnCS.NRS is not set, the CPU should set a reception timeout counter in software. If a reception occurs before the timeout counter elapses, the user should process the received slow and fast channel data as shown in the fast channel reception flow (**Figure 22.15**) and slow channel reception flow (**Figure 22.18**).

When the timeout counter elapses without any successful reception, the addressed sensor seems not to send any valid response. The CPU should analyze the RSENTnCS register to analyze the reason for no successful reception. A new request can be made considering that when RSENTnCS.NRS gets set no SPC trigger is sent.

According to the SPC protocol, a frame is received when the falling edge of the end pulse has been detected. It is the user responsibility to not make a SPC trigger request during the end pulse as this might not be recognized by the sensor.

Purpose of the timeout function is to define a timeout window for response reception in software.

**Figure 22.21** shows a transmission flow with a timeout function implemented in software. The timeout function is optional and can be omitted if not needed.

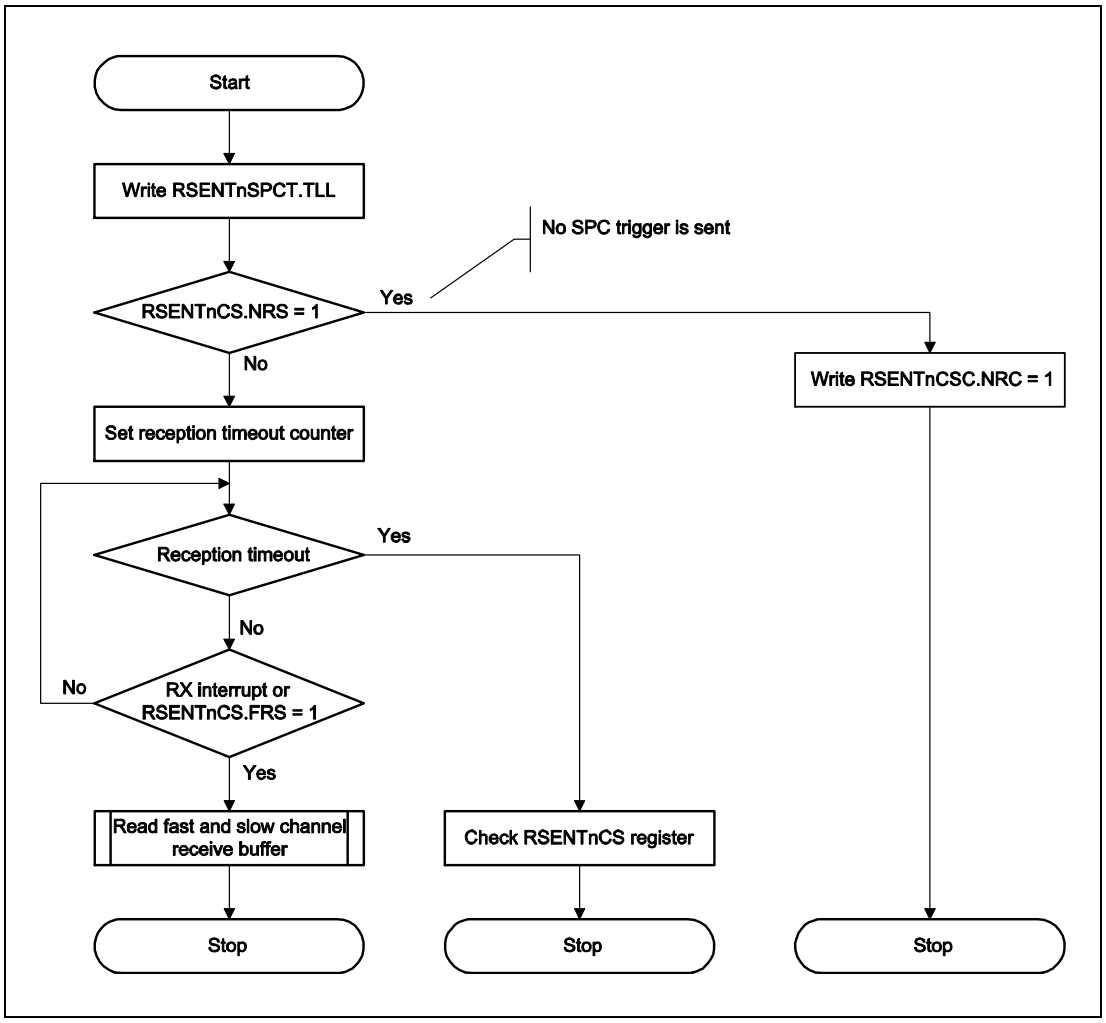

**Figure 22.21 Transmission Flow**

### 22.4.5 Interrupts and Checks

The RSENT module provides two interrupt lines.

The successful fast channel receive interrupt notifies the CPU that the fast channel receive buffer was updated and is holding a set of valid received data. Also, the reception status bit is set (RSENTnCS.FRS).

The status interrupt notifies the CPU that at least one of the error flags or message lost flags in the RSENTnCS register is set.

Whether a status flag in the RSENTnCS register is contributing to the generation of an interrupt event or not can be set individually.

The execution of the CRC checks can be disabled for the slow channel and fast channel individually. In case a check is disabled, the CRC of the received message is not checked and the related error flag is never set.

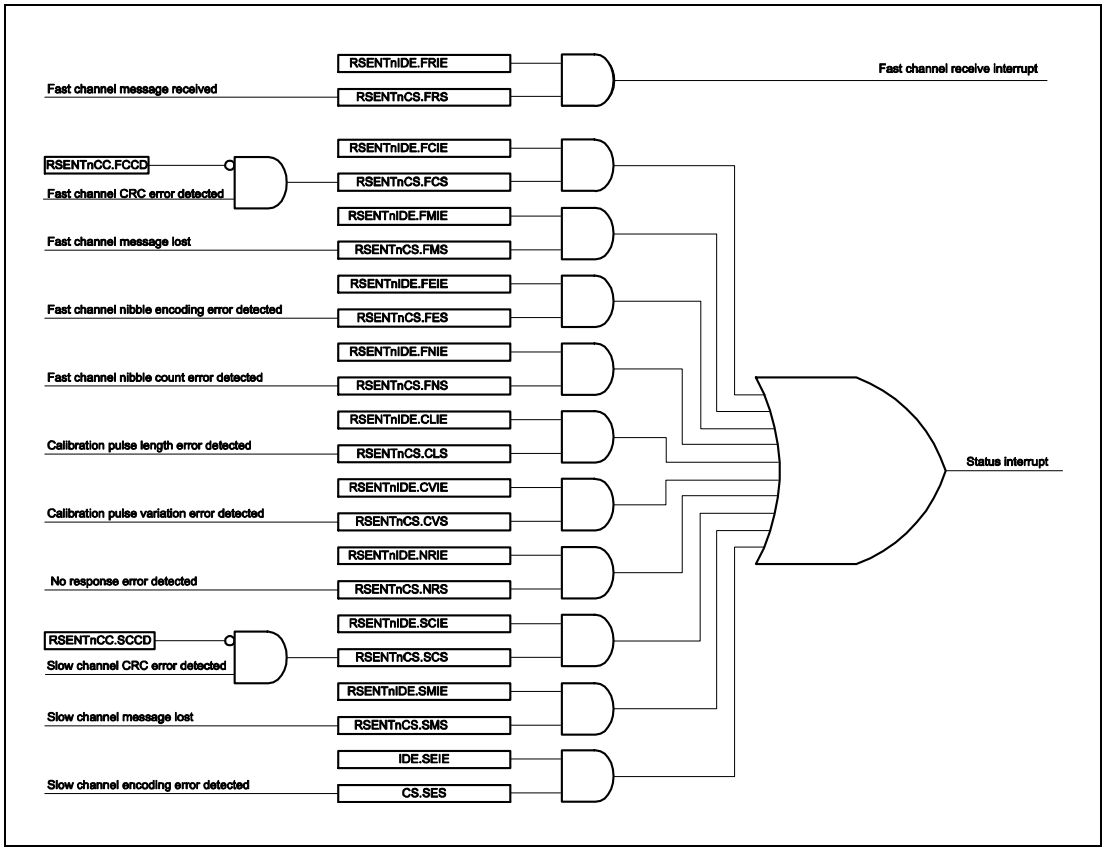

**Figure 22.22 Interrupt Structure**

**Table 22.42** gives an overview about the relationship between set status flags and the buffer update.

**Table 22.42 Status Flag Influence to Receive Buffer Behavior**

| RSENTnCS | Fast Channel Receive Buffer | Slow Channel Receive Buffer |
|---|---|---|
| FRS | Updated | Updated if last slow channel nibble received and RSENTnCS.SES = 0 and RSENTnCS.SCS = 0 |
| FCS | Not updated | Not impacted. Fast channel CRC does not cover the communication and status nibble |
| FMS | Background buffer overwritten | Not impacted |
| FES | Not updated | Receive process aborted. Search for new start condition |
| FNS | Not updated | Receive process aborted. Search for new start condition |
| CLS | Not updated | Receive process aborted. Search for new start condition |
| CVS | Not updated | Receive process aborted. Search for new start condition |
| NRS | Not updated | Receive process aborted. Search for new start condition |
| SCS | Not impacted | Not updated |
| SMS | Not impacted | Message lost |
| SES | Not impacted | Receive process aborted. Search for new start condition |

### 22.4.6 Limited Reset and Module stand-by

The RSENTn can be reset by limited reset from SYSCTRL. The Limited Reset is functionally equivalent to a hardware reset. Software must ensure that RSENTn is halted (RESET Mode or CONFIGURATION Mode). (See **Section 22.4.1, Modes of Operation**)

The RSENT clock can be disabled by the SYSCTRL module stand-by function. Software must ensure that RSENT is RESET mode or CONFIGURATION mode if module stand-by enable.

## 22.5 Difference among P1M-C, P1H-C and P1H-CE

Table 22.43 Different specification of RSENT

| Device | P1M-C (QFP, BGA-292) | P1M-C (BGA-156) | P1H-C (4MB, BGA-292) | P1H-C (4MB, BGA-156) | P1H-C (8MB) | P1H-CE |
|---|---|---|---|---|---|---|
| RSENT channel | 6 | 4 | 8 | 4 | 8 | 10 |

# Section 23 Window Watchdog Timer A (WDTA)

## 23.1 Features

The purpose of the Window Watchdog Timer A (WDTA) is to detect deadlock of CPU operation. WDTA is implemented as 1 or 2 macros in each device. One monitors so that PE1 won't be going out of control. Also, other monitors PE2. This timer generates an error signal if the counter is not cleared by CPU within a certain counter value. If the timer is cleared, MCU can keep normal operation. Additionally to detect failure mode, when the CPU feeds data for clearing the watchdog timer counter in incorrect timing due to unexpected CPU operation, extra feature are necessary such as a window trigger, VAC(Varying Activation Code) etc.

### 23.1.1 Number of Units and Channels

Table 23.1 Number of WDTA channel

| | Device | | | |
|---|---|---|---|---|
| **Macro** | P1M-C | P1H-C (4MB) | P1H-C (8MB) | P1H-CE |
| WDTA0 | 1 | 1 | 1 | 1 |
| WDTA1 | 0 | 1 | 1 | 1 |

### 23.1.2 Register Base Address

WDTAn base addresses are listed in the following table. WDTAn register addresses are given as offsets from the base addresses in general.

Table 23.2 Register Base Address

| Base Address Name | Base Address |
|---|---|
| <WDTA0_base> | FFED $0000_H$ |
| <WDTA1_base> | FFED $1000_H$ |

### 23.1.3 Clock Supply

Table 23.3 Clock Supply

| Unit Name | Specification | Description |
|---|---|---|
| WDTA0/ WDTA1 | High speed system clock : CLK_HSB | APB Bus clock |
| WDTA0/ WDTA1 | WDTA counter clock : WDTACLKI | WDT count clock*1<br>1/1 or 1/32 of CLK_IOSC*2 |

Note 1. Selectable by using the corresponding option byte

Note 2. See **Section 12, Clock Controller**

### 23.1.4 Interrupt Request

WDTAn interrupt requests are listed in the following table.

**Table 23.4 Interrupt Requests**

| Unit Name | Interrupt Name | Interrupt Number | DMA Number | Description |
|---|---|---|---|---|
| WDTA0 | INTWDTA0 | 8 | — | WDTA0 75% interrupt for PE1 |
| WDTA0 | | | | |
| WDTA1 | INTWDTA1 | 8 | — | WDTA1 75% interrupt for PE2 |
| WDTA1 | | | | |

**Table 23.5 Internal Error Signal**

| Unit Name | Interrupt for Unit | Description | Connected to |
|---|---|---|---|
| WDTA0 | WDTA0TERR*1 | WDTA0 error signal | ECM |
| WDTA1 | WDTA1TERR*1 | WDTA1 error signal | ECM |

Note 1. For details about error input to ECM, refer to **Section 29, Error Control Module (ECM)**

### 23.1.5 External Input / Output Pins

WDTAn has no external pins

## 23.2 Overview

### 23.2.1 Functional Overview

The Window Watchdog Timer A generates the ECM error signal if the 16-bit counter overflows or if any other error condition is fulfilled. The counter is cleared and restarted every time a WDTA trigger occurs while the window is open.
At 75% of the maximum counter value, the WDTA can generate an interrupt request INTWDTA0 and INTWDTA1. After reset release, the start-up options specify the start mode and the WDTA settings. The settings can be modified by writing the Watchdog Timer mode register WDTAnMD.

The Window Watchdog Timer A has the following functions:

- Operation mode after reset selectable by using start-up options
- Fixed activation code and variable activation code (VAC) selectable
- Two start modes available:
  - Default start mode (automatic start)
  - Software trigger start mode
- Generation of an error signal to ECM on error detection
- Interrupt request generation at 75% of the counter overflow value
- Window function

### 23.2.2 Block Diagram

**Figure 23.1** shows the main components of the Window Watchdog Timer A

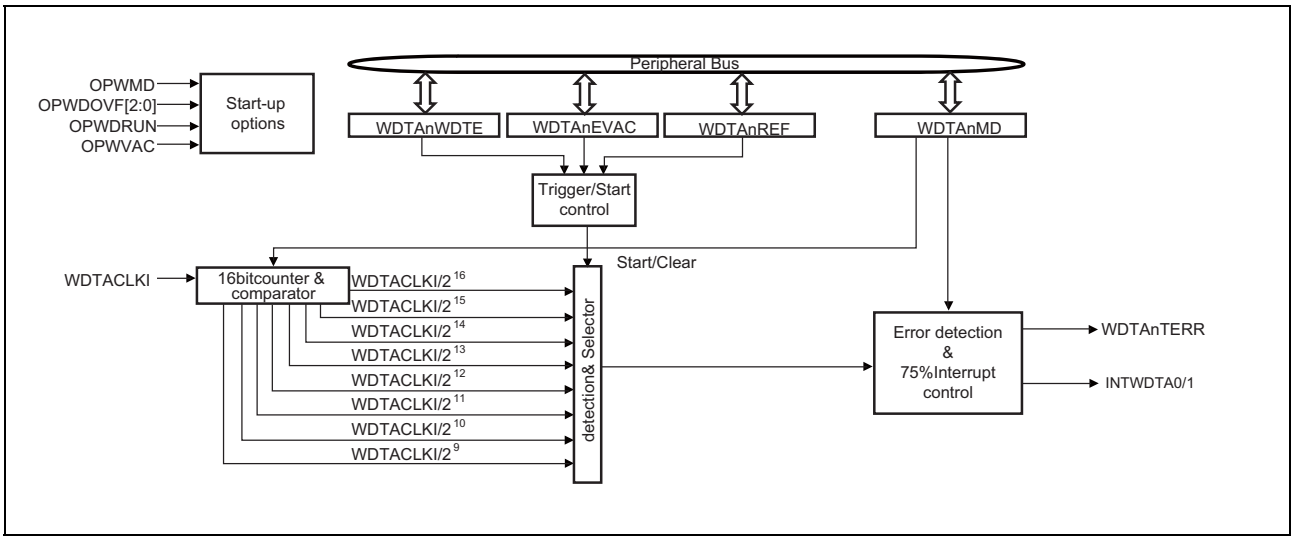

**Figure 23.1 Block diagram of the Window Watchdog Timer A**

# 23.3 Registers

## 23.3.1 List of Registers

WDTAn registers are listed in the following table.

**Table 23.6 Register list**

| Address | Register name | Description | Access Size[bit] | Value after reset | Access Protection | |
|---|---|---|---|---|---|---|
| | | | | | PBG | Other |
| * | * | WDTA0 | 8 | * | PBG2.PG2-WDT0 | — |
| * | * | WDTA1 | 8 | * | PBG2.PG2-WDT1 | — |

*: Regarding address, register name, and value after reset of WDTAn, see the following table

**Table 23.7 Register Reset Condition**

| Register Name | Reset condition | | | | |
|---|---|---|---|---|---|
| | Power On Reset | System Reset1 | System Reset2 | Application Reset1 | Limited Reset |
| All registers | √ | √ | √ | √ | — |

**Table 23.8 List of WDTn Registers**

| Module | Register | Symbol | Address |
|---|---|---|---|
| WDTAn | WDTA enable register | WDTAnWDTE | <WDTAn_base> + $0000_H$ |
| WDTAn | WDTA VAC enable register | WDTAnEVAC | <WDTAn_base> + $0004_H$ |
| WDTAn | WDTA reference value register | WDTAnREF | <WDTAn_base> + $0008_H$ |
| WDTAn | WDTA mode register | WDTAnMD | <WDTAn_base> + $000C_H$ |

## 23.3.2 WDTAnWDTE — WDTA enable register

This register is the WDTA start control and trigger register if the VAC function is not used (start-up option OPWDVAC = 0).

**NOTE**

See the **Table 23.17, WDTA start-up options**.

### WDTA trigger

Writing $AC_H$ to this register restarts the counter.The behavior of this register depends on activation of the VAC function, see **Table 23.11, WDTAnWDTE behavior**.

**Access:** This register can be read/written in 8-bit units.

**Address:** <WDTAn_base> + $0000_H$

**Value after reset:** The value after reset depends on the start-up options OPWDEN, OPWDRUN and OPWDVAC. See **Table 23.10, WDTAnRUN value after reset**.
This register is initialized by a reset of any type.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDTAnRUN | — | — | — | — | — | — | — |
| Value after reset | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 23.9 WDTAnWDTE register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | WDTAnRUN | Enables/disables the WDTAn:<br>0: WDTAn disabled<br>1: WDTAn enabled<br>Since the WDTA can not be stopped once it was started, this bit can only be cleared by a reset. |
| 6 to 0 | Reserved | When read, the value after reset is read. |

This bit is only valid if VAC is disabled (OPWDVAC = 0). In this case, the initial value of bit WDTAnRUN depends on other start-up options as listed below.

**Table 23.10 WDTAnRUN value after reset**

| Start-up options | | |
|---|---|---|
| **OPWDVAC** | **OPWDRUN** | **Value after reset of WDTAnRUN** |
| 0 | 1 | 1 |
| Other than above | | 0 |

The behavior of WDTAnWDTE during read/write accesses depends on activation of the VAC mode, as shown in **Table 23.11** below.

**Table 23.11 WDTAnWDTE behavior**

| | WDTAnWDTE | | |
|---|---|---|---|
| **OPWDVAC** | **Read** | **Write** | **Remark** |
| 0 | $AC_H$ | WDTA trigger $AC_H$*1 | VAC disabled, WDTAnWDTE enabled |
| 1 | $2C_H$ | ignored | VAC enabled, WDTAnWDTE disabled |

Note 1. Any other write value will lead to an error detection.

### 23.3.3 WDTAnMD — WDTA mode register

This register specifies the overflow interval time, the 75% interrupt enable/disable, and the window-open period.

It can be updated only once after reset release and before the first trigger. The updated value is effective after the next WDTA trigger.

Updating this register after the WDTA has been started leads to error detection, but the read value of this register can be written without generating an error.

**Access:** This register can be read/written in 8-bit units.

**Address:** <WDTAn_base> + $000C_H$

**Value after reset:** The value after reset depends on the start-up options OPWDOVF[2:0].
This register is initialized by a reset of any type.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | — | WDTAnOVF[2:0] | | | WDTAnWIE | — | WDTAnWS[1:0] | |
| Value after reset | 0 | — | — | — | 0 | 1 | 1 | 1 |
| R/W | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 23.12 WDTAnMD register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 6 to 4 | WDTAnOVF[2:0] | Selects the overflow interval time (μs) |

| WDTAn OVF2 | WDTAn OVF1 | WDTAn OVF0 | Overflow interval time |
|---|---|---|---|
| 0 | 0 | 0 | $2^9$ / WDTACLKI |
| 0 | 0 | 1 | $2^{10}$ / WDTACLKI |
| 0 | 1 | 0 | $2^{11}$ / WDTACLKI |
| 0 | 1 | 1 | $2^{12}$ / WDTACLKI |
| 1 | 0 | 0 | $2^{13}$ / WDTACLKI |
| 1 | 0 | 1 | $2^{14}$ / WDTACLKI |
| 1 | 1 | 0 | $2^{15}$ / WDTACLKI |
| 1 | 1 | 1 | $2^{16}$ / WDTACLKI |

The reset values of WDTAnOVF[2:0] depend on start-up option OPWDOVF[2:0].

| | | |
|---|---|---|
| 3 | WDTAnWIE | Enables/disables the 75% interrupt request INTWDTA0/1:<br>0: INTWDTA0/1 disabled(value after reset)<br>1: INTWDTA0/1 enabled |
| 2 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 1, 0 | WDTAnWS[1:0] | Selects the window-open period: |

| WDTAn WS1 | WDTAn WS0 | Window-open period |
|---|---|---|
| 0 | 0 | 25% |
| 0 | 1 | 50% |
| 1 | 0 | 75% |
| 1 | 1 | 100% (Default) |

### 23.3.4 WDTAnEVAC — WDTA enable VAC register

This register is the start control and trigger register if the VAC function is used (start-up option OPWDVAC = 1).

#### WDTA trigger

Writing the correct activation code to this register restarts the counter.

The behavior of this register depends on activation of the VAC function. See **Table 23.15, WDTAnEVAC behavior**.

**Access:** This register can be read/written in 8-bit units.

**Address:** <WDTAn_base> + $0004_H$

**Value after reset:** The value after reset depends on the start-up options OPWDEN,OPWRUN and OPWDVAC. See **Table 23.14, WDTAnEVAC value after reset**
This register is initialized by a reset of any type.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDTAnEVAC7 | — | — | — | — | — | — | — |
| Value after reset | — | 0 | 1 | 0 | 1 | 1 | 0 | 0 |
| R/W | R/W | R | R | R | R | R | R | R |

**Table 23.13 WDTAnEVAC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 | WDTAnEVAC7 | Enables/disables the WDTAn:<br>0: WDTAn disabled<br>1: WDTAn enabled<br>Since the WDTA cannot be stopped once it was started, this bit can only be cleared by a reset. Thus even if bit 7 of the activation code is 0, the WDTA will not stop. |
| 6 to 0 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |

This bit is only valid if VAC is enabled (OPWDVAC = 1). In this case, the value after reset of the WDTAnEVAC7 bit depends on other start-up options as listed below.

**Table 23.14 WDTAnEVAC value after reset**

| Start-up options | | |
|---|---|---|
| **OPWDRUN** | **Start mode** | **Value after reset of WDTAnEVAC7** |
| 0 | Software trigger | 0 |
| 1 | Default | 1 |
| Ignored | Software trigger | 0 |
| Ignored | Default | 1 |

The behavior of WDTAnEVAC during read/write accesses depends on activation of the VAC mode, as shown in **Table 23.15** below.

Table 23.15 WDTAnEVAC behavior

| OPWDVAC | WDTAnEVAC | | Remark |
|---|---|---|---|
| | Read | Write | |
| 0 | $2C_H$ | Ignored | VAC disabled |
| 1 | Last written VAC | ExpectWDTE*1 | VAC enabled |

Note 1. Any other write value will lead to an error detection.

## 23.3.5 WDTAnREF — WDTA reference value register

This register contains the reference value for calculating the activation code of the VAC function. It is automatically updated after every trigger operation.

If VAC is disabled (OPWDVAC = 0), reading this register returns $00_H$.

**Access:** This register can be read/written in 8-bit units.

**Address:** <WDTAn_base> + $0008_H$

**Value after reset:** $00_H$
This register is initialized by a reset of any type.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|
| | WDTAnREF[7:0] | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

Table 23.16 WDTAnREF register contents

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 0 | WDTAnREF[7:0] | Reference value for activation code calculation. |

## 23.4 Operation

### 23.4.1 WDTA Start-up Options

The start-up options determine the start-up configuration of the WDTA after reset release. They are described in **Table 23.17, WDTA start-up options**.

**Table 23.17 WDTA start-up options**

| Start-up option | Function | Description | Connected to |
|---|---|---|---|
| OPWD0MD | WDTA slow/fast mode | Switches between slow and fast mode:<br>0: WDTA slow mode (WDTACLKI = 1/32 of CLK_IOSC)<br>1: WDTA fast mode (WDTACLKI = 1/1 of CLK_IOSC) | • WDTA0: Flash option*1<br>• WDTA1: Flash option*1 |
| OPWDOVF[2:0] | Count clock setting | Specifies the reset value of the count clock control bits WDTAnMD.WDTAnOVF[2:0]. | • WDTA0/WDTA1: Flash option*1 |
| OPWDRUN | Start mode setting | Specifies the start mode:<br>0: Software trigger start mode<br>1: Default start mode | • WDTA0: Flash option*1<br>• WDTA1: Flash option*1 |
| OPWDVAC | Variable Activation Code (VAC) selection | Specifies the trigger register for the generation of counter re-start triggers to keep the counter from overflowing.<br>0: WDTAnWDTE (fixed)<br>1: WDTAnEVAC (variable)<br><br>When WDTAnWDTE is selected, the value to be written to the register (activation code) is fixed ($AC_H$). When WDTAnEVAC is selected, the activation code to be written to the register is variable. | • WDTA0: Flash option*1<br>• WDTA1: Flash option*1 |

Note 1. Refer **Section 32.12**

**NOTE**

The Window Watchdog Timer A generates an error signal for ECM if an error occurred. If the ECM is configured to generate a reset as a result on this error signal, it is indicated in a reset status register:

## 23.4.2 WDTA after reset release

### 23.4.2.1 Start modes

The WDTA provides two modes for the counter start after reset release:

- Software trigger start mode
  The counter value remains $0000_H$ after reset release.
  The counter is started with the first WDTA trigger.
- Default start mode
  The counter starts automatically after reset release.

### 23.4.2.2 Start mode selection

The start mode can be selected by the start-up options.

The start mode selection is listed in Table Start mode selection.

**Table 23.18 Start mode selection**

| Start-up options | | |
|---|---|---|
| **OPWDRUN** | **Reset type** | **Start mode** |
| 0 | Ignored | Software trigger |
| 1 | | Default |

### 23.4.2.3 WDTA settings after reset release

The WDTA settings are as follows between reset release and the first trigger:

**Table 23.19 WDTA settings after reset release**

| Function | Setting | Remark |
|---|---|---|
| Start mode | Specified by start-up options | |
| Count clock | | |
| 75% interrupt mode | Disabled | |
| Window-open period | 100% | If default start mode is specified, the first trigger is valid any time before the counter overflows. |

#### Change WDTA settings

After the first trigger, the WDTA continues according to the settings of the Watchdog Timer mode register WDTAnMD.

To change the WDTA settings, WDTAnMD must be written before the first trigger. Changing the value of WDTAnMD after the first trigger leads to an error.

If WDTAnMD is not changed before the first trigger, the WDTA mode is specified by the value after reset of WDTAnMD.

The new or value after reset of WDTAnMD applies after the first trigger.

### 23.4.2.4 Default start mode timing

The default start mode timing and the changes to the WDTA settings are illustrated in **Figure 23.2**.

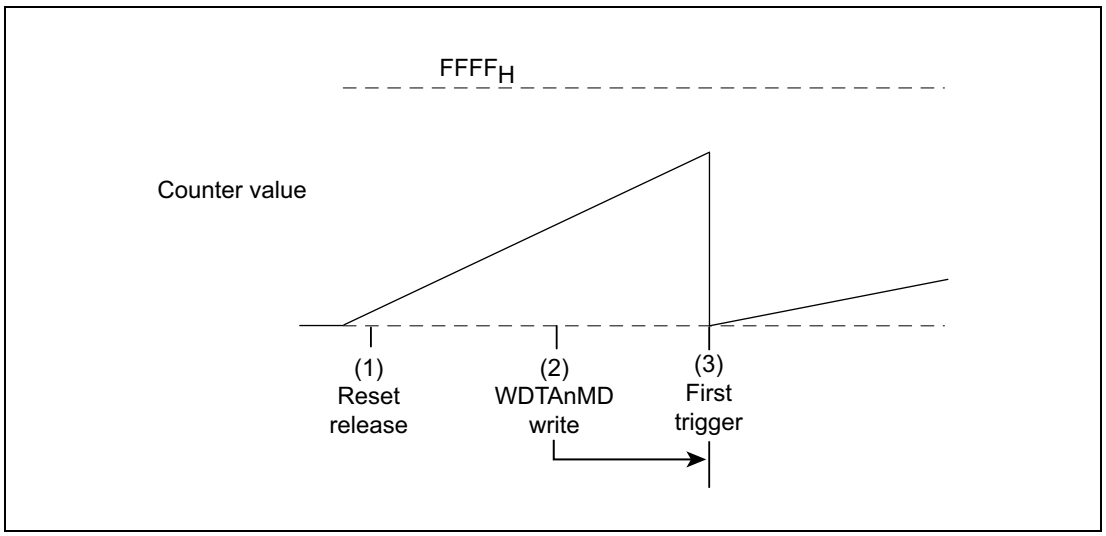

**Figure 23.2 Timing diagram of WDTA start in default start mode**

The timing diagram above shows the following:

(1) After reset release, the counter starts immediately.
The count clock is specified by the start-up options, for example:
– Count clock after reset release = WDTACLKI / $2^{13}$
(OPWDOVF[2:0] = $100_B$)

(2) WDTAnMD is written with WDTAnMD.WDTAnOVF[2:0] = $111_B$ before the first trigger.
However, the settings are not applied immediately.

(3) The first trigger must occur before the counter overflows.
After the first trigger, the settings specified in WDTAnMD are applied, for example a new count clock:
– Count clock after first trigger = WDTACLKI / $2^{16}$ (WDTAnMD.WDTAnOVF[2:0] = $111_B$

### 23.4.2.5 Software trigger start mode timing

The software trigger start mode timing and the changes to the WDTA settings are illustrated in **Figure 23.3**.

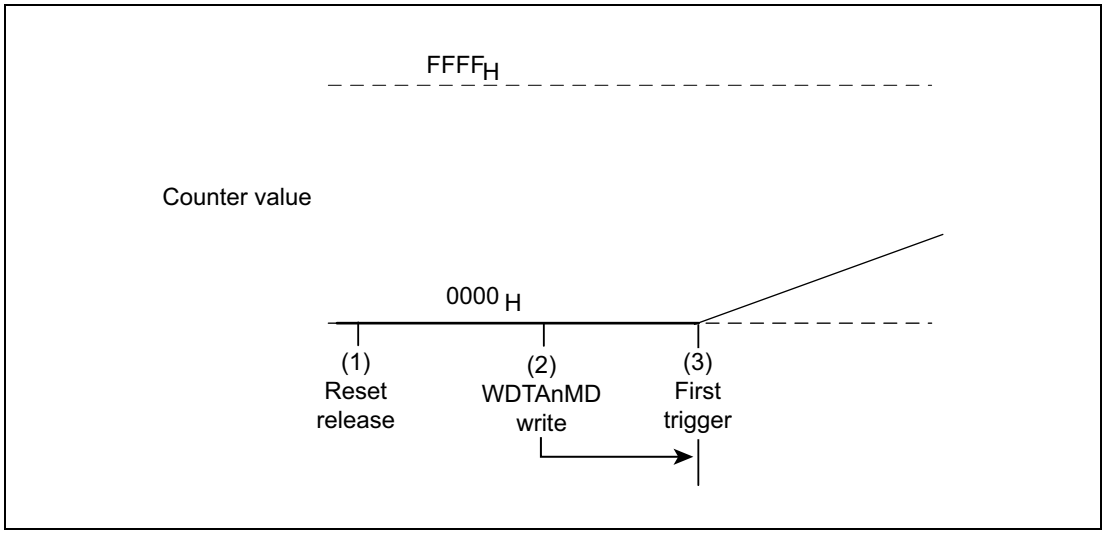

**Figure 23.3 Timing diagram of WDTA start in software trigger start mode**

The timing diagram above shows the following:

(1) After reset release, the counter remains $0000_H$ until the first trigger.
The count clock is specified by the start-up options, but it does not have any effect.

(2) WDTAnMD is written before the first trigger. However, the settings are not applied immediately.

(3) The counter starts at the first trigger.
The count clock and other settings specified in WDTAnMD are applied.

### 23.4.3 WDTA trigger

The WDTA trigger has the following functions:

- Counter start trigger in software trigger start mode
- Counter restart trigger to avoid counter overflow

The trigger register to be used differs depending on whether the activation code is fixed or variable. The type of activation code and the associated trigger register are specified by using the start-up option OPWDVAC.

**Table 23.20 Trigger register and activation code**

| Type of activation code | Trigger register | Activation code |
|---|---|---|
| Fixed | WDTAnWDTE | $AC_H$ |
| Variable | WDTAnEVAC | For details, refer to Calculation variable activation codes |

#### 23.4.3.1 Calculating variable activation codes

The variable activation code (ExpectWDTE) is calculated using a reference value in register WDTAnREF. The reference value in WDTAnREF is updated each time the trigger register WDTAnEVAC is written.

- Use the expression below to calculate the variable activation code (ExpectWDTE):
  ExpectWDTE = $AC_H$ – WDTAnREF (old)
- Use the expression below to calculate how the WDTAnREF value is updated:
  WDTAnREF (new) = rotate left 1 bit (ExpectWDTE)

The table below lists the variable activation codes according to the number of triggers.

**Table 23.21 Expected variable activation code development**

| No*1 | WDTAnREF (old) | | ExpectWDTE ($AC_H$ — WDTAnREF) | | WDTAnREF (new) | |
|---|---|---|---|---|---|---|
| 0 | 0000 0000 | $00_H$ | 1010 1100 | $AC_H$ | 0101 1001 | $59_H$ |
| 1 | 0101 1001 | $59_H$ | 0101 0011 | $53_H$ | 1010 0110 | $A6_H$ |
| 2 | 1010 0110 | $A6_H$ | 0000 0110 | $06_H$ | 0000 1100 | $0C_H$ |
| … | … | … | … | … | … | … |

Note 1. Number of triggers after reset

**NOTE**

Bit 7 of the WDTAnEVAC register (WDTAnEVAC7) cannot be cleared to 0 after the WDTA has been started. Thus even if bit 7 of the activation code is 0, the WDTA will not stop.

### 23.4.4 Error detection

The conditions for error detection are:

- Overflow interval time is exceeded (counter overflow)
- Wrong activation code is written to the trigger register
- Writing to the trigger register while the window is closed.
- Illegal update of Watchdog Timer mode register WDTAnMD:
  - Writing a new value to WDTAnMD after the first trigger leads to an error detection.
  - Writing the same value to WDTAnMD after the first trigger does not lead to an error detection.
- When an error is detected, an error signal for ECM (WDTAnTERR) is generated.

**Figure 23.4** shows the error signal to ECM generation when the counter overflows and default start mode is selected.

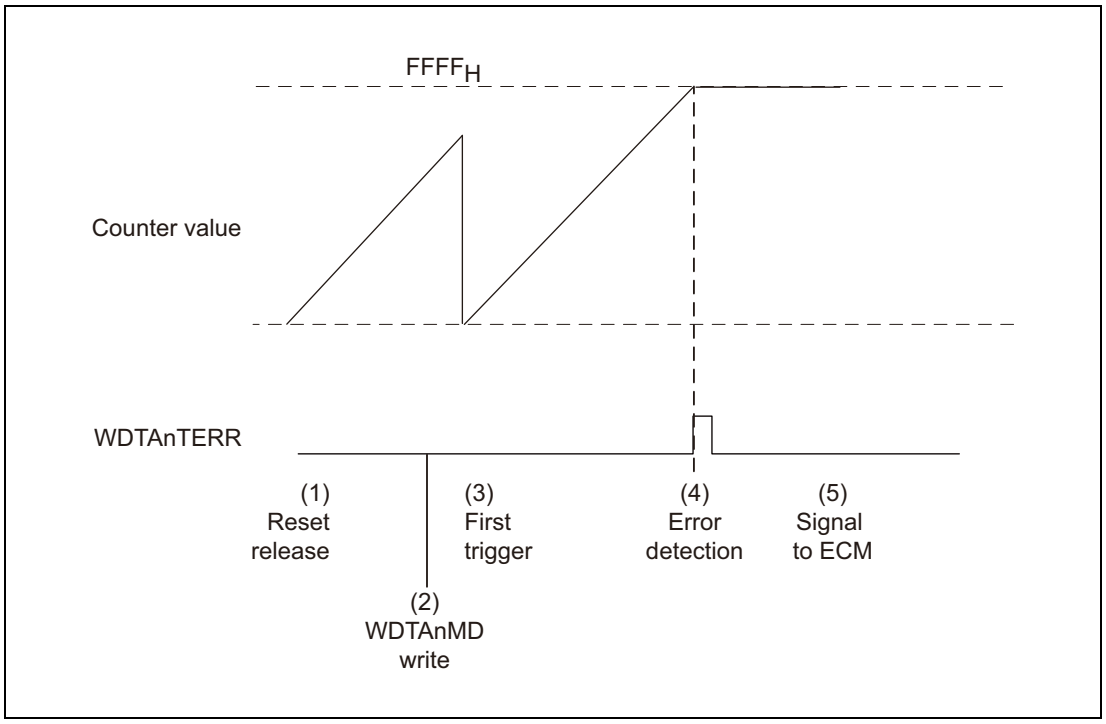

**Figure 23.4 Timing diagram of WDTA error signal to ECM module**

The timing diagram above shows the following:

(1) After reset release, the counter starts (default start mode is selected).

(2) WDTAnMD is written before the first trigger. However, the settings are not applied immediately.

(3) The counter is cleared at the first trigger and the new WDTA settings are applied.

(4) When the counter overflows, an error is detected. The WDTAnTERR is generated. The counter value remains until a reaction from ECM occurs.

### 23.4.5 75% interrupt request signals

When the counter reaches 75% of the maximum counter value, the interrupt request INTWDTAn is generated.

By use of WDTAnMD.WDTAnWIE this function can be enabled or disabled afterwards.

**Figure 23.5** shows the 75% interrupt request generation under following conditions:

- Default start mode selected
- Count clock changes after first trigger

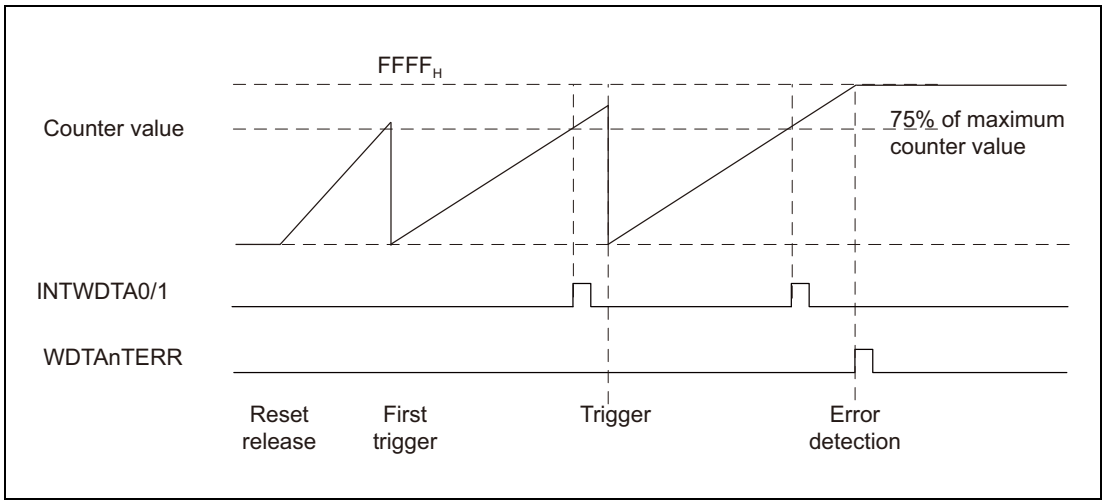

**Figure 23.5 Timing diagram of WDTA 75% interrupt request signals**

### 23.4.6 Window function

When the window-open period is set to less than 100%, an error is detected if the trigger occurs while the window is closed.

The definition of the window-open period differs before and after the first trigger:

- After reset release, the window-open period is 100%.
- After the first trigger, the window-open period is specified by bits WDTAnMD.WDTAnWS[1:0].

**Figure 23.6** shows WDTA operation with a window-open period of 25% and with default start mode selected.

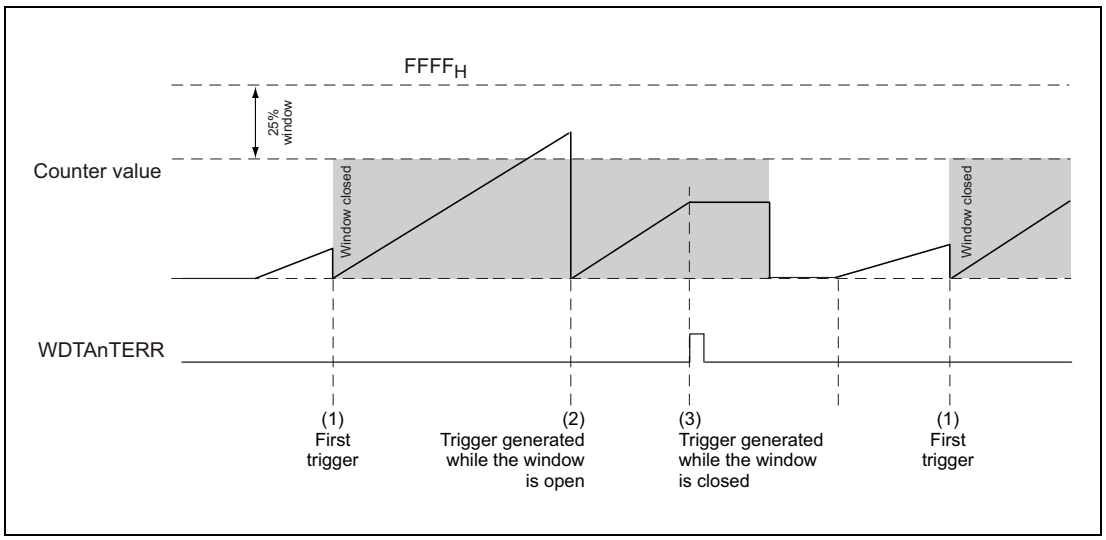

**Figure 23.6 Timing diagram of WDTA window function**

The timing diagram above shows the following:

(1) The window-open period is fixed to 100% for the first trigger.

(2) A trigger generated while the window is open does not lead to an error.

(3) A trigger generated while the window is closed generates an error signal to ECM module.

## 23.5 Cautions

1. Register access to WDTA0 is allowed from PE1 only. Do not access to WDTA0 from other masters.
   Register access to WDTA1 is allowed from PE2 only. Do not access to WDTA1 from other masters.
   Initial setting of each PBUS guard allows access from PE1/ PE2 to each WDTs. At first after start up, change the setting of PBUS guard for WDT0 to allow access from PE1 only. Also, change the setting of PBUS guard for WDT1 to allow access from PE2 only.
2. When WDT is default (automatic) start mode, WDT counter setting as default start mode begins to count up at the same time with a PE start up even if other PE doesn't start fetch. Please be careful in order to clear a counter of each WDT before reaching default threshold. When WDT counter can't be cleared before reaching the threshold, please use WDT by a Software start mode.

## 23.6 Difference among P1M-C, P1H-C and P1H-CE

There are differences in channels, interrupts, and external pins. For details, see **Table 23.1**, and **Table 23.4**.

# Section 24 System Timer (STM)

## 24.1 Features

The system timer (STM) is intended for typical operating system tasks like scheduling and synchronization of SW processes and supervision of timing budgets in single and multi-core environments. It will also be used for generation of wait loops or synchronization of SW processes with HW events. A set of 4 hardware counter channels allows running typical OS services like task scheduling and time budget monitoring on individual time bases. This reduces efforts to emulate additional timer channels in SW normally derived from only one common hardware timer. Multiple compare registers per counter channel can be used to start cyclic tasks with a defined temporal offset. A dedicated wide 64-bit counter channel enables the generation of a unique timestamp covering long period operation periods without overflow (e.g. complete automotive driving cycle) and thus eliminates any additional overflow SW handling.

### 24.1.1 Number of Units and Channels

Table 24.1 Number of STM channel

| Macro | Device | | | | Description |
|---|---|---|---|---|---|
| | P1M-C | P1H-C (4MB) | P1H-C (8MB) | P1H-CE | |
| STM0 | 1 | 1 | 1 | 1 | STM0 connect to NTU clock from FlexRay. Interrupt 8 of STM0 is non-maskable interrupt for PE1. |
| STM1 | 0 | 1 | 1 | 1 | STM1 don't connect to NTU clock from FlexRay. Interrupt 8 of STM1 is non-maskable interrupt for PE2. |

### 24.1.2 Register Base Address

STMn base addresses are listed in the following table. STMn register addresses are given as offsets from the base addresses in general.

Table 24.2 Register Base Address

| Base Address Name | Base Address |
|---|---|
| <STM0_base> | FFDD 8000H |
| <STM1_base> | FFDD 9000H |

### 24.1.3 Clock Supply

Table 24.3 Clock Supply

| Unit Name | Specification | Description |
|---|---|---|
| STM0 | High speed system clock: CLK_HSB | Peripheral clock (PCLK) and Counter clock source |
| | FlexRay NTU clock | Counter clock source |
| STM1 | High speed system clock: CLK_HSB | Peripheral clock (PCLK) and Counter clock source |

### 24.1.4 Interrupt Request

STMn interrupt requests are listed in the following table.

Table 24.4 STMn interrupt requests

| Unit Name | Interrupt Name | Interrupt Number | DMA Number | Description |
|---|---|---|---|---|
| STM0 | INTSTM00 | 41 | — | — |
| STM0 | INTSTM01 | 42 | — | — |
| STM0 | INTSTM02 | 12 | — | — |
| STM0 | INTSTM03 | 13 | — | — |
| STM0 | INTSTM04 | 14 | — | — |
| STM0 | INTSTM05 | 15 | — | — |
| STM0 | INTSTM06 | 135 | — | — |
| STM0 | INTSTM07 | 136 | — | — |
| STM0 | FEINT for PE1 | FEINT | — | Non-maskable interrupt for PE1 |
| STM1 | INTSTM10 | 43 | — | — |
| STM1 | INTSTM11 | 44 | — | — |
| STM1 | INTSTM12 | 45 | — | — |
| STM1 | INTSTM13 | 46 | — | — |
| STM1 | INTSTM14 | 137 | — | — |
| STM1 | INTSTM15 | 138 | — | — |
| STM1 | INTSTM16 | 139 | — | — |
| STM1 | INTSTM17 | 140 | — | — |
| STM1 | FEINT for PE2 | FEINT | — | Non-maskable interrupt for PE2 |

### 24.1.5 External Input / Output Pins

STMn has no external pins

## 24.2 Overview

### 24.2.1 Functional overview

- 1x64-bit / 3x32-bit counter channel
- Atomic read/write access to all registers
- 4 compare channels per counter channel (bit width corresponding to counter channel)
- Free-run compare mode, counting up
- Clock sources: Peripheral Clock PCLK, FlexRay NTU clock
- 9 interrupts (8x maskable, 1x non maskable high priority)
- Configurable assignment of interrupts to compare and overflow events
- Common register to start / stop multiple counter channels synchronously by one single register access
- Common status register, reflecting all channels' compare match and overflow flags by one single register access
- Anytime write access to compare registers, anytime read access to counter registers
- Application reset 1 (SW reset) for individual channels can be masked. When masked, counter keeps running on reset occurrence and counter register will not be initialized.

### 24.2.2 Counter channels and compare registers

The System Timer is composed of one 64-bit channel and three 32-bit counter channels. Each counter is equipped with 4 compare registers with corresponding bit width.

The counter registers can be read at any time, both while counter is running or stopped. The compare registers can be written at any time.

The CPU architecture supports 64-bit write access on the 32-bit peripheral bus. However in case of individual 32-bit write accesses to 64-bit counter or compare registers of channel 0, the updated register value will be processed after write to the upper 32-bit register. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.)

In case of reading the 64-bit counter value while the counter is running, the current 64-bit counter value will be captured first and read access will be performed on the captured value then. This is to avoid that the upper or lower 32-bit value changes between the two consecutive 32-bit read accesses.

### 24.2.3 Block Diagram

The following block diagram shows the main components of the System Timer.

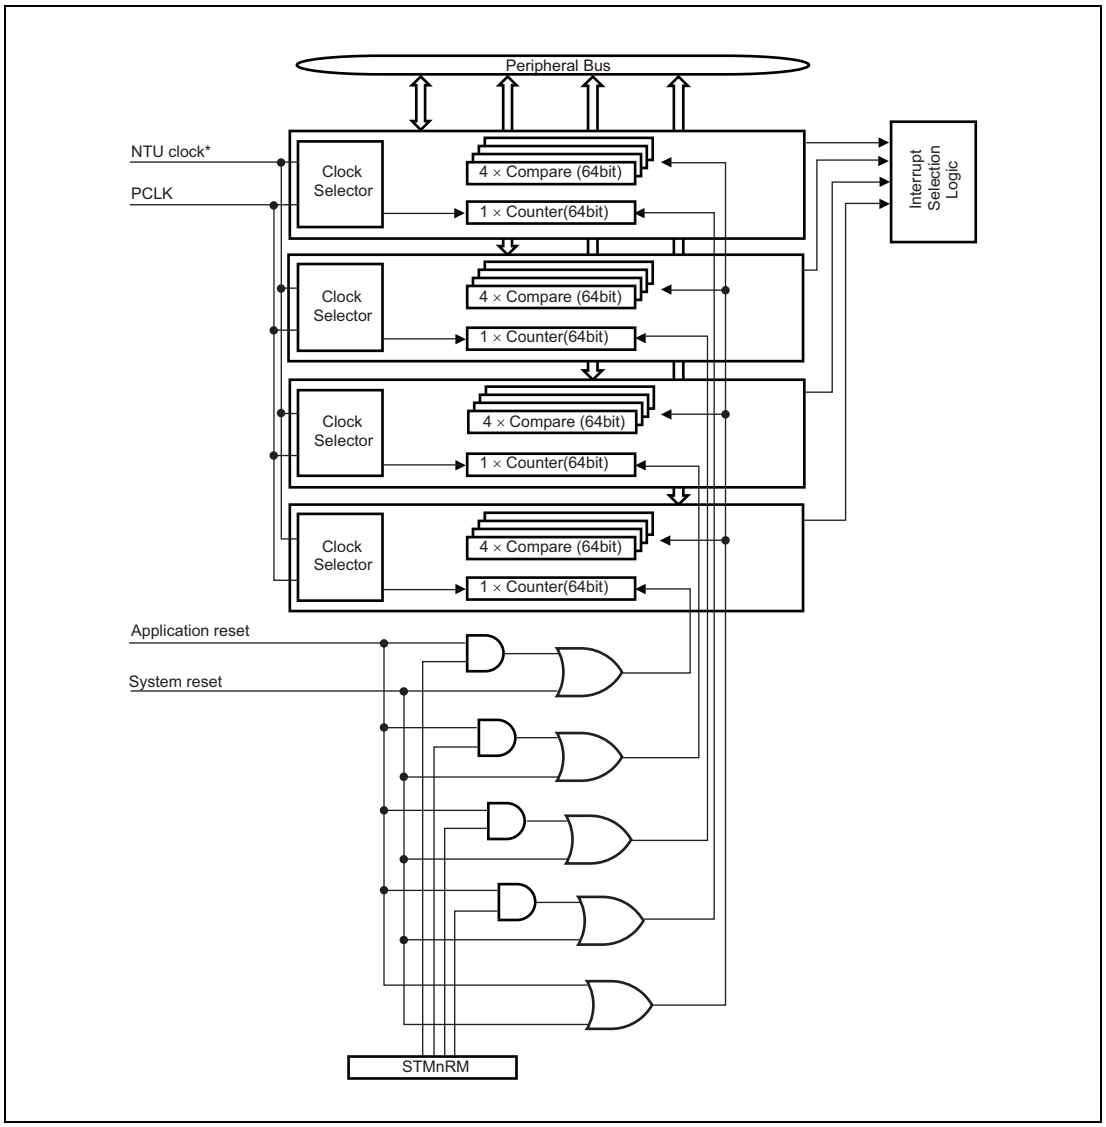

**Figure 24.1 STMn block diagram**

**NOTE**

STM1 does not support NTU clock function

## 24.3 Registers

This section contains a description of all registers of the System Timer.

### 24.3.1 List of Registers

The System Timer is controlled and operated by the following registers:

**Table 24.5 Register list**

| Address | Register name | Description | Access Size[bit] | Value after reset | Access Protection | |
|---|---|---|---|---|---|---|
| | | | | | PBG | Other |
| *1 | *1 | STM0 | 32 | *1 | PBG2.PG2-SSTM0 | — |
| *1 | *1 | STM1 | 32 | *1 | PBG2.PG2-SSTM1 | — |

Note 1. Regarding address, register name, and value after reset of STMn, see the following table

**Table 24.6 Register Reset Condition**

| Register Name | Reset condition | | | | |
|---|---|---|---|---|---|
| | Power On Reset | System Reset1 | System Reset2 | Application Reset1 | Limited Reset |
| STMnRM | √ | √ | √ | — | — |
| Other registers | √ | √ | √ | √ | — |

**Note:** “Other Registers” will only be reset if the corresponding channel is not masked in STMnRM register.

**Table 24.7 List of System Timer registers (1/2)**

| Channel | Register Name | Symbol | Address |
|---|---|---|---|
| CNT 0,1,2,3 Common Register | Timer Counter Source Clock Selection Register | STMnCKSEL*1 | <STMn_base> + $0000_H$ |
| | Timer Counter Start Register | STMnTS | <STMn_base> + $0010_H$ |
| | Timer Counter Stop Register | STMnTT | <STMn_base> + $0014_H$ |
| | Timer Counter Status Register | STMnCSTR | <STMn_base> + $0018_H$ |
| | Timer Status Register | STMnSTR | <STMn_base> + $0020_H$ |
| | Timer Status Clear Register | STMnSTC | <STMn_base> + $0024_H$ |
| | Timer Interrupt Selection Register | STMnIS | <STMn_base> + $0030_H$ |
| | Timer SW Reset Mask Register | STMnRM | <STMn_base> + $0034_H$ |
| CNT 0 | Timer Counter Register L | STMnCNT0L | <STMn_base> + $0040_H$ |
| | Timer Counter Register H | STMnCNT0H | <STMn_base> + $0044_H$ |
| | Timer Compare match Register AL | STMnCMP0AL | <STMn_base> + $0050_H$ |
| | Timer Compare match Register AH | STMnCMP0AH | <STMn_base> + $0054_H$ |
| | Timer Compare match Register BL | STMnCMP0BL | <STMn_base> + $0058_H$ |
| | Timer Compare match Register BH | STMnCMP0BH | <STMn_base> + $005C_H$ |
| | Timer Compare match Register CL | STMnCMP0CL | <STMn_base> + $0060_H$ |
| | Timer Compare match Register CH | STMnCMP0CH | <STMn_base> + $0064_H$ |
| | Timer Compare match Register DL | STMnCMP0DL | <STMn_base> + $0068_H$ |
| | Timer Compare match Register DH | STMnCMP0DH | <STMn_base> + $006C_H$ |

Table 24.7 List of System Timer registers (2/2)

| Channel | Register Name | Symbol | Address |
|---|---|---|---|
| CNT 1 | Timer Counter Register | STMnCNT1 | <STMn_base> + $0070_H$ |
| | Timer Compare match Register A | STMnCMP1A | <STMn_base> + $0080_H$ |
| | Timer Compare match Register B | STMnCMP1B | <STMn_base> + $0084_H$ |
| | Timer Compare match Register C | STMnCMP1C | <STMn_base> + $0088_H$ |
| | Timer Compare match Register D | STMnCMP1D | <STMn_base> + $008C_H$ |
| CNT 2 | Timer Counter Register | STMnCNT2 | <STMn_base> + $0090_H$ |
| | Timer Compare match Register A | STMnCMP2A | <STMn_base> + $00A0_H$ |
| | Timer Compare match Register B | STMnCMP2B | <STMn_base> + $00A4_H$ |
| | Timer Compare match Register C | STMnCMP2C | <STMn_base> + $00A8_H$ |
| | Timer Compare match Register D | STMnCMP2D | <STMn_base> + $00AC_H$ |
| CNT 3 | Timer Counter Register | STMnCNT3 | <STMn_base> + $00B0_H$ |
| | Timer Compare match Register A | STMnCMP3A | <STMn_base> + $00C0_H$ |
| | Timer Compare match Register B | STMnCMP3B | <STMn_base> + $00C4_H$ |
| | Timer Compare match Register C | STMnCMP3C | <STMn_base> + $00C8_H$ |
| | Timer Compare match Register D | STMnCMP3D | <STMn_base> + $00CC_H$ |

Note 1. STM1 does not have STM1CKSEL register.

## 24.3.2 STMnCKSEL — STMn timer counter source clock selection register

**Access:** STMnCKSEL register can be read/written in 32-/8-bit units.

**Address:** <STMn_base> + $0000_H$

**Value after reset:** 0000 $0000_H$ This register is initialized by a reset of any type.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CKSEL 3 | CKSEL 2 | CKSEL 1 | CKSEL 0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

Table 24.8 STMnCKSEL register contents

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | CKSELm | This bit selects the input clock for counter channel m (m = 0 to 3).<br>0: PCLK (Peripheral clock)<br>This clock is dependent from the configured CPU and peripheral bus clock.<br>1: FlexRay NTU clock<br>This clock is derived from the FlexRay IP's network time unit. It can be used to synchronize SW processes (e.g. AUTOSAR job list) with the Flexray network. See the FlexRay chapter for a detailed description of the NTU clock generation. |

### 24.3.3 STMnTS — STMn timer counter start register

**Access:** STMnTS register can be written in 32-/8-bit units.

**Address:** <STMn_base>+ $0010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | TS3 | TS2 | TS1 | TS0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | W | W | W | W |

**Table 24.9 STMnTS register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When writing, write the value after reset. |
| 3 to 0 | TSm | This bit starts the counter channel m.<br>0: No function<br>1: Starts the counter and sets STMnCSTR.CSTm = 1.<br>Setting this bit is ignored as long as STMnCSTR.CSTm = 1. |

**NOTES**

1. A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for channel m. If masking function is selected, the function related to register bits TSm is not affected by SW reset (application reset 1).
2. STMnTS is read always as $0000\ 0000_H$.

### 24.3.4 STMnTT — STMn timer counter stop register

**Access:** STMnTT register can be written in 32-/8-bit units.

**Address:** <STMn_base> + $0014_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 24.10 STMnTT register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When writing, write the value after reset. |
| 3 to 0 | TTm | This bit stops the counter channel m.<br>0: No function<br>1: Stops the counter and clears STMnCSTR.CSTm bit.<br>Setting this bit is ignored as long as STMnCSTR.CSTm = 0. |

**NOTES**

1. A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for channel m. If masking function is selected, the function related to register bits TTm is not affected by SW reset (application reset 1)
2. STMnTT is read always as $0000\ 0000_H$.

### 24.3.5 STMnCSTR — STMn timer counter status register

**Access:** STMnCSTR register can be read in 32-/8-bit units.

**Address:** <STMn_base> + $0018_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 24.11 STMnCSTR register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. |
| 3 to 0 | CSTm | This bit indicates whether the counter is enabled or disabled.<br>0: Counter disabled<br>1: Counter enabled<br>This bit is set to 1 in response to STMnTS.TS being set to 1.<br>Setting STMnTT.TTn to 1 re-sets this bit to 0. |

**NOTE**

A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for channel m. If masking function is selected, the function related to register bits CSTm is not affected by SW reset (application reset 1).

### 24.3.6 STMnSTR — STMn timer status register

**Access:** STMnSTR register can be read in 32-/8-bit units.

**Address:** <STMn_base> + $0020_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | OVF3 | OVF2 | OVF1 | OVF0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 24.12 STMnSTR register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | Reserved | When read, the value after reset is read. |
| 19 to 16 | OVFm | Overflow flag of timer channel m (m = 0 to 3)<br>0: No overflow has occurred<br>1: Overflow has occurred<br>Once set to 1 by overflow event, this bit remains 1 until cleared by SW write to overflow reset bit in STMn status clear register (STMnSTC.OVRm). |
| 15 to 0 | CMml | This bit indicates whether a compare match has occurred on compare register l (l = A, B, C, D) of timer channel m (m = 0 to 3)<br>0: No compare match has occurred<br>1: Compare match has occurred<br>Once set to 1 by compare match, this bit remains 1 until cleared by SW write to the compare match reset bit in STMn status clear register (STMnSTC.CMRml). |

**NOTE**

A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for channel m. If masking function is selected, the function related to register bits CSTm is not affected by SW reset (application reset 1).

### 24.3.7 STMnSTC — STMn timer status clear register

**Access:** STMnSTC register can be written in 32-/8-bit units.

**Address:** <STMn_base> + $0024_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by a reset of any type.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | OVR3 | OVR2 | OVR1 | OVR0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | W | W | W | W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CMR3D | CMR3C | CMR3B | CMR3A | CMR2D | CMR2C | CMR2B | CMR2A | CMR1D | CMR1C | CMR1B | CMR1A | CMR0D | CMR0C | CMR0B | CMR0A |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W | W |

**Table 24.13 STMnSTC register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 20 | Reserved | When writing, write the value after reset. |
| 19 to 16 | OVRm | Reset overflow flag of timer channel m (m = 0 to 3)<br>0: no function<br>1: Reset overflow flag (STMnSTR.OVF = 0) |
| 15 to 0 | CMRml | Reset compare match flag of compare register l (l = A, B, C, D) of timer channel m (m = 0 to 3)<br>0: no function<br>1: Reset compare match event flag (STMnSTR.CMml = 0) |

**NOTE**

STMnSTC is read always as $0000\ 0000_H$.

In case an overflow or compare match interrupt occurs while the OVRm / CMRml flag is cleared by SW, the interrupt will have higher priority and set the flag.

### 24.3.8 STMnIS — STMn timer interrupt selection register

**Access:** STMnIS register can be read/written in 32-/8-bit units.

**Address:** <STMn_base> + $0030_H$

**Value after reset:** $0000\ 0000_H$ This register is initialized by a reset of any type.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.14 STMnIS register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | When written, write the value after reset. When read, the value after reset is read. |
| 15 to 0 | STMINTi[1:0] | These bit groups select the system timer event to be signalled by STM interrupt i (i = 7 to 0).<br>Refer to Table **Table 24.15, Interrupt selection**. |

**Table 24.15 Interrupt selection**

| STMINTi[1:0] | STMINT0 | STMINT1 | STMINT2 | STMINT3 | STMINT4 | STMINT5 | STMINT6 | STMINT7 |
|---|---|---|---|---|---|---|---|---|
| 00 | CH0 A | CH0 B | CH0 C | CH0 D | CH1 A | CH1 B | CH1 C | CH1 D |
| 01 | CH2 A | CH2 B | CH3 A | CH3 B | CH2 A | CH2 B | CH3 A | CH3 B |
| 10 | Setting prohibited | Setting prohibited | Setting prohibited | OVF [CH0 v CH1 v CH2 v CH3] | Setting prohibited | Setting prohibited | Setting prohibited | OVF [CH0 v CH1 v CH2 v CH3] |
| 11 | Setting prohibited | Setting prohibited | Setting prohibited | Setting prohibited | Setting prohibited | Setting prohibited | Setting prohibited | Setting prohibited |

**NOTE**

It is prohibited to map the same system timer event to multiple STMINT interrupts.

Interrupt INTn8 is not listed in this register overview as its assignment is not configurable.

Please refer also to **Section 24.4.1, Interrupt assignment**.

### 24.3.9 STMnRM — STMn timer SW reset mask register

**Access:** STMnRM register can be read/written in 32-/8-bit units.

**Address:** <STMn_base> + $0034_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | RM3 | RM2 | RM1 | RM0 |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 24.16 STMnRM register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | When read, the value after reset is read. When writing, write the value after reset. |
| 3 to 0 | RMm | This bit masks the SW reset (application reset 1) for counter channel (m = 0 to 3). When SW reset is masked for channel m it behaves as follows:<br>• The counter continues counting up operation. SW reset occurrence has no impact on the counter operation and the counter value.<br>• The count enable status will not be changed by SW reset; no stop trigger will be generated by occurrence of SW reset.<br>All other STM registers will be reset independent whether masking was selected or not. The input clock will be set to the default value PCLK.<br>0: Reset mask disabled for channel m<br>(Channel m responds to SW reset (application reset 1))<br>1: Reset mask enabled for channel m<br>(Channel m does not responds to SW reset (application reset 1)) |

**NOTE**

A reset from any source will initialize the bits unless the masking function has been selected in the STMn reset mask register (STMnRM) for channel m. If masking function is selected, the related register bits RMm will not be changed by SW reset (application reset 1).

## 24.3.10 STMnCNT0L — STMn timer counter register low (lower 32-bit)

**Access:** This register can be read/written in 32-/8-bit units.

**Address:** <STMn_base> + $0040_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNT0L[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNT0L[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.17 STMnCNT0L register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | CNT0L[31:0] | Lower 32-bit of 64-bit counter value (channel 0) |

**NOTES**

1. A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for this channel. If masking function is selected, the register contents will not be changed by SW reset (application reset 1)
2. This register is part of a 64-bit register. The architecture supports 64-bit write access to the upper and lower register. However in case of individual 32-bit write accesses the total 64-bit register value will become effective after the higher 32-bit value has been written to. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.)
   Independent from access width, the user should use appropriate PBus-Guard setting to control the access to a 64-bit register. This is to avoid that during an access from one bus master (e.g. PE) another bus master (e.g. DMA) will access to the same register resulting in an invalid update of the register value.
3. Read access to counter registers is supported both while counter is running and stopped.
   In case of reading the 64-bit counter value while the counter is running, the current 64-bit counter value will be captured on read access to the lower 32-bit value. The captured upper 32-bit value can be read afterwards. This is to avoid that the upper or lower 32-bit value changes between the two consecutive 32-bit read accesses.
4. Write access is permitted only, while counter is stopped.

## 24.3.11 STMnCNT0H — STMn timer counter register high (upper 32-bit)

**Access:** This register can be read/written in 32-/8-bit units.

**Address:** <STMn_base> + $0044_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNT0H[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNT0H[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.18 STMnCNT0H register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | CNT0H[31:0] | Upper 32-bit of 64-bit counter value (channel 0) |

**NOTES**

1. A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for this channel. If masking function is selected, the register contents will not be changed by SW reset (application reset 1)
2. This register is part of a 64-bit register. The architecture supports 64-bit write access to the upper and lower register. However in case of individual 32-bit write accesses the total 64-bit register value will become effective after the higher 32-bit value has been written to. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.)
   Independent from access width, the user should use appropriate PBus-Guard setting to control the access to a 64-bit register. This is to avoid that during an access from one bus master (e.g. PE) another bus master (e.g. DMA) will access to the same register resulting in an invalid update of the register value.
3. Read access to counter registers is supported both while counter is running and stopped.
   In case of reading the 64-bit counter value while the counter is running, the current 64-bit counter value will be captured on read access to the lower 32-bit value. The captured upper 32-bit value can be read afterwards. This is to avoid that the upper or lower 32-bit value changes between the two consecutive 32-bit read accesses.
4. Write access is permitted only, while counter is stopped.

## 24.3.12 STMnCMP0IL — STMn timer compare match register low (lower 32-bit)

**Access:** This register can be read/written in 32-/8-bit units.

**Address:** STMnCMP0AL:<STMn_base> + $0050_H$
STMnCMP0BL:<STMn_base> + $0058_H$
STMnCMP0CL:<STMn_base> + $0060_H$
STMnCMP0DL:<STMn_base> + $0068_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CMP0IL[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

**Table 24.19 STMnCMP0IL register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | CMP0IL[31:0] | Lower 32-bit of 64-bit compare value (channel 0, I = A, B, C, D) |

**NOTE**

This register is part of a 64-bit register. The architecture supports 64-bit write access to the upper and lower register. However in case of individual 32-bit write accesses the total 64-bit register value will become effective after the higher 32-bit value has been written to. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.)
Independent from access width, the user should use appropriate PBus-Guard setting to control the access to a 64-bit register. This is to avoid that during an access from one bus master (e.g. PE) another bus master (e.g. DMA) will access to the same register resulting in an invalid update of the register value.

## 24.3.13 STMnCMP0IH — STMn timer compare match register high (upper 32-bit)

**Access:** This register can be read/written in 32-/8-bit units.

**Address:** STMnCMP0AH:<STMn_base> + $0054_H$
STMnCMP0BH:<STMn_base> + $005C_H$
STMnCMP0CH:<STMn_base> + $0064_H$

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CMP0IH[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.20 STMnCMP0IH register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | CMP0IH[31:0] | Upper 32-bit of 64-bit compare value (channel 0, I = A, B, C, D) |

**NOTE**

This register is part of a 64-bit register. The architecture supports 64-bit write access to the upper and lower register. However in case of individual 32-bit write accesses the total 64-bit register value will become effective after the higher 32-bit value has been written to. The appropriate write sequence must therefore be specified by software (i.e., that the register must be accessed from the lower 32 bits, and then the upper 32 bits.)
Independent from access width, the user should use appropriate PBus-Guard setting to control the access to a 64-bit register. This is to avoid that during an access from one bus master (e.g. PE) another bus master (e.g. DMA) will access to the same register resulting in an invalid update of the register value.

### 24.3.14 STMnCNTm — STMn timer counter register

**Access:** This register can be read/written in 32-/8-bit units.

**Address:** STMnCNT1:<STMn_base> + $0070_H$
STMnCNT2:<STMn_base> + $0090_H$
STMnCNT3:<STMn_base> + $00B0_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNTI[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CNTI[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.21 STMnCNTm register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | CNTm[31:0] | 32-bit counter value of channel m (m = 1 to 3) |

**NOTES**

1. A reset from any source will initialize the bits unless the masking function has been selected in the STMn SW reset mask register (STMnRM) for this channel. If masking function is selected, the register contents will not be changed by SW reset (application reset 1).
2. Read access to counter registers is supported both while counter is running and stopped.
3. Write access is permitted only, while counter is stopped.

## 24.3.15 STMnCMPml — STMn timer compare match register

**Access:** This register can be read/written in 32-/8-bit units.

**Address:** STMnCMP1A: <STMn_base> + $0080_H$, STMnCMP1B: <STMn_base> + $0084_H$,
STMnCMP1C: <STMn_base> + $0088_H$, STMnCMP1D: <STMn_base> + $008C_H$,
STMnCMP2A: <STMn_base> + $00A0_H$, STMnCMP2B: <STMn_base> + $00A4_H$,
STMnCMP2C: <STMn_base> + $00A8_H$, STMnCMP2D: <STMn_base> + $00AC_H$,
STMnCMP3A: <STMn_base> + $00C0_H$, STMnCMP3B: <STMn_base> + $00C4_H$,
STMnCMP3C: <STMn_base> + $00C8_H$, STMnCMP3D: <STMn_base> + $00CC_H$,

**Value after reset:** $0000\ 0000_H$ This register is initialized by a reset of any type.

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CMPml[31:16] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CMPml[15:0] | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 24.22 STMnCMPml register contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 0 | CMPml[31:0] | 32-bit of compare value of channel m (m = 1 to 3), compare register l ( l = A, B, C, D) |

# 24.4 Operation

## 24.4.1 Interrupt assignment

The System Timer (STM) provides 9 individual interrupt signals, one out of these (INT8) as non-maskable with high priority (Note: non-maskable high-priority interrupt cannot be linked to channel 0 and OVF event). The assignment of interrupts to the compare registers and counter channel's overflag signal can be configured in the Interrupt Selection

Logic as described in **Figure 24.1, STMn block diagram**, **Table 24.23, Configurable Interrupt vector assignment**.The overflow signals of channel 0-3 will be ORed and mapped to one common, selectable interrupt vector. The ORed compare signals of channel 1 are fix assigned to one common non-maskable interrupt (INTn8). Additioonally they can be assigned to further non-maskable interrupts

For details on interrupt controller, see "Interrupt Functions".

**Table 24.23 Configurable Interrupt vector assignment**

| | | Selectable Interrupt Vector | | Fix Interrupt vector |
|---|---|---|---|---|
| **STM channel** | **Interrupt source** | **Alt0** | **Alt1** | **FEINT** |
| 0 (64-bit) | Compare match A | INTn0 | — | — |
| | Compare match B | INTn1 | — | — |
| | Compare match C | INTn2 | — | — |
| | Compare match D | INTn3 | — | — |
| 1 (32-bit) | Compare match A | INTn4 | — | INTn8 |
| | Compare match B | INTn5 | — | |
| | Compare match C | INTn6 | — | |
| | Compare match D | INTn7 | — | |
| 2 (32-bit) | Compare match A | INTn0 | INTn4 | — |
| | Compare match B | INTn1 | INTn5 | — |
| | Compare match C | — | — | — |
| | Compare match D | — | — | — |
| 3 (32-bit) | Compare match A | INTn2 | INTn6 | — |
| | Compare match B | INTn3 | INTn7 | — |
| | Compare match C | — | — | — |
| | Compare match D | — | — | — |
| 0 | ORed OVF flags channel 0 to 3 [OVF0 v OVF1 v OVF2 v OVF3] | INTn3 | INTn7 | |
| 1 | | | | |
| 2 | | | | |
| 3 | | | | |

Note 1. FE-level maskable interrupt (FEINT)

Note 2. INTn8 occurence can be masked as described in **Section 6.8.7, FEINT Source selection**

## 24.4.2 Cautions

### 24.4.2.1 Interrupt cautions

#### (1) Interrupt after reset

After the reset of the STM (PRESET or SW reset which not be masked), both counters and compare match registers are initialized to 0. So when you enable the counter in STM directly after the reset, the compare match interrupt request will be sent out and the flag of compare match will also be set.You must ignore the compare match requests and clear the compare match flags first. The above case could be avoided by setting the compare match registers with any value but 0 before you enable the counters after the reset of STM.

#### (2) Interrupt request when corresponding flag has been set

STM0STR is the status register in STM, the interrupt request according to the compare match event or overflow event within STM will be not send out if the corresponding flag in STM0STR has been already set. But if the interrupt request conflicts with the clear of the corresponding flag, the interrupt request will be send out.

### 24.4.2.2 Overlap of one-pulse interrupt

Generally the output interrupt requests of STM are one-pulse signals but in the case below the OVFI and INT8_STM will not be one-pulse signals. So you should take care of those cases in STM.

case1: OVFI overlapped for several cycles

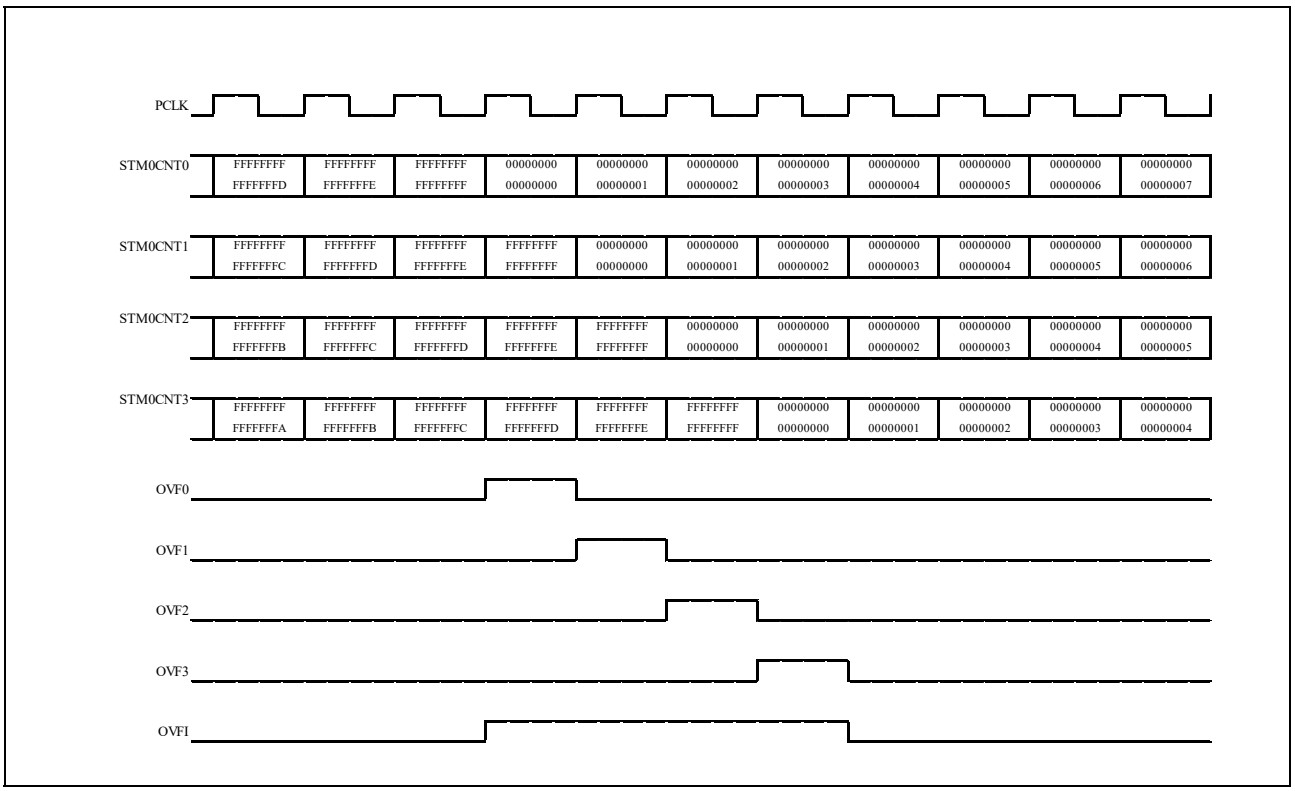

**Figure 24.2 OVFI overlapped for several cycles**

Case2: INT8_STM overlapped for several cycles

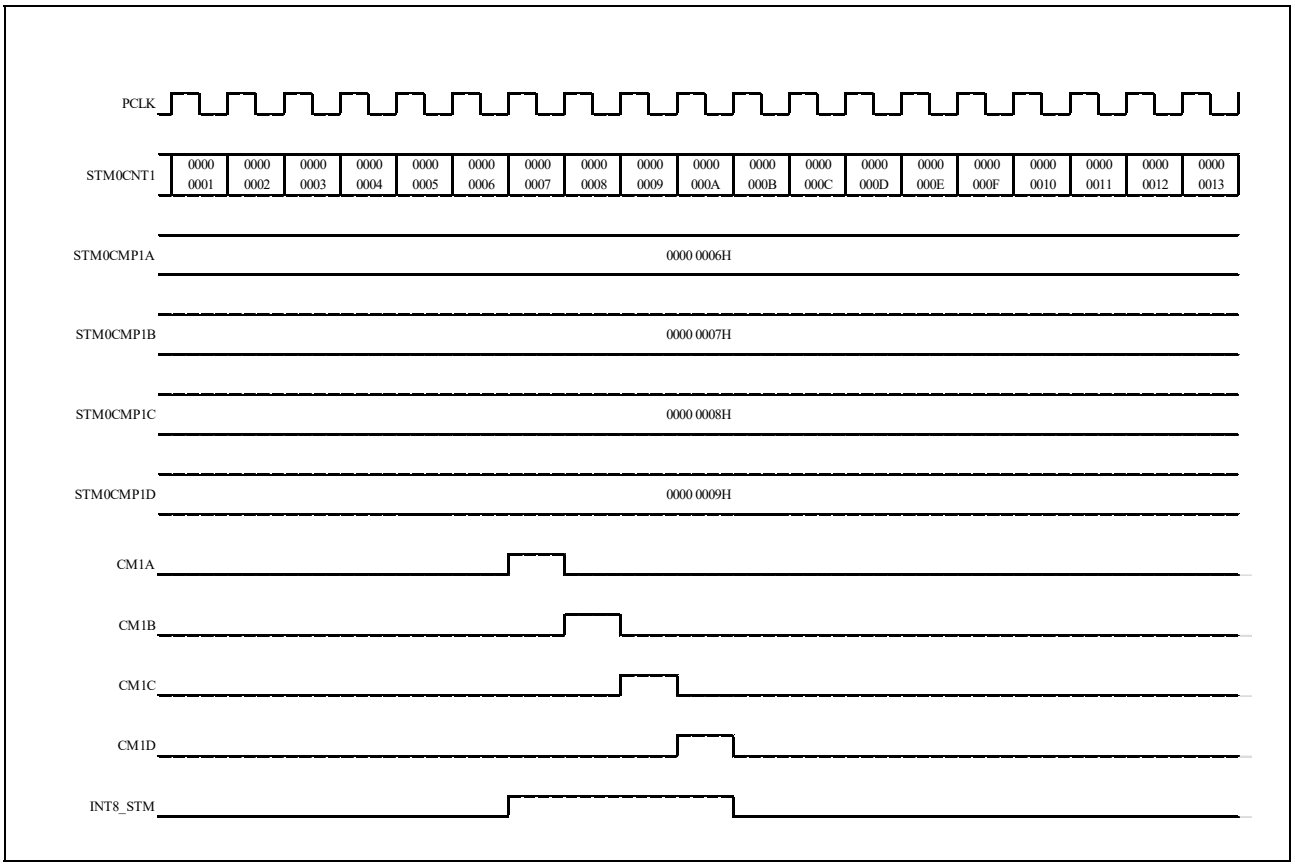

**Figure 24.3 INT8_STM overlapped for several cycles**

## 24.4.3 Attention in using

### 24.4.3.1 Confliction of compare match with writing of compare register

When compare match is conflicting with the writing of compare register, the compare match flag will be set with the consideration of not losing the compare event, and the compare match register will be written in too.

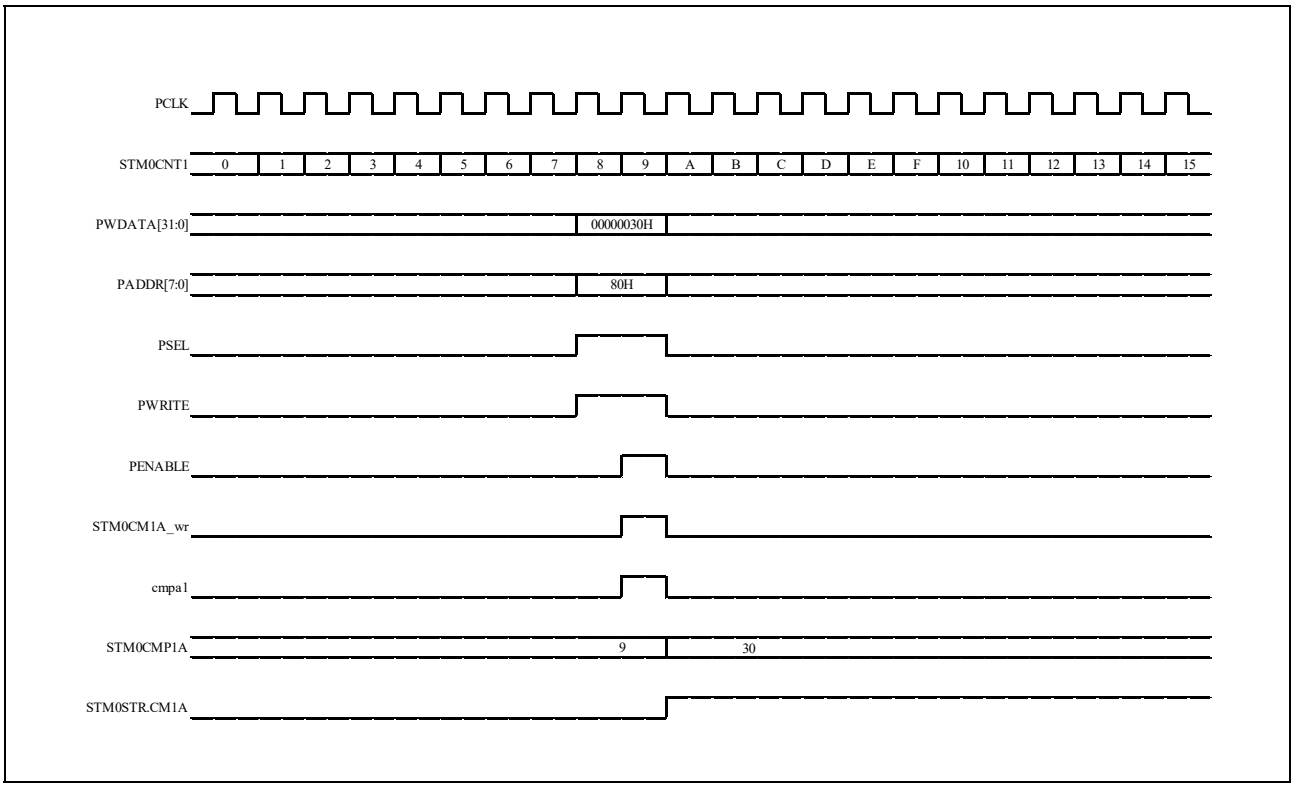

**Figure 24.4 Compare match event conflicting with write access (counting with PCLK)**

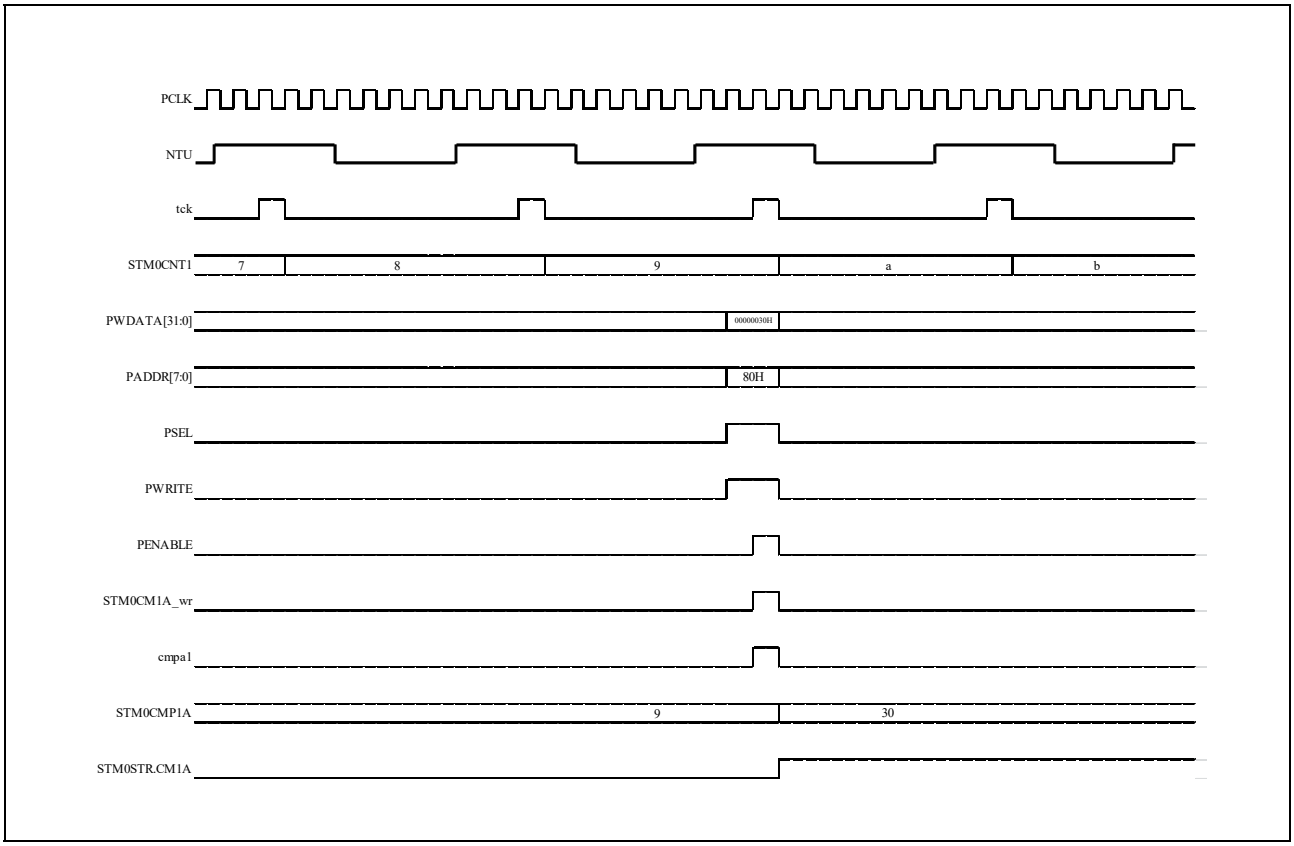

**Figure 24.5 Compare match event conflicting with write**

### 24.4.3.2 Confliction of compare match flag(overflow flag) set with its clear

When the compare match (overflow) flag's set conflict with its clear, compare match (overflow) flag will be set but the clear will be ignored whether the flag is 1 or 0 at that moment.You can get details from the below figure.

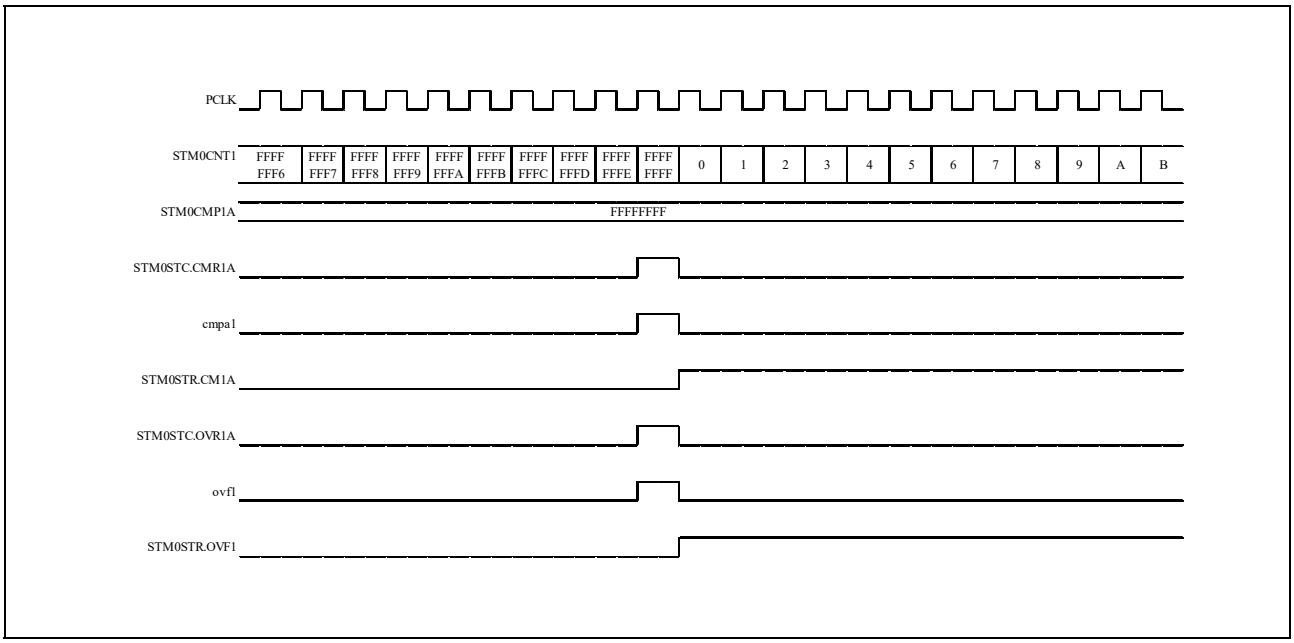

**Figure 24.6 Compare match event conflicting with its clear**

#### 24.4.3.3 Confliction of flag (compare match/overflow) set with counter stop

When the set signal of the flag conflict with the counter stop ,the flag will not be set until the coming of next count source clock after restart of the count. To compare match flag, if you update the compare match register or counter register with other values within the stop of the counter register, the flag will not be set even though the coming of next count source clock after restart of the count.To the overflow flag, if you update the counter register with other values within its stop, the flag will not be set even though the coming of next count source clock after restart of the count. In the figure below, the compare match flat will be set when the counter restarted if you had not updated the compare match register but if you had updated the compare match register during counter stop the compare match flat will not be set when the counter restarted.

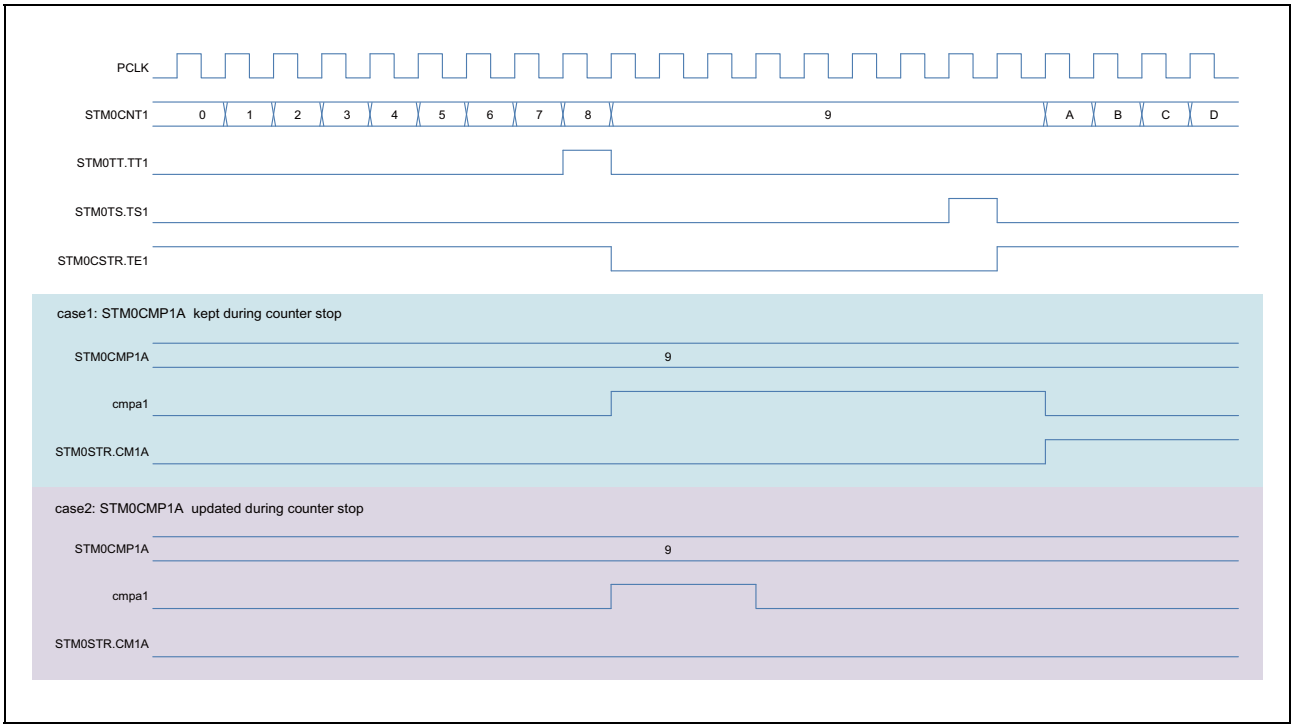

**Figure 24.7 Compare match event conflicting with counter stop**

### 24.4.3.4 Confliction of flag set with emulation mode start

When the set signal of the flag conflict with emulation mode, the flag will not be set.And when restore from the emulation mode it would be check once again whether the flag should be set or not.

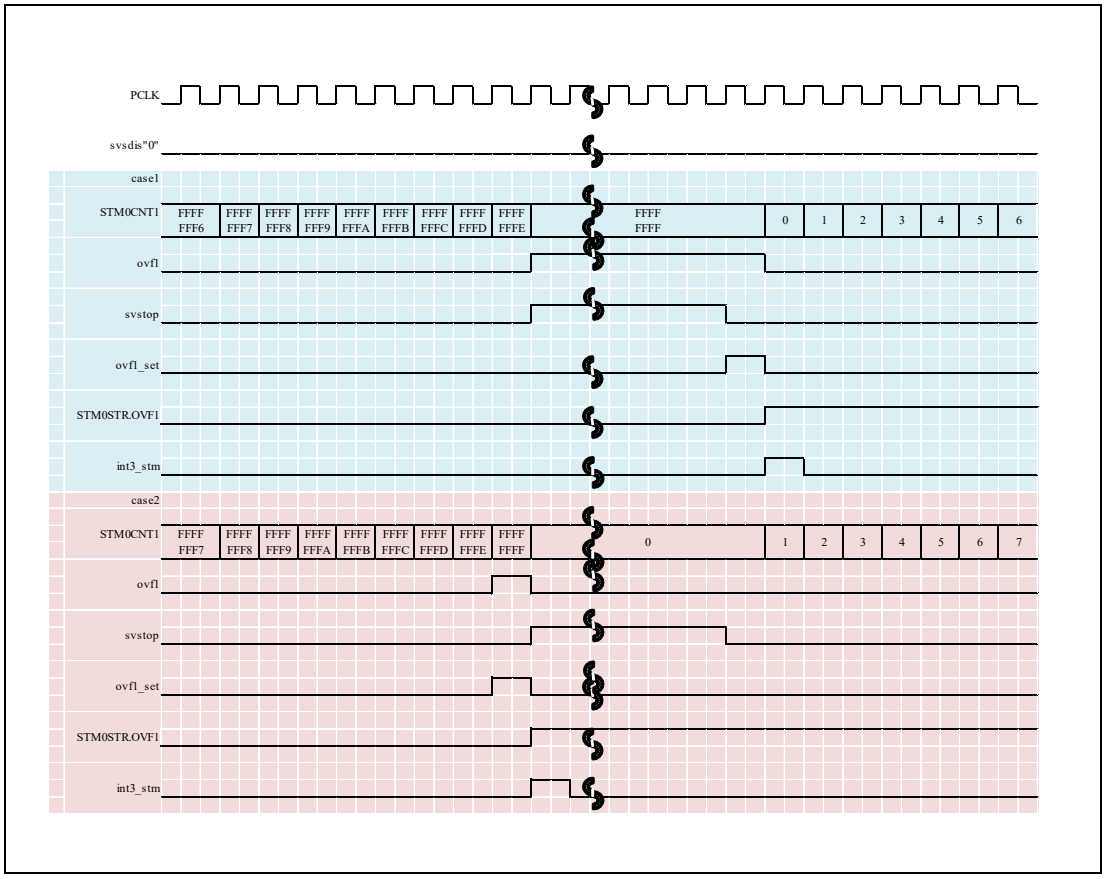

**Figure 24.8 Overflow event conflicting with emulation mode**

### 24.4.3.5 Confliction of interrupt requirement with flag clear

When the flag has been set in STM0STR, the interrupt requirement according to the corresponding flag set event will not be sent out,but only in the case that the corresponding flag clear happens at the same time .And in this case not only the interrupt requirement will be sent out but also the flag will not be cleared.

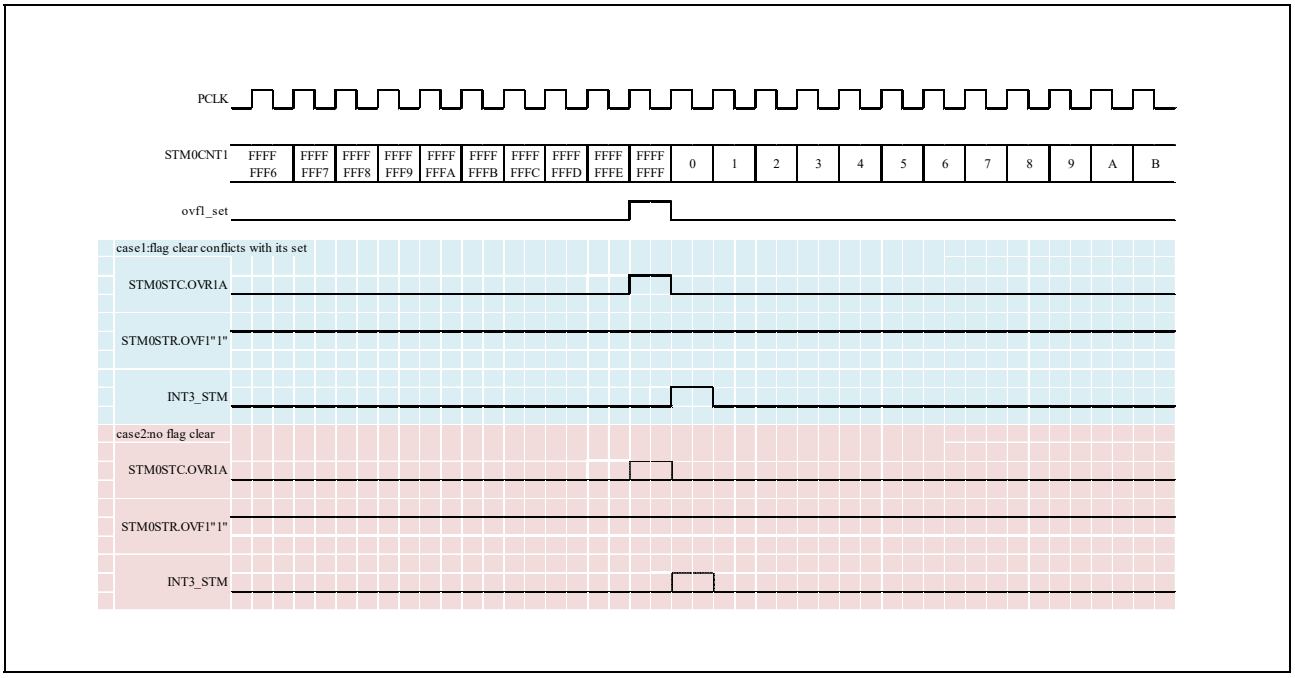

**Figure 24.9 Interrupt requirement conflicting with flag clear**

### 24.4.4 Access to register

Including the registers of STM0STR, STM0STC, all the counter registers and compare match registers should be access by 32-bit only.

The bit width of compare match register and the counter register in CNT0 is 64-bit. To those register, 64-bit access is supported and the 64-bit access will be divided into twice accesses of the 32-bit peripheral bus which used in STM. In case of individual 32-bit write or read accesses to 64-bit counter or compare registers of CNT0, the upper 32-bit register will be processed after the lower 32-bit register. Writing access to a 64-bit register, the register value will be updated when the upper 32-bit register is processed while reading access to a 64-bit register, the value of the register at that moment will be read out.

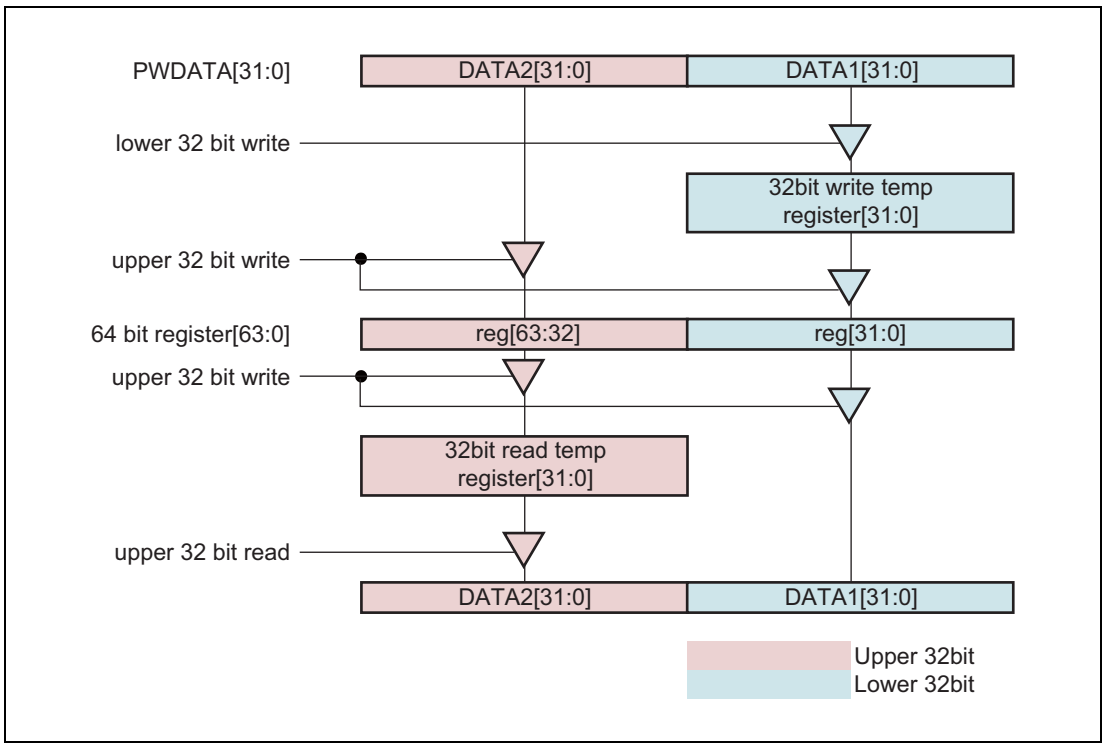

**Figure 24.10 Access to register**

### 24.4.5 Resets

There are Application reset and System reset in STM. To System reset, all of the STM registers will be initialized, to the Application reset, you can mask it or not. All of the registers behave as shown in the below table upon the Application reset or System reset.

**Table 24.24 Reset**

| Registers or bits in STM | | Application reset | | System reset |
|---|---|---|---|---|
| | | Masked (RMm = 1) | UnMask (RMm = 0) | |
| Counters | Counters in CNTm | KEPT | INIT | INIT |
| | Counters in other channels | INIT | INIT | INIT |
| Compare match register | Compare match register | INIT | INIT | INIT |
| STMnTS | TSm | KEPT | INIT | INIT |
| | Other TS bits in STMnTS[3:0] | INIT | INIT | INIT |
| STMnTT | TTm | KEPT | INIT | INIT |
| | Other TT bits in STMnTT[3:0] | INIT | INIT | INIT |
| STMnCSTR | Tem | KEPT | INIT | INIT |
| | other TE bits in STMnCSTR[3:0] | INIT | INIT | INIT |
| STMnSTR | OVFm | KEPT | INIT | INIT |
| | Other OVF or CM bits in STMnSTR[19:0] | INIT | INIT | INIT |
| STMnSTC | STMnSTC[19:0] | INIT | INIT | INIT |
| STMnRM | RMm | KEPT | KEPT | INIT |
| | Other RM bits in STMnRM[3:0] | INIT | INIT | INIT |
| STMnCKSEL | STMnCKSEL[3:0] | INIT | INIT | INIT |
| STMnIS | STMnIS[15:0] | INIT | INIT | INIT |

Note 1. m: m = 0 to 3
Note 2. INIT: initialized
Note 3. KEPT: values are kept

## 24.5 Difference among P1M-C, P1H-C and P1H-CE

There are differences in channels, interrupts, and external pins. For details, see **Table 24.1**, and **Table 24.5**.

# Section 25 Generic Timer Module (GTM)

Generic timer module (GTM) is a modular timer unit used to support chassis control applications. It is designed to unload the CPU from a high interrupt load. Most of the task of GTM can run independently from the CPU.

## 25.1 Feature

### 25.1.1 IP version

The table below shows IP version in each device.

**Table 25.1 IP version**

| IP | P1M-C (Config 2) | P1H-C, P1H-CE (Config 3) |
|---|---|---|
| GTM-IP | GTM-IP 207 | GTM-IP 208 |

### 25.1.2 Number of Sub-Units and Channels

The table below shows the availability of the GTM.

**Table 25.2 Sub-Units and Channels**

| | P1M-C | | | P1H-C, P1H-CE | | |
|---|---|---|---|---|---|---|
| Submodule | Number of Instances | Instance name | Channels | Number of Instances | Instance name | Channels |
| ARU | 1 | — | — | 1 | — | — |
| CMU | 1 | — | 8 (n = 0 to 7) | 1 | — | 8 (n = 0 to 7) |
| TBU | 1 | — | 2 (n = 0, 1) | 1 | — | 2 (n = 0, 1) |
| TIM | 2 | TIM0,<br>TIM1 | 8 (TIM0: n = 0 to 7)<br>8 (TIM1: n = 0 to 7) | 2 | TIM0,<br>TIM1 | 8 (TIM0: n = 0 to 7)<br>8 (TIM1: n = 0 to 7) |
| ATOM | 2 | ATOM0,<br>ATOM1 | 8 (ATOM0: n = 0 to 7)<br>4 (ATOM1: n = 0 to 3) | 3 | ATOM0,<br>ATOM1*2,<br>ATOM2*3 | 8 (ATOM0: n = 0 to 7)<br>8 (ATOM1: n = 0 to 7)<br>5 (ATOM2: n = 0 to 4) |
| DTM | 2 | DTM24,<br>DTM26 | 4 (DTM24: n = 0 to 3)<br>4 (DTM26: n = 0 to 3) | 3 | DTM24,<br>DTM26,<br>DTM28 | 4 (DTM24: n = 0 to 3)<br>4 (DTM26: n = 0 to 3)<br>4 (DTM28: n = 0 to 3) |
| MCS*1 | 1 | MCS0 | 9 (MCS0: n = 0 to 8) | 2 | MCS0,<br>MCS1 | 9 (MCS0: n = 0 to 8)<br>6 (MCS1: n = 0 to 5) |
| MCFG | — | — | — | 1 | — | — |
| ICM | 1 | — | — | 1 | — | — |
| CMP | 1 | — | — | 1 | — | — |
| MON | 1 | — | — | 1 | — | — |

Note 1. Each instance has a memory of 2x256 32-bit words.

Note 2. P1H-C (4MB, BGA-156) does not support ATOM1 (Ch. 4 to 7) output terminal, but internal functions are available.

Note 3. P1H-C (4MB, BGA-156) does not support ATOM2 all channels output terminal, but internal functions are available.

### 25.1.3 Register/RAM Base Address

GTM base addresses are listed in the following table. GTM register and RAM addresses are given as offsets from the base addresses in general.

**Table 25.3 Register and RAM Base Addresses**

| Base Address Name | Base Address |
|---|---|
| <GTM0_base> | FFE0 $0000_H$ |

### 25.1.4 Clock Supply

Clock supply by and to GTM is listed in the following table.

**Table 25.4 Clock Supply**

| Unit Name | Clock for the Unit | Supply Clock Name |
|---|---|---|
| GTM | AEI-bus clock (AEI_CLK) | CLK_HSB |
| | GTM global clock ((AEI_)SYS_CLK) | CLK_HSB |

### 25.1.5 Interrupt and DMA/DTS Requests

GTM interrupt requests are listed in the following table.

**Table 25.5 Interrupt Requests (1/2)**

| Interrupt Name | Description | Interrupt Number | DMA Trigger Number | DTS Trigger Number | Supporting Device | |
|---|---|---|---|---|---|---|
| | | | | | P1M-C | P1H-C, P1H-CE |
| INTGTM0ERR | GTM Error Interrupt | 47 | — | — | √ | √ |
| INTGTM0AEI | AEI Shared interrupt | 48 | — | — | √ | √ |
| INTGTM0ARU0 | ARU_NEW_DATA0 interrupt | 49 | 10 | — | √ | √ |
| INTGTM0ARU1 | ARU_NEW_DATA1 interrupt | 50 | 11 | — | √ | √ |
| INTGTM0ARU2 | ARU_ACC_ACK interrupt | 51 | 12 | — | √ | √ |
| INTGTM0CMP | CMP Shared interrupt | 52 | 13 | — | √ | √ |
| INTGTM0TIM00*1 | TIM0 Shared interrupts (TIM0_IRQ0) | 53 | 14 | 10 | √ | √ |
| INTGTM0TIM01*1 | TIM0 Shared interrupts (TIM0_IRQ1) | 141 | 15 | 11 | √ | √ |
| INTGTM0TIM02*1 | TIM0 Shared interrupts (TIM0_IRQ2) | 54 | 16 | 12 | √ | √ |
| INTGTM0TIM03*1 | TIM0 Shared interrupts (TIM0_IRQ3) | 142 | 17 | 13 | √ | √ |
| INTGTM0TIM04*1 | TIM0 Shared interrupts (TIM0_IRQ4) | 55 | 18 | 14 | √ | √ |
| INTGTM0TIM05*1 | TIM0 Shared interrupts (TIM0_IRQ5) | 143 | 19 | 15 | √ | √ |
| INTGTM0TIM06*1 | TIM0 Shared interrupts (TIM0_IRQ6) | 56 | 20 | 16 | √ | √ |
| INTGTM0TIM07*1 | TIM0 Shared interrupts (TIM0_IRQ7) | 144 | 21 | 17 | √ | √ |
| INTGTM0TIM10*1 | TIM1 Shared interrupts (TIM1_IRQ0) | 57 | 22 | 18 | √ | √ |
| INTGTM0TIM11*1 | TIM1 Shared interrupts (TIM1_IRQ1) | 145 | 23 | 19 | √ | √ |
| INTGTM0TIM12*1 | TIM1 Shared interrupts (TIM1_IRQ2) | 58 | 24 | 20 | √ | √ |
| INTGTM0TIM13*1 | TIM1 Shared interrupts (TIM1_IRQ3) | 146 | 25 | 21 | √ | √ |
| INTGTM0TIM14*1 | TIM1 Shared interrupts (TIM1_IRQ4) | 59 | 26 | 22 | √ | √ |
| INTGTM0TIM15*1 | TIM1 Shared interrupts (TIM1_IRQ5) | 147 | 27 | 23 | √ | √ |
| INTGTM0TIM16*1 | TIM1 Shared interrupts (TIM1_IRQ6) | 60 | 28 | 24 | √ | √ |
| INTGTM0TIM17*1 | TIM1 Shared interrupts (TIM1_IRQ7) | 148 | 29 | 25 | √ | √ |
| INTGTM0MCS00*1 | MCS0 Interrupt for channel (MCS0_IRQ0) | 61 | 30 | 118 | √ | √ |
| INTGTM0MCS01*1 | MCS0 Interrupt for channel (MCS0_IRQ1) | 149 | 31 | 119 | √ | √ |
| INTGTM0MCS02*1 | MCS0 Interrupt for channel (MCS0_IRQ2) | 62 | 32 | 120 | √ | √ |
| INTGTM0MCS03*1 | MCS0 Interrupt for channel (MCS0_IRQ3) | 150 | 33 | 121 | √ | √ |
| INTGTM0MCS04*1 | MCS0 Interrupt for channel (MCS0_IRQ4) | 63 | 34 | 122 | √ | √ |
| INTGTM0MCS05*1 | MCS0 Interrupt for channel (MCS0_IRQ5) | 151 | 35 | 123 | √ | √ |
| INTGTM0MCS06*1 | MCS0 Interrupt for channel (MCS0_IRQ6) | 64 | 36 | 124 | √ | √ |
| INTGTM0MCS07*1 | MCS0 Interrupt for channel (MCS0_IRQ7) | 152 | 37 | 125 | √ | √ |
| INTGTM0MCS08*1 | MCS0 Interrupt for channel (MCS0_IRQ8) | 65 | 38 | 126 | √ | √ |
| INTGTM0MCS10*1 | MCS1 Interrupt for channel (MCS1_IRQ0) | 153 | 39 | 100*2 | — | √ |
| INTGTM0MCS11*1 | MCS1 Interrupt for channel (MCS1_IRQ1) | 66 | 40 | 101*2 | — | √ |
| INTGTM0MCS12*1 | MCS1 Interrupt for channel (MCS1_IRQ2) | 154 | 41 | 102*2 | — | √ |
| INTGTM0MCS13*1 | MCS1 Interrupt for channel (MCS1_IRQ3) | 67 | 42 | 103*2 | — | √ |
| INTGTM0MCS14*1 | MCS1 Interrupt for channel (MCS1_IRQ4) | 155 | 43 | 104*2 | — | √ |
| INTGTM0MCS15*1 | MCS1 Interrupt for channel (MCS1_IRQ5) | 68 | 44 | 105*2 | — | √ |
| INTGTM0ATOM00*1 | ATOM0 Shared interrupts (ATOM0_IRQ0) | 69 | 45 | 127 | √ | √ |
| INTGTM0ATOM01*1 | ATOM0 Shared interrupts (ATOM0_IRQ1) | 156 | 46 | 118*2 | √ | √ |

Table 25.5 Interrupt Requests (2/2)

| Interrupt Name | Description | Interrupt Number | DMA Trigger Number | DTS Trigger Number | Supporting Device | |
|---|---|---|---|---|---|---|
| | | | | | P1M-C | P1H-C, P1H-CE |
| INTGTM0ATOM02*1 | ATOM0 Shared interrupts (ATOM0_IRQ2) | 70 | 47 | 119*2 | √ | √ |
| INTGTM0ATOM03*1 | ATOM0 Shared interrupts (ATOM0_IRQ3) | 157 | 48 | 120*2 | √ | √ |
| INTGTM0ATOM04*1 | ATOM0 Shared interrupts (ATOM0_IRQ4) | 71 | 49 | 121*2 | √ | √ |
| INTGTM0ATOM05*1 | ATOM0 Shared interrupts (ATOM0_IRQ5) | 158 | 50 | 122*2 | √ | √ |
| INTGTM0ATOM06*1 | ATOM0 Shared interrupts (ATOM0_IRQ6) | 72 | 51 | 123*2 | √ | √ |
| INTGTM0ATOM07*1 | ATOM0 Shared interrupts (ATOM0_IRQ7) | 159 | 52 | 124*2 | √ | √ |
| INTGTM0ATOM10*1 | ATOM1 Shared interrupts (ATOM1_IRQ0) | 73 | 53 | 125*2 | √ | √ |
| INTGTM0ATOM11*1 | ATOM1 Shared interrupts (ATOM1_IRQ1) | 160 | 54 | 126*2 | √ | √ |
| INTGTM0ATOM12*1 | ATOM1 Shared interrupts (ATOM1_IRQ2) | 74 | 55 | 127*2 | √ | √ |
| INTGTM0ATOM13*1 | ATOM1 Shared interrupts (ATOM1_IRQ3) | 161 | 56 | 96*2 | √ | √ |
| INTGTM0ATOM14*1 | ATOM1 Shared interrupts (ATOM1_IRQ4) | 75 | 57 | 97*2 | — | √ |
| INTGTM0ATOM15*1 | ATOM1 Shared interrupts (ATOM1_IRQ5) | 162 | 58 | 98*2 | — | √ |
| INTGTM0ATOM16*1 | ATOM1 Shared interrupts (ATOM1_IRQ6) | 76 | 59 | 99*2 | — | √ |
| INTGTM0ATOM17*1 | ATOM1 Shared interrupts (ATOM1_IRQ7) | 163 | 60 | 80*2 | — | √ |
| INTGTM0ATOM20*1 | ATOM2 Shared interrupts (ATOM2_IRQ0) | 77 | 61 | 81*2 | — | √ |
| INTGTM0ATOM21*1 | ATOM2 Shared interrupts (ATOM2_IRQ1) | 164 | 62 | 82*2 | — | √ |
| INTGTM0ATOM22*1 | ATOM2 Shared interrupts (ATOM2_IRQ2) | 78 | 63 | 83*2 | — | √ |
| INTGTM0ATOM23*1 | ATOM2 Shared interrupts (ATOM2_IRQ3) | 165 | 64 | 66*2 | — | √ |
| INTGTM0ATOM24*1 | ATOM2 Shared interrupts (ATOM2_IRQ4) | 79 | 65 | 67*2 | — | √ |

Note 1. These interrupts are also connected to PIC.

Note 2. Only available when secondary DTS trigger is selected.

### 25.1.6 External Input and Output Pins

External input/output pins of GTM are listed below.

**Table 25.6 Pin Function Information**

| Pin Name | I/O | Description | Supporting Device | |
|---|---|---|---|---|
| | | | P1M-C, P1H-C (4MB, BGA-156) | P1H-C (4MB, BGA-292), P1H-C (8MB), P1H-CE |
| GTM0I0 | I | Timer input signals for TIM0 (via PIC) | √ | √ |
| GTM0I1 | | | √ | √ |
| GTM0I2 | | | √ | √ |
| GTM0I3 | | | √ | √ |
| GTM0I4 | | | √ | √ |
| GTM0I5 | | | √ | √ |
| GTM0I6 | | | √ | √ |
| GTM0I7 | | | √ | √ |
| GTM1I0 | I | Timer input signals for TIM1 (via PIC) | √ | √ |
| GTM1I1 | | | √ | √ |
| GTM1I2 | | | √ | √ |
| GTM1I3 | | | √ | √ |
| GTM1I4 | | | √ | √ |
| GTM1I5 | | | √ | √ |
| GTM1I6 | | | √ | √ |
| GTM1I7 | | | √ | √ |
| GTMAT0O0*1 | O | Timer output signals for ATOM0 | √ | √ |
| GTMAT0O1*1 | | | √ | √ |
| GTMAT0O2*1 | | | √ | √ |
| GTMAT0O3*1 | | | √ | √ |
| GTMAT0O4 | | | √ | √ |
| GTMAT0O5 | | | √ | √ |
| GTMAT0O6 | | | √ | √ |
| GTMAT0O7 | | | √ | √ |
| GTMAT1O0*1 | O | Timer output signals for ATOM1 | √ | √ |
| GTMAT1O1*1 | | | √ | √ |
| GTMAT1O2*1 | | | √ | √ |
| GTMAT1O3*1 | | | √ | √ |
| GTMAT1O4 | | | — | √ |
| GTMAT1O5 | | | — | √ |
| GTMAT1O6 | | | — | √ |
| GTMAT1O7 | | | — | √ |
| GTMAT2O0*1 | O | Timer output signals for ATOM2 | — | √ |
| GTMAT2O1*1 | | | — | √ |
| GTMAT2O2*1 | | | — | √ |
| GTMAT2O3*1 | | | — | √ |
| GTMAT2O4 | | | — | √ |
| GTMAT0O0N*1 | O | Inverted timer output signals for ATOM0 | √ | √ |
| GTMAT0O1N*1 | | | √ | √ |
| GTMAT0O2N*1 | | | √ | √ |
| GTMAT0O3N*1 | | | √ | √ |
| GTMAT1O0N*1 | O | Inverted timer output signals for ATOM1 | √ | √ |
| GTMAT1O1N*1 | | | √ | √ |
| GTMAT1O2N*1 | | | √ | √ |
| GTMAT1O3N*1 | | | √ | √ |
| GTMAT2O0N*1 | O | Inverted timer output signals for ATOM2 | — | √ |
| GTMAT2O1N*1 | | | — | √ |
| GTMAT2O2N*1 | | | — | √ |
| GTMAT2O3N*1 | | | — | √ |
| ESO0Z | I | Hi-Z control for timer output via PIC | √ | √ |
| ESO1Z | | | √ | √ |
| ESO2Z | | | — | √ |

Note 1. Output buffer of these signals could be controlled to Hi-Z by PIC.

## 25.2 Overview

### 25.2.1 Functional Overview

GTM is a modular timer unit and consists at least of the following submodules.

- Advanced Routing Unit (ARU)
- Clock Management Unit (CMU)
- Time Base Unit (TBU)
- Timer Input Module (TIM)
- ARU-connected Timer Output Module (ATOM)
- Multi-Channel Sequencer (MCS)
- Interrupt Concentrator Module (ICM)
- Output Compare Unit (CMP)
- Monitoring Unit (MON)
- Dead Time Module (DTM)
- Memory Configuration Module (MCFG; Available only in P1H-C, and P1H-CE)

## 25.2.2 Block Diagram

The following figure shows the block diagram.

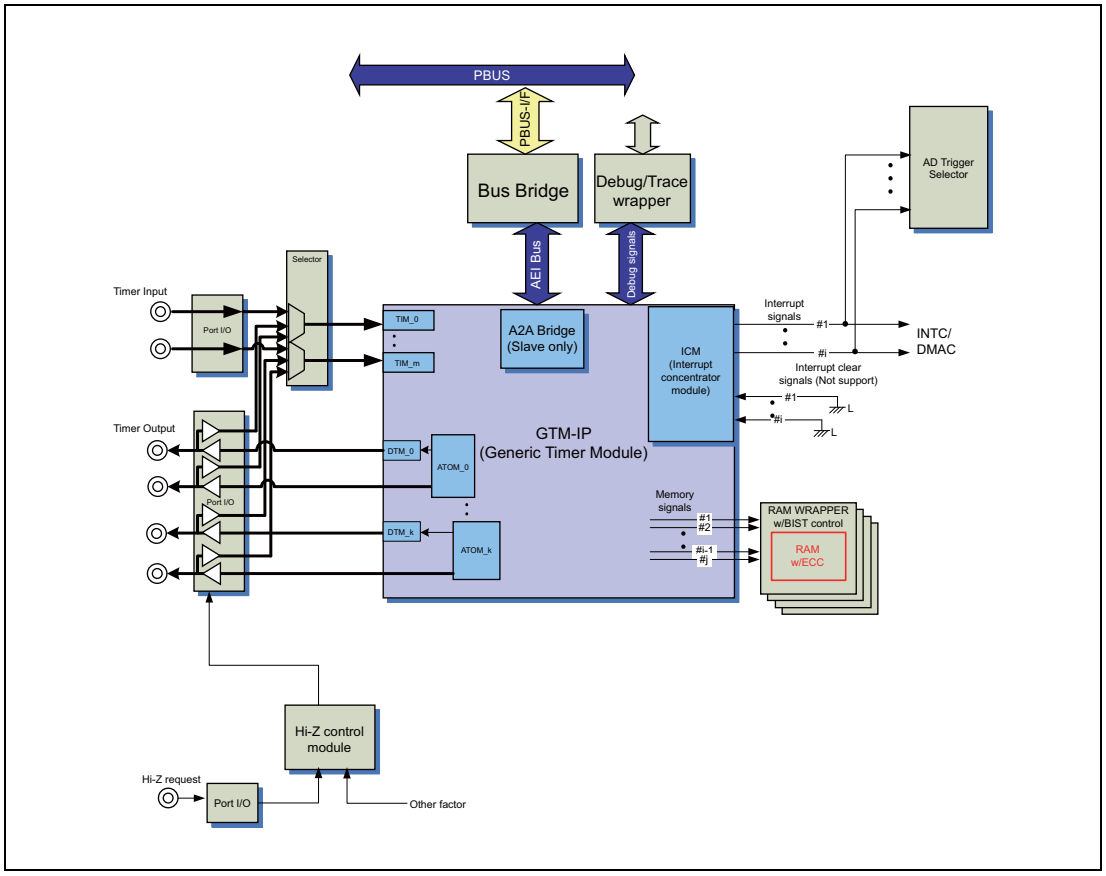

**Figure 25.1 GTM integration diagram**

# 25.3 Registers

## 25.3.1 List of Registers

GTM registers are listed in the following table.

**Table 25.7 List of Registers (1/37)**

| Module name | Address | Symbol | Register Name | Access Width | Support | | Access Protection | |
|---|---|---|---|---|---|---|---|---|
| | | | | | 207 | 208 | PBG | Other |
| GTM0 | <GTM0_base> + $00000_H$ | GTM0GTMREV | GTM-IP Version control register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00004_H$ | GTM0GTMRST | GTM-IP Global reset register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00008_H$ | GTM0GTMCTRL | GTM-IP Global control register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0000C_H$ | GTM0GTMAEIADDRXPT | GTM-IP AEI Timeout exception address register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00010_H$ | GTM0GTMIRQNOTIFY | GTM-IP Interrupt notification register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00014_H$ | GTM0GTMIRQEN | GTM-IP Interrupt enable register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00018_H$ | GTM0GTMIRQFORCINT | GTM-IP Software interrupt generation register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0001C_H$ | GTM0GTMIRQMODE | GTM-IP top level interrupts mode selection. | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00020_H$ | GTM0GTMEIRQEN | GTM-IP Error interrupt enable register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00024_H$ | GTM0GTMHWCONF | GTM-IP Hardware Configuration | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00030_H$ | GTM0GTMBRIDGEMODE | The operation mode for the AEI bridge | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00034_H$ | GTM0GTMBRIDGEPTR1 | AEI bridge status pointer 1 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00038_H$ | GTM0GTMBRIDGEPTR2 | AEI bridge status pointer 2 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00040_H$ | GTM0GTMTIM0AUXINSRC | GTM-IP TIM0 module AUX_IN source selection register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00044_H$ | GTM0GTMTIM1AUXINSRC | GTM-IP TIM1 module AUX_IN source selection register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0005C_H$ | GTM0GTMEXTCAPEN0 | GTM-IP trigger event forwarding in from TIM0 and TIM1 to MCS 0. | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00060_H$ | GTM0GTMEXTCAPEN1 | GTM-IP trigger event forwarding in from TIM1 to MCS1. | 32 | — | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00098_H$ | GTM0GTMATOM0OUT | GTM-IP ATOM output level | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0009C_H$ | GTM0GTMATOM2OUT | GTM-IP ATOM output level | 32 | — | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00100_H$ | GTM0TBUCHEN | TBU global channel enable | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00104_H$ | GTM0TBU0CTRL | TBU channel 0 control | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00108_H$ | GTM0TBU0BASE | TBU channel 0 base | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0010C_H$ | GTM0TBU1CTRL | TBU channel 1 control | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00110_H$ | GTM0TBU1BASE | TBU channel 1 base | 32 | √ | √ | PBG2. PG2-GTM0 | — |

Table 25.7 List of Registers (2/37)

| Module name | Address | Symbol | Register Name | Access Width | Support | | Access Protection | |
|---|---|---|---|---|---|---|---|---|
| | | | | | 207 | 208 | PBG | Other |
| GTM0 | <GTM0_base> + $00180_H$ | GTM0MONSTATUS | Monitor Status register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM | <GTM0_base> + $00184_H$ | GTM0MONACTIVITY0 | Monitor activity register 0 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0018C_H$ | GTM0MONACTIVITYMCS0 | Monitor activity register for MCS0 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00190_H$ | GTM0MONACTIVITYMCS1 | Monitor activity register for MCS1 | 32 | — | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00200_H$ | GTM0CMPEN | Comparator enable register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00204_H$ | GTM0CMPIRQNOTIFY | Event notification register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00208_H$ | GTM0CMPIRQEN | Interrupt enable register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0020C_H$ | GTM0CMPIRQFORCINT | Interrupt force register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00210_H$ | GTM0CMPIRQMODE | IRQ mode configuration register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00214_H$ | GTM0CMPEIRQEN | Error interrupt enable register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00280_H$ | GTM0ARUACCESS | ARU access register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00284_H$ | GTM0ARUDATAH | ARU access register upper data word | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00288_H$ | GTM0ARUDATAL | ARU access register lower data word | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0028C_H$ | GTM0ARUDBGACCESS0 | Debug access channel 0 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00290_H$ | GTM0ARUDBGDATA0H | Debug access 0 transfer register upper data word | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00294_H$ | GTM0ARUDBGDATA0L | Debug access 0 transfer register lower data word | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00298_H$ | GTM0ARUDBGACCESS1 | Debug access channel 1 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0029C_H$ | GTM0ARUDBGDATA1H | Debug access 1 transfer register upper data word | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $002A0_H$ | GTM0ARUDBGDATA1L | Debug access 1 transfer register lower data word | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $002A4_H$ | GTM0ARUIRQNOTIFY | ARU Interrupt notification register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $002A8_H$ | GTM0ARUIRQEN | ARU Interrupt enable register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $002AC_H$ | GTM0ARUIRQFORCINT | Register for forcing the *ARU_NEW_DATA*_IRQ interrupt | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $002B0_H$ | GTM0ARUIRQMODE | IRQ mode configuration register | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $002B4_H$ | GTM0ARUCADDREND | ARU caddr counter end value | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00300_H$ | GTM0CMUCLKEN | Clock enable | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00304_H$ | GTM0CMUGCLKNUM | Global clock control numerator | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $00308_H$ | GTM0CMUGCLKDEN | Global clock control denominator | 32 | √ | √ | PBG2. PG2-GTM0 | — |

Table 25.7 List of Registers (3/37)

| Module name | Address | Symbol | Register Name | Access Width | Support | | Access Protection | |
|---|---|---|---|---|---|---|---|---|
| | | | | | 207 | 208 | PBG | Other |
| GTM0 | <GTM0_base> + 0030C$_H$ | GTM0CMUCLK0CTRL | Control for clock source 0 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00310$_H$ | GTM0CMUCLK1CTRL | Control for clock source 1 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00314$_H$ | GTM0CMUCLK2CTRL | Control for clock source 2 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00318$_H$ | GTM0CMUCLK3CTRL | Control for clock source 3 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 0031C$_H$ | GTM0CMUCLK4CTRL | Control for clock source 4 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00320$_H$ | GTM0CMUCLK5CTRL | Control for clock source 5 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00324$_H$ | GTM0CMUCLK6CTRL | Control for clock source 6 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00328$_H$ | GTM0CMUCLK7CTRL | Control for clock source 7 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00348$_H$ | GTM0CMUGLBCTRL | Synchronizing ARU and clock source | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00600$_H$ | GTM0ICMIRQG0 | ICM Interrupt group register covering infra-structural and safety components (ARU, AEI, CMP) | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00608$_H$ | GTM0ICMIRQG2 | ICM Interrupt group register covering TIM0, TIM1 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00610$_H$ | GTM0ICMIRQG4 | ICM Interrupt group register covering MCS0 to MCS1 submodules | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00624$_H$ | GTM0ICMIRQG9 | ICM Interrupt group register covering GTM-IP output submodules ATOM0, ATOM1, ATOM2 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00630$_H$ | GTM0ICMIRQGMEI | ICM Interrupt group register for module error interrupt information | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00638$_H$ | GTM0ICMIRQGCEI1 | ICM Interrupt group register 1 for channel error interrupt information | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00640$_H$ | GTM0ICMIRQGCEI3 | ICM Interrupt group register 3 for channel error interrupt information | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00648$_H$ | GTM0ICMIRQGMCS0CI | ICM Interrupt group MCS 0 for Channel Interrupt information | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 0064C$_H$ | GTM0ICMIRQGMCS1CI | ICM Interrupt group MCS 0 for Channel Error Interrupt information | 32 | — | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00664$_H$ | GTM0ICMIRQGMCS0CEI | ICM Interrupt group MCS 1 for Channel Interrupt information | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00668$_H$ | GTM0ICMIRQGMCS1CEI | ICM Interrupt group MCS 1 for Channel Error Interrupt information | 32 | — | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 00F40$_H$ | GTM0MCFGCTRL | Memory layout configuration. | 32 | — | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 01000$_H$ | GTM0TIM00GPR0 | channel 0 general purpose 0 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 01004$_H$ | GTM0TIM00GPR1 | channel 0 general purpose 1 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 01008$_H$ | GTM0TIM00CNT | channel 0 SMU counter | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 0100C$_H$ | GTM0TIM00ECNT | channel 0 SMU edge counter | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + 01010$_H$ | GTM0TIM00CNTS | channel 0 SMU shadow counter | 32 | √ | √ | PBG2. PG2-GTM0 | — |

Table 25.7 List of Registers (4/37)

| Module name | Address | Symbol | Register Name | Access Width | Support | | Access Protection | |
|---|---|---|---|---|---|---|---|---|
| | | | | | 207 | 208 | PBG | Other |
| GTM0 | <GTM0_base> + $01014_H$ | GTM0TIM00TDUC | channel 0 TDU counter. | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $01018_H$ | GTM0TIM00TDUV | channel 0 TDU control. | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0101C_H$ | GTM0TIM00FLTRE | channel 0 filter parameter 0 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $01020_H$ | GTM0TIM00FLTFE | channel 0 filter parameter 1 | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $01024_H$ | GTM0TIM00CTRL | channel 0 control | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $01028_H$ | GTM0TIM00ECTRL | channel 0 extended control | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $0102C_H$ | GTM0TIM00IRQNOTIFY | channel 0 interrupt notification | 32 | √ | √ | PBG2. PG2-GTM0 | — |
| GTM0 | <GTM0_base> + $01030_H$ | GTM0TIM00IRQEN | channel 0 interrupt enable | 32 | √ | √ | PBG2. PG2-GTM0 | — |

## 25.4 Operation

### 25.4.1 Peripheral Bus Access

Due to its complexity, the GTM is attached to a bus system as a slave unit so as to provide register and MCS RAM access through the AEI interface to the CPU software and DMA functions. Please note that an access to the GTM registers and RAM modules has to be always 32-bit wide.

GTM contains MCS RAM structures. These RAM structures are not shared with other functionality and can be accessed via the bus system in a certain address range. For details of the memory map, see **Section 25.18.5, Memory Address Ranges** or **Section 25.19.5, Memory Address Ranges**.

GTM is accessible by all cores with the same access speed except the ICUMC core. See "**Section 3, CPU System**" for more details on CPU to peripheral access speed.

### 25.4.2 Reset

GTM is resettable by a dedicated bit, which allows the software to set GTM in reset state without using external reset. See "**Section 8, Reset Controller**".

### 25.4.3 Interrupt Factors

GTM generates up to 180 interrupt factors, which are visible outside of the GTM and are connected to the Interrupt Controller. These are ICM output interrupts as described in **Section 25.15.3, ICM Interrupt Signals**. The exact number of interrupts and their source depends on the GTM configuration. For details of each device, see **Section 25.1.5**.

### 25.4.4 Connection to ADCF

GTM can trigger the AD conversion start. The signals, which should trigger the conversion, are connected to the ADCF module inside this device. As trigger sources following signals are used:

- TIM_IRQ, after ICM
- ATOM_OUT
- MCS_IRQ, after ICM

Signals specified above are multiplexed together and routed to the ADCF. Multiplication scheme is described in "Section 26, Peripheral Interconnect (PIC)". The GTM can trigger the AD groups 0 to 4. In "Section 26, Peripheral Interconnect (PIC)" more details regarding the ADCF trigger selection can also be found.

### 25.4.5 Connection from ADCF

Every group of the ADCF generates one conversion end interrupt. This signal can be used to trigger the TIM channel of the GTM to save the timestamp information. After that, the TIM can start the DMA to transfer ADCF group's channels conversion results and the timestamp information to the memory. The ADCF group conversion end signals are connected in one-to-one manner to the TIM. The input signal to the TIM has to be defined during configuration of the TIM, for example: TIM0 channel 0 - external input signal or ADCF converter group 0 signal. The scheme of the ADCF to TIM connections is shown below:

- ADCF0 group 0 end of conversion interrupt -> TIM0 input 0 or TIM1 input 0 exclusively
- ADCF0 group 1 end of conversion interrupt -> TIM0 input 1 or TIM1 input 1 exclusively
- ADCF0 group 2 end of conversion interrupt -> TIM0 input 2 or TIM1 input 2 exclusively
- ADCF0 group 3 end of conversion interrupt -> TIM0 input 3 or TIM1 input 3 exclusively
- ADCF0 group 4 end of conversion interrupt -> TIM0 input 4 or TIM1 input 4 exclusively
- ADCF1 group 0 end of conversion interrupt -> TIM1 input 0
- ADCF1 group 1 end of conversion interrupt -> TIM1 input 1
- ADCF1 group 2 end of conversion interrupt -> TIM1 input 2
- ADCF1 group 3 end of conversion interrupt -> TIM1 input 3
- ADCF1 group 4 end of conversion interrupt -> TIM1 input 4

Please refer also to the "Section 26, Peripheral Interconnect (PIC)" for more information.

### 25.4.6 Sub-Module

Every ATOM submodule is connected to a 4-channel DTM (Dead Time Module) inside of the GTM. For the first 4 channels of the ATOM submodule, the connection to the DTM is selectable by a runtime configuration of the GTM registers. See **Section 25.12, Dead Time Module (DTM)** for DTM submodule description.

### 25.4.7 Safety Mechanism

The RAMs are protected by an ECC function. The ECC function is accessible and testable. For more details regarding ECC function, see "**Section 33, RAM Modules**". An ECC error will also be signaled to the respective MCS submodule.

An output signal from ATOM submodule can be read back using TIM submodule using the same pin. This function is a part of the safety mechanism. Please therefore see "**Section 28, Functional Safety**" for more details. Refer also to "Section 26, Peripheral Interconnect (PIC)" for more details.

The DTM submodule output signals are set into Hi-Z state automatically in reaction to an external input signal on the ESO (Emergency Shut-off) pin or on the error signal from ECM. Please refer also to "Section 26, Peripheral Interconnect (PIC)" and "**Section 29, Error Control Module (ECM)**" for more details.

### 25.4.8 Procedure of Module Standby and Limited Reset

This module supports module standby and limited reset functions. Before these functions are enabled, all of the followings must be ensured:

- Disable output pins of ATOM
  - Write the following register
    - GTM0ATOMiAGCOUTENSTAT = $5555_H$
  - Read the following register and wait the value matching
    - GTM0ATOMiAGCOUTENSTAT == $0_H$
- Stop operation of TBU
  - Write the following register
    - GTM0TBUCHEN = $5_H$
  - Read the following register and wait the value matching
    - GTM0TBUCHEN == $0_H$
- Disable all interrupts of sub-modules
  - Write the following registers
    - GTM0GTMIRQEN = $0_H$
    - GTM0GTMEIRQEN = $0_H$
    - GTM0ARUIRQEN = $0_H$
    - GTM0TIMixIRQEN = $0_H$
    - GTM0TIMixEIRQEN = $0_H$
    - GTM0ATOMixIRQEN = $0_H$
    - GTM0MCSixIRQEN= $0_H$
    - GTM0MCSixEIRQEN = $0_H$
    - GTM0CMPIRQEN = $0_H$
    - GTM0CMPEIRQEN = $0_H$
- Stop operation of MCS
  - Write the following registers
    - GTM0MCSixCTRL = $0_H$
    - GTM0MCSiCAT = $1FF_H$
    - GTM0MCS0CWT = $1FF_H$
  - Read the following register and wait the value matching
    - GTM0MCSixCTRL[0] == $0_H$
- No peripheral access to GTM

# 25.5 Introduction

## 25.5.1 Overview

This document is the specification for the Generic Timer Module (GTM). It contains a module framework with submodules of different functionality. These submodules can be combined in a configurable manner to form a complex timer module that serves different application domains and different classes within one application domain. Because of this scalability and configurability the timer is called generic.

The scalability and configurability is reached with an architecture philosophy where dedicated hardware submodules are located around a central routing unit (called Advanced Routing Unit (ARU)). The ARU can connect the submodules in a flexible manner. The connectivity is software programmable and can be configured during runtime.

Nevertheless, the GTM-IP is designed to unload the CPU or a peripheral core from a high interrupt load. Most of the tasks inside the GTM-IP can run -once setup by an external CPU- independent and in parallel to the software. There may be special situations, where the CPU has to take action but the goal of the GTM design was to reduce these situations to a minimum.

The hardware submodules have dedicated functionalities, e.g. there are timer input modules where incoming signals can be captured and characterized together with a notion of time. By combination of several submodules through the ARU complex functions can be established. E.g. the signals characterized at an input module can be routed to a signal processing unit where an intermediate value about the incoming signal frequency can be calculated.

The modules that help to implement such complex functions are called *infrastructural components* further on. These components are present in all GTM variants. However, the number of these components may vary from device to device.

Other submodules have a more general architecture and can fulfil typical timer functions, e.g. there are MCS and IO modules. A third group of submodules is responsible for supporting the implementation of safety functions to fulfil a defined safety level. The module ICM is responsible for interrupt services and defines the fourth group.

Each GTM-IP is build up therefore with submodules coming from those four groups. The application class is defined by the amount of components of those submodules integrated into the implemented GTM-IP.

### 25.5.2 Document Structure

The structure of this document is motivated out of the aforementioned submodule classes. **Section 25.6, GTM Architecture** describes the dedicated GTM-IP implementation this specification is written for. It gives an overview about the implemented submodules.

The following **Section 25.6** up to **Section 25.9** deals with the so called infrastructural components for routing, clock management and common time base functions. **Section 25.10**, **Section 25.11** and **Section 25.12** describe the signal input and output modules while the following **Section 25.13** explains the signal processing and generation submodule. **Section 25.14** describes the memory configuration submodule. The next sections provide a detailed description of application specific and safety related modules like the CMP and MON submodules. **Section 25.16** describes a module that bundles several interrupts coming from the other submodules and connect them to the outside world.

These submodule groups are shown in the following table:

| Chapter | Submodule | Group |
|---|---|---|
| **25.7** | Advanced Routing Unit (ARU) | Infrastructural components |
| **25.8** | Clock Management Unit (CMU) | Infrastructural components |
| **25.9** | Time Base Unit (TBU) | Infrastructural components |
| **25.10** | Timer Input Module (TIM) | IO Modules |
| **25.11** | ARU-connected Timer Output Module (ATOM) | IO Modules |
| **25.12** | Dead Time Module (DTM) | IO Modules |
| **25.13** | Multi Channel Sequencer (MCS) | Signal generation and processing |
| **25.14** | Memory Configuration (MCFG) | Memory Configuration |
| **25.15** | Interrupt Concentrator Module (ICM) | Interrupt services |
| **25.16** | Output Compare Unit (CMP) | Safety features |
| **25.17** | Monitoring Unit (MON) | Safety features |

## 25.6 GTM Architecture

### 25.6.1 Overview

As already mentioned in **Section 25.5, Introduction** the GTM-IP forms a generic timer platform that serves different application domains and different classes within these application domains. Depending on these multiple requirements of application domains multiple device configurations with different count of submodules (i.e. ATOM, MCS, TIM, TOM) and different count of channel per submodule (if applicable) are possible. In this section as an example of possible device configurations the GTM-IP_208 realization is outlined. The architecture of the GTM-IP_208 is depicted in **Figure 25.2**. The device dependent configuration (i.e. the count of submodules) is listed in **Section 25.19, GTM Device 208**.

### 25.6.1.1 GTM Architecture Block Diagram

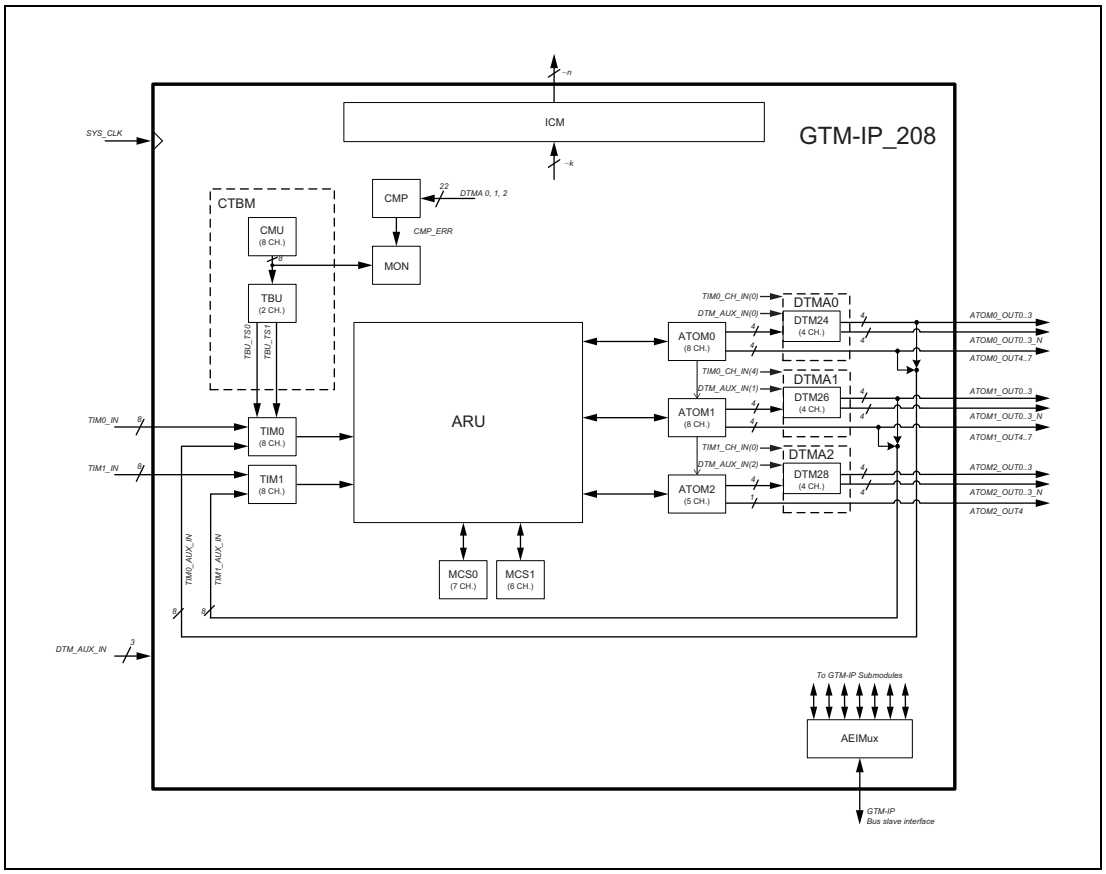

Figure 25.2 GTM Architecture Block Diagram

The central component of the GTM-IP is the Advanced Routing Unit (ARU) where most of the submodules are located around and connected to. This ARU forms together with the Clock Management Unit (CMU) and the Time Base Unit (TBU) the infrastructural part of the GTM. The ARU is able to route data from a connected source submodule to a connected destination submodule. The routing is done in a deterministic manner with a round-robin scheduling scheme of connected channels which receive data from ARU and with a worst case round-trip time.

The routed data word size of the ARU is 53 bit. The data word can logically be split into three parts. These parts are shown in **Figure 25.3, ARU Data Word** . Bits 0 to 23 and bits 24 to 47 typically hold data for the operation registers of the GTM-IP. This can be for example the duty cycle and period duration of a measured PWM input signal or the output characteristic of an output PWM to be generated. Another possible content of Data0 and Data1 can be two 24 bit values of the GTM-IP time bases TBU_TS0 and TBU_TS1. Bits 48 to 52 can contain control bits to send control information from one submodule to another. These ARU Control Bits (ACB) can have a different meaning for different submodules.

It is also possible to route data from a source to a destination and the destination can act later on as source for another destination. These routes through the GTM-IP are further on called data streams. For a detailed description of the ARU submodule see **Section 25.7, Advanced Routing Unit (ARU)** .

### 25.6.1.2 ARU Data Word Description

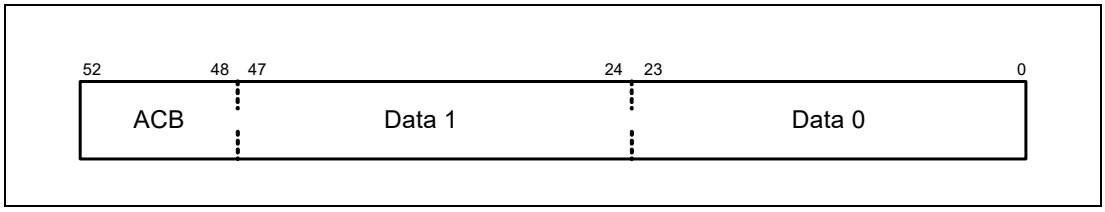

**Figure 25.3 ARU Data Word**

Signals are transferred into the GTM-IP at the Timer Input Modules (TIM). These modules are able to filter the input signals and annotate additional information. Each channel is for example able to measure pulse high or low times and the period of a PWM signal in parallel and route the values to ARU for further processing. The internal operation registers of the TIM submodule are 24 bits wide.

The Clock Management Unit (CMU) serves up to 8 different clocks for the GTM. It acts as a clock divider for the system clock. The counters implemented inside other submodules are typically driven from this submodule. Please note, that the CMU clocks are implemented as enable signals for the counters while the whole system runs with the GTM global clock SYS_CLK. This global clock typically corresponds to the microcontroller bus clock the GTM-IP is connected to and should not exceed 100MHz because of the power dissipation of the used transistors where the GTM is implemented with.

The TBU provides up to twice independent common time bases for the GTM-IP. In general, the number of time bases depends on the implemented device.

Signal outputs are generated with the ARU-connected TOMs (ATOM) and the corresponding Dead Time Modules (DTM).

The ATOMs offer the additional functionality to generate complex output signals without CPU interaction by serving these complex waveform characteristics by other submodules that are connected to the ARU like the Multi Channel Sequencer (MCS). The operation and shadow registers of the ATOM channels are 24 bit wide to have a higher resolution and to have the opportunity to compare against time base values coming from the TBU.

It is possible to trigger ATOM channels for a successor ATOM submodule through a trigger line between ATOM(x)_CH(7) and ATOM(x+1)_CH(0). But to avoid long trigger paths the GTM-IP integrator can configure after which ATOM submodule instance a register is placed into the trigger signal chain. Each register results in one SYS_CLK cycle delay of the trigger signal. See device specification of silicon vendor for unregistered trigger chain length.

Together with the MCS the ATOM is able to generate an arbitrary predefined output sequence at the GTM-IP output pins. The output sequence is defined by instructions located in RAM connected to the MCS submodule. The instructions define the points were an output signal should change or to react on other signal inputs. The output points can be one or two time stamps (or even angle stamp in case of an engine management system) provided by the TBU. Since the MCS is able to read data from the ARU it is also able to operate on incoming data routed from the TIM. Additionally, the MCS can process data that is located in its connected RAMs. The MCS RAM is located logically inside the MCS while the silicon vendor has to implement its own RAM technology there.

The two modules Compare Module (CMP) and Monitor Module (MON) implement safety related features. The CMP compares two output channels of an ATOM and sends the result to the MON submodule were the error is signalled to the CPU. The MON module is also able to monitor the ARU and CMU activities.

In the described implementation the submodules of the GTM-IP have a huge amount of different interrupt sources. These interrupt sources are grouped and concentrated by the Interrupt Concentrator Module (ICM) to form a much easier manageable bunch of interrupts that are visible outside of the GTM-IP.

On the GTM-IP top level there are some configurable signal connections from the signal output of the DTM modules to the input signals of the TIM modules.

The trigger out of TIM (i.e. the signals TIM[i]_EXT_CAPTURE(7:0) of each TIM instance i) are routed to ATOM instance [i] and TOM instance [i] with i=0..NTIM-1 (NTIM defines the number of available TIM instances, see **Table 25.2, Sub-Units and Channels**).

This TIM trigger can be used to trigger inside the ATOM or TOM instance either a channel or the global control register of AGC or TGC0/TGC1 unit.

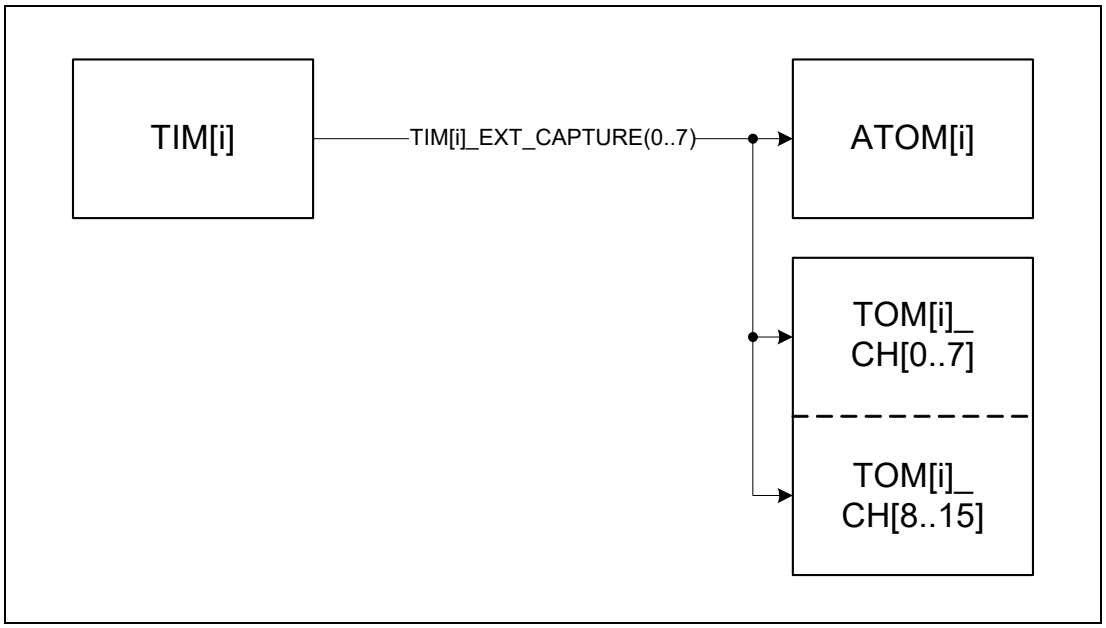

**Figure 25.4 The trigger out of TIM(1)**

The trigger out of TIM (i.e. the signals TIM[i]_EXT_CAPTURE(7:0) of each TIM instance i) are additionally routed to the MCS instance [i]. This trigger forwarding can be enabled by register GTM0GTMEXTCAPENi.

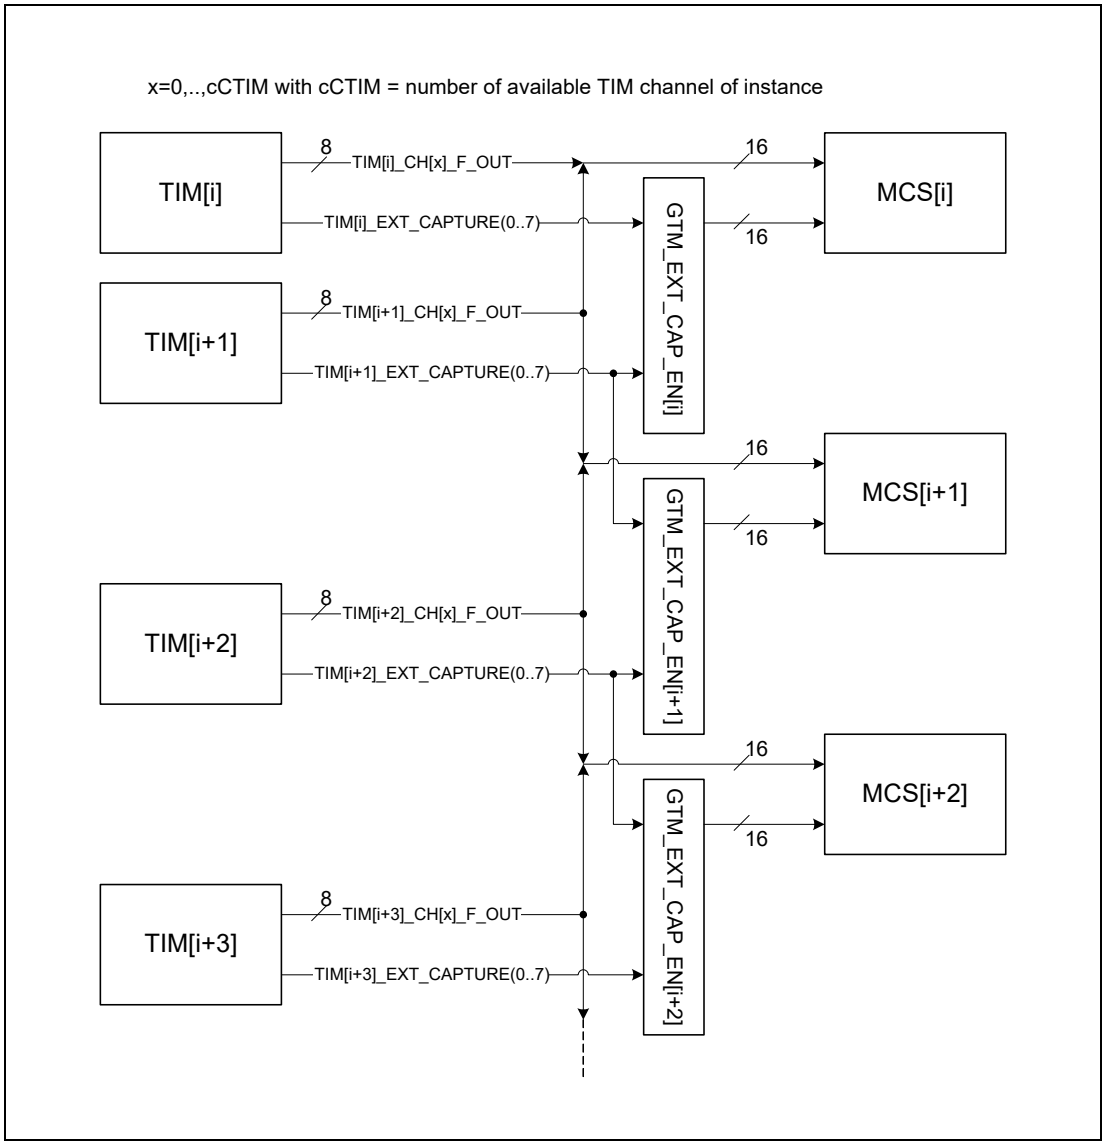

**Figure 25.5 The trigger out of TIM(2)**

## 25.6.2 GTM-IP Interfaces

In general the GTM-IP can be divided into four interface groups. Two interface groups represent the ports of the GTM-IP where incoming signals are assembled and outgoing signals are created. These interfaces are therefore connected to the GTM-IP input submodule TIM and to the GTM-IP output submodules DTM.

Another interface is the bus interface where the GTM-IP can be connected to the SoC system bus. This generic bus interface is described in more detail in **Section 25.6.2.1, GTM-IP Generic Bus Interface (AEI)** . The last interface is the interrupt controller interface. The GTM-IP provides several interrupt lines coming from the various submodules. These interrupt lines are concentrated inside the ICM and have to be adapted to the dedicated microcontroller environment where each interrupt handling can look different. The interrupt concept is described in more detail in **Section 25.6.5, GTM-IP Interrupt Concept** .

### 25.6.2.1 GTM-IP Generic Bus Interface (AEI)

The GTM-IP is equipped with a generic bus interface that can be widely adapted to different SoC bus systems. This generic bus interface is called AE-Interface (AEI). The adaptation of the AEI to SoC buses is typically done with a bridge module translating the AEI signals to the SoC bus signals of the silicon vendor. The AEI bus signals are depicted in the following table:

**Table 25.9 AEI bus signals**

| Signal name | I/O | Description | Bit width |
|---|---|---|---|
| AEI_SEL | I | GTM-IP select line | 1 |
| AEI_ADDR | I | GTM-IP address | 32 |
| AEI_PIPE | I | AEI Address phase signal | 1 |
| AEI_W1R0 | I | Read/Write access | 1 |
| AEI_WDATA | I | Write data bus | 32 |
| AEI_RDATA | O | Read data bus | 32 |
| AEI_READY | O | Data ready signal | 1 |
| AEI_STATUS | O | AEI Access status | 2 |

The AEI Status Signal may drive one of the following values:

**Table 25.10 AEI Status signal**

| AEI_STATUS | Description |
|---|---|
| 00 | No Error |
| 01 | Illegal Byte Addressing |
| 10 | Illegal Address Access |
| 11 | Unsupported Address |

The signal value “00” is driven if no error occurred during AEI access.

The signal value “01” is driven if the bus address is not an integer multiple of 4 (byte addressing).

The signal value “11” is driven if the address is not handled in the GTM.

The signal value “10” is driven if an illegal write access to one of the following register is performed:

(a) register is protected (e.g. protected by bit RF_PROT).

(b) writing a writable bit field of a register which is not implemented in the device with a value different from the reset value.

In case of an illegal write access signalled by status “10” the register will not be modified.

Reading registers will never return status “10”.

Write access to following addresses returns status "10" under special conditions:

GTM0ARUIRQFORCINT

GTM0ARUCADDREND

GTM0ATOMixCM0

GTM0ATOMixCM1

GTM0ATOMixSR0

GTM0ATOMixSR1

GTM0ATOMixRDADDR

GTM0ATOMixIRQFORCINT

GTM0CMPIRQFORCINT

GTM0CMUCLKEN

GTM0CMUGCLKNUM

GTM0CMUGCLKDEN

GTM0CMUCLKxCTRL

GTM0CMUGLBCTRL

GTM0GTMIRQFORCINT

GTM0GTMRST

GTM0TIMixCNTS

GTM0TIMixGPR1

GTM0TIMixIRQFORCINT

GTM0TIM00ECTRL

GTM0MCSixCTRL

GTM0MCSixPC

GTM0MCSixIRQFORCINT

GTM0MCSixCTRL

GTM0TBUCHEN

GTM0TBUxBASE

GTM0TBUxCTRL

MCS RAM during initialization

#### 25.6.2.2 GTM-IP Multi-master and multi-tasking support

To support multi-master and multi-task access to the registers of the GTM-IP a dedicated write-access scheme is used for critical control bits inside the IP that need such a mechanism. This can be for example a shared register where more than one channel can be controlled globally by one register write access. Such register bits are implemented inside the GTM-IP with a double bit mechanism, where the writing of ‘00’ and ‘11’ has no effect on the register bit and where ‘01’ sets the bit and ‘10’ resets the bit. If the CPU wants to read the status of the bit it always gets a ‘00’ if the bit is reset and it gets a ‘11’ if the bit is set.

### 25.6.3 ARU Routing Concept

One central concept of the GTM-IP is the routing mechanism of the ARU submodule for data streams. Each data word transferred between the ARU and its connected submodule is 53 bit wide. It is important to understand this concept in order to use the resources of the GTM-IP effectively. Each module that is connected to the ARU may provide an arbitrary number of ARU write channels and an arbitrary number of ARU read channels. In the following, the ARU write channels are named data sources and the ARU read channels are named data destinations.

The concept of the ARU intends to provide a flexible and resource efficient way for connecting any data source to an arbitrary data destination. In order to save resource costs, the ARU does not implement a switch matrix, but it implements a data router with serialized connectivity providing the same interconnection flexibility. **Figure 25.6** shows the ARU data routing principle. Data sources are marked with a green rectangle and the data destinations are marked with yellow rectangles. The dashed lines in the ARU depict the configurable connections between data sources and data destinations. A connection between a data source and a data destination is also called a data stream.

### 25.6.3.1 Principle of data routing using ARU

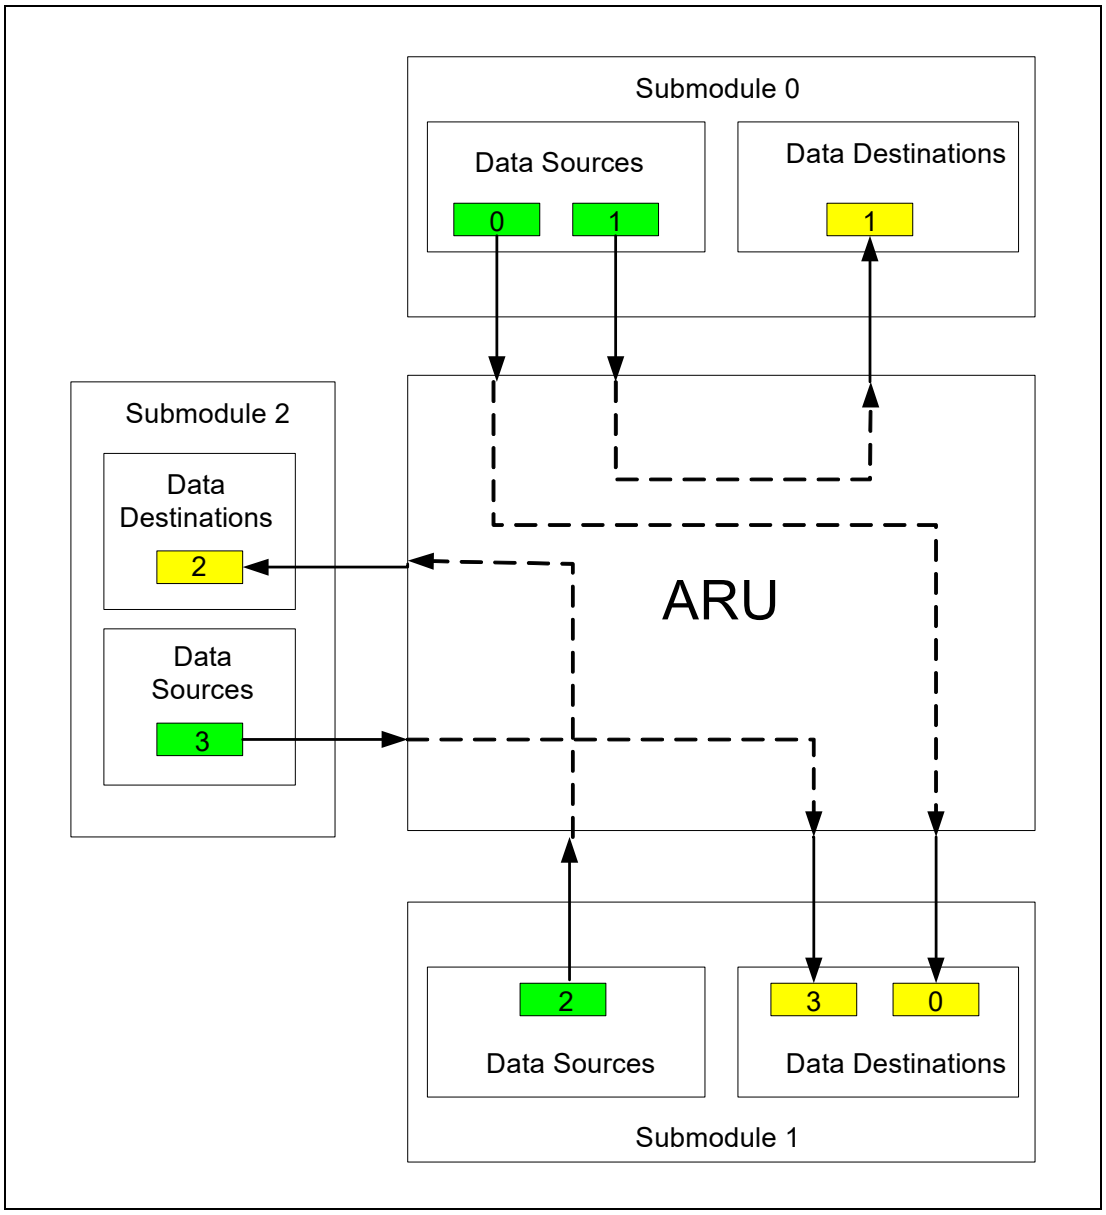

**Figure 25.6 Principle of data routing using ARU**

The configuration of the data streams is realized according to the following manner: Each data source has its fixed and unique source address: The fixed address of each data source is pointed out by the numbers in the green boxes of **Figure 25.6**. The address definitions of all available data sources in the GTM-IP can be obtained from **Table 25.204, ARU Write Address Overview**, **Table 25.211, ARU Write Address Overview**. The connection from a specific data source to a specific data destination is defined by configuring the corresponding address of a data source in the desired data destination. The configured address of each data destination is pointed out by the numbers in the yellow boxes of **Figure 25.6**.

Normally, the destination is idle and waits for data from the source. If the source offers new data, the destination does a destructive read, processes the data and goes idle again. The same data is never read twice.

The functionality of the ARU is as follows: The ARU sequentially polls the data destinations of the connected modules in a round-robin order. If a data destination requests new data from its configured data source and the data source has data available, the ARU delivers the data to the destination and it informs both, the data source and destination that the data is transferred. The data source marks the delivered ARU data as invalid which means that the destination consumed the data.

It should be noted that each data source should only be connected to a single data destination. This is because the destinations consume the data. If two destinations would reference the same source one destination would consume the data before the other destination could consume it. Since the data transfers are blocking, the second destination would block until it receives new data from the source. On the other hand, the transfer from a data source to the ARU is also blocking, which means that the source channel can only provide new data to the ARU when an old data word is consumed by a destination. In order to speed up the process of data transfers, the ARU handles two different data destinations in parallel.

Following table gives an overview about the number of channels for the GTM-IP_208 variant used as a reference within this chapter.

**Table 25.11 The number of channels for the GTM-IP_208 variant**

| Submodule | Number of data sources | Number of data destinations |
|---|---|---|
| ARU | 1 | 0 |
| CMU | 0 | 0 |
| TBU | 0 | 0 |
| TIM 0-1 | 16 | 0 |
| ATOM 0-2 | 21 | 21 |
| DTM | 0 | 0 |
| MCS 0-1 | 39 | 13 |
| ICM | 0 | 0 |
| CMP | 0 | 0 |
| MON | 0 | 0 |
| Total | 77 | 34 |

### 25.6.3.2 ARU Round Trip Time

The ARU uses a round-robin arbitration scheme with a fixed round trip time for all connected data destinations. This means that the time between two adjacent read requests resulting from a data destination channel always takes the round trip time, independently if the read request succeeds or fails.

#### 25.6.3.3 ARU Blocking Mechanism

Another important concept of the ARU is its blocking mechanism that is implemented for transferring data from a data source to a data destination. This mechanism is used by ARU connected submodules to synchronize the submodules to the routed data streams. **Figure 25.7** explains the blocking mechanism.

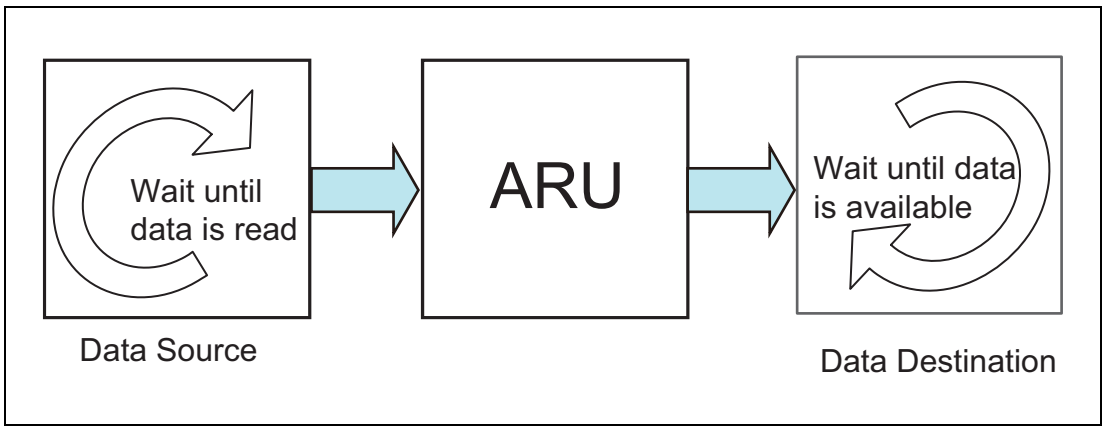

**Figure 25.7 Graphical representation of ARU blocking mechanism**

If a data destination requests data from a data source over the ARU but the data source does not have any data yet, it has to wait until the data source provides new data. In this case the submodule that owns the data destination may perform other tasks. When a data source produces new data faster than a data destination can consume the data the source raises an error interrupt and signals that the data could not be delivered in time. The new data is marked as valid for further transfers and the old data is overwritten.

In any case the round trip time for the ARU has a fixed reset value for a specific device configuration. The end value of the roundtrip counter can be changed with a configuration register GTM0ARUCADDREND inside the ARU. For more details see the ARU specific chapter.

Please refer also to **Section 25.18, GTM Device 207** and **Section 25.19, GTM Device 208**.

It is possible to reset the ARU roundtrip counter ARU_CADDR manually synchronous to CMU clock enable from configuration register inside CMU module. See CMU specific chapter for more details.

### 25.6.4 GTM-IP Clock and Time Base Management (CTBM)

Inside the GTM-IP several subunits are involved in the clock and time base management of the whole GTM. **Figure 25.8** shows the connections and sub blocks involved in these tasks. The sub blocks involved are called Clock and Time Base Management (CTBM) modules further on.

### 25.6.4.1 GTM-IP Clock and time base management architecture

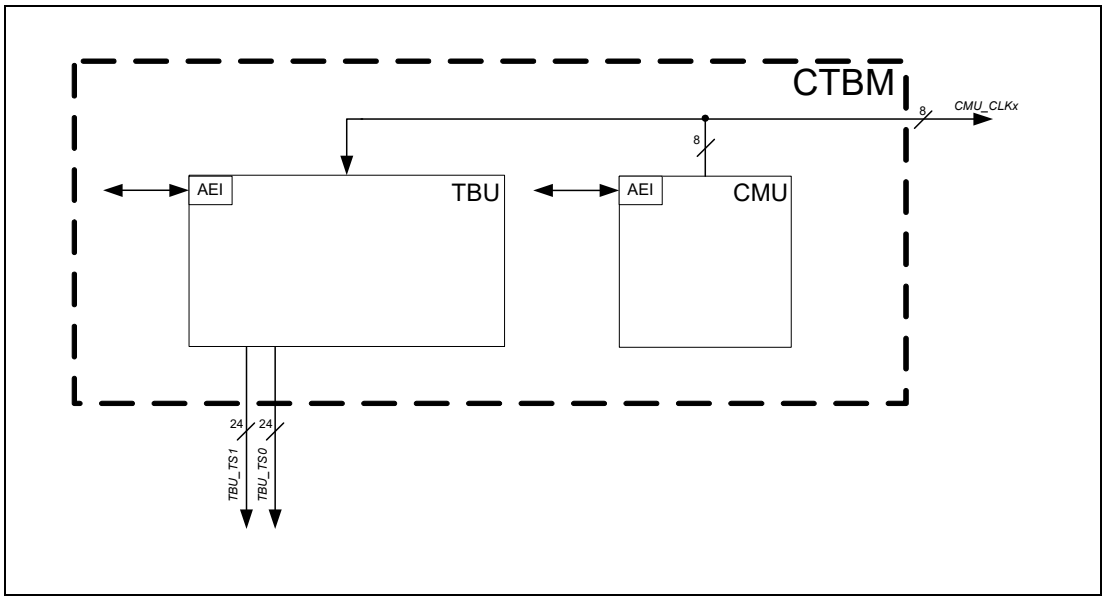

**Figure 25.8 GTM-IP Clock and time base management architecture**

One important module of the CTBM is the Clock Management Unit (CMU) which generates 8 clocks for the submodules of the GTM. For a detailed description of the CMU functionality and clocks see **Section 25.8, Clock Management Unit (CMU)** .

Inside the Time Base Unit (TBU) one of these eight clocks is used per channel to generate a common time base for the GTM. The TBU functionality is described in **Section 25.9, Time Base Unit (TBU)**.

In this device the TBU submodule generates the two time base signals TBU_TS0 and TBU_TS1 which are widely used inside the GTM as common time bases for signal characterization and generation.

### 25.6.5 GTM-IP Interrupt Concept

The submodules of the GTM-IP can generate thousands of interrupts on behalf of internal events. This high amount of interrupts is combined inside the Interrupt Concentrator Module (ICM) into interrupt groups. In this interrupt groups the GTM-IP submodule interrupt signals are bundled to a smaller set of interrupts. Out of these interrupt sets a smaller amount of interrupt signals is created and signalled outside of the GTM-IP as a signal GTM_<MOD>_IRQ, whereas <MOD> identifies the name of the corresponding GTM-IP submodule.

Moreover, each output signal GTM_<MOD>_IRQ has a corresponding input signal GTM_<MOD>_IRQ_CLR that can be used for clearing the interrupts. This input signals can be used by the surrounding microcontroller system as:

- acknowledge signal from a DMA controller
- validation signal from ADC
- clear signal from an GTM-external interrupt controller to do an atomic clear while entering an ISR routine

The controlling of the individual interrupts is done inside the submodules. If a submodule consists of several submodule channels that are most likely to work independent from each other (like TIM, MCS and ATOM), each submodule channel has its own interrupt control and status register set, named as interrupt set in the following. Other submodules (ARU, CMP and global GTM functionality) have a common interrupt set for the whole submodule.

The interrupt set consists of four registers: The IRQ_EN register, the IRQ_NOTIFY register, the IRQ_FORCINT register, and the IRQ_MODE register. While the registers IRQ_EN, IRQ_NOTIFY, and IRQ_FORCINT signalize the status and allow controlling of each individual interrupt source within an interrupt set, the register IRQ_MODE configures the interrupt mode that is applied to all interrupts that belong to the same interrupt set.

In order to support a wide variety of microcontroller architectures and interrupt systems with different interrupt signal output characteristics and internal interrupt handling the following four modes can be configured:

- Level mode
- Pulse mode
- Pulse-Notify mode
- Single-Pulse mode

These interrupt modes are described in more details in the following subsections.

The register IRQ_EN allows the enabling and disabling of an individual interrupt within an interrupt set. Independent of the configured mode, only enabled interrupts can signalize an interrupts on its signal GTM_<MOD>_IRQ.

The register IRQ_NOTIFY collects the occurrence of interrupt events. The behavior for setting a bit in this register depends on the configured mode and thus it is described later on in the mode descriptions.

Independent of the configured mode any write access with value ‘1’ to a bit in the register IRQ_NOTIFY always clears the corresponding IRQ_NOTIFY bit.

Moreover, the enabling of a disabled interrupt sources with a write access to the register IRQ_EN also clears the corresponding bit in the IRQ_NOTIFY register but only if the error interrupt source EIRQ_EN is disabled. However, if the enabling of a disabled interrupt is simultaneous to an incoming interrupt event, the interrupt event is dominant and the register IRQ_NOTIFY is not cleared.

Additionally, each write access to the register IRQ_MODE, clears all bits in the IRQ_NOTIFY register. It should be notified that the clearing of IRQ_NOTIFY is applied independently of the written data (e.g. no mode change).

Thus, a secure way for reconfiguring the interrupt mode of an interrupt set, is to disable all interrupts of the interrupt set with the register IRQ_EN, define the new interrupt mode by writing register IRQ_MODE, followed by enabling the desired interrupts with the register IRQ_EN.

Thus, a secure way for reconfiguring the interrupt mode of an error interrupt set, is to disable all error interrupts of the error interrupt set with the register EIRQ_EN, define the new interrupt mode by writing register IRQ_MODE, followed by enabling the desired error interrupts with the register EIRQ_EN.

The register IRQ_FORCINT is used by software for triggering individual interrupts with a write access with value ‘1’. Since a write access to IRQ_FORCINT only generates a single pulse, IRQ_FORCINT is not implemented as a true register and thus any read access to IRQ_FORCINT always results with a value of ‘0’.

It should be noted, that the mechanism for triggering interrupts with IRQ_FORCINT is globally disabled after reset. It has to be explicitly enabled by clearing the bit RF_PROT in the register GTM0GTMCTRL (see **Section 25.6.9.3, GTM0GTMCTRL** )

For the modules AEI-bridge, TIM, MCS and CMP each interrupt may configured to raise instead of the normal interrupt an error interrupt if enabled by the corresponding error interrupt enable bit in register EIRQ_EN.

Note, it is possible for one source to enable the normal interrupt and the error interrupt in parallel. Because of both interrupt clear signals could reset the notify bit this could cause problems in a system and therefore it is inadvisable.

Similar to enabling an interrupt, the enabling of a disabled error interrupt source with a write access to the register EIRQ_EN also clears the corresponding bit in the IRQ_NOTIFY register only if the interrupt source IRQ_EN is disabled. However, if the enabling of a disabled error interrupt is simultaneous to an incoming interrupt event, the interrupt event is dominant and the register IRQ_NOTIFY is not cleared.

All enabled error interrupts are or-combined inside the ICM and assigned to the dedicated GTM port gtm_err_irq. A corresponding input gtm_err_irq_clr allows the reset of this error interrupt from outside the GTM (hardware clear).

To be able to detect the module source of the error interrupt the ICM provides the register GTM0ICMIRQGMEI.

The error interrupt causing channel can be determined for the modules TIM by evaluating the ICM register GTM0ICMIRQGCEI1.

The error interrupt causing channel can be determined for MCS by evaluating the ICM register GTM0ICMIRQGCEI3.

### 25.6.5.1 Level interrupt mode

The default interrupt mode is the Level Interrupt Mode. In this mode each occurred interrupt event is collected in the register IRQ_NOTIFY, independent of the corresponding enable bit of register IRQ_EN and EIRQ_EN.

An interrupt event, which is defined as a pulse on the signal Int_out of **Figure 25.9** , may be triggered by the interrupt source of the submodule or by software performing a write access to the corresponding register IRQ_FORCINT, with a disabled bit RF_PROT in register GTM0GTMCTRL.

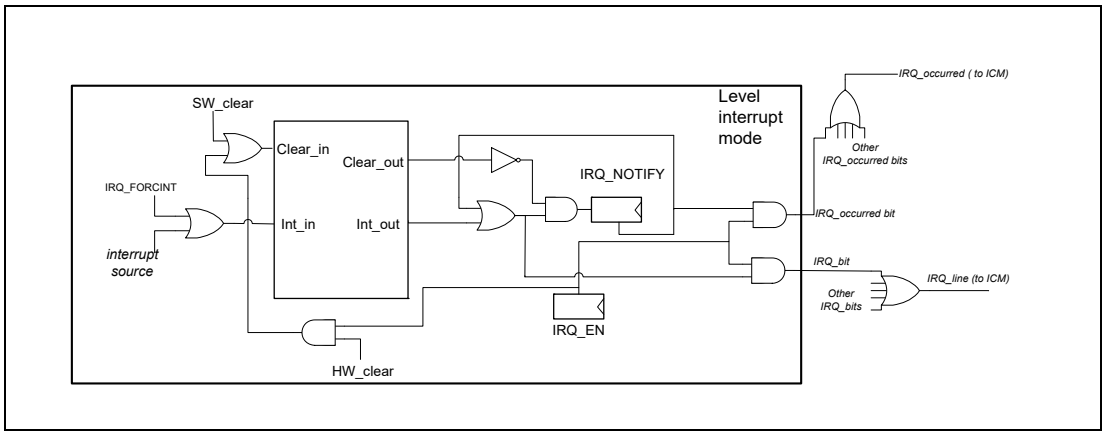

**Figure 25.9 Level interrupt mode scheme**

A collected interrupt bit in register IRQ_NOTIFY may be cleared by a clear event, which is defined as a pulse on signal Clear_out of **Figure 25.9**. A clear event can be performed with a write access with value '1' to the corresponding bit in the register IRQ_NOTIFY leading to a pulse on signals SW_clear. A clear event may also result from an externally connected signal GTM_<MOD>_IRQ_CLR, which is routed to the signal HW_clear of **Figure 25.9**. However, the hardware clear mechanism is only possible, if the corresponding interrupt is enabled by register IRQ_EN.

As the **Table 25.12** shows, interrupt events are dominant in the case of a simultaneous interrupt event and clear event.

**Table 25.12 Priority of Interrupt Events and Clear Events**

| Int_in | Clear_in | Int_out | Clear_out |
|---|---|---|---|
| 0 | 0 | 0 | 0 |
| 0 | 1 | 0 | 1 |
| 1 | 0 | 1 | 0 |
| 1 | 1 | 1 | 0 |

As it can be seen from the **Figure 25.9** an occurred interrupt event is signalled as a constant signal level with value 1 to the signal IRQ_bit, if the corresponding interrupt is enabled in register IRQ_EN.

With exception of the submodules ARU and DPLL, the signal IRQ_bit is OR-combined with the neighboring IRQ_bit signals of the same interrupt set and they are routed as a signal IRQ_line to the interrupt concentrator module (ICM). The interrupt signals IRQ_bit of the submodules DPLL and ARU are routed directly as a signal IRQ_line to the submodule ICM. In some cases (submodules TOM and ATOM) the ICM may further OR-combine several IRQ_line signals to an outgoing interrupt signal GTM_<MOD>_IRQ. In the other cases the IRQ_line signals are directly connected to the outgoing signals GTM_<MOD>_IRQ, within the submodule ICM.

The signal IRQ_occurred is connected in a similar way as the signal IRQ_line, however this signal is used for monitoring the interrupt state of the register IRQ_NOTIFY in the registers of the ICM.

The additional error interrupt enable mechanism for level interrupt is shown below.

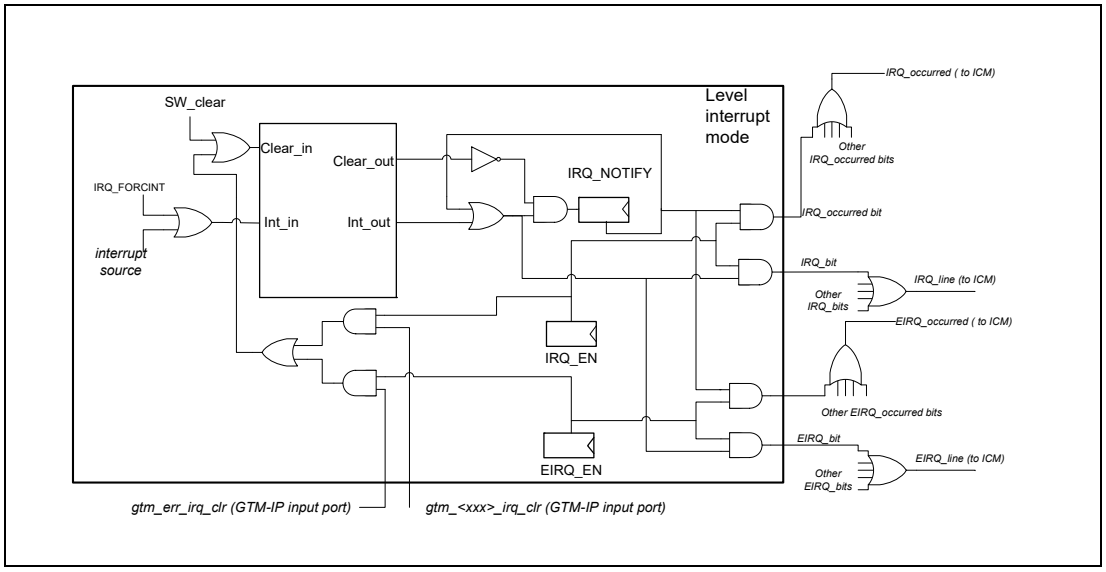

**Figure 25.10 Level interrupt scheme for modules AEI-bridge, TIM, MCS, CMP**

A collected interrupt bit in register IRQ_NOTIFY may be cleared by a clear event, which is defined as a pulse on signal Clear_out of **Figure 25.10**. A clear event can be performed with a write access with value '1' to the corresponding bit in the register IRQ_NOTIFY leading to a pulse on signals SW_clear. A clear event may also result from externally connected signal gtm_<MOD>_irq_clr or gtm_err_irq_clr, which is routed as a HW_clear to Clear_in of **Figure 25.10**. However, the hardware clear mechanism is only possible, if the corresponding interrupt or error interrupt is enabled by register IRQ_EN or EIRQ_EN.

As it can be seen from the **Figure 25.10** an occurred interrupt event is signalled as a constant signal level with value 1 to the signal IRQ_bit, if the corresponding interrupt is enabled in register IRQ_EN.

### 25.6.5.2 Pulse interrupt mode

The Pulse interrupt mode behavior can be observed from **Figure 25.11**.

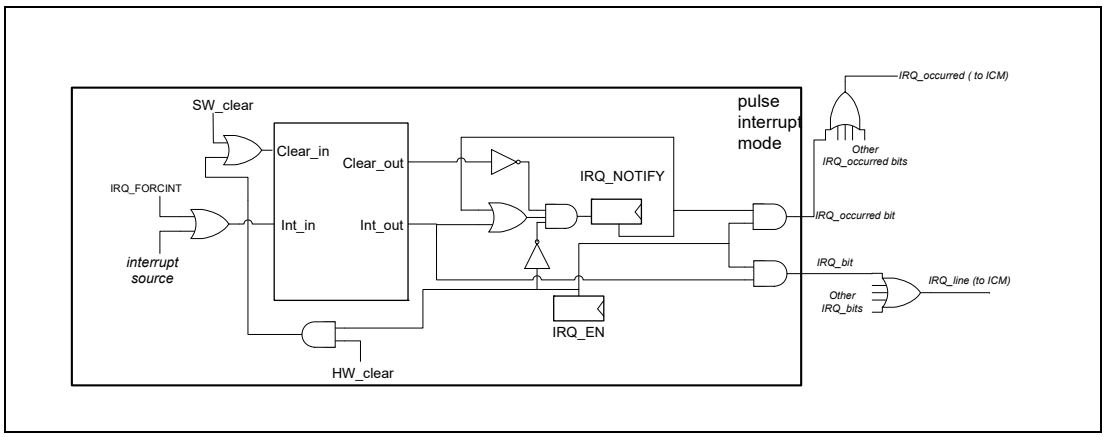

**Figure 25.11 Pulse interrupt mode scheme**

In Pulse Interrupt Mode each Interrupt Event will generate a pulse on the IRQ_bit signal if IRQ_EN is enabled.

As it can be seen from the figure, the interrupt bit in IRQ_NOTIFY register is always cleared if IRQ_EN is enabled.

However, if an interrupt is disabled in the register IRQ_EN, an occurred interrupt event is captured in the register IRQ_NOTIFY, in order to allow polling for disabled interrupts by software.

Disabled interrupts may be cleared by an interrupt clear event.

In Pulse interrupt mode, the signal IRQ_occurred is always 0.

The additional error interrupt enable mechanism for pulse interrupt is shown below.

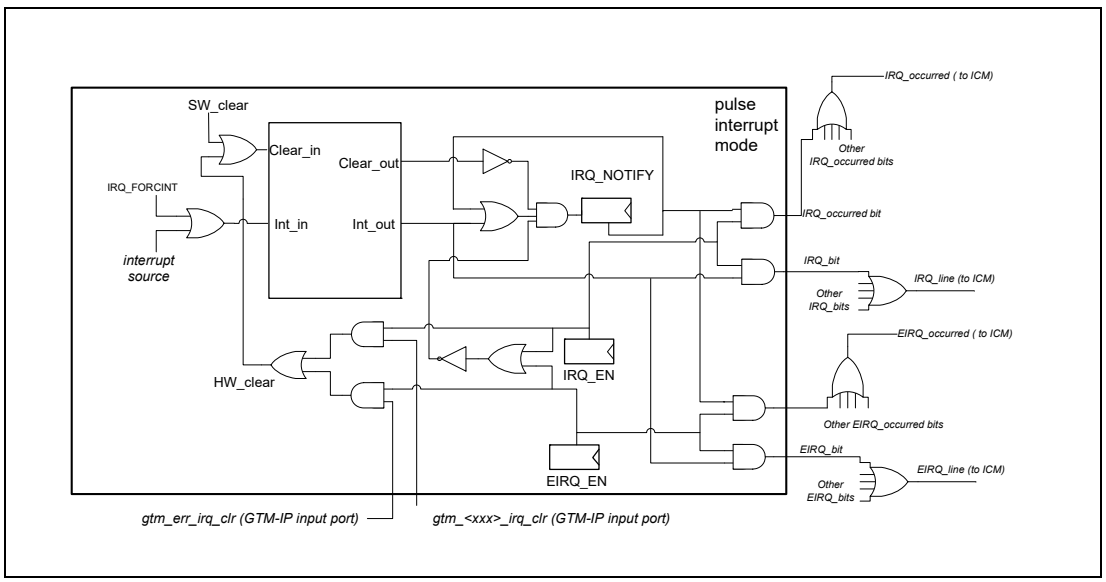

**Figure 25.12 Pulse interrupt scheme for modules AEI-bridge, TIM, MCS, CMP**

In Pulse Interrupt Mode each Interrupt Event will generate a pulse on the EIRQ_bit signal if EIRQ_EN is enabled.

As it can be seen from the figure, the interrupt bit in IRQ_NOTIFY register is always cleared if EIRQ_EN or IRQ_EN are enabled.

However, if an error interrupt is disabled in the register EIRQ_EN, an occurred error interrupt event is captured in the register IRQ_NOTIFY, in order to allow polling for disabled error interrupts by software.

Disabled error interrupts may be cleared by an error interrupt clear event.

In Pulse interrupt mode, the signal EIRQ_occurred is always 0.

### 25.6.5.3 Pulse-notify interrupt mode

In Pulse-notify Interrupt mode, all interrupt events are captured in the register IRQ_NOTIFY. If an interrupt is enabled by the register IRQ_EN, each interrupt event will also generate a pulse on the IRQ_bit signal. The signal IRQ_occurred will be high if interrupt is enabled in register IRQ_EN and the corresponding bit of register IRQ_NOTIFY is set. The Pulse-notify interrupt mode is shown in **Figure 25.13**.

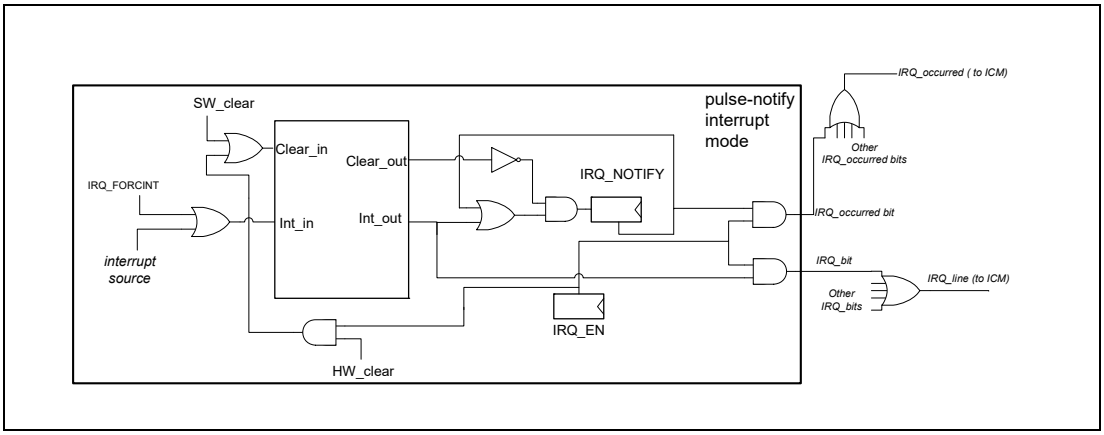

**Figure 25.13 Pulse-notify interrupt mode scheme**

The additional error interrupt enable mechanism for pulse-notify interrupt is shown below

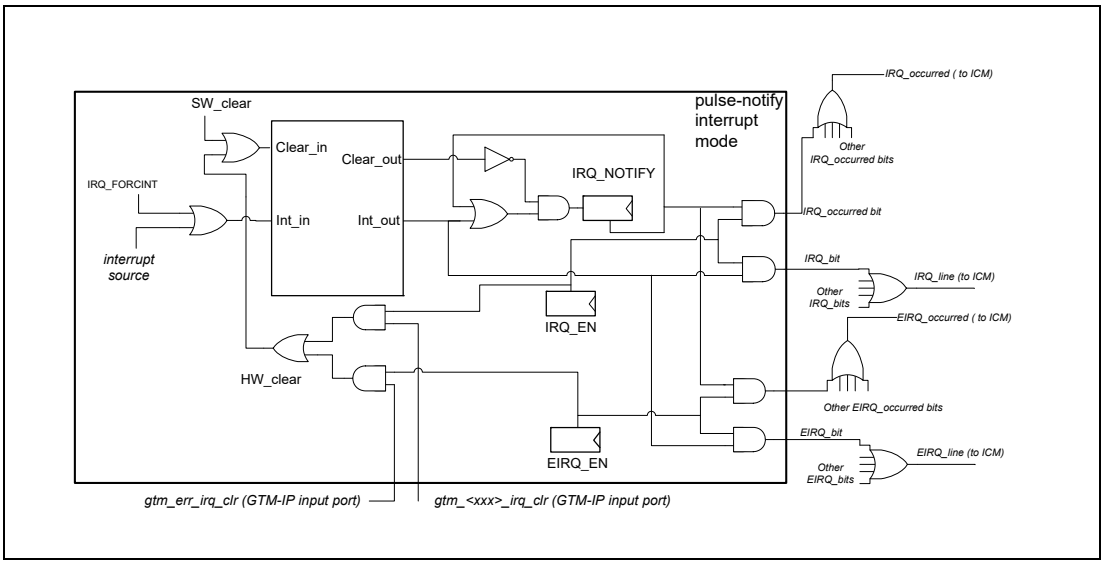

**Figure 25.14 Pulse-notify interrupt scheme for modules AEI-bridge, TIM, MCS, CMP**

In Pulse-notify Interrupt mode, all error interrupt events are captured in the register IRQ_NOTIFY. If an error interrupt is enabled by the register EIRQ_EN, each error interrupt event will also generate a pulse on the EIRQ_bit signal. The signal EIRQ_occurred will be high if error interrupt is enabled in register EIRQ_EN and the corresponding bit of register IRQ_NOTIFY is set. The Pulse-notify interrupt mode for error interrupts is shown in **Figure 25.14**.

### 25.6.5.4 Single-pulse interrupt mode

In Single-pulse Interrupt Mode, an interrupt event is always captured in the register IRQ_NOTIFY, independent of the state of IRQ_EN. However, only the first interrupt event of an enabled interrupt within a common interrupt set is forwarded to signal IRQ_line. Additional interrupt events of the same interrupt set cannot generate pulses on the signal IRQ_line, until the corresponding bits in register IRQ_NOTIFY of enabled interrupts are cleared by a clear event. The IRQ_occurred signal line will be high, if the IRQ_EN and the IRQ_NOTIFY register bits are set. The Single-pulse interrupt mode is shown in **Figure 25.15**.

The only exceptions are the modules ARU and DPLL. In these modules the IRQ_occurred bit of each interrupt is directly connected (without OR-conjunction of neighboring IRQ_occurred bits) to the inverter for suppressing further interrupt pulses.

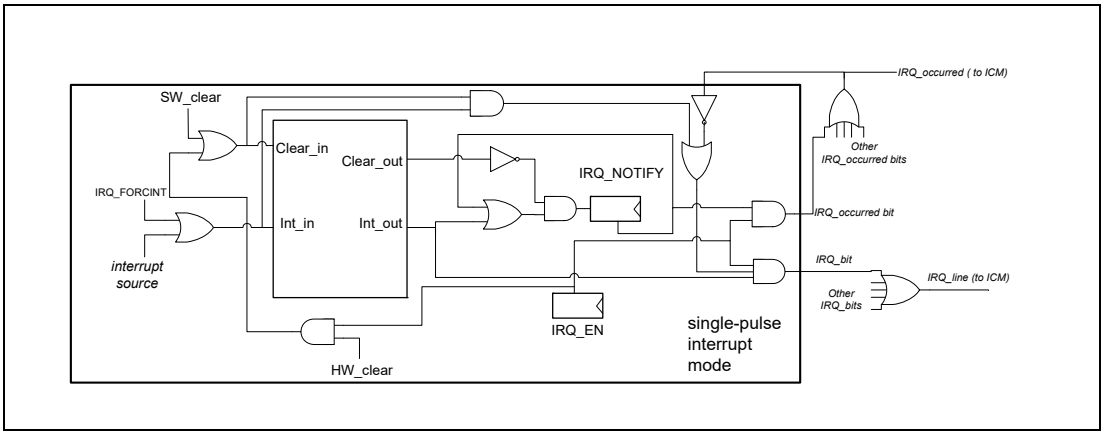

**Figure 25.15 Single-pulse interrupt mode scheme**

To avoid unexpected IRQ behavior in the single pulse mode, all desired interrupt sources should be enabled by a single write access to IRQ_EN and the notification bits should be cleared by a single write access to the register IRQ_NOTIFY.

The additional error interrupt enable mechanism for single-pulse interrupt is shown below

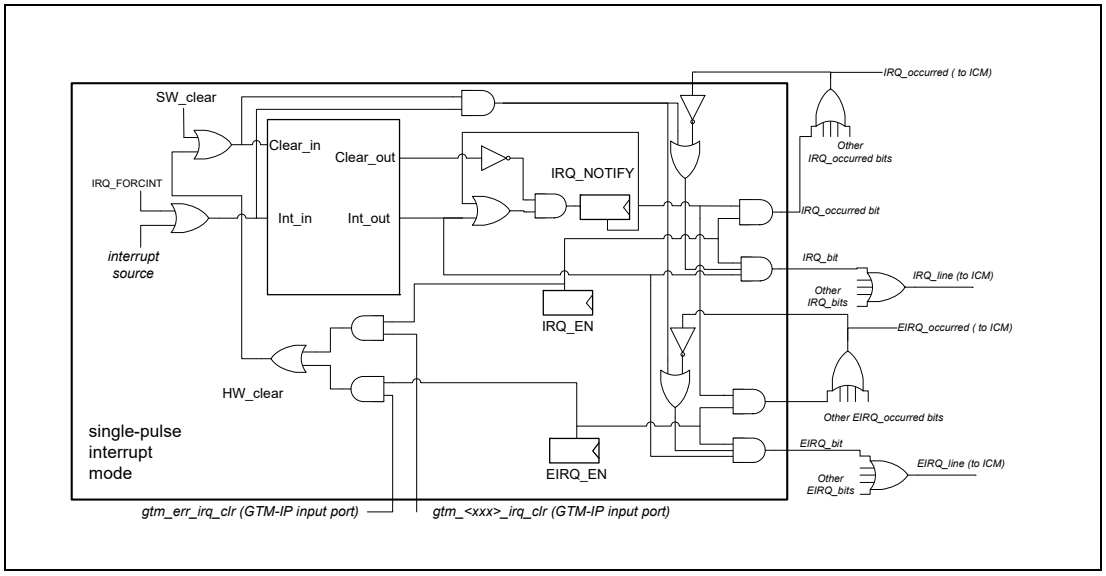

**Figure 25.16 Single-pulse interrupt scheme for modules AEI-bridge, TIM, MCS, CMP**

In Single-pulse Interrupt Mode, an error interrupt event is always captured in the register IRQ_NOTIFY, independent of the state of EIRQ_EN. However, only the first error interrupt event of an enabled error interrupt within a common error interrupt set is forwarded to signal EIRQ_line. Additional error interrupt events of the same error interrupt set cannot generate pulses on the signal EIRQ_line, until the corresponding bits in register IRQ_NOTIFY of enabled error interrupts are cleared by a clear event. The EIRQ_occurred signal line will be high, if the EIRQ_EN and the IRQ_NOTIFY register bits are set. The Single-pulse interrupt mode for error interrupts is shown in **Figure 25.16**.

To avoid unexpected EIRQ behavior in the single pulse mode, all desired error interrupt sources should be enabled by a single write access to EIRQ_EN and the notification bits should be cleared by a single write access to the register IRQ_NOTIFY.

An exception is the module ARU.

In this module the EIRQ_occurred bit of each error interrupt is directly connected (without OR-conjunction of neighboring EIRQ_occurred bits) to the inverter for suppressing further error interrupt pulses.

### 25.6.5.5 GTM-IP Interrupt concentration method

Because of the grouping of interrupts inside the ICM, it can be necessary for the software to access the ICM submodule first to determine the interrupt set that is responsible for an interrupt. A second access to the responsible register IRQ_NOTIFY is then necessary to identify the interrupt source, serve it and to reset the interrupt flag in register IRQ_NOTIFY afterwards. The interrupt flags are never reset by an access to the ICM. For a detailed description of the ICM submodule see **Section 25.15, Interrupt Concentrator Module (ICM)** .

## 25.6.6 GTM-IP Software Debugger Support

For software debugger support the GTM-IP comes with several features. E.g. status register bits must not be altered by a read access from a software debugger. To avoid this behavior to reset a status register bit by software, the CPU has to write a '1' explicitly to the register bit to reset its content.

The **Table 25.13** describes the behavior of some GTM-IP registers with special functionality on behalf of read accesses from the AEI bus interface.

### 25.6.6.1 Register behavior in case of Software Debugger accesses

**Table 25.13 Register behavior in case of Software Debugger accesses**

| Module | Register | Description |
|---|---|---|
| TIM | GTM0TIMixGPR0/1 | The overflow bit is not altered in case of a Debugger read access to this registers. |
| ATOM | GTM0ATOMixSR0/1 | In SOMC mode a read access to this register by the Debugger does not release the channel for a new compare/match event. |

Further on, some important states inside the GTM-IP submodule have to be signalled to the outside world, when reached and should for example trigger the software debugger to stop program execution. For this internal state signalling see the GTM-IP module integration guide.

The GTM provides an external signal gtm_halt, which disables clock signal SYS_CLK for debugging purposes. If SYS_CLK is disabled, a connected debugger can read any GTM related register and the GTM internal RAMs using AEI. Moreover, the debugger can also perform write accesses to the internal RAMs and to all GTM related registers in order to enable advanced debugging features (e.g. modifications of register contents in single step mode).

## 25.6.7 GTM-IP Programming conventions

To serve different application domains the GTM-IP is a highly configurable module with many configuration modes. In principle the submodules of the GTM-IP are intended to be configured at system start-up to fulfil certain functionality for the application domain the microcontroller runs in.

For example, a TIM input channel can be used to monitor an application specific external signal, and this signal has to be filtered. Therefore, the configuration of the TIM channel filter mode will be specific to the external signal characteristic. While it can be necessary to adapt the filter thresholds during runtime an adaptation of the filter mode during runtime is not reasonable. Thus, the change of the filter mode during runtime can lead to an unexpected behavior.

In general, the programmer has to be careful when reprogramming configuration registers of the GTM-IP submodules during runtime. It is recommended to disable the channels before reconfiguration takes place to avoid unexpected behavior of the GTM-IP.

### 25.6.8 GTM-IP TOP-Level Configuration Registers Overview

GTM-IP TOP-level contains following configuration registers:

**Table 25.14 Register list**

| Symbol | Register Name | Details in Section |
|---|---|---|
| GTM0GTMREV | GTM-IP Version control register | **25.6.9.1** |
| GTM0GTMRST | GTM-IP Global reset register | **25.6.9.2** |
| GTM0GTMCTRL | GTM-IP Global control register | **25.6.9.3** |
| GTM0GTMAEIADDRXPT | GTM-IP AEI Timeout exception address register | **25.6.9.4** |
| GTM0GTMIRQNOTIFY | GTM-IP Interrupt notification register | **25.6.9.5** |
| GTM0GTMIRQEN | GTM-IP Interrupt enable register | **25.6.9.6** |
| GTM0GTMEIRQEN | GTM-IP Error interrupt enable register | **25.6.9.12** |
| GTM0GTMIRQFORCINT | GTM-IP Software interrupt generation register | **25.6.9.7** |
| GTM0GTMIRQMODE | GTM-IP top level interrupts mode selection. Please note that this mode selection is only valid for the three interrupts described in **Section 25.6.9.5, GTM0GTMIRQNOTIFY** | **25.6.9.8** |
| GTM0GTMTIMiAUXINSRC (i = 0, 1) | GTM-IP TIM[i] module AUX_IN source selection register | **25.6.9.13** |
| GTM0GTMHWCONF | GTM-IP Hardware Configuration | **25.6.9.14** |
| GTM0GTMATOMiOUT (i = 0, 2) | GTM-IP ATOM output level | **25.6.9.15** |
| GTM0GTMEXTCAPENi (i = 0, 1) | GTM-IP trigger event forwarding in from TIM[i] and TIM[i+1] to MCS instance [i]. | **25.6.9.16** |

## 25.6.9 GTM-IP TOP-Level Configuration Registers Description

### 25.6.9.1 GTM0GTMREV

**Access:** This register can be read in 32-bit units.

**Address:** <GTM_base> + $00000_H$

**Value after reset:** Undefined

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DEV_CODE2 | | | | DEV_CODE1 | | | | DEV_CODE0 | | | | MAJOR | | | |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | MINOR | | | | NO | | | | STEP | | | | | | | |
| Value after reset | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.15 GTM0GTMREV Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | DEV_CODE2 | Device encoding digit 2. |
| 27 to 24 | DEV_CODE1 | Device encoding digit 1. |
| 23 to 20 | DEV_CODE0 | Device encoding digit 0. |
| 19 to 16 | MAJOR | Major version number<br>Define major version number of GTM-IP specification. |
| 15 to 12 | MINOR | Minor version number<br>Define minor version number of GTM-IP specification. |
| 11 to 8 | NO | Delivery number<br>Define delivery number of GTM-IP specification. |
| 7 to 0 | STEP | Release step<br>GTM Release step. |

**NOTES**

1. The numbers are encoded in BCD. Values “A” – “F” are characters.
2. See **Section 25.18.3.1, GTM0GTMREV** and **Section 25.19.3.1, GTM0GTMREV** for reset value.

### 25.6.9.2 GTM0GTMRST

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00004_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | RST |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 25.16 GTM0GTMRST Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 7 to 0 | STEP | GTM-IP Reset<br>0: No reset action<br>1: Initiate reset action for all submodules<br>**NOTES**<br>1. This bit is automatically cleared by hardware after it was written. Therefore, the register is always read as zero (0) by the software.<br>2. This bit is write protected by bit RF_PROT of **Section 25.6.9.3, GTM0GTMCTRL** |

### 25.6.9.3 GTM0GTMCTRL

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00008_H$

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | TO_VAL | | | | | — | — | TO_MODE | RF_PROT |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R | R | R/W | R/W |

**Table 25.17 GTM0GTMCTRL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 8 to 4 | TO_VAL | AEI timeout value.<br>These bits define the number of cycles after which a timeout event occurs. When TO_VAL equals zero (0) the AEI timeout functionality is disabled. |
| 3, 2 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 1 | TO_MODE | AEI timeout mode.<br>0: Observe: If timeout_counter=0 the address and rw signal in addition with timeout flag will be stored to the GTM0GTMAEIADDRXPT register. Following timeout_counter=0 accesses will not overwrite the first entry in the aei_addr_timeout register. Clearing the timeout flag/aei_status error_code will reenable the storing of a next faulty access.<br>1: Abort: In addition to observe mode the pending access will be aborted by signalling an illegal module access on aei_status and sending ready. In case of a read deliver as data 0 by serving of next AEI accesses. |
| 0 | RF_PROT | RST and FORCINT protection.<br>0: SW RST (global), SW interrupt FORCINT, and SW RAM reset functionality is enabled<br>1: SW RST (global), SW interrupt FORCINT, and SW RAM reset functionality is disabled |

### 25.6.9.4 GTM0GTMAEIADDRXPT

**Access:** This register can be read in 32-bit units.

**Address:** <GTM_base> + $0000C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | TO_W1R0 | TO_ADDR | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | TO_ADDR | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.18 GTM0GTMAEIADDRXPT Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 9 | Reserved | These bits are always read as 0 |
| 20 | TO_W1R0 | AEI timeout Read/Write flag.<br>This bit defines the AEI Read/Write flag for which the AEI timeout event occurred. |
| 19 to 0 | TO_ADDR | AEI timeout address.<br>This bit field defines the AEI address for which the AEI timeout event occurred. |

### 25.6.9.5 GTM0GTMIRQNOTIFY

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00010_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.23 GTM0GTMBRIDGEMODE Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | BUFF_DPT | Buffer depth of AEI bridge.<br>Signals the buffer depth of the GTM AEI bridge implementation.<br>**NOTE**<br>Reset value depends on the hardware configuration chosen by silicon vendor. For detail, see **Section 25.18.4.1, GTM0GTMBRIDGEMODE**, or **Section 25.19.4.1, GTM0GTMBRIDGEMODE**. |
| 23 to 17 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 16 | BRG_RST | Bridge software reset.<br>0: No bridge reset request.<br>1: Bridge reset request.<br>**NOTE**<br>This bit is cleared automatically after write. |
| 15 to 13 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 12 | SYNC_INPUT_REG | Additional pipelined stage in synchronous bridge mode<br>0: No additional pipelined stage implemented.<br>1: Additional pipelined stage implemented. All accesses in synchronous mode will be increased by one clock cycle.<br>**NOTE**<br>Reset value depends on the hardware configuration chosen by silicon vendor. For detail, see **Section 25.18.4.1, GTM0GTMBRIDGEMODE**, or **Section 25.19.4.1, GTM0GTMBRIDGEMODE**. |
| 11, 10 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 9 | BUFF_OVL | Buffer overflow register.<br>0: No buffer overflow occurred.<br>1: Buffer overflow occurred.<br>A buffer overflow can occur while multiple aborts are issued by the external bus or a pipelined instruction is started while FBC = 0 (see GTM0GTMBRIDGEPTR1 register). |
| 8 | MODE_UP_PGR | Mode update in progress.<br>0: No update in progress.<br>1: Update in progress. |

**Table 25.23 GTM0GTMBRIDGEMODE Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 7 to 2 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 1 | MSK_WR_RSP | Mask write response.<br>0: Do not mask the write response<br>1: Mask write response |
| 0 | BRG_MODE | Defines the operation mode for the AEI bridge.<br>0: AEI bridge operates in sync_bridge mode<br>1: AEI bridge operates in async_bridge mode<br>**NOTE**<br>Reset value depends on the hardware configuration chosen by silicon vendor. For detail, see **Section 25.18.4.1, GTM0GTMBRIDGEMODE**, or **Section 25.19.4.1, GTM0GTMBRIDGEMODE**. |

### 25.6.9.10 GTM0GTMBRIDGEPTR1

**Access:** This register can be read in 32-bit units.

**Address:** <GTM_base> + $00034_H$

**Value after reset:** $0xx0\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | RSP_TRAN_RDY | | | | | | FBC | | | | | | ABT_TRAN_PGR | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | – | – | – | – | – | – | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ABT_TRAN_PGR | TRAN_IN_PGR | | | | | FIRST_RSP_PTR | | | | | NEW_TRAN_PTR | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.24 GTM0GTMBRIDGEPTR1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 26 | RSP_TRAN_RDY | Response transactions ready.<br>Amount of ready response transactions. |
| 25 to 20 | FBC | Free buffer count.<br>Number of free buffer entries.<br>**NOTE**<br>Initial value depends on the hardware configuration chosen by silicon vendor. (see BUFF_DPT in GTM0GTMBRIDGEMODE register). |
| 19 to 15 | ABT_TRAN_PGR | Aborted transaction in progress pointer. |
| 14 to 10 | TRAN_IN_PGR | Transaction in progress pointer (acquire) |
| 9 to 5 | FIRST_RSP_PTR | First response pointer.<br>Signals the actual value of first response pointer. |
| 4 to 0 | NEW_TRAN_PTR | New transaction pointer.<br>Signals the actual value of the new transaction pointer. |

**NOTES**

1. This register operates on the AEI_CLK domain.
2. This register holds diagnosis information about the AEI bus bridge. Each access to the GTM_IP will update the defined pointer bit fields. Depending on the mode of GTM_MODE_BRIDGE (BRG_MODE, MSK_WR_RESP), the AEI protocol and operating frequency which is use, the 4 pointer bitfields will change at different clock cycles relative to the start of the transaction. This leads to the fact that reading the register can show values not equal to the defined Initial Value, even directly after a write to GTM0GTMBRIDGEMODE with BRG_RST = 1 was done.

### 25.6.9.11 GTM0GTMBRIDGEPTR2

**Access:** This register can be read in 32-bit units.

**Address:** <GTM_base> + $00038_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

## 25.7 Advanced Routing Unit (ARU)

### 25.7.1 Overview

The Advanced Routing Unit (ARU) is a flexible infrastructure component for transferring 53 bit wide data (five control bits and two 24 bit values) between several submodules of the GTM core in a configurable manner.

Since the concept of the ARU has already been described in **Section 25.6.3, ARU Routing Concept**, this section only describes additional ARU features that can be used by the software for configuring and debugging ARU related data streams.

Also the definition of ‘streams’ and ‘channels’ in the ARU context is done in **Section 25.6.3, ARU Routing Concept**.

### 25.7.2 Special Data Sources

Besides the addresses of the submodule related data sources as described in **Table 25.204, ARU Write Address Overview**, **Table 25.211, ARU Write Address Overview**, the ARU provides two special data sources that can be used for the configuration of data streams. These data sources are defined as follows:

Address $1FF_H$: Data source that provides always a 53 bit data word with zeros. A read access to this memory location will never block a requesting data destination.

Address $1FE_H$: Data source that never provides a data word. A read access to this memory location will always block a requesting data destination. This is the reset value of the read registers inside the data destinations.

Address $000_H$: This address is reserved and can be used to bring data through the ARU registers GTM0ARUDATAH and GTM0ARUDATAL into the system by writing the write address $000_H$ into the GTM0ARUACCESS register. This means that software test data can be brought into the GTM-IP by the CPU.

### 25.7.3 ARU Access via AEI

Besides the data transfer between the connected submodules, there are two possibilities to access ARU data via the AEI.

#### 25.7.3.1 Default ARU Access

The default ARU access incorporates the registers GTM0ARUACCESS, which is used for initiation of a read or write request and the registers GTM0ARUDATAH and GTM0ARUDATAL that provide the ARU data word to be transferred.

The status of a read or write transfer can be determined by polling specific bits in register GTM0ARUACCESS. Furthermore the acc_ack bit in the interrupt notify register is set after the read or write access is performed to avoid data loss e.g. on access cancelation.

A pending read or write request may also be cancelled by clearing the associated bit.

In the case of a read request, the AEI access behaves as a read request initiated by a data destination of a module. The read request is served by the ARU immediately when no other destination has a pending read request. This means, that an AEI read access does not take part in the scheduling of the destination channels and that the time between two consecutive read accesses is not limited by the round trip time.

On the other hand, the AEI access has the lowest priority behind the ARU scheduler that serves the destination channels. Thus, in worst case, the read request is served after one round trip of the ARU, when all destination channels would request data at the same point in time.

In the case of the write request, the ARU provides the write data at the address defined by the ADDR bit field inside the GTM0ARUACCESS register.

To avoid data loss, the reserved ARU address $0_H$ has to be used to bring data into the system. Otherwise, in case the address specified inside the ADDR bit field is defined for another submodule that acts as a source at the ARU data loss may occur and no deterministic behavior is guaranteed.

This is because the regular source submodule is not aware that its address is used by the ARU itself to provide data to a destination.

It is guaranteed that the ARU write data is send to the destination in case of both modules want to provide data at the same time.

Configuring both read and write request bits results in a read request, if the write request bit inside the register isn't already set. The read request bit will be set but not the write request bit. The following table describes the important cases of the bit 12 (RREQ) and bit 13 (WREQ) of the GTM0ARUACCESS register:

**Table 25.31 ARU Access**

| AEI write access : aei_wdata (13:12) | Actual value of GTM0ARUACCESS (13:12) | Next value of GTM0ARUACCESS (13:12) | Comment |
|---|---|---|---|
| 0 0 | 0 1 | 0 0 | Cancel read request |
| 0 0 | 1 0 | 0 0 | Cancel write request |
| 0 1 | 1 0 | 1 0 | Unchanged register |
| 1 0 | 0 1 | 0 1 | Unchanged register |
| 1 1 | 0 0 | 0 1 | Both read and write request results in a read request |
| 1 1 | 1 0 | 1 0 | As before but WREQ bit is already set → unchanged register |

### 25.7.3.2 Debug Access

The debug access mode enables to inspect routed data of configured data streams during runtime.

The ARU provides two independent debug channels, whereas each is configured by a dedicated ARU read address in register GTM0ARUDBGACCESS0 and GTM0ARUDBGACCESS1 respectively.

The registers GTM0ARUDBGDATA0H and GTM0ARUDBGDATA0L (GTM0ARUDBGDATA1H and GTM0ARUDBGDATA1L) provide read access to the latest data word that the corresponding data source sent through the ARU.

Any time when data is transferred through the ARU from a data source to the destination requesting the data the interrupt signal ARU_NEW_DATA0_IRQ (ARU_NEW_DATA1_IRQ) is raised.

For advanced debugging purposes, the interrupt signal can also be triggered by software using the register GTM0ARUIRQFORCINT.

Please note, that the debug mechanism should not be used by the application, when a HW-Debugger is used to trace the ARU communication. In that case, the debug registers are used by the HW-Debugger to specify the ARU streams that should be traced.

### 25.7.4 ARU Interrupt Signals

The following table describes ARU interrupt signals:

**Table 25.32 ARU Interrupt Signals**

| Signal | Description |
|---|---|
| ARU_NEW_DATA0_IRQ | Indicates that data is transferred through the ARU using debug channel GTM0ARUDBGACCESS0. |
| ARU_NEW_DATA1_IRQ | Indicates that data is transferred through the ARU using debug channel GTM0ARUDBGACCESS1. |
| ACC_ACK_IRQ | ARU access acknowledge IRQ. |

### 25.7.5 ARU Configuration Registers Overview

The following table shows a conclusion of configuration registers address offsets and initial values.

**Table 25.33 Register List**

| Symbol | Register Name | Details in Section |
|---|---|---|
| GTM0ARUACCESS | ARU access register | **25.7.6.1** |
| GTM0ARUDATAH | ARU access register upper data word | **25.7.6.2** |
| GTM0ARUDATAL | ARU access register lower data word | **25.7.6.3** |
| GTM0ARUDBGACCESS0 | Debug access channel 0 | **25.7.6.4** |
| GTM0ARUDBGDATA0H | Debug access 0 transfer register upper data word | **25.7.6.5** |
| GTM0ARUDBGDATA0L | Debug access 0 transfer register lower data word | **25.7.6.6** |
| GTM0ARUDBGACCESS1 | Debug access channel 0 | **25.7.6.7** |
| GTM0ARUDBGDATA1H | Debug access 1 transfer register upper data word | **25.7.6.8** |
| GTM0ARUDBGDATA1L | Debug access 1 transfer register lower data word | **25.7.6.9** |
| GTM0ARUIRQNOTIFY | ARU Interrupt notification register | **25.7.6.10** |
| GTM0ARUIRQEN | ARU Interrupt enable register | **25.7.6.11** |
| GTM0ARUIRQFORCINT | Register for forcing the ARU_NEW_DATA_IRQ interrupt | **25.7.6.12** |
| GTM0ARUIRQMODE | IRQ mode configuration register | **25.7.6.13** |
| GTM0ARUCADDREND | ARU caddr counter end value | **25.7.6.14** |

## 25.7.6 ARU Configuration Registers Description

### 25.7.6.1 GTM0ARUACCESS

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00280_H$

**Value after reset:** 0000 $01FE_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | WREQ | RREQ | — | — | — | ADDR | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 |
| R/W | R | R | R/W | R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.34 GTM0ARUACCESS Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 14 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 13 | WREQ | Initiate write request<br>0: No write request is pending<br>1: Mark data in registers GTM0ARUDATAH and GTM0ARUDATAL as valid<br>**NOTES**<br>1. This bit is cleared automatically after transaction. Moreover, it can be cleared by software to cancel a write request.<br>2. WREQ bit are only writable if RREQ bit is zero, so to switch from WREQ to RREQ a cancel request has to be performed before.<br>3. Configuring both RREQ and WREQ bits results in a read request, so WREQ bit will not be set<br>4. The data is provided at address ADDR. This address has to be programmed as the source address in the destination submodule channel. In worst case, the data is provided after one full ARU round trip. |
| 12 | RREQ | Initiate read request<br>0: No read request is pending<br>1: Set read request to source channel addressed by ADDR<br>**NOTES**<br>1. This bit is cleared automatically after transaction. Moreover, it can be cleared by software to cancel a read request.<br>2. RREQ bit are only writable if WREQ bit is zero, so to switch from RREQ to WREQ a cancel request has to be performed before.<br>3. Configuring both RREQ and WREQ bits results in a read request, so RREQ bit will be set if the WREQ bit of the register isn't already set.<br>4. The ARU read request on address ADDR is served immediately when no other destination has actually a read request when the RREQ bit is set by CPU. In a worst case scenario, the read request is served after one round trip of the ARU, but this is only the case when every destination channel issues a read request at consecutive points in time. |
| 11 to 9 | Reserved | These bits are always read as 0. When written, write the initial value. |

**Table 25.34 GTM0ARUACCESS Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 8 to 0 | ADDR | ARU address<br>Define the ARU address used for transferring data<br>**NOTES**<br>1. For an ARU write request, the preferred address $0_H$ have to be used.<br>2. A write request to the address $1FF_H$ (always full address) or $1FE_H$ (always empty address) are ignored and doesn't have any effect.<br>3. ARU address bits ADDR are only writable if RREQ and WREQ bits are zero |

**Note:** The register GTM0ARUACCESS can be used either for reading or for writing at the same point in time.

### 25.7.6.2 GTM0ARUDATAH

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00284_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | DATA | | | | | | | | | | | | |

| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.35 GTM0ARUDATAH Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 28 to 0 | DATA | Upper ARU data word<br>Transfer upper ARU data word addressed by ADDR. The data bits 24 to 52 of an ARU word are mapped to the data bits 0 to 28 of this register |

### 25.7.6.3 GTM0ARUDATAL

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00288_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | DATA | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | DATA | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.36 GTM0ARUDATAL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | These bits are always read as 0. |
| 28 to 0 | DATA | Lower ARU data word<br>**NOTES**<br>1. Transfer lower ARU data word addressed by ADDR. The data bits 0 to 23 of an ARU word are mapped to the data bits 0 to 23 of this register and the data bits 48 to 52 of an ARU word are mapped to the data bits 24 to 28 of this register when data is read by the CPU.<br>2. For writing data into the ARU by the CPU the bits 24 to 28 are not transferred to bit 48 to 52 of the ARU word. Only bits 0 to 23 are written to bits 0 to 23 of the ARU word. |

### 25.7.6.4 GTM0ARUDBGACCESS0

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $0028C_H$

**Value after reset:** $0000\ 01FE_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |

**Table 25.47 GTM0ARUCADDREND Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 7 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 6 to 0 | CADDR_END | Set end value of ARU caddr counter<br>**NOTES**<br>1. The ARU roundtrip counter aru_caddr runs from zero to caddr_end value.<br>2. Shorten the ARU roundtrip cycle by setting a smaller number than the defined reset value will cause that not all ARU-connected modules will be served.<br>3. Making the roundtrip cycle longer than the reset value would cause longer ARU roundtrip time and as a result some ARU-connected modules will not be served as fast as possible for this device.<br>4. The reset value is device-specific. For more information see **Section 25.18.3.2, GTM0ARUCADDREND** and **Section 25.19.3.2, GTM0ARUCADDREND**.<br>5. This bit is write protected by bit RF_PROT of register GTM0GTMCTRL. |

# 25.8 Clock Management Unit (CMU)

## 25.8.1 Overview

The Clock Management Unit (CMU) is responsible for clock generation of the counters and of the GTM-IP. The CMU generate different clock sources for the whole GTM-IP. **Figure 25.17** shows a block diagram of the CMU.

The Configurable Clock Generation (CFGU) subunit provides eight dedicated clock sources for the following GTM submodules: TIM, ATOM, TBU, and MON. Each instance of such a submodule can choose an arbitrary clock source, in order to specify wide-ranging time bases.

The clock source signals CMU_CLK[x] (x = 0 to 7) are implemented in form of enable signals for the corresponding registers, which means that the actual clock signal of all registers always use the SYS_CLK signal.

The four configurable clock signals CMU_CLK0, CMU_CLK1, CMU_CLK6 and CMU_CLK7 are connected to the TIM filter counters.

### 25.8.1.1 CMU Block Diagram

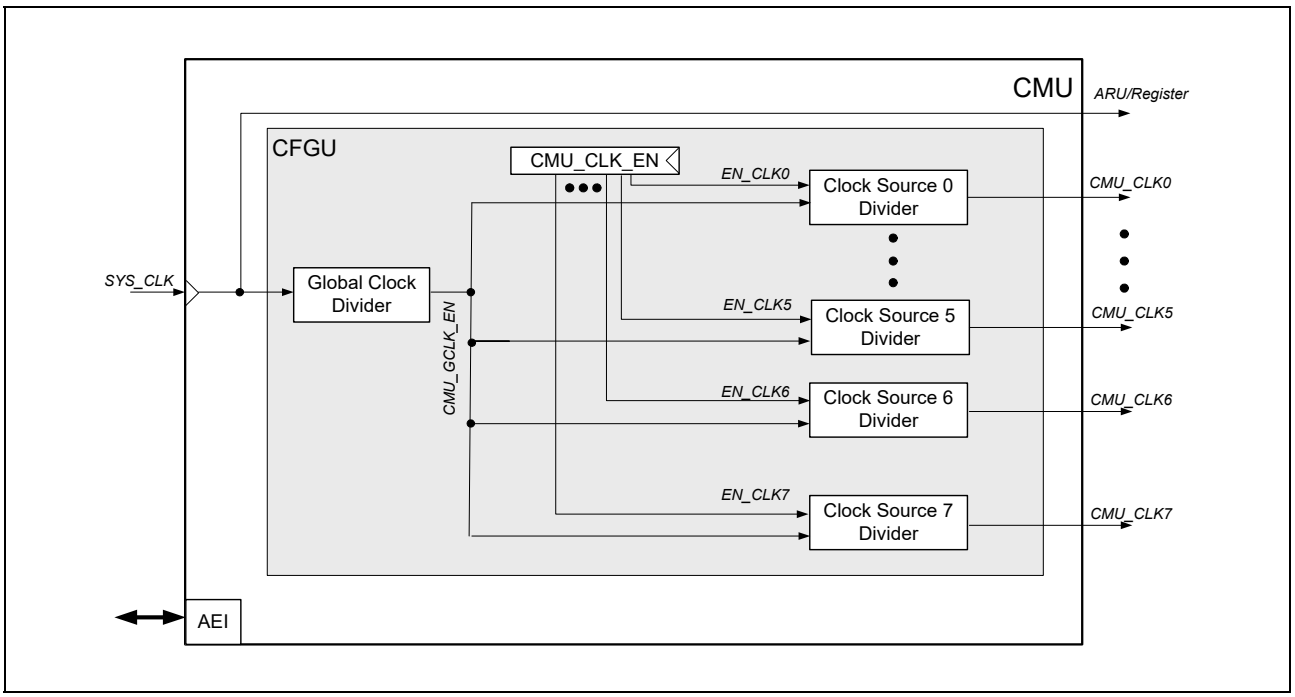

**Figure 25.17 CMU Block Diagram**

### 25.8.2 Global Clock Divider

The sub block Global Clock Divider can be used to divide the GTM-IP global input clock signal SYS_CLK into a common subdivided clock signal.

The divided clock signal of the sub block Global Clock Divider is implemented as an enable signal that enables dedicated clocks from the SYS_CLK signal to generate the user specified divided clock frequency.

The resulting fractional divider (Z/N) specified through equation:

$T_{CMU_GCLK_EN} = (Z/N)*T_{SYS_CLK}$

is implemented according the following algorithm

( Z: CMU_GCLK_NUM(23:0) ; N: GCLK_DEN(23:0) ; Z, N >0 ):

(1) Set remainder (R), operand1 (OP1) and operand2 (OP2) register during init-phase (with implicit conversion to signed):
R = Z, OP1 = N, OP2 = N-Z;

(2) After leaving init-phase (at least one CMU_CLK[x] has been enabled) the sign of remainder R for each SYS_CLK cycle will be checked:

(3) If R>0 keep updating remainder and keep CMU_GCLK_EN = ‘0’:
R = R-OP1;

(4) If R<0 update remainder and set CMU_GCLK_EN = ‘1’:
R = R-OP2;

After at most (Z/N+1) subtractions (3) there will be a negative R and an active phase of the generated clock enable (for one cycle) will be triggered (4). The remainder R is a measure for the distance to a real Z/N clock and will be regarded for the next generated clock enable cycle phase. The new R value will be R = R + (Z-N). In the worst case the remainder R will sum up to an additional cycle in the generated clock enable period after Z-cycles. In the other cases equally distributed additional cycles will be inserted for the generated clock enable. If Z is an integer multiple of N no additional cycles will be included for the generated clock enable at all.

Note that for a better resource sharing all arithmetic has been reduced to subtractions and the initialization of the remainder R uses the complement of (Z-N).

### 25.8.3 Configurable Clock Generation Subunit (CFGU)

The CMU subunit CFGU provides up to eight configurable clock divider blocks that divide the common CMU_GCLK_EN signal into dedicated enable signals for the GTM-IP sub blocks.

The configuration of the eight different clock signals CMU_CLK[x] (x: 0 to 7) always depends on the configuration of the global clock enable signal CMU_GCLK_EN. Additionally, each clock source has its own configuration data, provided by the control register GTM0CMUCLKxCTRL (x: 0 to 7).

According to the configuration of the Global Clock Divider, the configuration of the Clock Source x Divider is done by setting an appropriate value in the bit field CLK_CNT[x] of the register GTM0CMUCLKxCTRL.

The frequency fx =1/Tx of the corresponding clock enable signal CMU_CLK[x] can be determined by the unsigned representation of CLK_CNT[x] of the register GTM0CMUCLKxCTRL in the following way:

$T_{CMU_CLK[x]} = (CLK_CNT[x] + 1) * T_{CMU_GCLK_EN}$

The corresponding wave form is shown in **Figure 25.18**.

To avoid unexpected behavior of the hardware, the configuration of a register GTM0CMUCLKxCTRL can only be changed, when the corresponding clock signal CMU_CLK[x] is disabled.

Further, any changes to the registers GTM0CMUGCLKNUM and GTM0CMUGCLKDEN can only be performed, when all clock enable signals CMU_CLK[x] are disabled.

The clock source signals CMU_CLK[x] (x: 0 to 7) are implemented in form of enable signals for the corresponding registers, which means that the actual clock signal of all registers always use the SYS_CLK signal.

The hardware guarantees that all clock signals CMU_CLK[x], which were enabled simultaneous, are synchronized to each other. Simultaneous enabling does mean that the bits EN_CLK[x] in the register GTM0CMUCLKEN are set by the same write access.

### 25.8.4 Wave Form of Generated Clock Signal CMU_CLK[x]

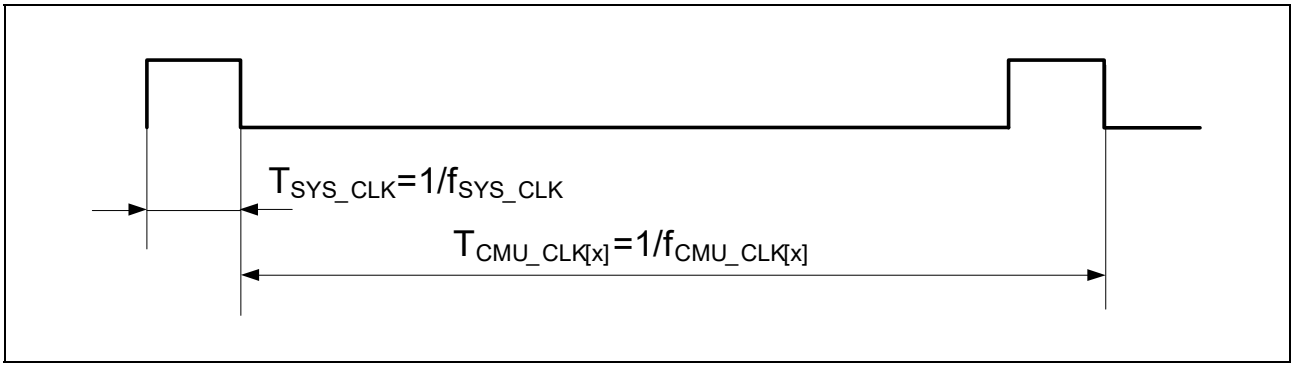

**Figure 25.18 Wave Form of Generated Clock Signal CMU_CLK[x]**

### 25.8.5 CMU Configuration Registers Overview

Following configuration registers are considered in CMU submodule:

**Table 25.48 Register List**

| Symbol | Register Name | Details in Section |
|---|---|---|
| GTM0CMUCLKEN | Clock enable | **25.8.6.1** |
| GTM0CMUGCLKNUM | Global clock control numerator | **25.8.6.2** |
| GTM0CMUGCLKDEN | Global clock control denominator | **25.8.6.3** |
| GTM0CMUCLK0CTRL | Control for clock source 0 | **25.8.6.4** |
| GTM0CMUCLK1CTRL | Control for clock source 1 | **25.8.6.4** |
| GTM0CMUCLK2CTRL | Control for clock source 2 | **25.8.6.4** |
| GTM0CMUCLK3CTRL | Control for clock source 3 | **25.8.6.4** |
| GTM0CMUCLK4CTRL | Control for clock source 4 | **25.8.6.4** |
| GTM0CMUCLK5CTRL | Control for clock source 5 | **25.8.6.4** |
| GTM0CMUCLK6CTRL | Control for clock source 6 | **25.8.6.4** |
| GTM0CMUCLK7CTRL | Control for clock source 7 | **25.8.6.4** |
| GTM0CMUGLBCTRL | Synchronizing ARU and clock source | **25.8.6.5** |

## 25.8.6 CMU Configuration Register Description

### 25.8.6.1 GTM0CMUCLKEN

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00300_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | EN_FXCLK | | EN_ECLK2 | | EN_ECLK1 | | EN_ECLK0 | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.49 GTM0CMUCLKEN Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 23, 22 | EN_FXCLK | Enable all CMU_FXCLK, see bits 1, 0<br>**NOTE**<br>EN_ECLK0-2 and EN_FXCLK not implemented for this device. Writing values unequal 0 will result in AEI_STATUS signal "10" |
| 21, 20 | EN_ECLK2 | Enable ECLK 2 generation subunit, see bits 1, 0 |
| 19, 18 | EN_ECLK1 | Enable ECLK 1 generation subunit, see bits 1, 0 |
| 17, 16 | EN_ECLK0 | Enable ECLK 0 generation subunit, see bits 1, 0 |
| 15, 14 | EN_CLK7 | Enable clock source 7, see bits 1, 0 |
| 13, 12 | EN_CLK6 | Enable clock source 6, see bits 1, 0 |
| 11, 10 | EN_CLK5 | Enable clock source 5, see bits 1, 0 |
| 9, 8 | EN_CLK4 | Enable clock source 4, see bits 1, 0 |
| 7, 6 | EN_CLK3 | Enable clock source 3, see bits 1, 0 |
| 5, 4 | EN_CLK2 | Enable clock source 2, see bits 1, 0 |
| 3, 2 | EN_CLK1 | Enable clock source 1, see bits 1, 0 |
| 1, 0 | EN_CLK0 | Enable clock source 0<br>00: Clock source is disabled (ignore write access)<br>01: Disable clock signal and reset internal states<br>10: Enable clock signal<br>11: Clock signal enabled (ignore write access)<br>**NOTES**<br>1. Any read access to an EN_CLK[x] bit field will always result in a value 00 or 11 indicating current state. A modification of the state is only performed with the values 01 and 10. Writing the values 00 and 11 is always ignored.<br>2. Any disabling to EN_CLK[x] will be reset internal counters for configurable clocks. |

### 25.8.6.2 GTM0CMUGCLKNUM

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00304_H$

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CMU_GCLK_NUM | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.50 GTM0CMUGCLKNUM Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 23 to 0 | CMU_GCLK_NUM | Numerator for global clock divider. Defines numerator of the fractional divider.<br>**NOTES**<br>1. Value can only be modified when all clock enables EN_CLK[x] are disabled.<br>2. The CMU hardware alters the content of GTM0CMUGCLKNUM and GTM0CMUGCLKDEN automatically to $1_H$, if GTM0CMUGCLKNUM is specified less than GTM0CMUGCLKDEN or one of the values is specified with a value zero. Thus, a secure way for altering the values is writing twice to the register GTM0CMUGCLKNUM followed by a single write to register GTM0CMUGCLKDEN. |

### 25.8.6.3 GTM0CMUGCLKDEN

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00308_H$

**Value after reset:** $0000\ 0001_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | GCLK_DEN | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GCLK_DEN | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.51 GTM0CMUGCLKDEN Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 23 to 0 | GCLK_DEN | Denominator for global clock divider. Defines denominator of the fractional divider<br>**NOTES**<br>1. Value can only be modified when all clock enables EN_CLK[x] are disabled.<br>2. The CMU hardware alters the content of GTM0CMUGCLKNUM and GTM0CMUGCLKDEN automatically to 0x1, if GTM0CMUGCLKNUM is specified less than GTM0CMUGCLKDEN or one of the values is specified with a value zero. Thus, a secure way for altering the values is writing twice to the register GTM0CMUGCLKNUM followed by a single write to register GTM0CMUGCLKDEN. |

### 25.8.6.4 GTM0CMUCLKxCTRL (x = 0 to 7)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0CMUCLK0CTRL: <GTM_base> + $0030C_H$
GTM0CMUCLK1CTRL: <GTM_base> + $00310_H$
GTM0CMUCLK2CTRL: <GTM_base> + $00314_H$
GTM0CMUCLK3CTRL: <GTM_base> + $00318_H$
GTM0CMUCLK4CTRL: <GTM_base> + $0031C_H$
GTM0CMUCLK5CTRL: <GTM_base> + $00320_H$
GTM0CMUCLK6CTRL: <GTM_base> + $00324_H$
GTM0CMUCLK7CTRL: <GTM_base> + $00328_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | CLK_CNT | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.52 GTM0CMUCLKxCTRL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 23 to 0 | CLK_CNT | Clock count. Defines count value for the clock divider of clock source CMU_CLK[x] (x = 0 to 7).<br>**NOTE**<br>Value can only be modified when clock enable EN_CLK[x] (x = 0 to 7) is disabled. |

### 25.8.6.5 GTM0CMUGLBCTRL

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00348_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | ARU_ADDR_RSTGLB |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R/W |

**Table 25.53 GTM0CMUGLBCTRL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 1 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 0 | ARU_ADDR_RSTGLB | Reset ARU address counter<br>**NOTES**<br>1. Writing value “1” to this bit field results in a request to reset of the ARU address counter. The next following write access to register GTM0CMUCLKEN applies the ARU reset and resets this bit. This feature can be used to synchronize the ARU round trip time to the CMU clocks.<br>2. This bit is write protected. Before writing to this bit set bit RF_PROT of register GTM0GTMCTRL to '0'. |

# 25.9 Time Base Unit (TBU)

## 25.9.1 Overview

The Time Base Unit TBU provides common time bases for the GTM-IP. The TBU submodule is organized in channels, where the number of channels is device dependent. There are at most two channels implemented inside the TBU. The TBU channel 0 time base register GTM0TBU0BASE is 27 bits and it is configurable whether the lower 24 bit or the upper 24 bit are provided to the GTM as signal TBU_TS0. The TBU channels 1 has a time base register GTM0TBU1BASE of 24 bit length. The time base register value TBU_TS1 are provided to subsequent submodules of the GTM.

The TBU_UP1 signals are set to high for a single SYS_CLK period, whenever the corresponding signal TBU_TS1 is getting updated. The signal TBU_UP0_L is set to high for a single SYS_CLK period if the signal TBU_TS0 and TBU_TS1 is getting updated and TBU_UP0_H is set to high for a single SYS_CLK period, whenever if the upper 24 bit of TBU_TS0 are updated.

The time base channels can run independently of each other and can be enabled and disabled synchronously by control bits in a global TBU channel enable register GTM0TBUCHEN. **Section 25.9.1.1, TBU Block Diagram** shows a block diagram of the Time Base Unit.

### 25.9.1.1 TBU Block Diagram

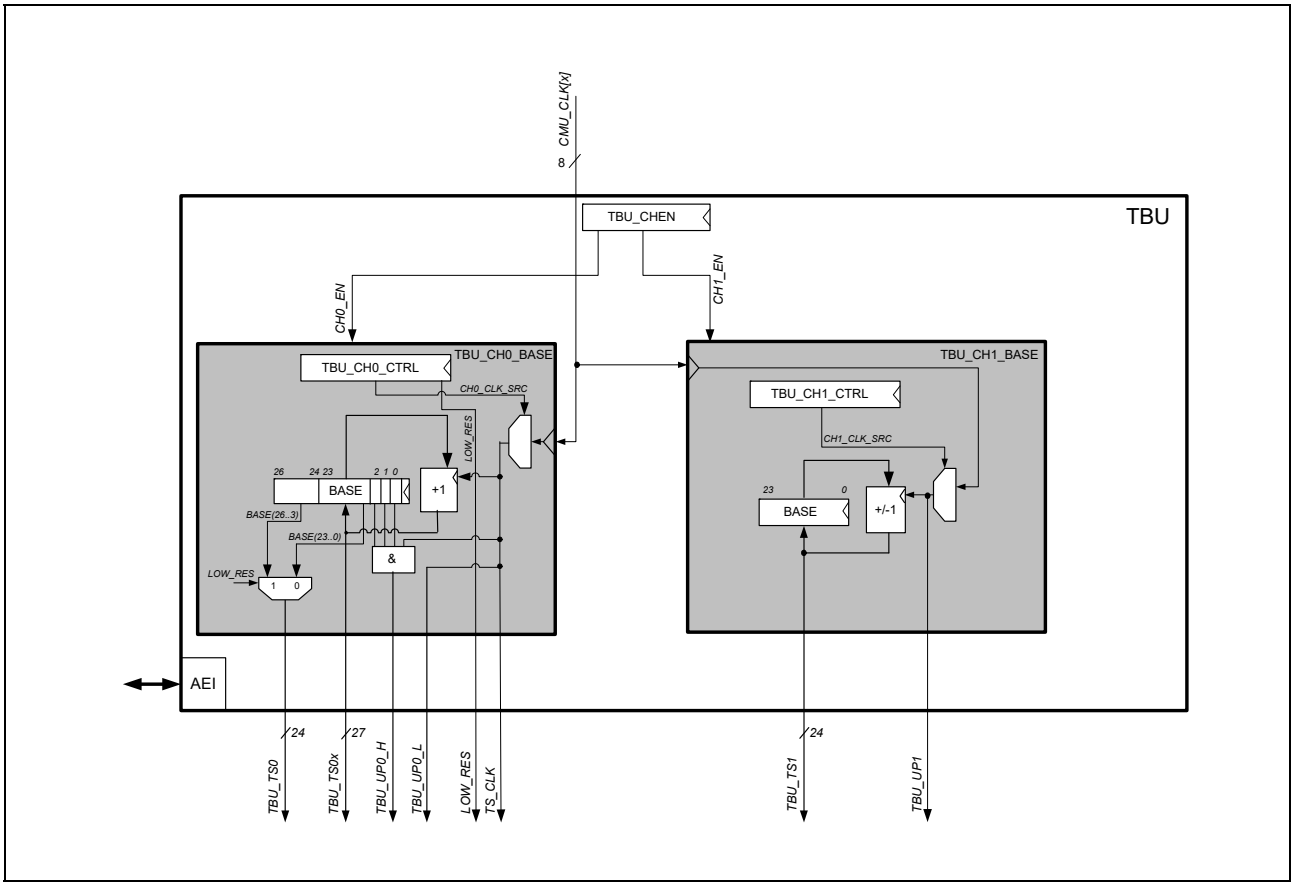

Figure 25.19 BU Block Diagram

The configuration of the independent time base channels TBU_BASE_[z] (z = 0, 1) is done via the AEI interface. Each TBU channel may select one of the eight CMU_CLK[x] (x = 0 to 7) signals coming from the CMU submodule.

## 25.9.2 TBU Time Base Channels

The time base values are generated within the TBU time base channels in two independent operation modes.

### 25.9.2.1 TBU Channel Modes

TBU channel 0 provides a 27 bit counter in a free running counter mode. Dependent on the bit field LOW_RES of register GTM0TBU0CTRL, the lower 24 bits (bit 0 to 23) or the upper 24 bits (bits 3 to 26) are provided to the GTM submodules.

TBU channel 1 is running as a free running counter.

The time base register GTM0TBU1BASE can be initialized with a start value just before enabling the corresponding TBU channel.

Moreover, the time base register GTM0TBU1BASE can always be read in order to determine the actual value of the counter.

The time base register GTM0TBU1BASE is updated on every specified incoming clock event by the selected signal CMU_CLK[x] (dependent on GTM0TBUzCTRL register). In general the time base register GTM0TBU1BASE is incremented on every CMU_CLK[x] clock tick.

## 25.9.3 TBU Configuration Registers Overview

Following table shows a conclusion of configuration registers address offsets and initial values.

**Table 25.54 Register List**

| Symbol | Register Name | Details in Section |
|---|---|---|
| GTM0TBUCHEN | TBU global channel enable | **25.9.4.1** |
| GTM0TBU0CTRL | TBU channel 0 control | **25.9.4.2** |
| GTM0TBU0BASE | TBU channel 0 base | **25.9.4.3** |
| GTM0TBU1CTRL | TBU channel 1 control | **25.9.4.4** |
| GTM0TBU1BASE | TBU channel 1 base | **25.9.4.5** |

## 25.9.4 TBU Registers description

### 25.9.4.1 GTM0TBUCHEN

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00100_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CH_CLK_SRC | | | LOW_RES |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W |

**Table 25.56 GTM0TBU0CTRL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 3 to 1 | CH_CLK_SRC | Clock source for channel x (x = 0 to 2) time base counter<br>000: CMU_CLK0 selected<br>001: CMU_CLK1 selected<br>010: CMU_CLK2 selected<br>011: CMU_CLK3 selected<br>100: CMU_CLK4 selected<br>101: CMU_CLK5 selected<br>110: CMU_CLK6 selected<br>111: CMU_CLK7 selected<br>**NOTE**<br>This value can only be modified if channel 0 is disabled. |
| 0 | LOW_RES | GTM0TBU0BASE register resolution.<br>0: TBU channel uses lower counter bits (bit 0 to 23)<br>1: TBU channel uses upper counter bits (bit 3 to 26)<br>**NOTES**<br>1. The two resolutions for the TBU channel 0 can be used in the TIM channel 0.<br>2. This value can only be modified if channel 0 is disabled. |

### 25.9.4.3 GTM0TBU0BASE

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00108_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | BASE | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | BASE | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.57 GTM0TBU0BASE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 26 to 0 | BASE | Time base value for channel 0.<br>**NOTES**<br>1. The value of BASE can only be written if the TBU channel 0 is disabled.<br>2. If channel 0 is enabled, a read access to this register provides the current value of the underlying 27 bit counter. |

### 25.9.4.4 GTM0TBU1CTRL

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $0010C_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | — | — | — | — | CH_CLK_SRC | | | — |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R |

**Table 25.58 GTM0TBU1CTRL Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 4 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 3 to 1 | CH_CLK_SRC | Clock source for channel 1 time base counter<br>000: CMU_CLK0 selected<br>001: CMU_CLK1 selected<br>010: CMU_CLK2 selected<br>011: CMU_CLK3 selected<br>100: CMU_CLK4 selected<br>101: CMU_CLK5 selected<br>110: CMU_CLK6 selected<br>111: CMU_CLK7 selected<br>**NOTE**<br>This value can only be modified if channel y was disabled. |
| 0 | Reserved | These bits are always read as 0. When written, write the initial value. |

### 25.9.4.5 GTM0TBU1BASE

**Access:** This register can be read/written in 32-bit units.

**Address:** <GTM_base> + $00110_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | BASE | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.59 GTM0TBU1BASE Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 23 to 0 | BASE | Time base value for channel 1<br>**NOTES**<br>1. The value of BASE can only be written if the corresponding TBU channel y is disabled.<br>2. If the corresponding channel y is enabled, a read access to this register provides the current value of the underlying counter. |

# 25.10 Timer Input Module (TIM)

## 25.10.1 Overview

The Timer Input Module (TIM) is responsible for filtering and capturing input signals of the GTM. Several characteristics of the input signals can be measured inside the TIM channels. For advanced data processing the detected input characteristics of the TIM module can be routed through the ARU to subsequent processing units of the GTM.

Input characteristics mean either time stamp values of detected input rising or falling edges together with the new signal level or the number of edges received since channel enable together with the actual time stamp or PWM signal durations for a whole PWM period.

The architecture of TIM is shown in **Figure 25.20**.

### 25.10.1.1 TIM Block Diagram

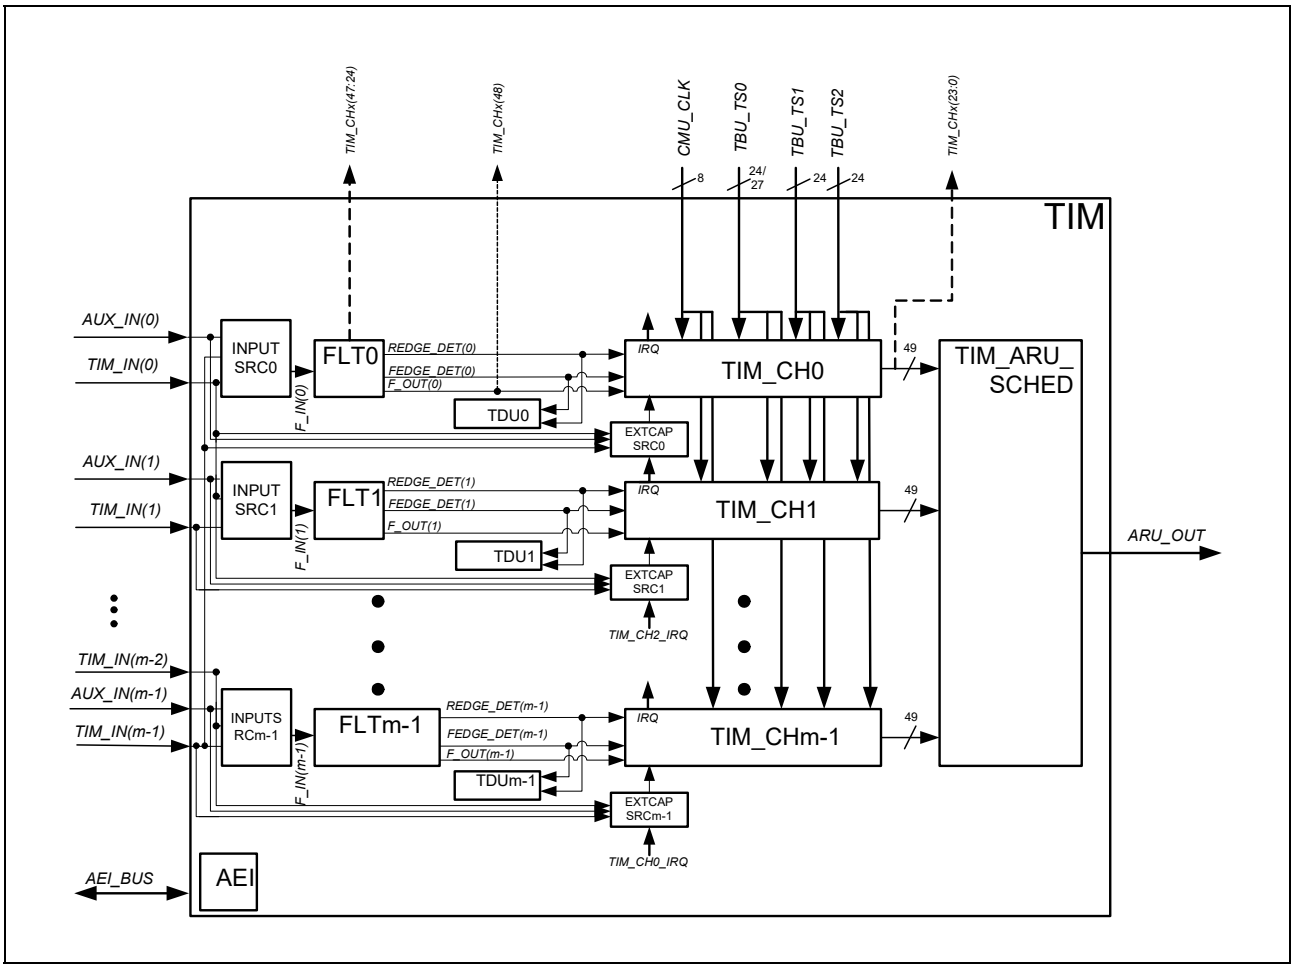

**Figure 25.20 TIM Block Diagram**

The number of channels m inside a TIM submodule depends on the device.

Each of the *m* dedicated input signals are filtered inside the FLTx subunit of the TIM Module. It should be noted that the incoming input signals are synchronized to the clock SYS_CLK, resulting in a delay of two SYS_CLK periods for the incoming signals.

The submodule TIM provides different filter mechanisms described in more detail in **Section 25.10.2, TIM Filter Functionality (FLT)** . After filtering, the signal is routed to the corresponding TIM channel.

The measurement values can be read by the CPU directly via the AEI-Bus or they can be routed through the ARU to other submodules of the GTM.

For timeout detection of an incoming signal (no subsequent edge detected during a specified duration) each individual channel has a Timeout Detection Unit (TDU).

The two (three) time bases coming from the TBU are connected to the TIM channels to annotate time stamps to incoming signals. For TIM0 the extended 27 bit width time base TBU_TS0 is connected to the TIM channels, and the user has to select if the lower 24 bits (TBU_TS0[23:0]) or the higher 24 bits (TBU_TS0[26:3]) are stored inside the GPR0 and GPR1 registers.

### 25.10.1.2 Input source selection INPUTSRCx

It can be configured which source shall be used for processing in the FLT,TDU,TIM_CH units. It can be selected by the bit fields CICTRL and MODE_x, VAL_x in the register GTM0TIM0INSRC which source is in use.

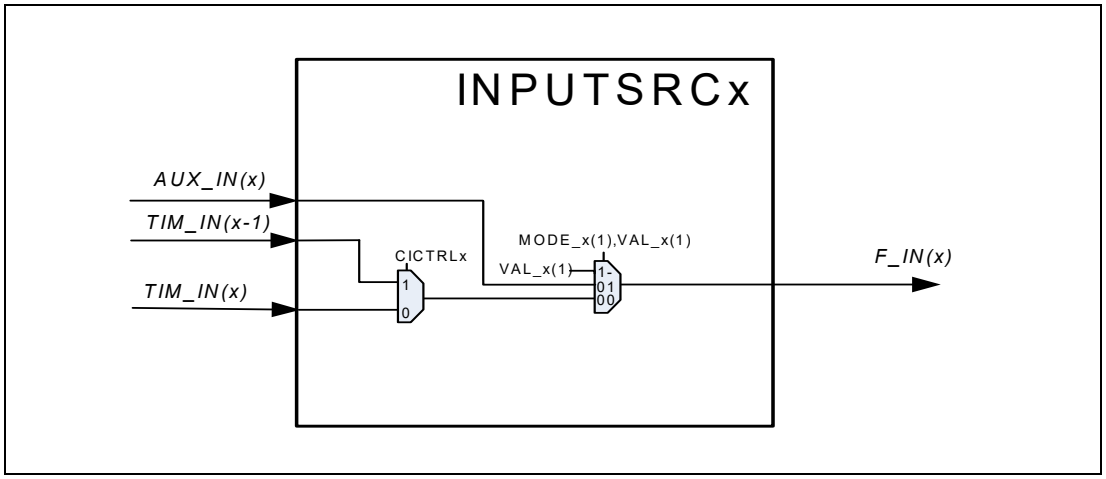

**Figure 25.21 INPUTSRC Block Diagram**

In a certain MODE_x, VAL_x combination the input signal F_IN(x) can be driven by VAL_x(1) with 0 or 1 directly.

Due to the fact that all 8 channels are bundled in the register GTM0TIM0INSRC a synchronous control of all 8 input channels is possible.

Two adjacent channels can be combined by setting the CICTRL bit field in the corresponding GTM0TIMixCTRLregister. This allows for a combination of complex measurements on one input signal with two TIM channels.

The additional input signal AUX_IN[x] can be selected as an input signal. See **Section 25.6.1.1, GTM Architecture Block Diagram** .

### 25.10.1.3 Input observation

It is possible to observe for all channels of one instance by reading TIM_INP_VAL the actual signal values of the following processing stages:

- TIM_IN(7:0) signals after TIM input synchronization
- TIM F_IN(7:0) signals after TIM INPUTSRC selection (input to TIM_FLT)
- TIM F_OUT(7:0) signals after TIM filter functionality (output of TIM_FLT)

### 25.10.1.4 External capture source selection EXTCAPSRCx

Each channel can operate on an external capture signal EXT_CAPTURE. The source to use for this signal can be configured by the bit field EXT_CAP_SRCx in the register GTM0TIM00ECTRL .

The EXT_CAPTURE signal will be distributed to other GTM modules (e.g. TOM/ATOM) .

**NOTE**

The EXT_CAPTURE signal generation is independent of the signal EXT_CAP_EN.

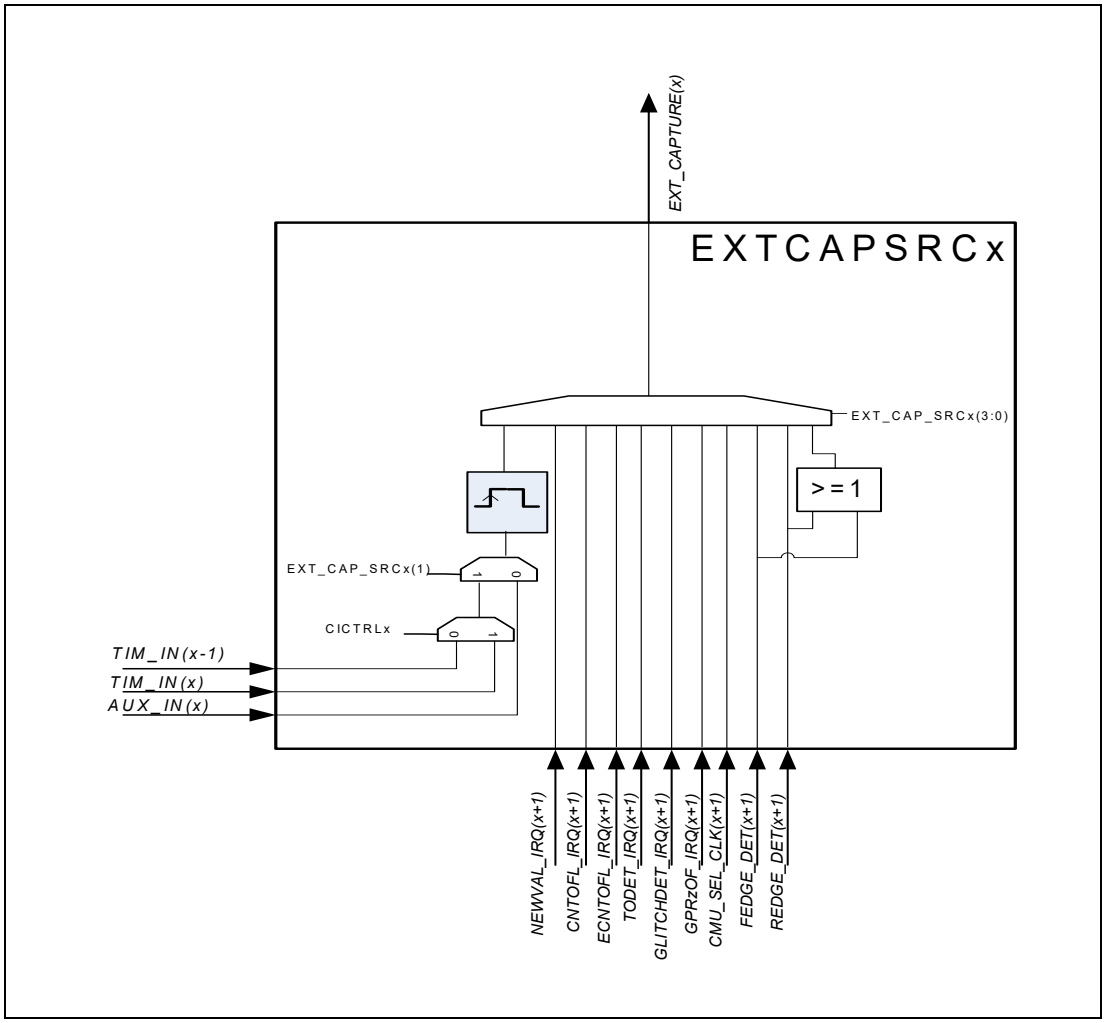

**Figure 25.22 XTCAPSRC Block Diagram**

The external capture functionality can be enabled for the TIM channel x with the bit EXT_CAP_EN in the register GTM0TIMixCTRL, it will trigger on each rising edge. A pulse generation for each rising edge of the selected input signal TIM_IN[x] and AUX_IN[x] is applied.

The six TIM channel interrupt sources can be triggered by the operation in the certain TIM channel modes. Alternatively they can be issued by a soft trigger using the corresponding bits in the register GTM0TIMixIRQFORCINT.

## 25.10.2 TIM Filter Functionality (FLT)

### 25.10.2.1 Overview

The TIM submodule provides a configurable filter mechanism for each input signal. These filter mechanism is provided inside the FLT subunit.

FLT architecture is shown in **Figure 25.23**.

The filter includes a clock synchronization unit (CSU), an edge detection unit (EDU), and a filter counter associated to the filter unit (FLTU).

The CSU is synchronizing the incoming signal F_IN to the selected filter clock frequency, which is controlled with the bit field FLT_CNT_FRQ of register GTM0TIMixCTRL.

The synchronized input signal F_IN_SYNC is used for further processing within the filter.

It should be noted that glitches with a duration less than the selected CMU clock period are lost.

The filter modes can be applied individually to the falling and rising edges of an input signal. The following filter modes are available:

- Immediate edge propagation mode,
- Individual de-glitch time mode (up/down counter)
- Individual de-glitch time mode (hold counter).

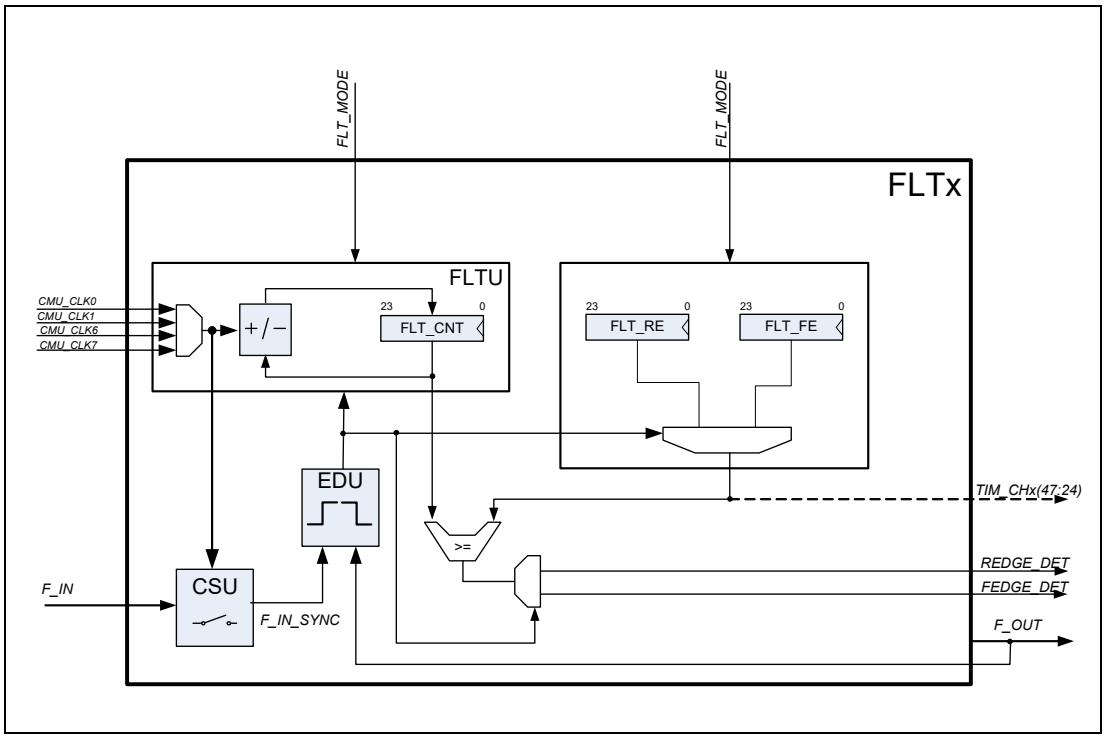

**Figure 25.23 FLT Architecture**

The filter parameters (deglitch and acceptance time) for the rising and falling edge can be configured inside the two filter parameter registers FLT_RE (rising edge) and FLT_FE (falling edge). The exact meaning of the parameter depends on the filter mode.

However the delay time T of both filter parameters FLT_xE can always be determined by:

$T = (FLT_xE + 1) * T_{FLT_CLK}$,

whereas $T_{FLT_CLK}$ is the clock period of the selected CMU clock signal in bit field FLT_CNT_FRQ of register GTM0TIMixCTRL.

When a glitch is detected on an input signal a status flag GLITCHDET is set inside the GTM0TIMixIRQNOTIFY register.

**Table 25.60** gives an overview about the meanings for the registers FLT_RE and FLT_FE. In the individual deglitch time modes, the actual filter threshold for a detected regular edge is provided on the TIM[i]_CH[x] (47:24) output line. In the case of immediate edge propagation mode, a value of zero is provided on the TIM[i]_CH[x] (47:24) output line.

**Table 25.60 Filter Parameter summary for the different Filter Modes**

| Filter mode | Meaning of FLT_RE | Meaning of FLT_FE |
|---|---|---|
| Immediate edge propagation | Acceptance time for rising edge | Acceptance time for falling edge |
| Individual de-glitch time (up/ down counter) | De-glitch time for rising edge | De-glitch time for falling edge |
| Individual de-glitch time (hold counter) | De-glitch time for rising edge | De-glitch time for falling edge |

A counter FLT_CNT is used to measure the glitch and acceptance times.

The frequency of the FLT_CNT counter is configurable in bit field FLT_CNT_FRQ of register GTM0TIMixCTRL.

The counter FLT_CNT can either be clock with the CMU_CLK0, CMU_CLK1, CMU_CLK6 or the CMU_CLK7 signal. These signals are coming from the CMU submodule.

The FLT_CNT, FLT_FE and FLT_RE registers are 24-bit width. For example, when the resolution of the CMU_CLK0 signal is 50ns this allows maximal de-glitch and acceptance times of about 838ms for the filter.

### 25.10.2.2 TIM Filter Modes

#### (1) Immediate Edge Propagation Mode

In immediate edge propagation mode after detection of an edge the new signal level on F_IN_SYNC is propagated to F_OUT with a delay of one TFLT_CLK period and the new signal level remains unchanged until the configured acceptance time expires.

For each edge type the acceptance time can be specified separately in the FLT_RE and FLT_FE registers.

Each signal change on the input F_IN_SYNC during the duration of the acceptance time has no effect on the output signal level F_OUT of the filter but it sets the glitch GLITCHDET bit in the GTM0TIMixIRQNOTIFY register.

After it expires an acceptance time the input signal F_IN_SYNC is observed and on signal level change the filter raises a new detected edge and the new signal level is propagated to F_OUT.

Independent of a signal level change the value of F_OUT is always set to F_IN_SYNC, when the acceptance time expires (see also **Figure 25.25** ).

**Figure 25.24** shows an example for the immediate edge propagation mode, in the case of rising edge detection. Both, the signal before filtering (F_IN) and after filtering (F_OUT) are shown. The acceptance time at1 is specified in the register FLT_RE.

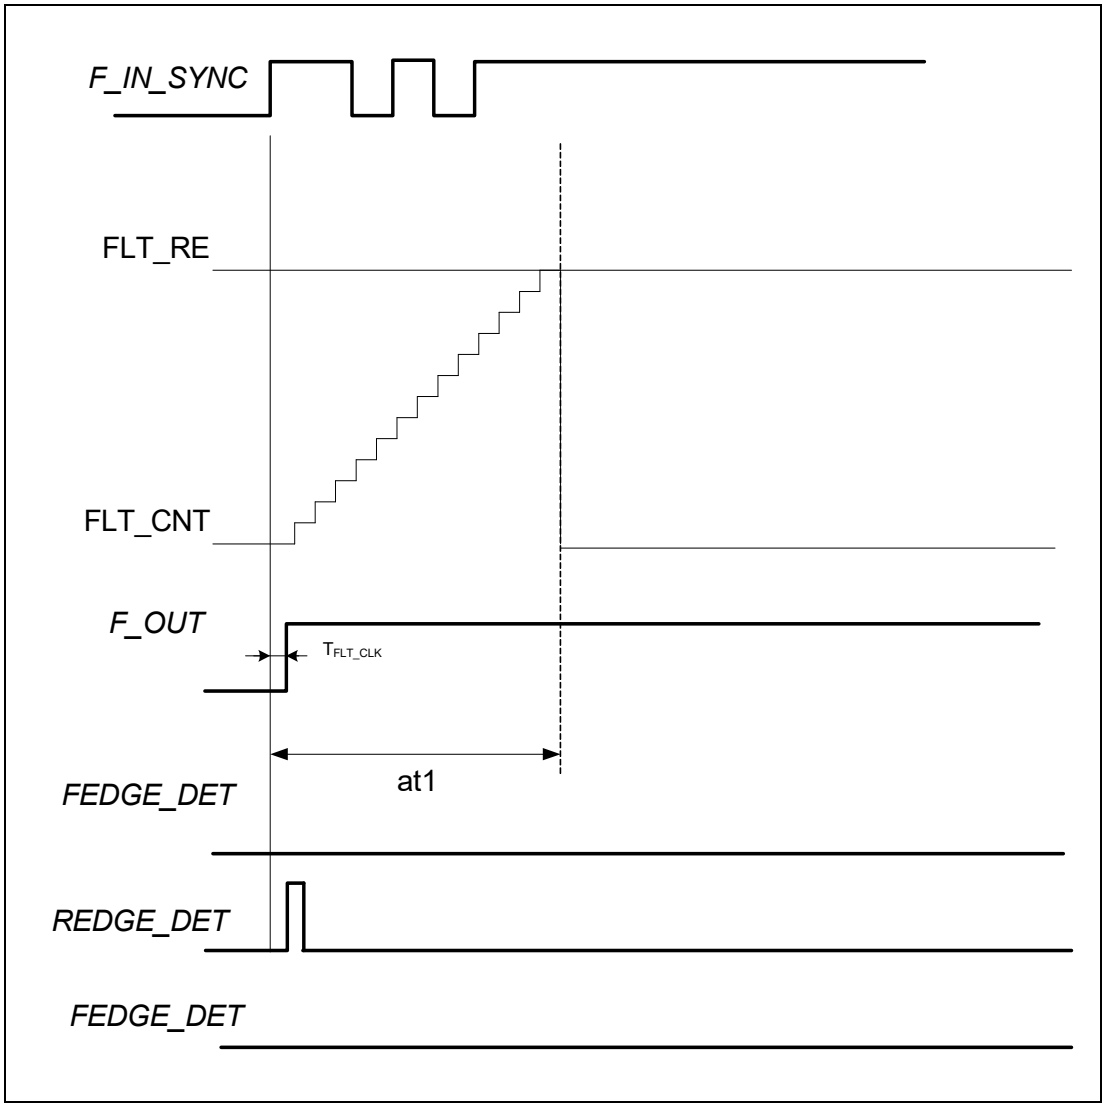

**Figure 25.24 Immediate Edge Propagation Mode in the case of a rising edge**

In immediate edge propagation mode the glitch measurement mechanism is not applied to the edge detection. Detected edges on F_IN_SYNC are transferred directly to F_OUT.

The counter FLT_CNT is incremented until acceptance time threshold is reached.

**Figure 25.25** shows a more complex example of the TIM filter, in which both, rising and falling edges are configured in immediate edge propagation mode.

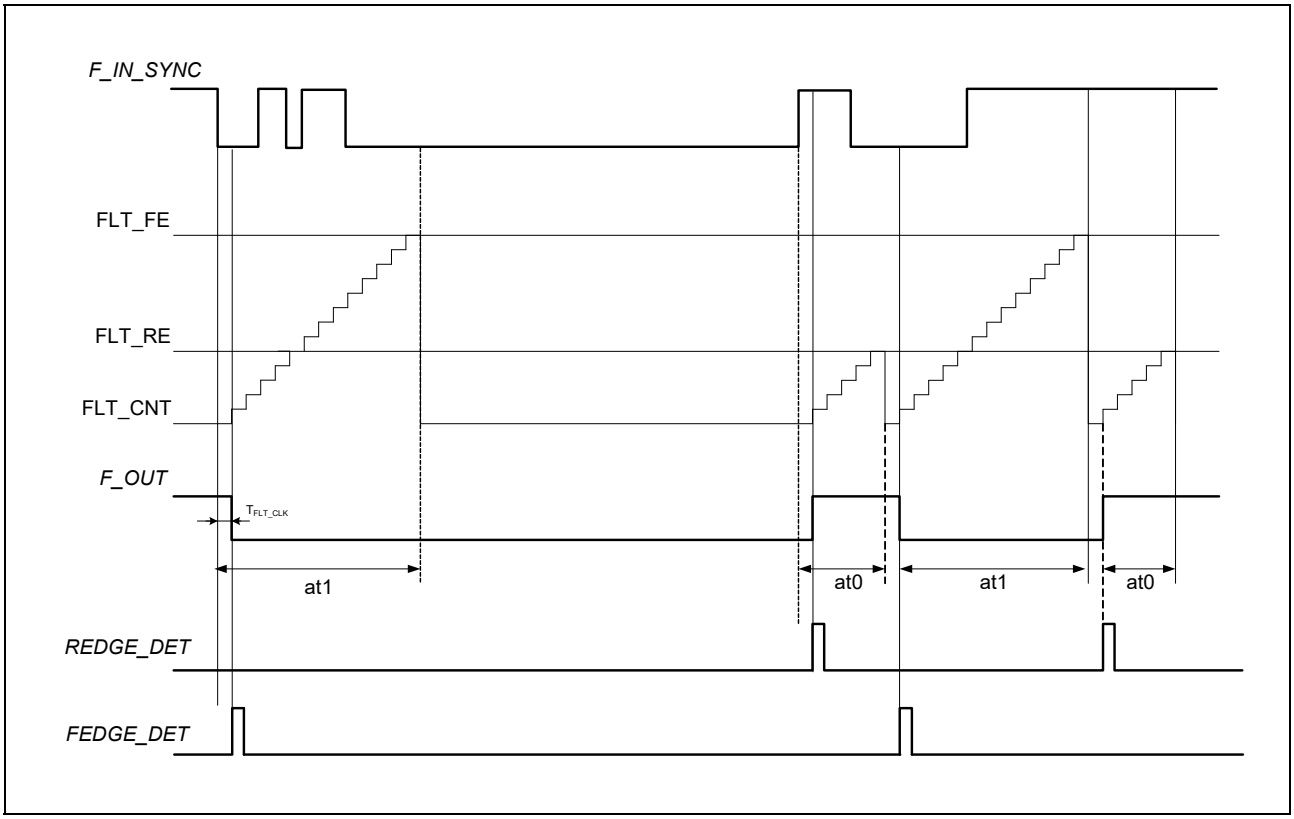

**Figure 25.25 Immediate Edge Propagation Mode in the case of a rising and falling edge**

If the FLT_CNT has reached the acceptance time for a specific signal edge and the signal F_IN_SYNC has already changed to the opposite level of F_OUT, the opposite signal level is set to F_OUT and the acceptance time measurement is started immediately. **Figure 25.25** shows this scenario at the detection of the first rising edge and the second falling edge.

### (2) Individual De-Glitch Time Mode (up/down counter)

In individual de-glitch time mode (up/down counter) each edge of an input signal can be filtered with an individual de-glitch threshold filter value mentioned in the registers FLT_RE and FLT_FE, respectively.

The filter counter register FLT_CNT is incremented when the signal level on F_IN_SYNC is unequal to the signal level on F_OUT and decremented if F_IN_SYNC equals F_OUT.

After FLT_CNT has reached a value of zero during decrementation the counter is stopped immediately.

If a glitch is detected a glitch detection bit GLITCHDET is set in the GTM0TIMixIRQNOTIFY register.

The detected edge signal together with the new signal level is propagated to F_OUT after the individual de-glitch threshold is reached. **Figure 25.26** shows the behavior of the filter in individual de-glitch time (up/down counter) mode in the case of the rising edge detection.

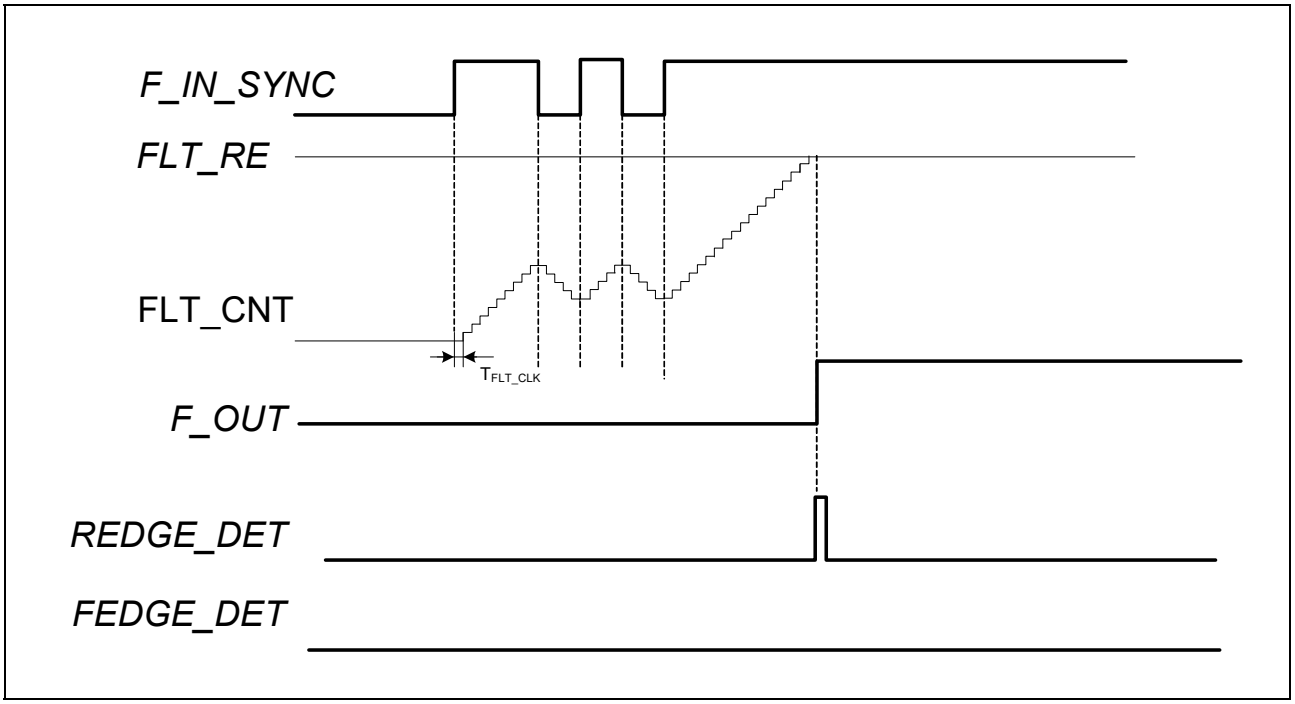

**Figure 25.26 Individual De-Glitch Time Mode (up/down counter) in the case of a rising edge**

### (3) Individual De-Glitch Time Mode (hold counter)

In individual de-glitch time mode (hold counter) each edge of an input signal can be filtered with an individual de-glitch threshold filter value mentioned in the registers FLT_RE and FLT_FE, respectively.

The filter counter register FLT_CNT is incremented when the signal level on F_IN_SYNC is unequal to the signal level on F_OUT and the counter value of FLT_CNT is hold if F_IN equals F_OUT.

If a glitch is detected the glitch detection bit GLITCHDET is set in the GTM0TIMixIRQNOTIFY register.

The detected edge signal together with the new signal level is propagated to F_OUT after the individual de-glitch threshold is reached. **Figure 25.27** shows the behavior of the filter in individual de-glitch time (hold counter) mode in the case of the rising edge detection.

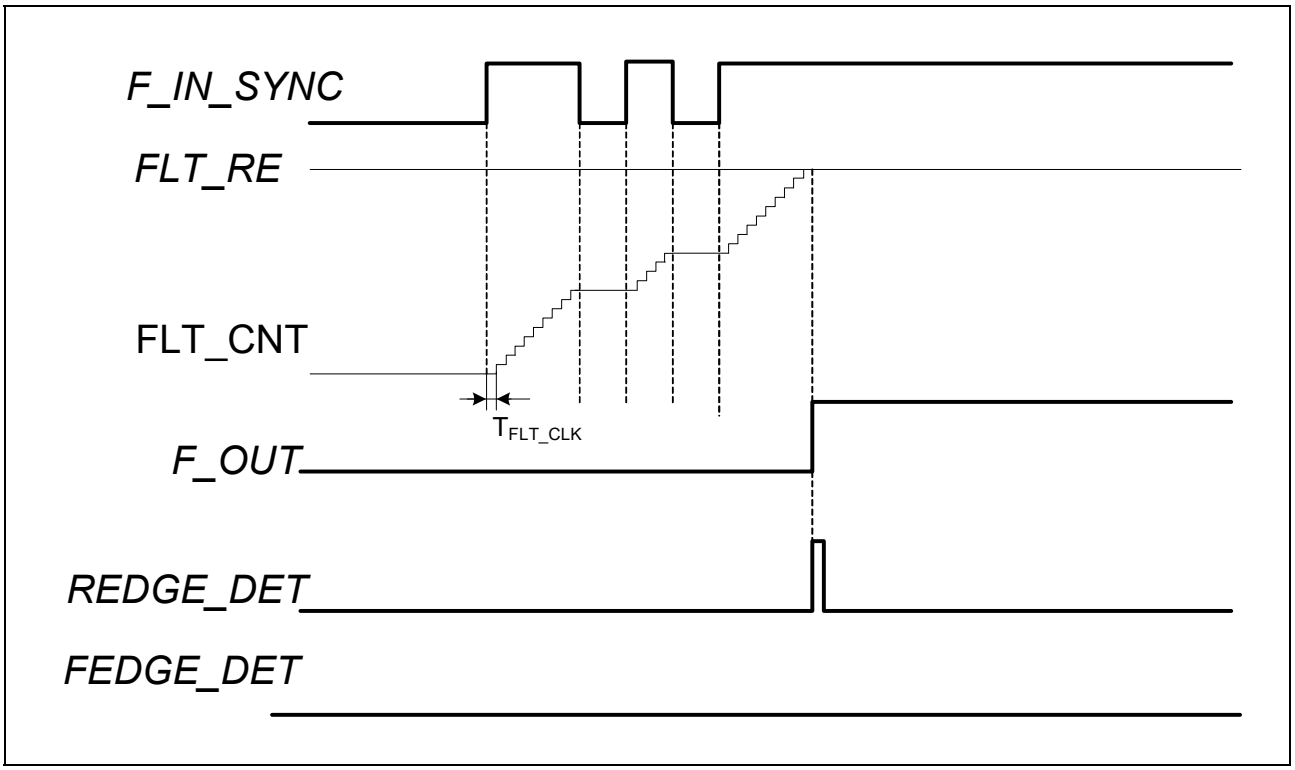

**Figure 25.27 Individual De-Glitch Time Mode (hold counter) in the case of a rising edge**

#### (4) Immediate Edge Propagation and Individual De-Glitch Mode

As already mentioned, the three different filter modes can be applied individually to each edge of the measured signal.

However, if one edge is configured with immediate edge propagation and the other edge with an individual deglitch mode (whether up/down counter or hold counter) a special consideration has to be applied.

Assume that the rising edge is configured for immediate edge propagation and the falling edge with individual deglitch mode (up/down counter) as shown in **Figure 25.28**.

If the falling edge of the incoming signal already occurs during the measuring of the acceptance time of the rising edge, the measurement of the deglitch time on the falling edge is started delayed, but immediately after the acceptance time measurement phase of the rising edge has finished.

Consequently, the deglitch counter can not measure the time TERROR, as shown in **Figure 25.28**.

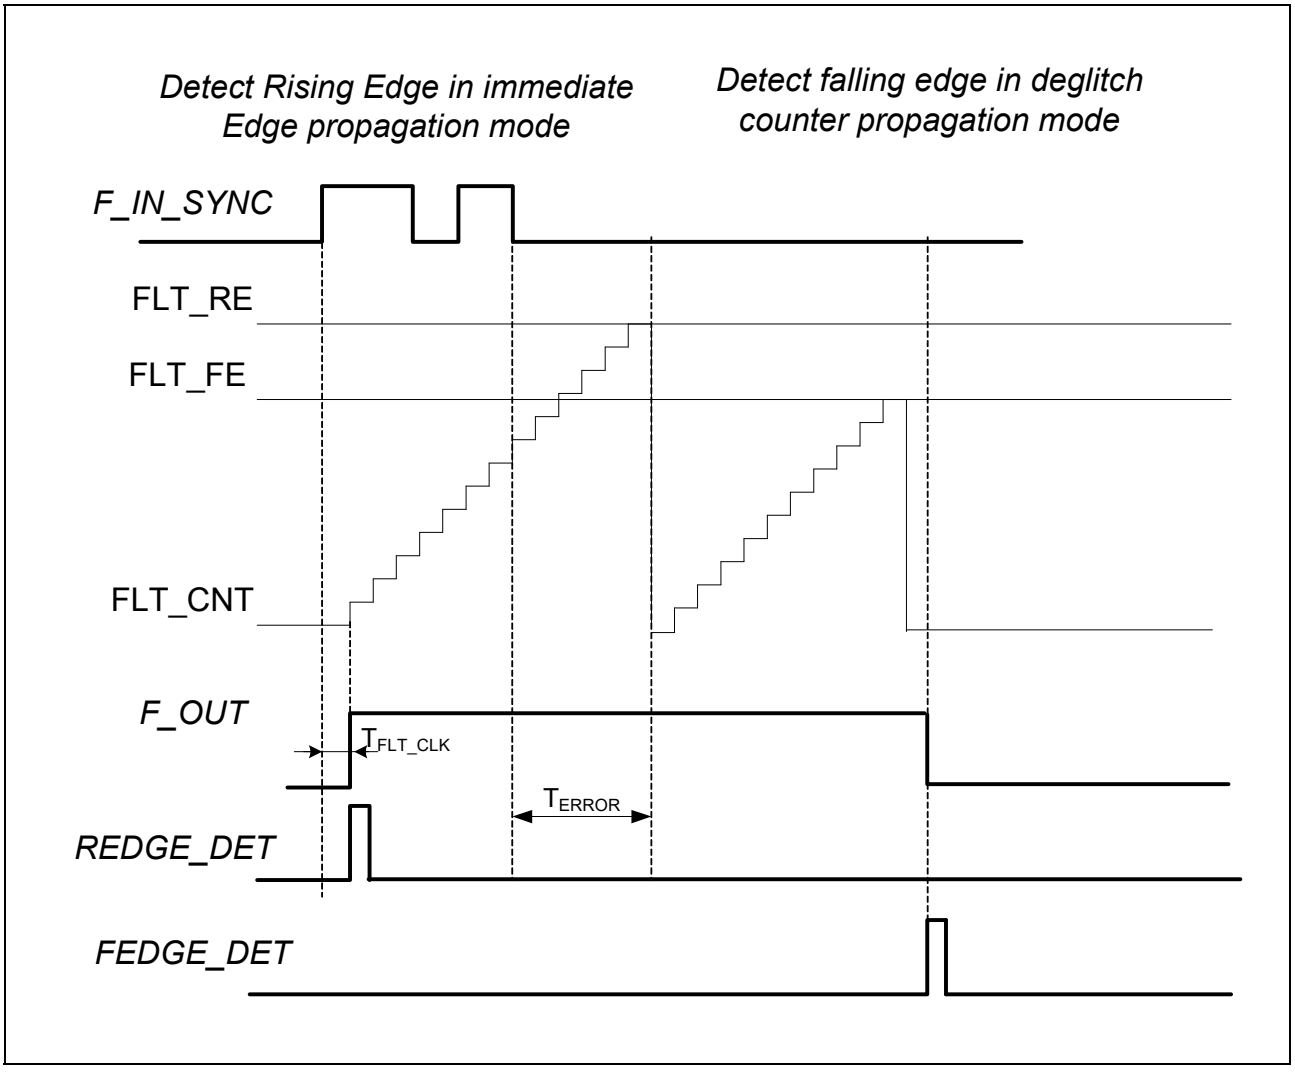

Figure 25.28 Mixed mode measurement

#### 25.10.2.3 TIM Filter reconfiguration

If FLT_EN=1 a change of FLT_RE or FLT_FE will take place immediately.

If FLT_EN=1 a change of FLT_MODE_RE or FLT_MODE_FE will be used with the next occurring corresponding edge. If the mode is changed while the filter unit is processing a certain mode, it will end this edge filtering in the mode as started.

If FLT_EN=1 a change of FLT_CTR_RE or FLT_CTR_FE will take place immediately.

### 25.10.3 Timeout Detection Unit (TDU)

The Timeout Detection Unit (TDU) is responsible for timeout detection of the TIM input signals.

Each channel of the TIM submodule has its own Timeout Detection Unit (TDU) where a timeout event can be set up on the filtered input signal of the corresponding channel.

The TDU architecture is shown in **Section 25.10.3.1, Architecture of the TDU Subunit**.

#### 25.10.3.1 Architecture of the TDU Subunit

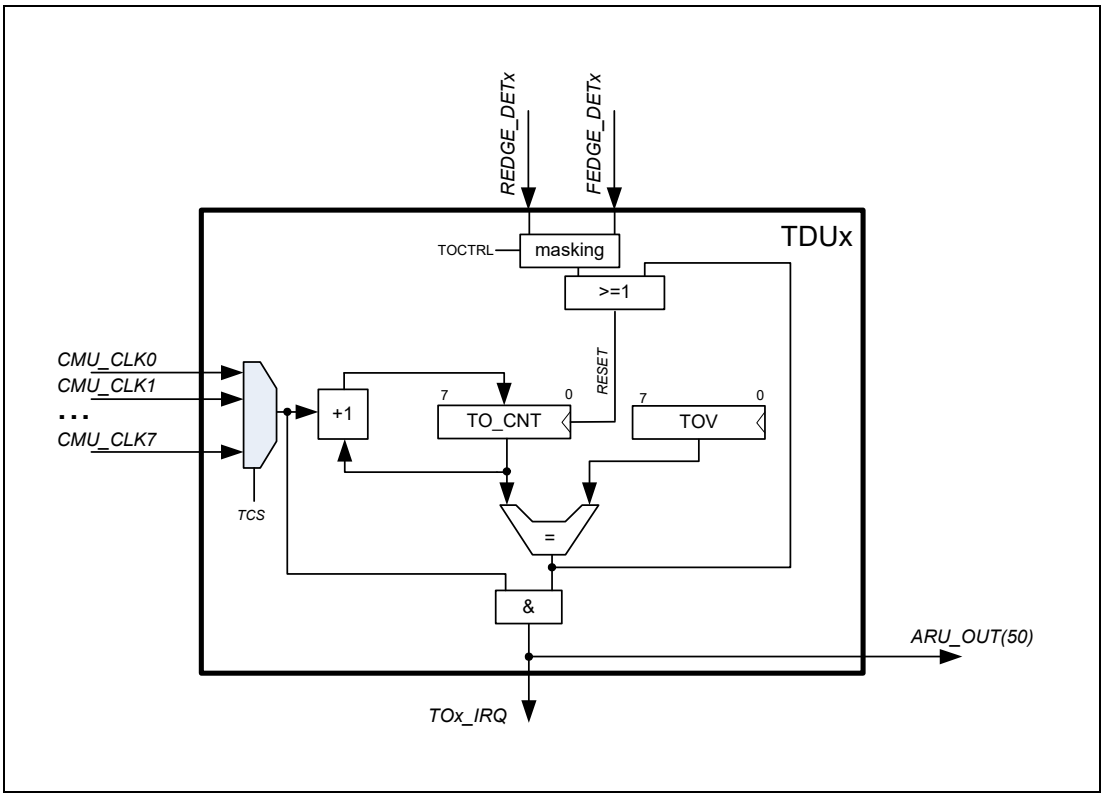

**Figure 25.29 Architecture of the TDU Subunit**

It is possible to detect timeouts with the resolution of the specified CMU_CLKx input signal selected with the bit field TCS of the register GTM0TIMixTDUV. The individual timeout values have to be specified in number of ticks of the selected input clock signal and have to be specified in the field TOV of timeout value register GTM0TIMixTDUV of the TIM channel x.

The exact time out value TTDU can be calculated with:

$T_{TDU}$=(TOV+1)*$T_{CMU_CLKx}$,

whereas TCMU_CLKx is the clock period of the selected CMU clock signal.

Timeout detection can be enabled or disabled individually inside the GTM0TIMixCTRLregister by setting/resetting the TOCTRL bit.

Timeout detection can be enabled to be sensitive to falling, rising or both edges of the input signal by writing the corresponding values to the bit field TOCTRL.

The counter TO_CNT is reset by each detected valid input edge coming either from the filtered input signal or when the timeout value TOV is reached by the counter TO_CNT.

After such a reset or by enabling the channel inside the GTM0TIMixCTRLregister the counter TO_CNT starts counting again from value 0 with the specified clock input signal.

Otherwise, timeout measurements starts immediately after the TOCTRL bit inside the GTM0TIMixCTRLregister is written (enabled).

The TDU generates an interrupt signal TIM_TODETx_IRQ whenever a timeout is detected for an individual input signal, and the TODET bit is set inside the GTM0TIMixIRQNOTIFY register.

In addition, when the ARU access is enabled with the ARU_EN bit inside the GTM0TIMixCTRLregister, the actual values stored inside the registers GTM0TIMixGPR0 and GTM0TIMixGPR1 are sent together with the last stored signal level to the ARU if a timeout event occurs.

To signal that a timeout occurred, the ARU_OUT(50) bit (ACB(2)) is set. The bit ACB(0) will be updated with the timeout event to the signal level on which the timeout was detected.

Thus, a destination could determine if a timeout occurred at the TIM input by evaluating ACB bit 2.

Since the TIM channel still monitors its input pin although the timeout happened, a valid edge could occur at the input pin while the timeout information is still valid at the ARU. In that case, the new edge associated data is stored inside the registers GTM0TIMixGPR0 and GTM0TIMixGPR1, the GPR overflow detected bit is set together in the ACB field (ACB(1)) with the timeout bit (ACB(2)) and the values are marked as valid to the ARU.

The ACB bit 2 is cleared, when a successful ARU write access by the TIM channel took place.

The ACB bit 1 is cleared, when a successful ARU write access by the TIM channel took place.

When a valid edge initiates an ARU write access which has not ended while a new timeout occurs the GPR overflow detected bit (ACB(1)) is set. The bit ACB(0) will be updated to the level on which the timeout occurred.

When a timeout occurred and initiates an ARU write access which has not ended while a new timeout occurs the GPR overflow detected bit (ACB(1)) is not set.

The following table clarifies the meaning of the ACB Bits for valid data provided by a TIM channel:

**Table 25.61 The ACB Bits for valid data provided by a TIM channel**

| ACB4/3 | ACB2 | ACB1 | ACB0 | Description |
|---|---|---|---|---|
| dc | 0 | 0 | SL | Valid edge detected |
| dc | 0 | 1 | SL | Input edge overwritten by subsequent edge |
| dc | 1 | 0 | SL | Timeout detected without valid edge |
| dc | 1 | 1 | SL | Timeout detected with subsequent valid edge detected |

## 25.10.4 TIM Channel Architecture

### 25.10.4.1 Overview

Each TIM channel consist of an input edge counter ECNT, a Signal Measurement Unit (SMU) with a counter CNT, a counter shadow register CNTS for SMU counter and two general purpose registers GPR0 and GPR1 for value storage.

The value TOV of the timeout register GTM0TIMixTDUV is provided to TDU subunit of each individual channel for timeout measurement. The architecture of the TIM channel is depicted in **Figure 25.30**.

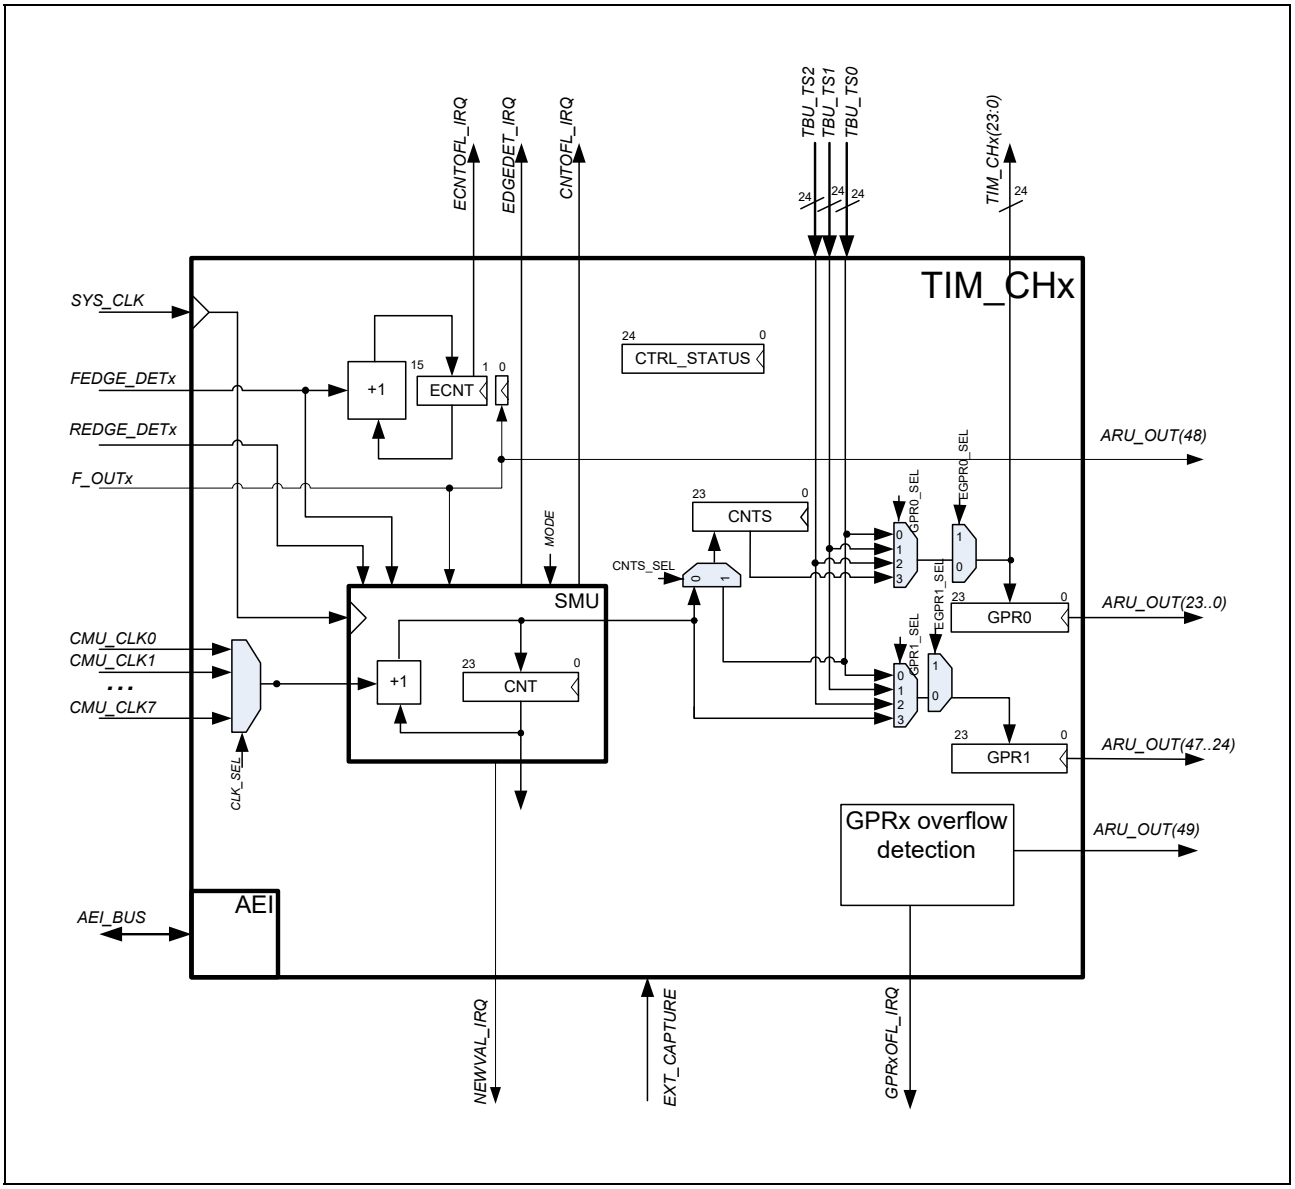

**Figure 25.30 TIM Channel Architecture**

Each TIM channel receives both input trigger signals REDGE_DETx and FEDGE_DETx, generated by the corresponding filter module in order to signalize a detected echo of the input signal F_INx. The signal F_OUTx shows the filtered signal of the channel's input signal F_INx.

The edge counter ECNT counts every incoming filtered edge (rising and falling). The counter value is uneven in case of detected rising, and even in case of detected falling edge. Thus, the input signal level

is part of the counter and can be obtained by bit 0 of ECNT. (However, the actual counter implementation counts only falling edges on ECNT[n:1] bits. It generates ECNT by composing the ECNT[n:1] bits with F_OUTx as bit 0).

Thus, the whole ECNT counter value is always odd, when a positive edge was received and always even, when a negative edge was received.

The current ECNT[7:0] register content is made visible on the bits 31 down to 24 of the registers GPR0, GPR1, and CNTS. This allows the software to detect inconsistent read accesses to registers GPR0, GPR1, and CNTS. However, the update strategy of these registers depends on the selected TIM modes, and thus the consistency check has to be adapted carefully.

It can be chosen with the bit field FR_ECNT_OFL when an ECNT overflow is signalled on ECNTOFL. An ECNT overflow can be signalled on 8 bit or full range resolution.

While reading the register GTM0TIMixECNT the bit ECNT[0] shows the input signal value F_OUTx independent of the state (enabled / disabled) of the channel. If a channel gets disabled (OSM mode or resetting TIM_EN) the content of GTM0TIMixECNT will be frozen until a read of the register takes place. This read will reset the ECNT counter. Continuing reads will show the input signal value in bit ECNT[0] again.

When new data is written into GPR0 and GPR1 the NEWVAL bit is set in GTM0TIMixIRQNOTIFY register and depending on corresponding enable bit value the NEWVALx_IRQ interrupt is raised.

Each TIM input channel has an ARU connection for providing data via the ARU to the other GTM submodules. The data provided to the ARU depends on the TIM channel mode and its corresponding adjustments (e.g. multiplexer configuration).

The bit ARU_EN of register GTM0TIMixCTRLdecides, whether the measurement results of registers GPR0 and GPR1 are consumed by another submodule via ARU (ARU_EN = 1) or the CPU via AEI (ARU_EN = 0).

To guarantee a consistent delivery of data from the GPR0 and GPR1 registers to the ARU or the CPU each TIM channel has to ensure that the data is consumed before it is overwritten with new values.

If new data was produced by the TIM channel (bit NEWVAL is set inside GTM0TIMixIRQNOTIFY register) while the old data is not consumed by the ARU (ARU_EN = 1) or CPU (ARU_EN = 0), the TIM channel sets the GPROFL bit inside the status register GTM0TIMixIRQNOTIFY and it overwrites the data inside the registers GPR0 and GPR1. In addition when ARU_EN = 1 the bit ACB(1) is set to 1 to indicate the overflow in the ARU data.

If the CPU is selected as consumer for the registers GPR0 and GPR1 (ARU_EN = 0), the acknowledge for reading out data is performed by a read access to the register GPR0. Thus, register GPR1 should be read always before GPR0.

If the ARU is selected as consumer for the registers GPR0 and GPR1 (ARU_EN = 1), the acknowledge for reading out data is performed by the ARU itself. However, the registers GPR0 and GPR1 could be read by CPU without giving an acknowledge.

### 25.10.4.2 TIM Channel Modes

The TIM provides six different measurement modes that can be configured with the bit field TIM_MODE of register GTM0TIMixCTRL. The measurement modes are described in the following subsections. Besides these different basic measurement modes, there exist distinct configuration bits in the register GTM0TIMixCTRLfor a more detailed controlling of each mode. The meanings of these bits are as follows:

- DSL: control the signal level for the measurement modes (e.g. if a measurement is started with rising edge or falling edge, or if high level pulses or low level pulses are measured.
- EGPR0_SEL, GPR0_SEL and EGPR1_SEL, GPR1_SEL: control the actual content of the registers GPR0 and GPR1 after a measurement has finished.
- CNTS_SEL: control the content of the registers CNTS. The actual time for updating the CNTS register is mode dependent.
- OSM: activate measurement in one-shot mode or continuous mode. In one-shot mode only one measurement cycle is performed and after that the channel is disabled.
- NEWVAL: The NEWVAL IRQ interrupt is triggered at the end of a measurement cycle, signalling that the registers GPR0 and GPR1 are updated.
- ARU_EN: enables sending of the registers GPR0 and GPR1 together with the actual signal level (in bit 48) and the overflow signal GPROFL (in bit 49), and the timeout status information (bit 50) to the ARU.
- EXT_CAP_EN: forces an update of the registers GPR0 and GPR1 and CNTS (TIM channel mode dependant) only on each rising edge of the EXT_CAPTURE signal and triggers a NEWVAL IRQ interrupt. If this mode is disabled the NEWVAL IRQ interrupt is triggered at the end of each measurement cycle.

For each channel the source of the EXT_CAPTURE signal can be configured with the bit fields EXT_CAP_SRC in the register GTM0TIM00ECTRL.

#### (1) TIM PWM Measurement Mode (TPWM)

In TIM PWM Measurement Mode the TIM channel measures duty cycle and period of an incoming PWM signal. The DSL bit defines the polarity of the PWM signal to be measured.

When measurement of pulse high time and period is requested (PWM with a high level duty cycle, DSL=1), the channel starts measuring after the first rising edge is detected by the filter.

Measurement is done with the CNT register counting with the configured clock coming from CMU_CLKx until a falling edge is detected.

Then the counter value is stored inside the shadow register CNTS (if CNTS_SEL = 0) and the counter CNT counts continuously until the next rising edge is reached.

On this following rising edge the content of the CNTS register is transferred to GPR0 and the content of CNT register is transferred to GPR1, assuming settings for the selectors GPR0_SEL= 11 and GPR1_SEL= 11. By this, GPR0 contains the duty cycle length and GPR1 contains the period. It should be noted, that the bits 1 to 7 of the ECNT may be used to check data consistency of the registers GPR0 and GPR1.

In addition the CNT register is cleared NEWVAL status bit inside of GTM0TIMixIRQNOTIFY status register and depending on corresponding interrupt enable condition TIM_NEWVALx_IRQ interrupt is raised.

The CNTS register update is not performed until the measurement is started (first edge defined by DSL is detected). Afterwards each edge leaving the level defined by DSL is performing a CNTS register update.

If a PWM with a low level duty cycle should be measured (DSL = 0), the channel waits for a falling edge until measurement is started. On this edge the low level duty cycle time is stored first in CNTS and then finally in GPR0 and the period is stored in GPR1.

When a PWM period was successfully measured, the data in the registers GPR0 and GPR1 is marked as valid for reading by the ARU when the ARU_EN bit is set inside GTM0TIMixCTRLregister, the NEWVAL bit is set inside the GTM0TIMixIRQNOTIFY register, and a new measurement is started.

If the preceding PWM values were not consumed by a reader attached to the ARU (ARU_EN bit enabled) or by the CPU the TIM channel set GPROFL status bit in GTM0TIMixIRQNOTIFY and depending on corresponding interrupt enable bit value raises a GPROFL_IRQ and overwrites the old values in GPR0 and GPR1. A new measurement is started afterwards.

If the register CNT produces an overflow during the measurement, the bit CNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_CNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

If the register ECNT produces an overflow during the measurement, the bit ECNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_ECNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

### (a) External capture TIM PWM Measurement Mode (TPWM)

If external capture is enabled, the pwm measurement is done continuously. The actual measurement values are captured to GPRx if an external capture event occurs.

Operation is done depending on cmu clock, ISL, DSL bit and the input signal value defined in next table:

**Table 25.62 External capture TIM PWM Measurement Mode (TPWM)**

| Input signal F_OUTx | selected CMU Clock | External capture | ISL | DSL | Action description |
|---|---|---|---|---|---|
| 0 | 1 | 0 | — | 0 | CNT++ |
| 1 | 1 | 0 | — | 0 | no |
| Rising edge | — | 0 | 0 | 0 | capture CNT value in CNTS |
| Falling edge | — | 0 | 0 | 0 | CNT = 0 |
| Rising edge | — | 0 | 1 | 0 | no |
| Falling edge | — | 0 | 1 | 0 | capture CNT value in CNTS; CNT = 0 |
| 1 | 1 | 0 | — | 1 | CNT++ |
| 0 | 1 | 0 | — | 1 | no |
| Falling edge | — | 0 | 0 | 1 | capture CNT value in CNTS |
| Rising edge | — | 0 | 0 | 1 | CNT = 0 |
| Falling edge | — | 0 | 1 | 1 | no |
| Rising edge | — | 0 | 1 | 1 | capture CNT value in CNTS; CNT = 0 |
| — | — | Rising edge | — | — | do GPRx capture ; issue NEWVAL_IRQ |
| — | 0 | 0 | — | — | no |

The CNTS register update is not performed until the measurement is started (first edge defined by DSL is detected). Afterwards the update of the CNTS register is defined by ISL,DSL combinations in the table above.

### (2) TIM Pulse Integration Mode (TPIM)

In TIM Pulse Integration Mode each TIM channel is able to measure a sum of pulse high or low times on an input signal, depending on the selected signal level bit DSL of register GTM0TIMixCTRLregister.

The pulse times are measured by incrementing the TIM channel counter CNT whenever the pulse has the specified signal level DSL. The counter is stopped whenever the input signal has the opposite signal level.

The counter CNT counts with the CMU_CLKx clock specified by the CLK_SEL bit field of the GTM0TIMixCTRLregister.

The CNT register is reset at the time the channel is activated (enabling via AEI write access) and it accumulates pulses while the channel is staying enabled.

Whenever the counter is stopped, the registers CNTS, GPR0 and GPR1 are updated according to settings of its corresponding input multiplexers, using the bits EGPR0_SEL, EGPR1_SEL, GPR0_SEL, GPR1_SEL, and CNTS_SEL. It should be noted, that the bits 1 to 7 of the ECNT may be used to check data consistency of the registers GPR0 and GPR1.

When the ARU_EN bit is set inside the GTM0TIMixCTRLregister the measurement results of the registers GPR0 and GPR1 can be send to subsequent submodules attached to the ARU.

#### (a) External capture TIM Pulse Integration Mode (TPIM)

If external capture is enabled, the pulse integration is done until next external capture event occurs.

Operation is done depending on cmu clock, DSL bit and the input signal value defined in next table:

**Table 25.63 External capture TIM Pulse Integration Mode (TPIM)**

| Input signal F_OUTx | selected CMU Clock | External capture | ISL | DSL | Action description |
|---|---|---|---|---|---|
| 0 | 1 | 0 | — | 0 | CNT++ |
| 1 | 1 | 0 | — | 0 | no |
| 1 | 1 | 0 | — | 1 | CNT++ |
| 0 | 1 | 0 | — | 1 | no |
| — | — | Rising edge | — | — | do capture ; issue NEWVAL_IRQ; CNT = 0 |
| — | 0 | 0 | — | — | no |

### (3) TIM Input Event Mode (TIEM)

In TIM Input Event Mode the TIM channel is able to count edges.

It is configurable if rising, falling or both edges should be counted. This can be done with the bit fields DSL and ISL in GTM0TIMixCTRLregister.

In addition, a TIM[i]_NEWVAL[x]_IRQ interrupt is raised when the configured edge was received and this interrupt was enabled.

The counter register CNT is used to count the number of edges, and the bit fields EGPR0_SEL, EGPR1_SEL,GPR0_SEL, GPR1_SEL, and CNTS_SEL can be used to configure the desired update values for the registers GPR0, GPR1 and CNTS. These register are updated whenever the edge counter CNT is incremented due to the arrival of a desired edge.

If the preceding data was not consumed by a reader attached to the ARU or by the CPU the TIM channel sets GPROFL status bit and raises a GPROFL[x]_IRQ if it was enabled in GTM0TIMixIRQEN register and overwrites the old values in GPR0 and GPR1 with the new ones.

If the register CNT produces an overflow during the measurement, the bit CNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_CNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

If the register ECNT produces an overflow during the measurement, the bit ECNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_ECNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

The TIM Input Event Mode does not depend on the bit field CLK_SEL of register GTM0TIMixCTRL.

#### (a) External capture TIM Input Event Mode (TIEM)

If external capture is enabled, capturing is done depending on the DSL, ISL bit and the input signal value defined in next table:

**Table 25.64 External capture TIM Input Event Mode (TIEM)**

| Input signal F_OUTx | External capture | ISL | DSL | Action description |
|---|---|---|---|---|
| — | Rising edge | 1 | — | do capture; issue NEWVAL_IRQ; CNT++ |
| — | 0 | 1 | — | no |
| 1 | Rising edge | 0 | 1 | do capture; issue NEWVAL_IRQ; CNT++ |
| 0 | — | 0 | 1 | no |
| 0 | Rising edge | 0 | 0 | do capture; issue NEWVAL_IRQ; CNT++ |
| 1 | — | 0 | 0 | no |

### (4) TIM Input Prescaler Mode (TIPM)

In the TIM Input Prescaler Mode the number of edges which should be detected before a TIM[i]_NEWVAL[x]_IRQ is raised is programmable. In this mode it must be specified in the CNTS register after how many edges the interrupt has to be raised.

A value of 0 in CNTS means that after one edge an interrupt is raised and a value of 1 means that after two edges an interrupt is raised, and so on.

The edges to be counted can be selected by the bit fields DSL and ISL of register GTM0TIMixCTRL.

With each triggered interrupt, the registers GPR0 and GPR1 are updated according to bits EGPR0_SEL, EGPR1_SEL,GPR0_SEL and GPR1_SEL.

If the register ECNT produces an overflow during the measurement, the bit ECNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_ECNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

The TIM Input Prescaler Mode does not depend on the bit field CLK_SEL of register GTM0TIMixCTRL.

#### (a) External capture TIM Input Prescaler Mode (TIPM)

If external capture is enabled, the external capture events are counted instead of the input signal edges.

Operation is done depending on the external capture signal, DSL, ISL bit and the input signal value defined in next table:

**Table 25.65 External capture TIM Input Prescaler Mode (TIPM)**

| Input signal F_OUTx | External capture | ISL | DSL | Action description |
|---|---|---|---|---|
| — | Rising edge | 1 | — | if CNT == CNTS then<br>do capture ;issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| — | 0 | 1 | — | no |
| 1 | Rising edge | 0 | 1 | if CNT == CNTS then<br>do capture ;issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 0 | — | 0 | 1 | no |
| 0 | Rising edge | 0 | 0 | if CNT == CNTS then<br>do capture ;issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 1 | — | 0 | 0 | no |

### (5) TIM Bit Compression Mode (TBCM)

The TIM Bit Compression Mode can be used to combine all filtered input signals of a TIM submodule to a parallel m bit data word, which can be routed to the ARU, where m is the number of channels available in the TIM submodule.

**Figure 25.31** gives an overview of the TIM bit compression mode.

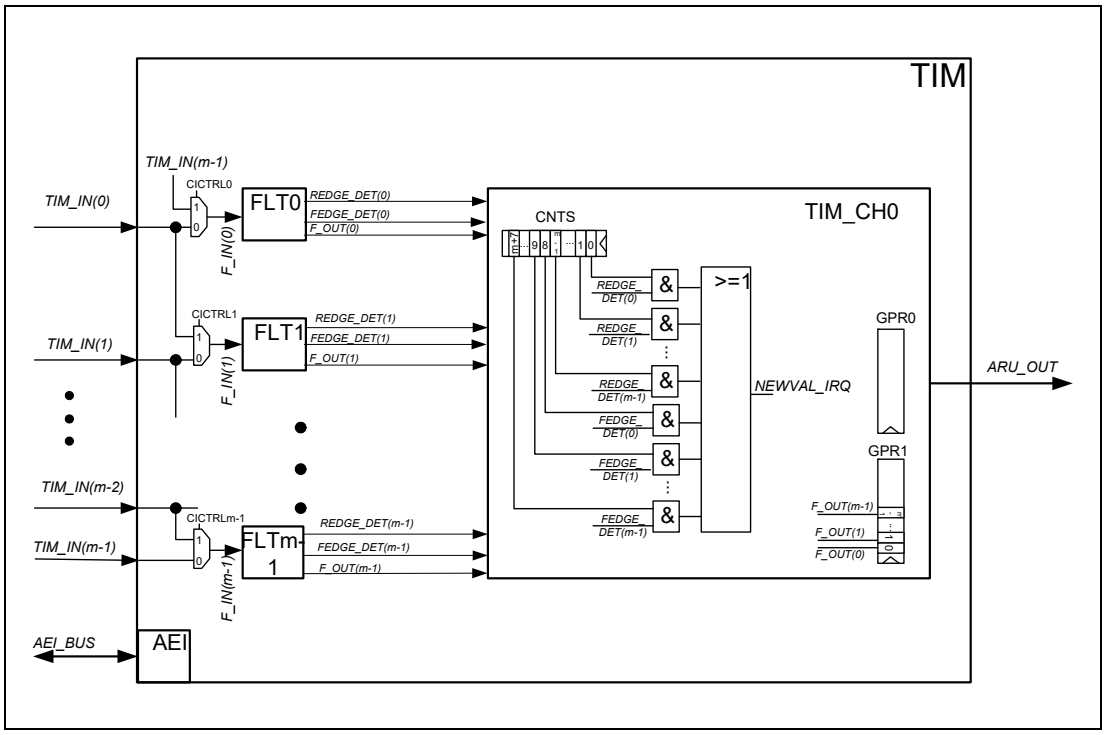

**Figure 25.31 TIM Bit Compression Mode**

The register CNTS of a channel is used to configure the event that releases the NEWVAL_IRQ and samples the input signals F_IN(0) to F_IN(m–1) in ascending order as a parallel data word in GPR1.

The bits 0 to m–1 of the CNTS register are used to select the REDGE_DET signals of the TIM filters 0 to m–1 as a sampling event, and the bits 8 to (7+m) are used to select the FEDGE_DET signals of the TIM filters 0 to m–1, respectively. If multiple events are selected, the events are OR-combined (see also **Figure 25.31**).

EGPR0_SEL,GPR0_SEL selects the timestamp value, which is routed through the ARU. GPR1_SEL is not applicable in TBCM mode.

If the bit ARU_EN of register GTM0TIMixCTRLis set, the sampled data of register GPR1 is routed together with a time stamp of register GPR0 to the ARU, whenever the NEWVAL_IRQ is released.

In TIM Bit compression mode, the register ECNT increments with each NEWVAL_IRQ, which means that the value of ECNT may depend on all m input signals. Consequently, the LSB of ECNT does not reflect the actual level of the input signal TIM_IN(x).

If the register ECNT produces an overflow during the measurement, the bit ECNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_ECNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

The TIM Bit Compression Mode does not depend on the bit field CLK_SEL of register GTM0TIMixCTRL.

(a) External capture Bit Compression Mode (TBCM)

If external capture is enabled, capturing is done depending on the DSL, ISL bit and the input signal value defined in next table:

**Table 25.66 External capture Bit Compression Mode (TBCM)**

| Input signal F_OUTx | External capture | ISL | DSL | Action description |
|---|---|---|---|---|
| — | Rising edge | 1 | — | do capture ;issue NEWVAL_IRQ; CNT++ |
| — | 0 | 1 | — | no |
| 1 | Rising edge | 0 | 1 | do capture ;issue NEWVAL_IRQ; CNT++ |
| 0 | — | 0 | 1 | no |
| 0 | Rising edge | 0 | 0 | do capture ;issue NEWVAL_IRQ; CNT++ |
| 1 | — | 0 | 0 | no |

### (6) TIM Gated Periodic Sampling Mode (TGPS)

In the TIM Gated Periodic Sampling Mode the number of CMU clock cycles which should elapse before capturing and raising TIM[i]_NEWVAL[x]_IRQ is programmable. In this mode it must be specified in the CNTS register after how many CMU clock cycles the interrupt has to be raised.

A value of 0 in GTM0TIMixCNTS means that after one CLK_SEL edge a trigger/interrupt is raised, and a value of 1 means that after two edges a trigger/interrupt is raised, and so on.

In the GTM0TIMixCNT register the elapsed cycles were incremented and compared against GTM0TIMixCNTS. If GTM0TIMixCNT is greater or equal to GTM0TIMixCNTS a trigger will be raised. This allows by writing a value to GTM0TIMixCNTS that the actual period time can be changed on the fly.

Operation is done depending on cmu clock, DSL, ISL bit and the input signal value defined in next table:

**Table 25.67 TIM Gated Periodic Sampling Mode (TGPS)**

| Input signal F_OUTx | selected CMU Clock | External capture | ISL | DSL | Action description |
|---|---|---|---|---|---|
| — | 1 | 0 | 1 | — | if CNT == CNTS then<br>do capture ;issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 0 | 0 | 0 | 0 | 1 | no |
| 1 | 1 | 0 | 0 | 1 | if CNT == CNTS then<br>do capture ;issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 0 | 0 | — | 0 | 1 | no |
| 0 | 1 | 0 | 0 | 0 | if CNT == CNTS then<br>do capture ;issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 1 | 0 | 0 | 0 | 0 | no |
| — | 0 | 0 | — | — | no |

In this mode the GTM0TIMixGPR1 operates as a shadow register for GTM0TIMixCNTS. This would allow that the period for the next sampling period could be specified. The update of GTM0TIMixCNTS will only take place once on a trigger if the GTM0TIMixGPR1 was written by the CPU. This means that the captured value from the previous trigger can be read by the CPU from GTM0TIMixGPR1 and afterwards the new sampling period for the next sampling period (the one after the actual sampling period) could be written.

With each triggered interrupt, the registers GPR0 and GPR1 are updated according to bits GPR0_SEL, GPR1_SEL, EGPR0_SEL and EGPR1_SEL.

When selecting ECNT as a source for the capture registers, GPRx will show the edge count and the input signal value at point of capture. Selecting GPR0_SEL = '11' and EGPR0_SEL = '0' for TIM channel 0 all 8 TIM input signals will be captured to GPR0[7:0].

In the TGPS Mode the bit field CLK_SEL of register GTM0TIMixCTRLwill define the selected CMU clock which will be used.

The behavior of the ECNT counter is configurable by ECNT_RESET. If set to 1 on each interrupt (period expired) the ECNT will be reset. Otherwise it operates in wrap around mode.

If the register ECNT produces an overflow during the measurement, the bit ECNTOFL is set inside the register GTM0TIMixIRQNOTIFY and interrupt TIM_ECNTOFL[x]_IRQ is raised depending on corresponding interrupt enable condition.

### (a) External capture TIM Gated Periodic Sampling Mode (TGPS)

If external capture is enabled, the external capture events will capture the GPRx, reset the counter CNT and issue a NEWVAL_IRQ.

Operation is done depending on the cmu clock, external capture signal, DSL, ISL bit and the input signal value defined in next table:

**Table 25.68 External capture TIM Gated Periodic Sampling Mode (TGPS)**

| Input signal F_OUTx | selected CMU Clock | External capture | ISL | DSL | Action description |
|---|---|---|---|---|---|
| — | 1 | 0 | 1 | — | if CNT == CNTS then<br>do capture; issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 0 | 0 | 0 | 0 | 1 | no |
| 1 | 1 | 0 | 0 | 1 | if CNT == CNTS then<br>do capture; issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 0 | 0 | — | 0 | 1 | no |
| 0 | 1 | 0 | 0 | 0 | if CNT == CNTS then<br>do capture; issue NEWVAL_IRQ; CNT = 0<br>else<br>CNT++<br>endif |
| 1 | 0 | 0 | 0 | 0 | no |
| — | 0 | 0 | — | — | no |
| — | — | rising edge | — | — | do capture; issue NEWVAL_IRQ; CNT = 0 |

### 25.10.5 TIM Interrupt Signals

TIM provides 6 interrupt lines per channel. These interrupts are shown below:

**Table 25.69 TIM Interrupt Signals**

| Signal | Description |
|---|---|
| TIM[i]_NEWVAL[x]_IRQ | New measurement value detected by SMU of channel x (x: 0 to 7) |
| TIM[i]_ECNTOFL[x]_IRQ | ECNT counter overflow of channel x (x: 0 to 7) |
| TIM[i]_CNTOFL[x]_IRQ | SMU CNT counter overflow of channel x (x: 0 to 7) |
| TIM[i]_GPROFL[x]_IRQ | GPR0 and GPR1 data overflow, old data was not read out before new data has arrived at input pin of channel x (x: 0 to 7) |
| TIM[i]_TODET[x]_IRQ | Time out reached for input signal of channel x (x: 0 to 7) |
| TIM[i]_GLITCHDET_IRQ | A glitch was detected by the TIM filter of channel x (x: 0 to 7) |

### 25.10.6 TIM Configuration Registers Overview

TIM contains following configuration registers:

**Table 25.70 Register list**

| Symbol | Register Name | Detail in Section |
|---|---|---|
| GTM0TIMixCTRL | channel x control | **25.10.7.1**, **25.10.7.2** |
| GTM0TIM00ECTRL | channel x (x: 0 to 7) extended control | **25.10.7.19** |
| GTM0TIMixFLTRE | channel x (x: 0 to 7) filter parameter 0 | **25.10.7.3** |
| GTM0TIMixFLTFE | channel x (x: 0 to 7) filter parameter 1 | **25.10.7.4** |
| GTM0TIMixTDUV | channel x (x: 0 to 7) TDU control. | **25.10.7.16** |
| GTM0TIMixTDUC | channel x (x: 0 to 7) TDU counter. | **25.10.7.17** |
| GTM0TIMixGPR0 | channel x (x: 0 to 7) general purpose 0 | **25.10.7.5** |
| GTM0TIMixGPR1 | channel x (x: 0 to 7) general purpose 1 | **25.10.7.6** |
| GTM0TIMixCNT | channel x (x: 0 to 7) SMU counter | **25.10.7.7** |
| GTM0TIMixECNT | channel x (x: 0 to 7) SMU edge counter | **25.10.7.18** |
| GTM0TIMixCNTS | channel x (x: 0 to 7) SMU shadow counter | **25.10.7.8** |
| GTM0TIMixIRQNOTIFY | channel x (x: 0 to 7) interrupt notification | **25.10.7.9** |
| GTM0TIMixIRQEN | channel x (x: 0 to 7) interrupt enable | **25.10.7.10** |
| GTM0TIMixEIRQEN | channel x (x: 0 to 7) error interrupt enable | **25.10.7.15** |
| GTM0TIMixIRQFORCINT | channel x (x: 0 to 7) software interrupt force | **25.10.7.11** |
| GTM0TIMixIRQMODE | IRQ mode configuration register (x: 0 to 7) | **25.10.7.12** |
| GTM0TIMiRST | TIM global software reset | **25.10.7.13** |
| GTM0TIMiINSRC | TIM AUX IN source selection | **25.10.7.14** |
| GTM0TIMiINPVAL | TIM input value observation | **25.10.7.20** |

## 25.10.7 TIM Configuration Registers Description

### 25.10.7.1 GTM0TIM1xCTRL (x = 0 to 7)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0TIM10ECTRL: <GTM_base> + $01824_H$
GTM0TIM11ECTRL: <GTM_base> + $018A4_H$
GTM0TIM12ECTRL: <GTM_base> + $01924_H$
GTM0TIM13ECTRL: <GTM_base> + $019A4_H$
GTM0TIM14ECTRL: <GTM_base> + $01A24_H$
GTM0TIM15ECTRL: <GTM_base> + $01AA4_H$
GTM0TIM16ECTRL: <GTM_base> + $01B24_H$
GTM0TIM17ECTRL: <GTM_base> + $01BA4_H$

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |

**Table 25.71 GTM0TIM1xCTRL Register Contents (1/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31, 30 | TOCTRL | Timeout control<br>00: Timeout feature disabled<br>11: Timeout feature enabled for both edges<br>01: Timeout feature enabled for rising edge only<br>10: Timeout feature enabled for falling edge only |
| 29 | EGPR1_SEL | Extension of GPR1_SEL bit field.<br>Details described in GPR1_SEL bit field. |
| 28 | EGPR0_SEL | Extension of GPR0_SEL bit field.<br>Details described in GPR0_SEL bit field. |
| 27 | FR_ECNT_OFL | Extended Edge counter overflow behavior<br>0: Overflow will be signalled on ECNT bit width = 8<br>1: Overflow will be signalled on EECNT bit width (full range) |
| 26 to 24 | CLK_SEL | CMU clock source select for channel.<br>000: CMU_CLK0 selected<br>001: CMU_CLK1 selected<br>010: CMU_CLK2 selected<br>011: CMU_CLK3 selected<br>100: CMU_CLK4 selected<br>101: CMU_CLK5 selected<br>110: CMU_CLK6 selected<br>111: CMU_CLK7 selected |
| 23 | FLT_CTR_FE | Filter counter mode for falling edge.<br>0: Up/Down Counter<br>1: Hold Counter<br>**NOTE**<br>This bit is only applicable in Individual Deglitch Time Mode. |

Table 25.71 GTM0TIM1xCTRL Register Contents (2/4)

| Bit Position | Bit Name | Function |
|---|---|---|
| 22 | FLT_MODE_FE | Filter mode for falling edge.<br>0: Immediate edge propagation mode<br>1: Individual de-glitch mode |
| 21 | FLT_CTR_RE | Filter counter mode for rising edge.<br>0: Up/Down Counter<br>1: Hold Counter<br>**NOTE**<br>This bit is only applicable in Individual Deglitch Time Mode. |
| 20 | FLT_MODE_RE | Filter mode for rising edge.<br>0: Immediate edge propagation mode<br>1: Individual de-glitch mode |
| 19 | EXT_CAP_EN | Enables external capture mode. The selected TIM mode is only sensitive to external capture pulses the input event changes are ignored.<br>0: External capture disabled<br>1: External capture enabled |
| 18, 17 | FLT_CNT_FRQ | Filter counter frequency select<br>00: FLT_CNT counts with CMU_CLK0<br>01: FLT_CNT counts with CMU_CLK1<br>10: FLT_CNT counts with CMU_CLK6<br>11: FLT_CNT counts with CMU_CLK7 |
| 16 | FLT_EN | Filter enable for channel x (x = 0 to 7)<br>0: Filter disabled and internal states are reset<br>1: Filter enabled<br>**NOTE**<br>If the filter is disabled all filter related units (including CSU) are bypassed, which means that the signal F_IN is directly routed to signal F_OUT. |
| 15 | ECNT_RESET | Enables resetting the ECNT counter in periodic sampling mode<br>0: ECNT counter operating in wrap around mode<br>1: ECNT counter is reset with periodic sampling |
| 14 | ISL | Ignore signal level<br>0: Use DSL bit for selecting active signal level<br>1: Ignore DSL and treat both edges as active edge<br>**NOTE**<br>This bit is only applicable in Input Event mode (TIEM). |
| 13 | DSL | Signal level control<br>0: Measurement starts with falling edge (low level measurement)<br>1: Measurement starts with rising edge (high level measurement) |
| 12 | CNTS_SEL | Selection for CNTS register<br>0: Use CNT register as input<br>1: Use TBU_TS0 as input<br>**NOTE**<br>The functionality of the CNTS_SEL is disabled in the modes TIPM and TBCM. |

**Table 25.71 GTM0TIM1xCTRL Register Contents (3/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 11, 10 | GPR1_SEL | Selection for GPR1 register<br>If EGPR1_SEL =0:<br>00: Use TBU_TS0 as input<br>01: Use TBU_TS1 as input<br>10: Use TBU_TS2 as input<br>11: Use CNT as input<br>If EGPR1_SEL =1:<br>00: Use ECNT as input<br>01: Use TIM_INP_VAL as input<br>10: Reserved<br>11: Reserved<br>**NOTES**<br>1. In TBCM mode: EGPR1_SEL = 1, GPR1_SEL=01 selects TIM_INP_VAL as input, in all other cases TIM Filter F_OUT is used.<br>2. If a reserved value is written to the EGPR1_SEL, GPR1_SEL bit fields, the hardware will use TBU_TS0 input. |
| 9, 8 | GPR0_SEL | Selection for GPR0 register<br>If EGPR0_SEL =0:<br>00: Use TBU_TS0 as input<br>01: Use TBU_TS1 as input<br>10: Use TBU_TS2 as input<br>11: Use CNTS as input;if TGPS mode in channel = 0 is selected use TIM Filter F_OUT as input<br>If EGPR0_SEL =1:<br>00: Use ECNT as input<br>01: Use TIM_INP_VAL as input<br>10: Reserved<br>11: Reserved<br>**NOTE**<br>If a reserved value is written to the EGPR0_SEL, GPR0_SEL bit fields, the hardware will use TBU_TS0 input. |
| 7 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 6 | CICTRL | Channel Input Control.<br>0: Use signal TIM_IN(x) as input for channel x<br>1: Use signal TIM_IN(x-1) as input for channel x (or TIM_IN(m-1) if x is 0) |
| 5 | ARU_EN | GPR0 and GPR1 register values routed to ARU<br>0: Registers content not routed<br>1: Registers content routed |
| 4 | OSM | One-shot mode<br>0: Continuous operation mode<br>1: One-shot mode<br>**NOTE**<br>After finishing the action in one-shot mode the TIM_EN bit is cleared automatically. |

**Table 25.71 GTM0TIM1xCTRL Register Contents (4/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 to 1 | TIM_MODE | TIM channel x (x = 0 to 7) mode<br>000: PWM Measurement Mode (TPWM)<br>001: Pulse Integration Mode (TPIM)<br>010: Input Event Mode (TIEM)<br>011: Input Prescaler Mode (TIPM)<br>100: Bit Compression Mode (TBCM)<br>101: Gated Periodic Sampling Mode (TGPS)<br>**NOTES**<br>1. If an undefined value is written to the TIM_MODE register, the hardware switches automatically to TIM_MODE = 000 (TPWM mode).<br>2. The TIM_MODE register should not be changed while the TIM channel is enabled.<br>3. If the TIM channel is enabled and operating in TPWM or TPIM mode after the first valid edge defined by DSL has occurred, a reconfiguration of DSL,ISL,TIM_MODE will not change the channel behavior. Reading these bit fields after reconfiguration will show the newly configured settings but the initial channel behavior will not change. Only a disabling of the TIM channel by setting TIM_EN = 0 and reenabling with TIM_EN = 1 will change the channel operation mode. |
| 0 | TIM_EN | TIM channel x (x = 0 to 7) enable<br>0: Channel disabled<br>1: Channel enabled<br>**NOTES**<br>1. Enabling of the channel resets the registers ECNT, GTM0TIMixCNT, GTM0TIMixGPR0, and GTM0TIMixGPR1 to their reset values.<br>2. After finishing the action in one-shot mode the TIM_EN bit is cleared automatically. Otherwise, the bit must be cleared manually. |

### 25.10.7.2 GTM0TIM0xCTRL (x = 0 to 7)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0TIM00ECTRL: <GTM_base> + $01024_H$
GTM0TIM01ECTRL: <GTM_base> + $010A4_H$

|---|---|---|
| 11, 10 | GPR1_SEL | Selection for GPR1 register<br>If EGPR1_SEL = 0:<br>00: Use TBU_TS0 as input<br>01: Use TBU_TS1 as input<br>10: Use TBU_TS2 as input<br>11: Use CNT as input<br>If EGPR1_SEL =1:<br>00: Use ECNT as input<br>01: Use TIM_INP_VAL as input<br>10: Reserved<br>11: Reserved<br>**NOTES**<br>1. In TBCM mode: EGPR1_SEL=1, GPR1_SEL=01 selects TIM_INP_VAL as input, in all other cases TIM Filter F_OUT is used.<br>2. If a reserved value is written to the EGPR1_SEL, GPR1_SEL bit fields , the hardware will use TBU_TS0 input. |
| 9, 8 | GPR0_SEL | Selection for GPR0 register<br>If EGPR0_SEL = 0:<br>00: Use TBU_TS0 as input<br>01: Use TBU_TS1 as input<br>10: Use TBU_TS2 as input<br>11: Use CNTS as input;if TGPS mode in channel = 0 is selected use TIM Filter F_OUT as input<br>If EGPR0_SEL =1:<br>00: Use ECNT as input<br>01: Use TIM_INP_VAL as input<br>10: Reserved<br>11: Reserved<br>**NOTE**<br>If a reserved value is written to the EGPR0_SEL, GPR0_SEL bit fields, the hardware will use TBU_TS0 input. |
| 7 | TBU0_SEL | TBU_TS0 bits input select for TIM0_CH[x]_GPRz (z: 0, 1)<br>0: Use TBU_TS0(23 to 0) to store in TIM0_CH[x]_GPR0/TIM0_CH[x]_GPR1<br>1: Use TBU_TS0(26 to 3) to store in TIM0_CH[x]_GPR0/TIM0_CH[x]_GPR1 |
| 6 | CICTRL | Channel Input Control.<br>0: Use signal TIM_IN(x) as input for channel x<br>1: Use signal TIM_IN(x-1) as input for channel x (or TIM_IN(m-1) if x is 0) |
| 5 | ARU_EN | GPR0 and GPR1 register values routed to ARU<br>0: Registers content not routed<br>1: Registers content routed |
| 4 | OSM | One-shot mode<br>0: Continuous operation mode<br>1: One-shot mode<br>**NOTE**<br>After finishing the action in one-shot mode the TIM_EN bit is cleared automatically. |

**Table 25.72 GTM0TIM0xCTRL Register Contents (4/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 3 to 1 | TIM_MODE | TIM channel x (x = 0 to 7) mode<br>000: PWM Measurement Mode (TPWM)<br>001: Pulse Integration Mode (TPIM)<br>010: Input Event Mode (TIEM)<br>011: Input Prescaler Mode (TIPM)<br>100: Bit Compression Mode (TBCM)<br>101: Gated Periodic Sampling Mode (TGPS)<br>**NOTES**<br>1. If an undefined value is written to the TIM_MODE register, the hardware switches automatically to TIM_MODE = 000 (TPWM mode).<br>2. The TIM_MODE register should not be changed while the TIM channel is enabled.<br>3. If the TIM channel is enabled and operating in TPWM or TPIM mode after the first valid edge defined by DSL has occurred, a reconfiguration of DSL,ISL,TIM_MODE will not change the channel behavior. Reading these bit fields after reconfiguration will show the newly configured settings but the initial channel behavior will not change. Only a disabling of the TIM channel by setting TIM_EN = 0 and reenabling with TIM_EN = 1 will change the channel operation mode. |
| 0 | TIM_EN | TIM channel x (x = 0 to 7) enable<br>0: Channel disabled<br>1: Channel enabled<br>**NOTES**<br>1. Enabling of the channel resets the registers ECNT, GTM0TIMixCNT, GTM0TIMixGPR0, and GTM0TIMixGPR1 to their reset values.<br>2. After finishing the action in one-shot mode the TIM_EN bit is cleared automatically. Otherwise, the bit must be cleared manually. |

### 25.10.7.3 GTM0TIMixFLTRE (i = 0,1, x = 0 to 7)

**Access:** This register can be read/written in 32-bit units.

**Address:**
GTM0TIM00FLTRE: <GTM_base> + $0101C_H$, GTM0TIM10FLTRE: <GTM_base> + $0181C_H$
GTM0TIM01FLTRE: <GTM_base> + $0109C_H$, GTM0TIM11FLTRE: <GTM_base> + $0189C_H$
GTM0TIM02FLTRE: <GTM_base> + $0111C_H$, GTM0TIM12FLTRE: <GTM_base> + $0191C_H$
GTM0TIM03FLTRE: <GTM_base> + $0119C_H$, GTM0TIM13FLTRE: <GTM_base> + $0199C_H$
GTM0TIM04FLTRE: <GTM_base> + $0121C_H$, GTM0TIM14FLTRE: <GTM_base> + $01A1C_H$
GTM0TIM05FLTRE: <GTM_base> + $0129C_H$, GTM0TIM15FLTRE: <GTM_base> + $01A9C_H$
GTM0TIM06FLTRE: <GTM_base> + $0131C_H$, GTM0TIM16FLTRE: <GTM_base> + $01B1C_H$
GTM0TIM07FLTRE: <GTM_base> + $0139C_H$, GTM0TIM17FLTRE: <GTM_base> + $01B9C_H$

**Value after reset:** $0000\ 0000_H$

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

**Table 25.75 GTM0TIMixGPR0 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | ECNT | Edge counter.<br>**NOTE**<br>The ECNT counts every incoming filtered edge (rising and falling). The counter value is uneven in case of detected rising, and even in case of detected falling edge. Thus, the input signal level is part of the counter and can be obtained by bit 0 of ECNT. |
| 23 to 0 | GPR0 | Input signal characteristic parameter 0. |

**NOTES**

1. The ECNT register is reset to its initial value when the channel is enabled. Please note, that bit 0 depends on the input level coming from the filter unit and defines the reset value immediately.
2. The content of this register has different meaning for the TIM channels modes. The content directly depends on the bit fields EGPR0_SEL, GPR0_SEL of register GTM0TIMixCTRL.

### 25.10.7.6 GTM0TIMixGPR1 (i = 0,1, x = 0 to 7)

**Access:** This register can be read/written in 32-bit units.

**Address:**

| | |
|---|---|
| GTM0TIM00GPR1: <GTM_base> + $01004_H$, | GTM0TIM10GPR1: <GTM_base> + $01804_H$ |
| GTM0TIM01GPR1: <GTM_base> + $01084_H$, | GTM0TIM11GPR1: <GTM_base> + $01884_H$ |
| GTM0TIM02GPR1: <GTM_base> + $01104_H$, | GTM0TIM12GPR1: <GTM_base> + $01904_H$ |
| GTM0TIM03GPR1: <GTM_base> + $01184_H$, | GTM0TIM13GPR1: <GTM_base> + $01984_H$ |
| GTM0TIM04GPR1: <GTM_base> + $01204_H$, | GTM0TIM14GPR1: <GTM_base> + $01A04_H$ |
| GTM0TIM05GPR1: <GTM_base> + $01284_H$, | GTM0TIM15GPR1: <GTM_base> + $01A84_H$ |
| GTM0TIM06GPR1: <GTM_base> + $01304_H$, | GTM0TIM16GPR1: <GTM_base> + $01B04_H$ |
| GTM0TIM07GPR1: <GTM_base> + $01384_H$, | GTM0TIM17GPR1: <GTM_base> + $01B84_H$ |

**Value after reset:** $0X00\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | ECNT | | | | | | | | GPR1 | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | — | — | — | — | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | GPR1 | | | | | | | | | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.76 GTM0TIMixGPR1 Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | ECNT | Edge counter.<br>**NOTE**<br>The ECNT counts every incoming filtered edge (rising and falling). The counter value is uneven in case of detected rising, and even in case of detected falling edge. Thus, the input signal level is part of the counter and can be obtained by bit 0 of ECNT. |
| 23 to 0 | GPR1 | Input signal characteristic parameter 1.<br>**NOTE**<br>In TBCM mode if EGPR1_SEL=1, GPR1_SEL=01 then TIM_INP_VAL is used as input in all other cases TIM Filter F_OUT is used as input and Bits GPR1(23:8) = 0 |

**NOTES**

1. The ECNT register is reset to its initial value when the channel is enabled. Please note, that bit 0 depends on the input level coming from the filter unit and defines the reset value immediately.
2. The content of this register has different meaning for the TIM channels modes. The content directly depends on the bit fields EGPR1_SEL, GPR1_SEL of register GTM0TIMixCTRL.
3. The content of this register can only be written in TIM channel mode TGPS.

### 25.10.7.7 GTM0TIMixCNT (i = 0,1, x = 0 to 7)

**Access:** This register can be read in 32-bit units.

**Address:**

| | |
|---|---|
| GTM0TIM00CNT: <GTM_base> + $01008_H$, | GTM0TIM10CNT: <GTM_base> + $01808_H$ |
| GTM0TIM01CNT: <GTM_base> + $01088_H$, | GTM0TIM11CNT: <GTM_base> + $01888_H$ |
| GTM0TIM02CNT: <GTM_base> + $01108_H$, | GTM0TIM12CNT: <GTM_base> + $01908_H$ |
| GTM0TIM03CNT: <GTM_base> + $01188_H$, | GTM0TIM13CNT: <GTM_base> + $01988_H$ |
| GTM0TIM04CNT: <GTM_base> + $01208_H$, | GTM0TIM14CNT: <GTM_base> + $01A08_H$ |
| GTM0TIM05CNT: <GTM_base> + $01288_H$, | GTM0TIM15CNT: <GTM_base> + $01A88_H$ |
| GTM0TIM06CNT: <GTM_base> + $01308_H$, | GTM0TIM16CNT: <GTM_base> + $01B08_H$ |
| GTM0TIM07CNT: <GTM_base> + $01388_H$, | GTM0TIM17CNT: <GTM_base> + $01B88_H$ |

**Value after reset:** $0000\ 0000_H$

| Bit | 31 | 30 | 29 | 28 | 27 | 26 | 25 | 24 | 23 | 22 | 21 | 20 | 19 | 18 | 17 | 16 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | — | — | — | — | — | — | — | — | CNT | | | | | | | |
| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

| Value after reset | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

**Table 25.78 GTM0TIMixCNTS Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 24 | ECNT | Edge counter.<br>**NOTE**<br>The ECNT counts every incoming filtered edge (rising and falling). The counter value is uneven in case of detected rising, and even in case of detected falling edge. Thus, the input signal level is part of the counter and can be obtained by bit 0 of ECNT. |
| 23 to 0 | CNTS | Counter shadow register. |

**NOTES**

1. The ECNT register is reset to its initial value when the channel is enabled. Please note, that bit 0 depends on the input level coming from the filter unit and defines the reset value immediately.
2. The content of this register has different meaning for the TIM channels modes. The content depends directly on the bit field CNTS_SEL of register GTM0TIMixCTRL.
3. The register GTM0TIMixCNTS is only writable in TIPM,TBCM and TGPS mode.

### 25.10.7.9 GTM0TIMixIRQNOTIFY (i = 0,1, x = 0 to 7)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0TIM00IRQNOTIFY: <GTM_base> + $0102C_H$, GTM0TIM10IRQNOTIFY: <GTM_base> + $0182C_H$
GTM0TIM01IRQNOTIFY: <GTM_base> + $010AC_H$, GTM0TIM11IRQNOTIFY: <GTM_base> + $018AC_H$

# 25.11 ARU-connected Timer Output Module (ATOM)

## 25.11.1 Overview

The ARU-connected Timer Output Module (ATOM) is able to generate complex output signals without CPU interaction due to its connectivity to the ARU. Typically, output signal characteristics are provided over the ARU connection through submodules connected to ARU like e.g. the MCS, DPLL or PSM. Each ATOM submodule contains eight output channels which can operate independently from each other in several configurable operation modes. A block diagram of the ATOM submodule is depicted in **Figure 25.32**.

The following design variables are used inside this chapter. See **Section 25.18, GTM Device 207** and **Section 25.19, GTM Device 208** for correct value.

**NOTE**

cCATO : ATOM channel count; number of channels per instance – 1

### 25.11.1.1 ATOM block diagram

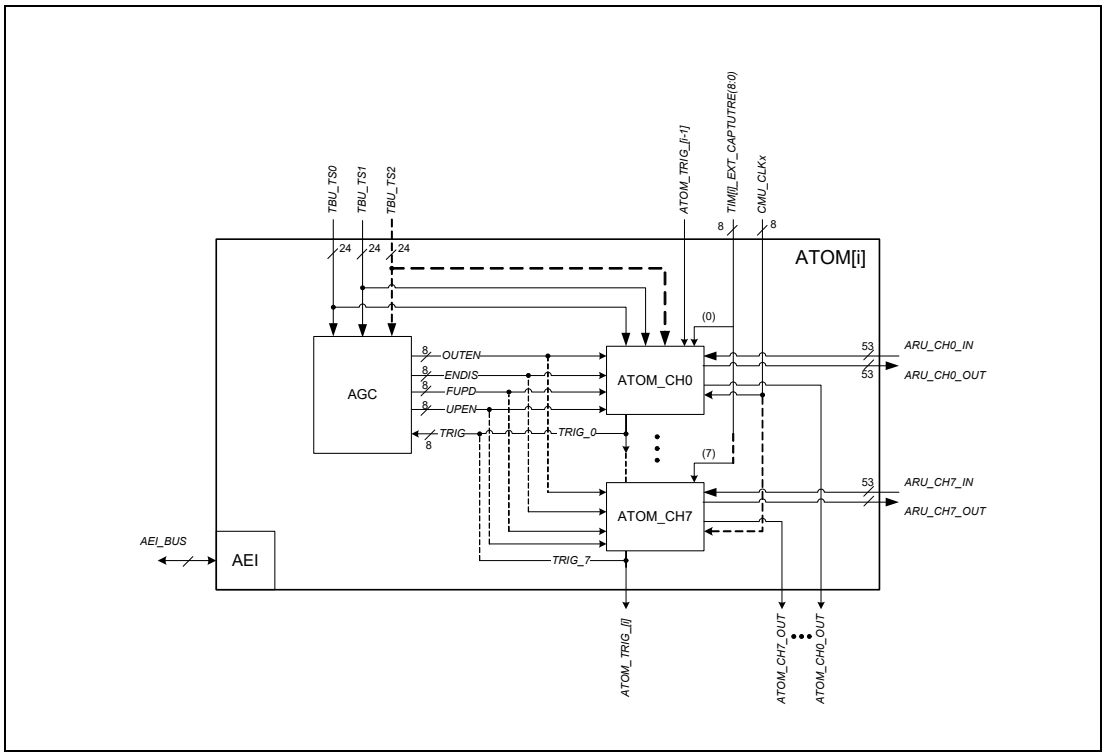

**Figure 25.32 ATOM block diagram**

The architecture of the ATOM submodule is similar to the TOM submodule, but there are some differences. First, the ATOM integrates only eight output channels. Hence, there exists one ATOM Global Control subunit (AGC) for the ATOM channels. The ATOM is connected to the ARU and can set up individual read requests from the ARU and write requests to the ARU. Furthermore, the ATOM channels are able to generate signals on behalf of time stamps and the ATOM channels are able to generate a serial output signal on behalf of an internal shift register.

Each ATOM channel provides five modes of operation:

- ATOM Signal Output Mode Immediate (SOMI)
- ATOM Signal Output Mode Compare (SOMC)
- ATOM Signal Output Mode PWM (SOMP)
- ATOM Signal Output Mode Serial (SOMS)
- ATOM Signal Output Mode Buffered Compare (SOMB)

These modes are described in more detail in **Section 25.11.3, ATOM Channel modes** .

The ATOM channels' operation registers (e.g. counter, compare registers) are 24 bit wide. Moreover, the input clocks for the ATOM channels come from the configurable CMU_CLKx signals of the CMU submodule. This gives the freedom to select a programmable input clock for the ATOM channel counters. The ATOM channel is able to generate a serial bit stream, which is shifted out at the ATOM[i]_CH[x]_OUT output. When configured in this serial shift mode (SOMS) the selected CMU clock defines the shift frequency.

Each ATOM channel provides a so called operation and shadow register set. With this architecture it is possible to work with the operation register set, while the shadow register set can be reloaded with new parameters over CPU and/or ARU.

When update via ARU is selected, it is possible to configure if both shadow registers are updated via ARU or only one of the shadow registers is updated for SOMP mode.

On the other hand, the shadow registers can be used to provide data to the ARU when one or both of the compare units inside an ATOM channel match. This feature is only applicable in SOMC mode.

In TOM channels it is possible to reload the content of the operation registers with the content of the corresponding shadow registers and change the clock input signal for the counter register simultaneously. This simultaneous change of the input clock frequency together with reloading the operation registers is also implemented in the ATOM channels.

In addition to the feature that the CPU can select another CMU_CLKx during operation (i.e. updating the shadow register bit field CLK_SRC_SR of the GTM0ATOMixCTRL register), the selection can also be changed via the ARU. Then, for the clock source update, the ACBI register bits of the GTM0ATOMixSTAT register are used as a shadow register for the new clock source.

In general, the behavior of the compare units CCU0 and CCU1 and the output signal behavior is controlled with the ACB bit field inside the GTM0ATOMixCTRL register when the ARU connection is disabled and the behavior is controlled via ARU through the ACBI bit field of the GTM0ATOMixSTAT register, when the ARU is enabled.

Since the ATOM is connected to the ARU, the shadow registers of an ATOM channel can be reloaded via the ARU connection or via CPU over its AEI interface. When loaded via the ARU interface, the shadow registers act as a buffer between the ARU and the channel operation registers. Thus, a new parameter set for a PWM can be reloaded via ARU into the shadow registers, while the operation registers work on the actual parameter set.

The trigger signal ATOM_TRIG_[i–1] of ATOM instance i comes from the preceding instance i–1, the trigger ATOM_TRIG_[i] is routed to succeeding instance i+1.

Note, ATOM0 is connected to its own output ATOM_TRIG_0, i.e. the last channel of ATOM instance 0 can trigger the first channel of ATOM instance 0 (this path is registered, which means delayed by one SYS_CLK period).

### 25.11.1.2 ATOM Global control (AGC)

Synchronous start and stop of more than one output channel is possible with the AGC subunit. This subunit has the same functionality as the TGC subunit of the TOM submodule. For a description of the AGC subunit functionality, please refer therefore to chapter **(2) AGC Subunit**.

#### (1) Overview

There exist one global channel control unit (AGC) to drive a number of individual ATOM channels synchronously by external or internal events.

An AGC can drive up to eight ATOM channels.

The ATOM submodule supports four different kinds of signalling mechanisms:

- Global enable/disable mechanism for each ATOM channel with control register GTM0ATOMiAGCENDISCTRL and status register GTM0ATOMiAGCENDISSTAT
- Global output enable mechanism for each ATOM channel with control register GTM0ATOMiAGCOUTENCTRL and status register GTM0ATOMiAGCOUTENSTAT
- Global force update mechanism for each ATOM channel with control register GTM0ATOMiAGCFUPDCTRL
- Update enable of the register CM0, CM1 and CLK_SRC for each ATOM channel with the control bit field UPEN_CTRL[z] of GTM0ATOMiAGCGLBCTRL

#### (2) AGC Subunit

Each of the first three individual mechanisms (enable/disable of the channel, output enable and force update) can be driven by three different trigger sources.

The three trigger sources are :

- the host CPU (bit HOST_TRIG of register GTM0ATOMiAGCGLBCTRL)
- the TBU time stamp (signal TBU_TS0..2 if available)
- the internal trigger signal TRIG (bunch of trigger signals TRIG_[x]) which can be either the trigger TRIG_CCU0 of channel x, the trigger of preceeding channel x-1 (i.e signal TRIG_[x–1]) or the external trigger TIM_EXT_CAPTURE(x) of assigned TIM channel x.

The first way is to trigger the control mechanism by a direct register write access via host CPU (bit HOST_TRIG of register AOM[i]_AGC_GLB_CTRL).

The second way is provided by a compare match trigger on behalf of a specified time base coming from the module TBU (selected by bits TBU_SEL) and the time stamp compare value defined in the bit field ACT_TB of register GTM0ATOMiAGCACTTB.

Note, a signed compare of ACT_TB and selected TBU_TS[x] is performed.

The third possibility is the input TRIG (bunch of trigger signals TRIG_[x]) coming from the ATOM channels 0 to 7.

The corresponding trigger signal TRIG_[x] coming from channel [x] can be masked by the register GTM0ATOMiAGCINTTRIG.

To enable or disable each individual ATOM channel, the registers GTM0ATOMiAGCENDISCTRL and/or GTM0ATOMiAGCENDISSTAT have to be used.

The register GTM0ATOMiAGCENDISSTAT controls directly the signal ENDIS. A write access to this register is possible.

The register GTM0ATOMiAGCENDISCTRL is a shadow register that overwrites the value of register AOM[i]_AGC_ENDIS_STAT if one of the three trigger conditions matches.

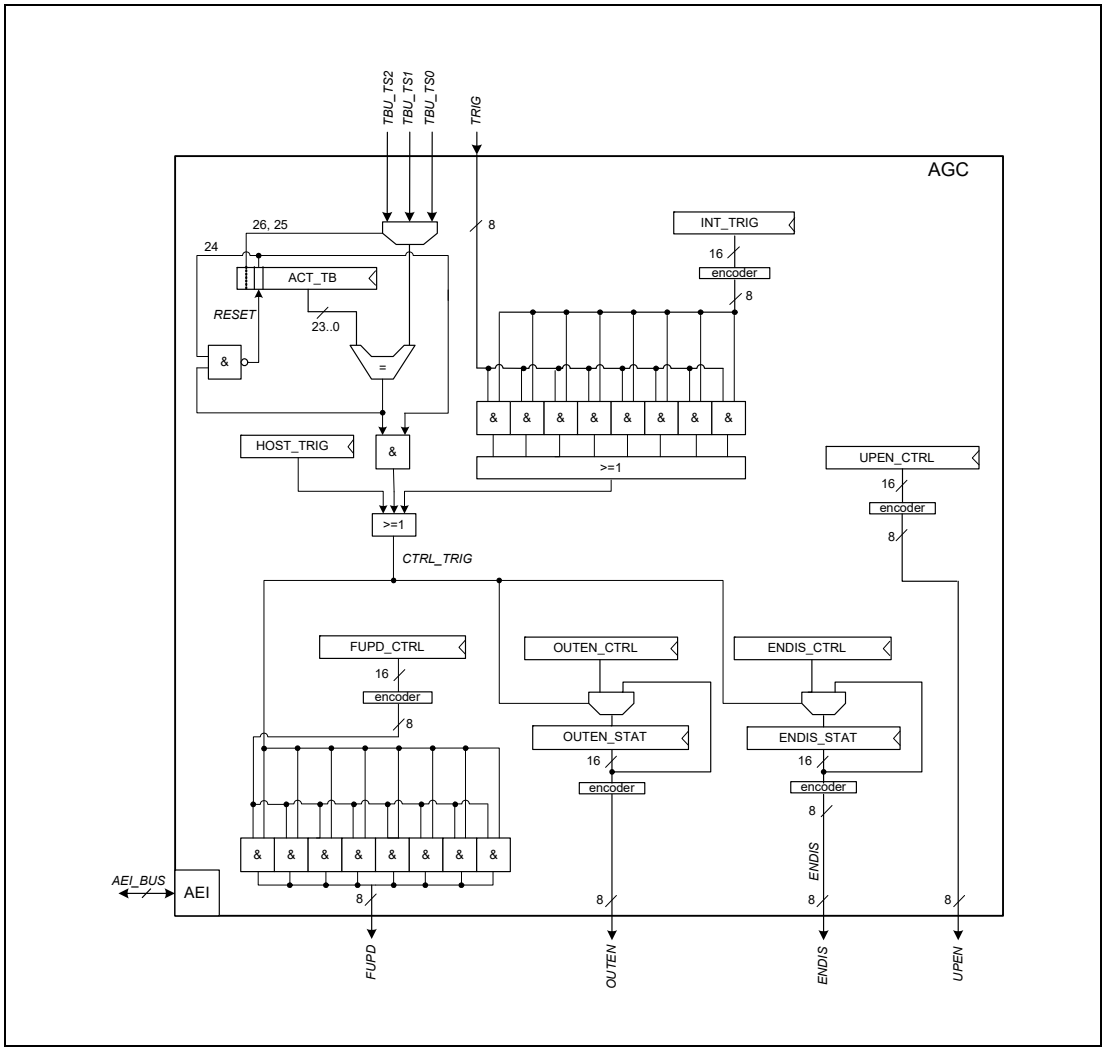

**Figure 25.33 ATOM Global channel control mechanism**

The output of the individual ATOM channels can be controlled using the register GTM0ATOMiAGCOUTENCTRL and GTM0ATOMiAGCOUTENSTAT.

The register GTM0ATOMiAGCOUTENSTAT controls directly the signal OUTEN. A write access to this register is possible.

The register GTM0ATOMiAGCOUTENCTRL is a shadow register that overwrites the value of register GTM0ATOMiAGCOUTENSTAT if one of the three trigger conditions matches.

If a ATOM channel is disabled by the register GTM0ATOMiAGCOUTENSTAT, the actual value of the channel output at ATOM_CH[x]_OUT is defined by the signal level bit (SL) defined in the channel control register GTM0ATOMixCTRL.

If the output is enabled, the output at ATOM_CH[x]_OUT depends on value of Flip-Flop SOUR.

The register GTM0ATOMiAGCFUPDCTRL defines which of the ATOM channels receive a FORCE_UPDATE event if the trigger signal CTRL_TRIG is raised.

The register bits UPEN_CTRL[x] defines for which ATOM channel the update of the working register CM0, CM1 and CLK_SRC by the corresponding shadow register SR0, SR1 and CLK_SRC_SR is

enabled. If update is enabled, the register CM0, CM1 and CLK_SRC will be updated on reset of counter register CN0 (see **Figure 25.34**).

### (3) ATOM Channel mode overview

Each ATOM channel offers the following different operation modes:

In ATOM Signal Output Mode Immediate (SOMI), the ATOM channels generate an output signal immediately after receiving an ARU word according to the two signal level output bits of the ARU word received through the ACBI bit field. Due to the fact, that the ARU destination channels are served in a round robin order, the output signal can jitter in this mode with a jitter of the ARU round trip time.

In ATOM Signal Output Mode Compare (SOMC), the ATOM channel generates an output signal on behalf of time stamps that are located in the ATOM operation registers. These time stamps are compared with the time stamps, the TBU generates. The ATOM is able to receive new time stamps either by CPU or via the ARU. The new time stamps are directly loaded into the channels operation register. The shadow registers are used as capture registers for two time base values, when a compare match of the channels operation registers occurs.

In ATOM Signal Output Mode PWM (SOMP), the ATOM channel is able to generate simple and complex PWM output signals like the TOM submodule by comparing its operation registers with a submodule internal counter. In difference to the TOM, the ATOM shadow registers can be reloaded by the CPU and by the ARU in the background, while the channel operates on the operation registers.

In ATOM Signal Output Mode Serial (SOMS), the ATOM channel generates a serial output bit stream on behalf of a shift register. The number of bits shifted and the shift direction is configurable. The shift frequency is determined by one of the CMU_CLKx clock signals. See **Section 25.11.3.4, ATOM Signal Output Mode Serial (SOMS)** for further details.

In ATOM Signal Output Buffered Compare (SOMB), the ATOM channel generates an output signal on behalf of time stamps that located in the ATOM operation registers. These time stamps are compared with the time stamps, the TBU generates. The ATOM is able to receive new compare values either by CPU or via the ARU. The new compare values received via ARU are stored first in the shadow register and only if previous compare match is occurred, the operation register are updated with the content of the shadow register.

## 25.11.2 ATOM Channel architecture

Each ATOM channel is able to generate output signals according to four operation modes. The architecture of the ATOM channels is similar to the architecture of the TOM channels. The general architecture of an ATOM channel is depicted in **Figure 25.34**.

### 25.11.2.1 ATOM channel architecture

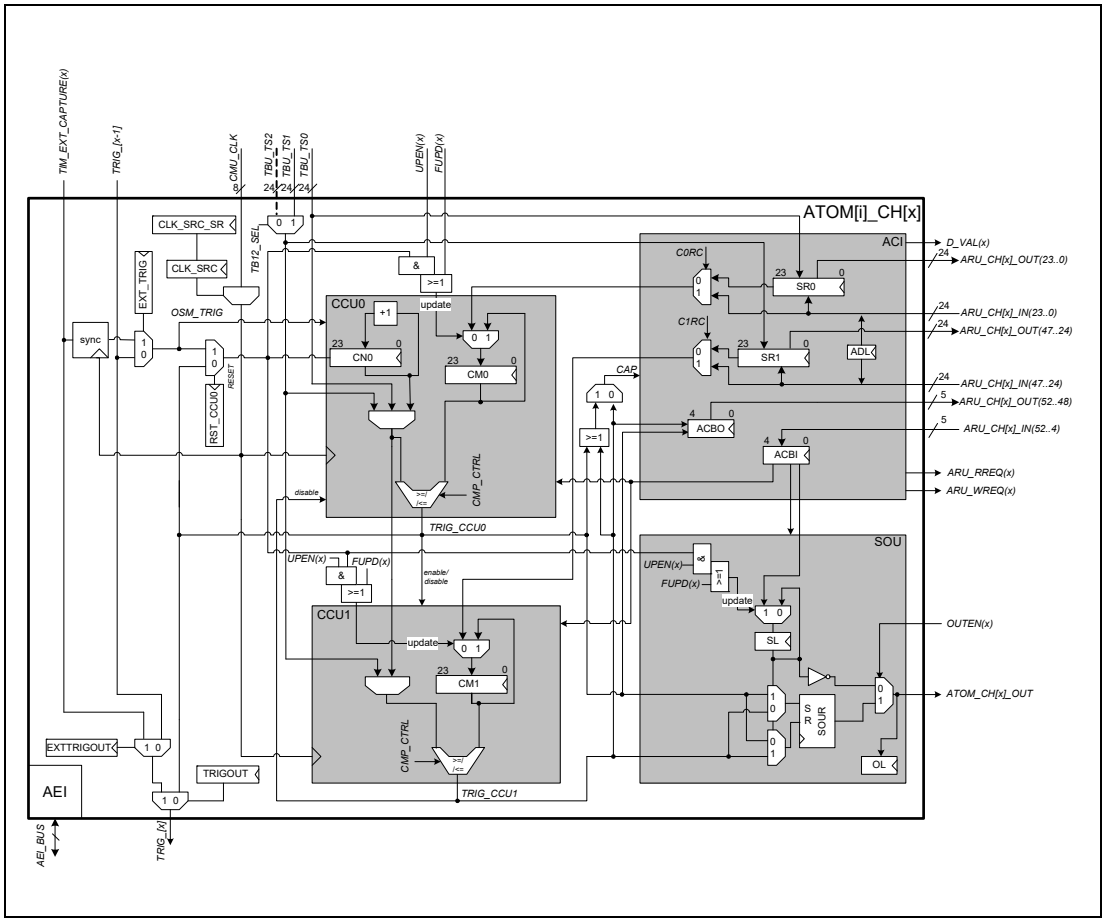

**Figure 25.34 ATOM channel architecture**

In all ATOM channels the operation registers CN0, CM0 and CM1 and the shadow registers SR0 and SR1 are the 24 bit width. The comparators inside CCU0 and CCU1 provide a selectable signed greater/equal or less/equal comparison to compare against the GTM time bases TBU_TS0, TBU_TS1 and, if available, TBU_TS2 . See **Section 25.9, Time Base Unit (TBU)** for further details. For an overview of the implemented TBU submodule version see **Section 25.6.1.1, GTM Architecture Block Diagram** . The CCU0 and CCU1 units have different tasks for the different ATOM channel modes.

The signed compare is used to detect time base overflows and to guarantee, that a compare match event can be set up for the future even when the time base will first overflow and then reach the compare value. Please note, that for a correct behavior of this signed compare, the new compare value must not be specified larger/smaller than half of the range of the total time base value ($7FFFFF_H$).

In SOMC/SOMB mode, the two compare units CCUx can be used in combination to each other. When used in combination, the trigger lines TRIG_CCU0 and TRIG_CCU1 can be used to enable/disable the other compare unit on a match event. See **Section 25.11.3.2, ATOM Signal Output Mode**

**Compare (SOMC)** and **Section 25.11.3.5, ATOM Signal Output Mode Buffered Compare(SOMB)** for further details.

The Signal Output Unit (SOU) generates the output signal for each ATOM channel. This output signal level depends on the ATOM channel mode and on the SL bit of the GTM0ATOMixCTRL register in combination with the two control bits. These two control bits ACB(1) and ACB(0) can either be received via CPU in the ACB register field of the GTM0ATOMixCTRL register or via ARU in the ACBI bit field of the GTM0ATOMixSTAT register.

The SL bit in the GTM0ATOMixCTRL register defines in all modes the operational behavior of the ATOM channel.

When the channel and its output is disabled, the output signal level of the channel is the inverse of the SL bit.

In SOMI, SOMC and SOMB mode the output signal level depends on the SL, ACB0 and ACB1 bits. In SOMP mode the output signal level depends on the two trigger signals TRIG_CCU0 and TRIG_CCU1 since theses two triggers define the PWM timing characteristics and the SL bit defines the level of the duty cycle. In SOMS mode the output signal level is defined by the bit pattern that has to be shifted out by the ATOM channel. The bit pattern is located inside the CM1 register.

The ARU Communication Interface (ACI) subunit is responsible for requesting data routed through ARU to the ATOM channel in SOMI, SOMP, SOMB and SOMS modes, and additionally for providing data to the ARU in SOMC mode.

In SOMC mode the ACI shadow registers have a different behavior and are used as output buffer registers for data send to ARU.

### 25.11.2.2 ARU Communication Interface

The ATOM channels have an ARU Communication Interface (ACI) subunit. This subunit is responsible for data exchange from and to the ARU. This is done with the two implemented registers SR0, SR1, and the ACBI and ACBO bit fields that are part of the GTM0ATOMixSTAT register. The ACI architecture is shown in **Figure 25.35**.

If the ARU_EN bit is set inside the GTM0ATOMixCTRL register, the ATOM channel is enabled by setting the enable bits inside the GTM0ATOMiAGCENDISSTAT register and the CPU hasn't written data not equal to zero into the CM0, CM1, SR0, SR1 register, the ATOM channel will first request data from the ARU before the signal generation starts in SOMP, SOMS, SOMC and SOMB mode.

Note: if in SOMP mode there is data inside the CM0 or SR0 register not equal to '0' the channel counter CN0 will start counting immediately, regardless whether the channel has received ARU data yet.

Note: if in SOMS mode there is data inside the CM0 or SR0 register not equal to '0' the channel will start shifting immediately, regardless whether the channel has received ARU data yet.

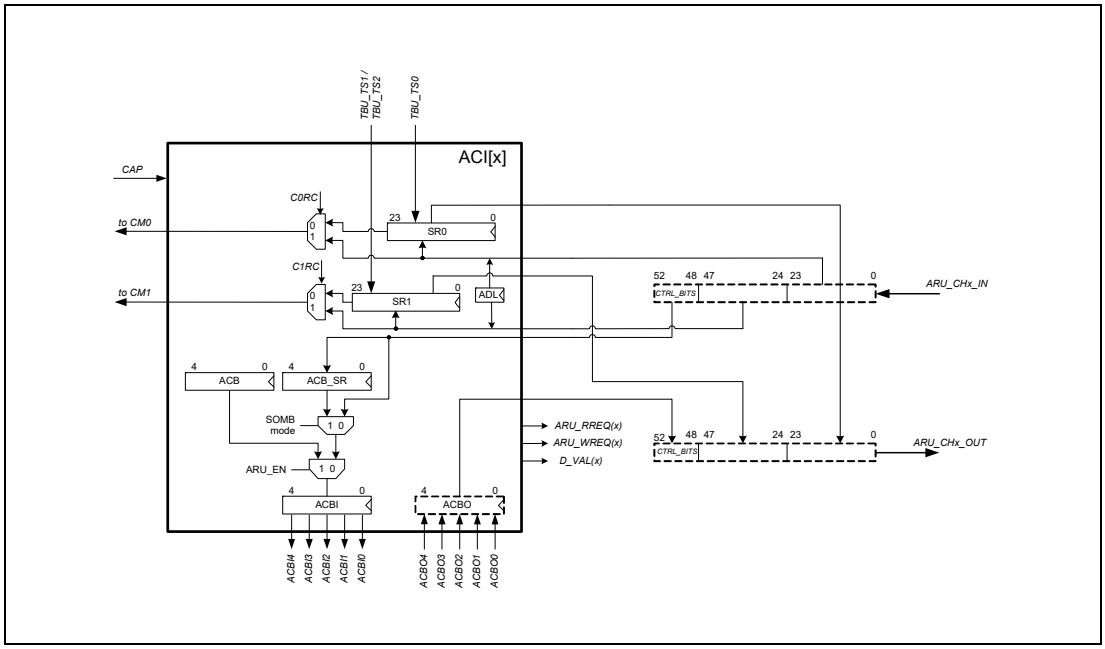

**Figure 25.35 ACI architecture overview**

Incoming ARU data (53 bit width signal ARU_CHx_IN) is split into three parts by the ACI and communicated to the ATOM channel registers. In SOMI, SOMP, SOMS and SOMB modes incoming ARU data ARU_CHx_IN is split in a way that the lower 24 bits of the ARU data (23 down to 0) are stored in the SR0 register, the upper bits (47 down to 24) are stored in the SR1 register. The bits 52 down to 48 (CTRL_BITS) are stored in SOMI, SOMP and SOMS mode in the ACBI bit field of the register GTM0ATOMixSTAT, in SOMB mode in the internal ACB_SR register.

The ATOM channel has to ensure, that in a case when the channel operation registers CM0 and CM1 are updated with the SR0 and SR1 register content and an ARU transfer to these shadow registers happens in parallel that either the old data in both shadow registers is transferred into the operation registers or both new values from the ARU are transferred.

In SOMC mode incoming ARU data ARU_CHx_IN is written directly to the ATOM channel operation register in the way that the lower 24 bits (23 down to 0) are written to CM0, and the bits 47 down to 24 are written to register CM1. The bits 52 down to 48 are stored in the ACBI bit field of the GTM0ATOMixSTAT register and control the behavior of the compare units and the output signal of the ATOM channel.

In SOMC mode the SR0 and SR1 registers serve as capture registers for the time stamps coming from TBU whenever a compare match event is signalled by the CCU0 and/or CCU1 subunits via the CAP signal line. These two time stamps are then provided together with actual ATOM channel status information located in the ACBO bit field to the ARU at the dedicated ARU write address of the ATOM channel when the ARU is enabled.

The encoding of the ARU control bits in the different ATOM operation modes is described in more detail in the following chapters.

### 25.11.3 ATOM Channel modes

As described above, each ATOM channel can operate independently from each other in one of five dedicated output modes:

- ATOM Signal Output Mode Immediate (SOMI)
- ATOM Signal Output Mode Compare (SOMC)
- ATOM Signal Output Mode PWM (SOMP)
- ATOM Signal Output Mode Serial (SOMS)
- ATOM Signal Output Mode Buffered Compare (SOMB)

The Signal Output Mode PWM (SOMP) is principally the same like the output mode for the TOM submodule except the bit reverse mode which is not included in the ATOM. In addition, it is possible to reload the shadow registers over the ARU without the need of a CPU interaction. The three other modes provide additional functionality for signal output control. All operation modes are described in more detail in the following sections.

Note that in any output mode, if a channel is enabled, one-shot mode is disabled (OSM = 0; only used in modes SOMP and SOMS) and CM0 >= CN0, the counter CN0 is incrementing until it reaches CM0.

To avoid unintended counting of CN0 after enabling a channel, it is recommended to reset a channel (or at least CN0 and CM0) before any change on the mode bits MODE, ARU_EN and OSM.

#### 25.11.3.1 ATOM Signal Output Mode Immediate (SOMI)

In ATOM Signal Output Mode Immediate (SOMI), the ATOM channel generates output signals on the ATOM[i]_CH[x]_OUT output port immediate after update of the bit ACBI(0) of register GTM0ATOMixSTAT or ACB(0) bit of register GTM0ATOMixCTRL.

If ARU access is enabled by setting bit ARU_EN in register GTM0ATOMixCTRL, the update of the output ATOM[i]_CH[x]_OUT depends on the bit ACBI(0) of register GTM0ATOMixSTAT received at the ACI subunit and the bit SL bit of register GTM0ATOMixCTRL. The remaining 48 ARU bits (47 down to 0) have no meaning in this mode.

If ARU access is disabled, the update of the output ATOM[i]_CH[x]_OUT depends on the bit ACB(0) and the bit SL of register GTM0ATOMixCTRL.

The initial ATOM channel port pin ATOM[i]_CH[x]_OUT signal level has to be specified by the SL bit field of the GTM0ATOMixCTRL register when OUTEN_CTRL register bit field OUTEN_CTRLx is disabled (see **Section 25.11.6.5, GTM0ATOMiAGCOUTENCTRL (i = 0 to 2)** ) for details.

In SOMI mode the output behavior depends on the SL bit of register GTM0ATOMixCTRL and the bit ACBI(0) of the GTM0ATOMixSTAT register or the bit ACB0 of register GTM0ATOMixCTRL:

**Table 25.91 ATOM Signal Output Mode Immediate (SOMI)**

| SL | ACBI(0)/ACB(0) | Output Behavior |
|---|---|---|
| 0 | 0 | Set output to inverse of SL (1) |
| 0 | 1 | Set output to SL (0) |
| 1 | 0 | Set output to inverse of SL (0) |
| 1 | 1 | Set output to SL (1) |

The signal level bit ACBI(0) is transferred to the SOU subunit of the ATOM and made visible at the output port according to the table above immediately after the data was received by the ACI. This can introduce a jitter on the output signal since the ARU channels are served in a time multiplexed fashion.

### (1) GTM0ATOMixCTRL in SOMI mode (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATM00CTRL: <GTM_base> + $0D004_H$, GTM0ATM01CTRL: <GTM_base> + $0D084_H$, GTM0ATM02CTRL: <GTM_base> + $0D104_H$, GTM0ATM03CTRL: <GTM_base> + $0D184_H$, GTM0ATM04CTRL: <GTM_base> + $0D204_H$, GTM0ATM05CTRL: <GTM_base> + $0D284_H$, GTM0ATM06CTRL: <GTM_base> + $0D304_H$, GTM0ATM07CTRL: <GTM_base> + $0D384_H$, GTM0ATM10CTRL: <GTM_base> + $0D804_H$, GTM0ATM11CTRL: <GTM_base> + $0D884_H$, GTM0ATM12CTRL: <GTM_base> + $0D904_H$, GTM0ATM13CTRL: <GTM_base> + $0D984_H$, GTM0ATM14CTRL: <GTM_base> + $0DA04_H$, GTM0ATM15CTRL: <GTM_base> + $0DA84_H$, GTM0ATM16CTRL: <GTM_base> + $0DB04_H$, GTM0ATM17CTRL: <GTM_base> + $0DB84_H$, GTM0ATM20CTRL: <GTM_base> + $0E004_H$, GTM0ATM21CTRL: <GTM_base> + $0E084_H$, GTM0ATM22CTRL: <GTM_base> + $0E104_H$, GTM0ATM23CTRL: <GTM_base> + $0E184_H$, GTM0ATM24CTRL: <GTM_base> + $0E204_H$

### 25.11.3.2 ATOM Signal Output Mode Compare (SOMC)

#### (1) Overview

In ATOM Signal Output Mode Compare (SOMC) the output action is performed in dependence of the comparison between input values located in CM0 and/or CM1 registers and the two (three) time base values TBU_TS0 or TBU_TS1 (or TBU_TS2) provided by the TBU. For a description of the time base generation see the TBU specification in **Section 25.9, Time Base Unit (TBU)**. It is configurable, which of the two (three) time bases is to be compared with one or both values in CM0 and CM1.

The behavior of the two compare units CCU0 and CCU1 is controlled either with the bits 4 down to 2 of ACB bit field inside the GTM0ATOMixCTRL register, when the ARU connection is disabled or with the ACBI bit field of the GTM0ATOMixSTAT register, when the ARU is enabled. In that case the ACB bit field is updated via the ARU control bits 52 down to 48.

The CCUx trigger signals TRIG_CCU0 and TRIG_CCU1 always create edges, dependent on the predefined signal level in SL bit in combination with two control bits that can be specified by either ARU or CPU within the aforementioned GTM0ATOMixCTRL or GTM0ATOMixSTAT registers.

In SOMC mode the channel is always disabled after the specified compare match event occurred. The shadow registers are used to store two time stamp values at the match time. The channel can be enabled again by first reading the shadow registers, either by CPU or ARU and by providing new data for CMx registers through CPU or ARU. For a detailed description see **(2), SOMC Mode under CPU control** and **(3), SOMC Mode under ARU control**.

If three time bases exist for the GTM-IP there must be a preselection between TBU_TS1 and TBU_TS2 for the ATOM channel. This can be done with TB12_SEL bit in the GTM0ATOMixCTRL register.

The comparison in CCU0/1 with time base TBU_TS1 or TBU_TS2 can be done on a greater/equal or less/equal compare according to the CMP_CTRL bit. This control bit has no effect to a compare unit CCU0 or CCU1 that compares against TBU_TS0. In this case always a greater/equal compare is done. The bit CMP_CTRL is part of the GTM0ATOMixCTRL register.

When configured in SOMC mode, the channel port pin has to be initialized to an initial signal level. This initial level after enabling the ATOM channel is determined by the SL bit in the GTM0ATOMixCTRL register. If the output is disabled, the signal level is set to the inverse level of the SL bit.

If the channel is disabled, the register SOUR is set to the SL bit in the GTM0ATOMixCTRL register.

On a compare match event the shadow register SR0 and SR1 are used to capture the TBU time stamp values. SR0 always holds TBU_TS0 and SR1 either holds TBU_TS1 or TBU_TS2 dependent on the TB12_SEL bit in the GTM0ATOMixCTRL register.

Please note, that when the channel is disabled and the compare registers are written, the compare registers CMx are loaded with the written value and the channel starts with the comparison on behalf of this values, when the channel is enabled.

### (2) SOMC Mode under CPU control

As already mentioned above the ATOM channel can be controlled either by CPU or by ARU. When the channel should be controlled by CPU, the ARU_EN bit inside the GTM0ATOMixCTRL register has to be reset.

The output of the ATOM channel is set on a compare match event depending on the ACB10 bit field in combination with the SL bit both located in the GTM0ATOMixCTRL register. The output behavior according to the ACB10 bit field in the control register is shown in the following table:

**Table 25.93 The output behavior according to the ACB10 bit field in the control register**

| SL | ACB10(5) | ACB10(4) | Output behavior |
|---|---|---|---|
| 0 | 0 | 0 | No signal level change at output (exception in **Table 25.96, ATOM CCUx Serve first definition ACB42 = '001'** ) |
| 0 | 0 | 1 | Set output signal level to 1 |
| 0 | 1 | 0 | Set output signal level to 0 |
| 0 | 1 | 1 | Toggle output signal level (exception in **Table 25.96, ATOM CCUx Serve first definition ACB42 = '001'** ) |
| 1 | 0 | 0 | No signal level change at output(exception in **Table 25.96, ATOM CCUx Serve first definition ACB42 = '001'** ) |
| 1 | 0 | 1 | Set output signal level to 0 |
| 1 | 1 | 0 | Set output signal level to 1 |
| 1 | 1 | 1 | Toggle output signal level (exception in **Table 25.96, ATOM CCUx Serve first definition ACB42 = '001'** ) |

The capture/compare strategy of the two CCUx units can be controlled with the ACB42 bit field inside the GTM0ATOMixCTRL register. The meaning of these bits is shown in the following table:

**Table 25.94 The meaning of ACB42 bits (1/2)**

| ACB42(8) | ACB42(7) | ACB42(6) | CCUx control |
|---|---|---|---|
| 0 | 0 | 0 | Serve First: Compare in CCU0 using *TBU_TS0* and in parallel in CCU1 using *TBU_TS1* or *TBU_TS2*. Disable other CCUx on compare match. Output signal level on the compare match of the matching CCUx unit is defined by combination of SL, ACB10(5) and ACB10(4).<br>Details see **Table 25.96** |
| 0 | 0 | 1 | Serve First: Compare in CCU0 using *TBU_TS0* and in parallel in CCU1 using *TBU_TS1* or *TBU_TS2*. Disable other CCUx on compare match. Output signal level on the compare match of the matching CCUx unit is defined by combination of SL, ACB10(5) and ACB10(4).<br>Details see **Table 25.96** |
| 0 | 1 | 0 | Compare in CCU0 only, use time base *TBU_TS0*. Output signal level is defined by combination of SL, ACB10(5) and ACB10(4) bits. |
| 0 | 1 | 1 | Compare in CCU1 only, use time base *TBU_TS1* or *TBU_TS2*. Output signal level is defined by combination of SL, ACB10(5) and ACB10(4) bits. |
| 1 | 0 | 0 | Serve Last: Compare in CCU0 and then in CCU1 using *TBU_TS0*. Output signal level when CCU0 matches is defined by combination of SL, ACB10(5) and ACB10(4). On the CCU1 match the output level is toggled. |

Table 25.94 The meaning of ACB42 bits (2/2)

| ACB42(8) | ACB42(7) | ACB42(6) | CCUx control |
|---|---|---|---|
| 1 | 0 | 1 | Serve Last: Compare in CCU0 and then in CCU1 using TBU_TS1 or TBU_TS2. Output signal level when CCU0 matches is defined by combination of SL, ACB10(5) and ACB10(4). On the CCU1 match the output level is toggled. |
| 1 | 1 | 0 | Serve Last: Compare in CCU0 using TBU_TS0 and then in CCU1 using TBU_TS1 or TBU_TS2. Output signal level when CCU1 matches is defined by combination of SL, ACB10(5) and ACB10(4). |
| 1 | 1 | 1 | Not used when ARU disabled. |

The behavior of the ACBI/ACB42 bit combinations ‘000’ and ‘001’ is described in more detail in **Table 25.95, ATOM CCUx Serve first definition ACB42 = ‘000’** and **Table 25.96, ATOM CCUx Serve first definition ACB42 = ‘001’**.

Table 25.95 ATOM CCUx Serve first definition ACB42 = ‘000’

| ACB4 | ACB3 | ACB2 | ACB1 | ACB0 | SL | CCU0 match | CCU1 match | Pin level new |

If the ATOM channel is enabled, the CM0 and/or CM1 registers and the ACB42 bit field of the GTM0ATOMixCTRL register can be updated by the CPU as long as the first match event occurs in case of a serve last compare strategy or as long as the overall match event in case of the other compare strategies.

After a compare match event that causes an update of the shadow registers SR0/SR1 and before reading the SR0 and/or SR1 register via ARU, the update of the registers CM0 and/or CM1 is possible but has no effect.

To set up a new compare action, first the SR0 and/or SR1 register containing captured values have to be read and then new compare values have to be written into the register CM0 and/or CM1.

Which CMx register has to be updated depends on the compare strategy defined in the ACB42 bit field of the channel control register. Since the channel immediately starts with the comparison after the CMx register was/were written, the compare strategy has to be updated before the CMx registers are written.

For the serve last compare strategies, if the register CM0 and CM1 are updated, it can happen that one or both compare values are already located in the past. In any way the ATOM channel will first wait until both compare values are written before it starts the time base comparisons to avoid a deadlock.

The CPU can check at any time if at least one of the ATOM channels' capture compare register contains valid data and waits for a compare event to happen. This is signalled by the DV bit inside the GTM0ATOMixSTAT register.

Note, for serve last compare strategies, if DV bit is currently not set, writing to CM0 or CM1 sets immediately the DV bit although the compare is only started if both values are written.

In SOMC mode and CCUx control mode 'serve last' exist an exception for update of register CM0/CM1. If in this mode the CCU0 compare match event occurred, the update of register CM0/CM1 via CPU is blocked until the CCU1 compare match event.

In the serve last mode (ACB42 = “100” or ACB42 = “101”) it is possible to generate very small spikes on the output pin by loading CM0 and CM1 with two time stamp values for TBU_TS0, TBU_TS1 or TBU_TS2 close together. The output pin will then be set or reset dependent on the SL bit and the specified ACB10(5) and ACB10(4) bits in the ACB10 bit field of the GTM0ATOMixCTRL register on the first match event and the output will toggle on the second compare event in the CCU1 compare unit.

It is important to note, that the bigger (smaller) time stamp has to be loaded into the CM1 register, since the CCU0 will enable the CCU1 once it has reached its comparison time stamp. The order of the comparison time stamps depends on the defined greater/equal or less/equal comparison of the CCUx units.

In addition to storing the captured time stamps in the shadow registers, the ATOM channel provides the result of the compare match event in the ACBO(4) and ACBO(3) bits of the GTM0ATOMixSTAT register. The meaning of the bits is shown in the following table:

**Table 25.97 ACDO bits**

| ACBO(4) | ACBO(3) | Indication |
|---|---|---|
| 0 | 1 | CCU0 compare match occurred |
| 1 | 0 | CCU1 compare match occurred |

Please note, that in case of the ‘serve last’ compare strategy, when the SLA-bit in the GTM0ATOMixCTRL register is not set, the ACBO(4) bit is always set and the ACBO(3) bit is always reset after the compare match event occurred.

The ACBO bit field is reset, when the DV bit is set.

Depending on the capture compare unit where the time base matched the interrupt CCU0TCx_IRQ or CCU1TCx_IRQ is raised.

The behavior of an ATOM channel in SOMC mode under CPU control is visualized in **Figure 25.36** .

**NOTE**

In case of 'serve first' compare strategy, if both events CCU0 and CCU1 occur at the same point in time, both interrupts will be raised.

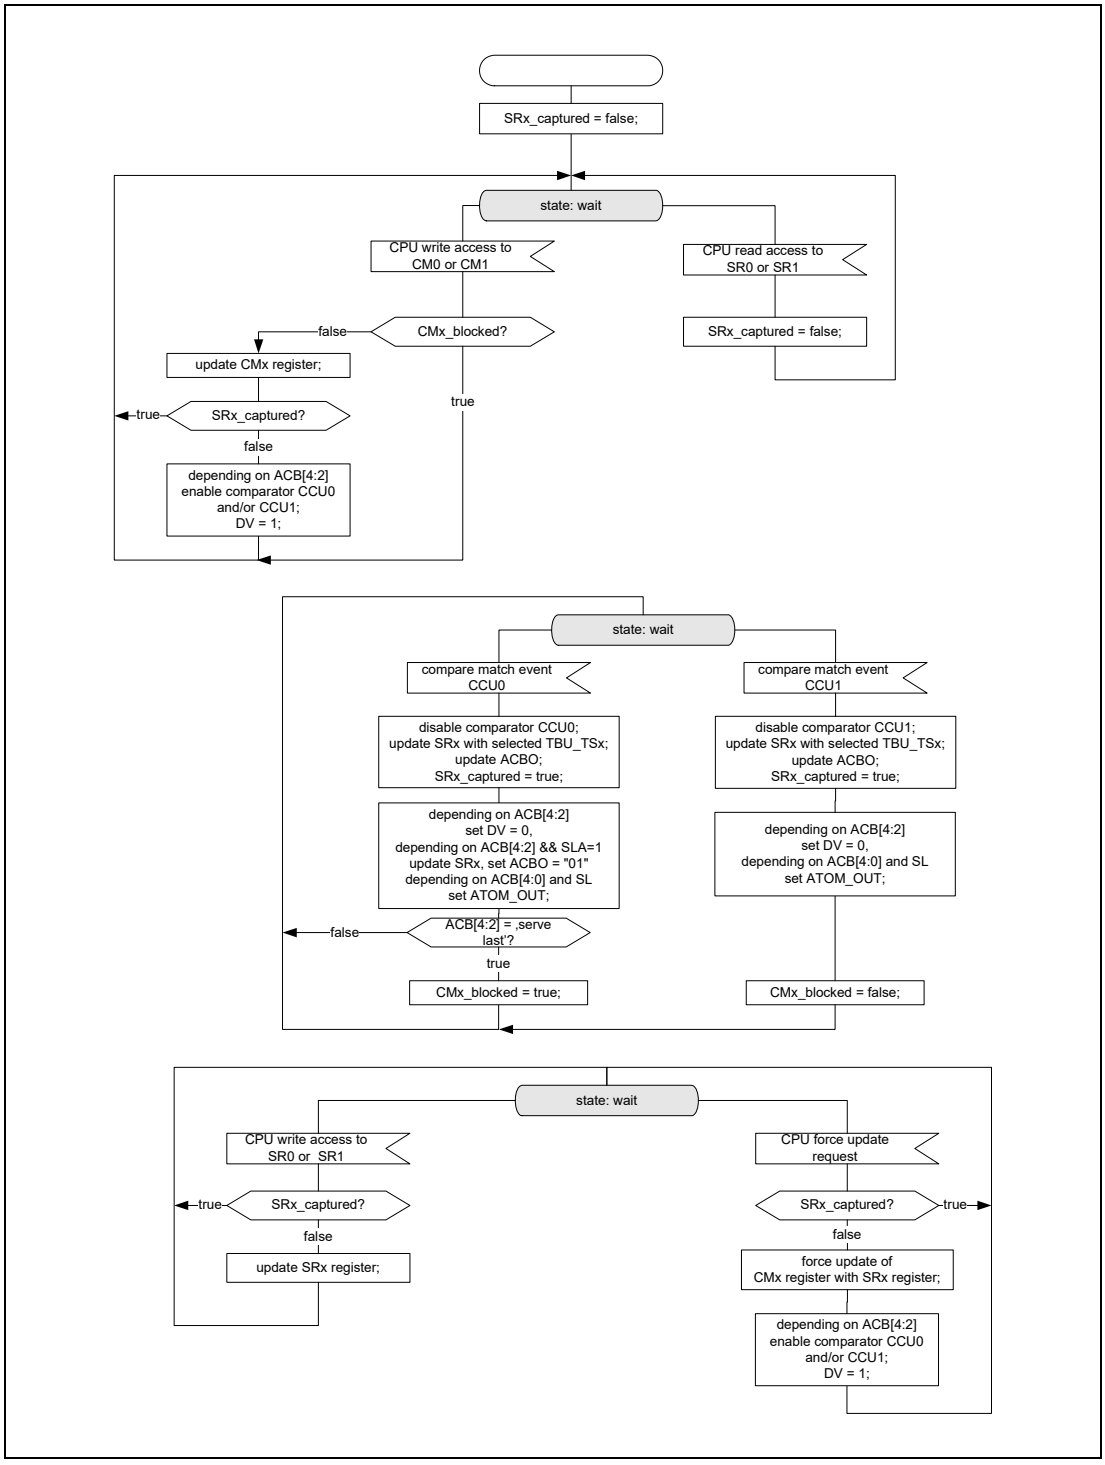

**Figure 25.36 SOMC state diagram for channel under CPU control**

### (3) SOMC Mode under ARU control

When the channel should be controlled by ARU, the ARU_EN bit inside the GTM0ATOMixCTRL register has to be set.

In case, the ATOM channel is under ARU control the content for the compare registers CM0 and CM1 as well as the update of the compare strategy can be loaded via the 53 bit ARU word.

The ARU word 23 to 0 is loaded into the CM0 register while the ARU word 47 to 24 is loaded into the CM1 register. The five ARU control bits 52 to 48 are loaded into the ACBI bit field of the GTM0ATOMixSTAT register and control the channel compare strategy as well as the output behavior in case of compare match events.

For the five ARU control bits 52 to 48 the bits 49 and 48 are loaded into the ACBI bits 1 and 0. The output behavior also depends on the setting of the SL bit inside of the GTM0ATOMixCTRL register and is shown in the following table:

**Table 25.98 The output behavior depends on the setting of the SL bit**

| SL | ACBI(1) | ACBI(0) | Output behavior |
|---|---|---|---|
| 0 | 0 | 0 | No signal level change at output (exception in **Table 25.95** and **Table 25.96**) |
| 0 | 0 | 1 | Set output signal level to 1 |
| 0 | 1 | 0 | Set output signal level to 0 |
| 0 | 1 | 1 | Toggle output signal level (exception in **Table 25.95** and **Table 25.96**) |
| 1 | 0 | 0 | No signal level change at output (exception in **Table 25.95** and **Table 25.96**) |
| 1 | 0 | 1 | Set output signal level to 0 |
| 1 | 1 | 0 | Set output signal level to 1 |
| 1 | 1 | 1 | Toggle output signal level(exception in **Table 25.95** and **Table 25.96**) |

For the five ARU control bits 52 to 48 the bits 52 to 50 are loaded into the ACBI bits 4 to 2. With these three bits the capture/compare units CCUx can be controlled as shown in the following table:

**Table 25.99 CCUxcontrol (1/2)**

| ACBI(4) | ACBI(3) | ACBI(2) | CCUx control |
|---|---|---|---|
| 0 | 0 | 0 | Serve First: Compare in CCU0 using TBU_TS0 and in parallel in CCU1 using TBU_TS1 or TBU_TS2. Disable other CCUx on compare match. Output signal level on the compare match of the matching CCUx unit is defined by combination of SL, ACBI(1) and ACBI(0). Details see **Table 25.96** |
| 0 | 0 | 1 | Serve First: Compare in CCU0 using TBU_TS0 and in parallel in CCU1 using TBU_TS1 or TBU_TS2. Disable other CCUx on compare match. Output signal level on the compare match of the matching CCUx unit is defined by combination of SL, ACBI(1) and ACBI(0). Details see **Table 25.95** |
| 0 | 1 | 0 | Compare in CCU0 only, use time base TBU_TS0. Output signal level is defined by combination of SL, ACBI(1) and ACBI(0) bits. |
| 0 | 1 | 1 | Compare in CCU1 only, use time base TBU_TS1 or TBU_TS2. Output signal level is defined by combination of SL, ACBI(1) and ACBI(0) bits. |
| 1 | 0 | 0 | Serve Last: Compare in CCU0 and then in CCU1 using TBU_TS0. Output signal level when CCU0 matches is defined by combination of SL, ACBI(1) and ACBI(0). On the CCU1 match the output level is toggled. |

**Table 25.99 CCUxcontrol (2/2)**

| ACBI(4) | ACBI(3) | ACBI(2) | CCUx control |
|---|---|---|---|
| 1 | 0 | 1 | Serve Last: Compare in CCU0 and then in CCU1 using TBU_TS1 or TBU_TS2. Output signal level when CCU0 matches is defined by combination of SL, ACBI(1) and ACBI(0). On the CCU1 match the output level is toggled. |
| 1 | 1 | 0 | Serve Last: Compare in CCU0 using TBU_TS0 and then in CCU1 using TBU_TS1 or TBU_TS2. Output signal level when CCU1 matches is defined by combination of SL, ACBI(1) and ACBI(0). |
| 1 | 1 | 1 | Change ARU read address to ATOM_RDADDR1<br>DV flag is not set. Neither ACBI(1) nor ACBI(0) is evaluated. |

It is important to note that the bit combination “111” for the ACBI(4), ACBI(3) and ACBI(2) bits forces the channel to request new compare values from another destination read address defined in the ATOM_RDADDR1 bit field of the GTM0ATOMixRDADDR register. After data was successfully received and the compare event occurred the ATOM channel switches back to ATOM_RDADDR0 to receive the next data from there.

After the specified compare match event, the captured time stamps are stored in SR0 and SR1 and the compare result is stored in the ACBO bit field of the GTM0ATOMixSTAT register. The meaning of the ACBO(4) and ACBO(3) bits of the GTM0ATOMixSTAT is shown in the following table:

**Table 25.100 ACBO bits**

| ACBO(4) | ACBO(3) | Return value to ARU |
|---|---|---|
| 0 | 1 | CCU0 compare match occurred |
| 1 | 0 | CCU1 compare match occurred |

Please note, that in case of the ‘serve last’ compare strategy, when the SLA-bit in the GTM0ATOMixCTRL register is not set, the ACBO(4) bit is always set and the ACBO(3) bit is always reset after the compare match event occurred.

The ACBO bit field is reset, when the DV bit is set.

Depending on the capture compare unit where the time base matched the interrupt CCU0TCx_IRQ or CCU1TCx_IRQ is raised.

When CCU0 and CCU1 is used for comparison it is possible to generate very small spikes on the output pin by loading CM0 and CM1 with two time stamp values for TBU_TS0, TBU_TS1 or TBU_TS2 close together. The output pin will then be set or reset dependent on the SL bit and the specified ACBI(0) and ACBI(1) bits in the ACBI bit field of the GTM0ATOMixSTAT register on the first match event and the output will toggle on the second match event.

It is important to note, that the bigger (smaller) time stamp has to be loaded into the CM1 register, since the CCU0 will enable the CCU1 once it has reached its comparison time stamp. The order of the comparison time stamps depends on the defined greater/equal or less/equal comparison of the CCUx units.

For compare strategy ‘serve last’ the CCU0 and CCU1 compare match may occur sequentially. During different phases of compare match the CPU access rights to register CM0 and CM1 as well as to WR_REQ bit is different. These access rights by CPU to register CM0 and CM1 and the WR_REQ are depicted in the following figure.

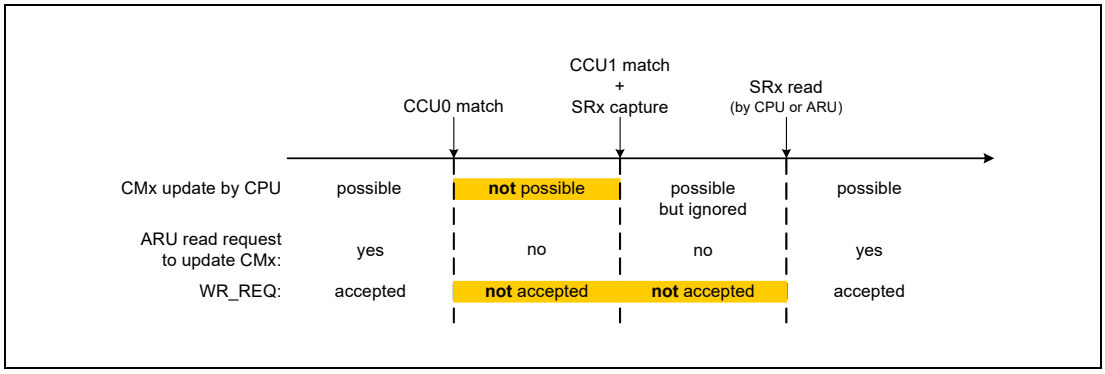

**Figure 25.37 CPU access rights in case of compare strategy 'serve last**

### (a) ARU Non-Blocking mode

When the compare registers are updated via ARU the update behavior of the channel is configurable with the ABM bit inside the GTM0ATOMixCTRL register. When the ABM bit is reset, the ATOM channel is in ARU non-blocking mode.

In this ARU non-blocking mode, data received via ARU is continuously transferred to the registers CM0 and CM1 and the bit field ACBI of register GTM0ATOMixSTAT as long as no specified compare match event occurs.

After a compare match event that causes an update of the shadow register SR0/SR1 and before reading the SR0/SR1 register via CPU or ARU, the update of the registers CM0/ CM1 via CPU or ARU is possible but has no effect.

To set up a new compare action, first the SR0/SR1 registers containing captured values have to be read and then new compare values have to be written into the register CM0/CM1. This can be done either by ARU or by CPU.

When the CPU does the register accesses, only one of the shadow registers has to be read. Dependent on the compare strategy, the CPU has to write one or both of the compare registers.

In SOMC mode and CCUx control mode ‘serve last’ exist an exception for update of register CM0/ CM1. If in this mode the CCU0 compare match event occurred, the update of register CM0/CM1 via CPU or ARU is blocked until the CCU1 compare match event occurs.

The CPU can check at any time if the ATOM channel has received valid data from the ARU and waits for a compare event to happen. This is signalled by the DV bit inside the GTM0ATOMixSTAT register.

The behavior of an ATOM channel in SOMC mode, when ARU is enabled and ARU blocking mode is disabled is shown in **Figure 25.38**.

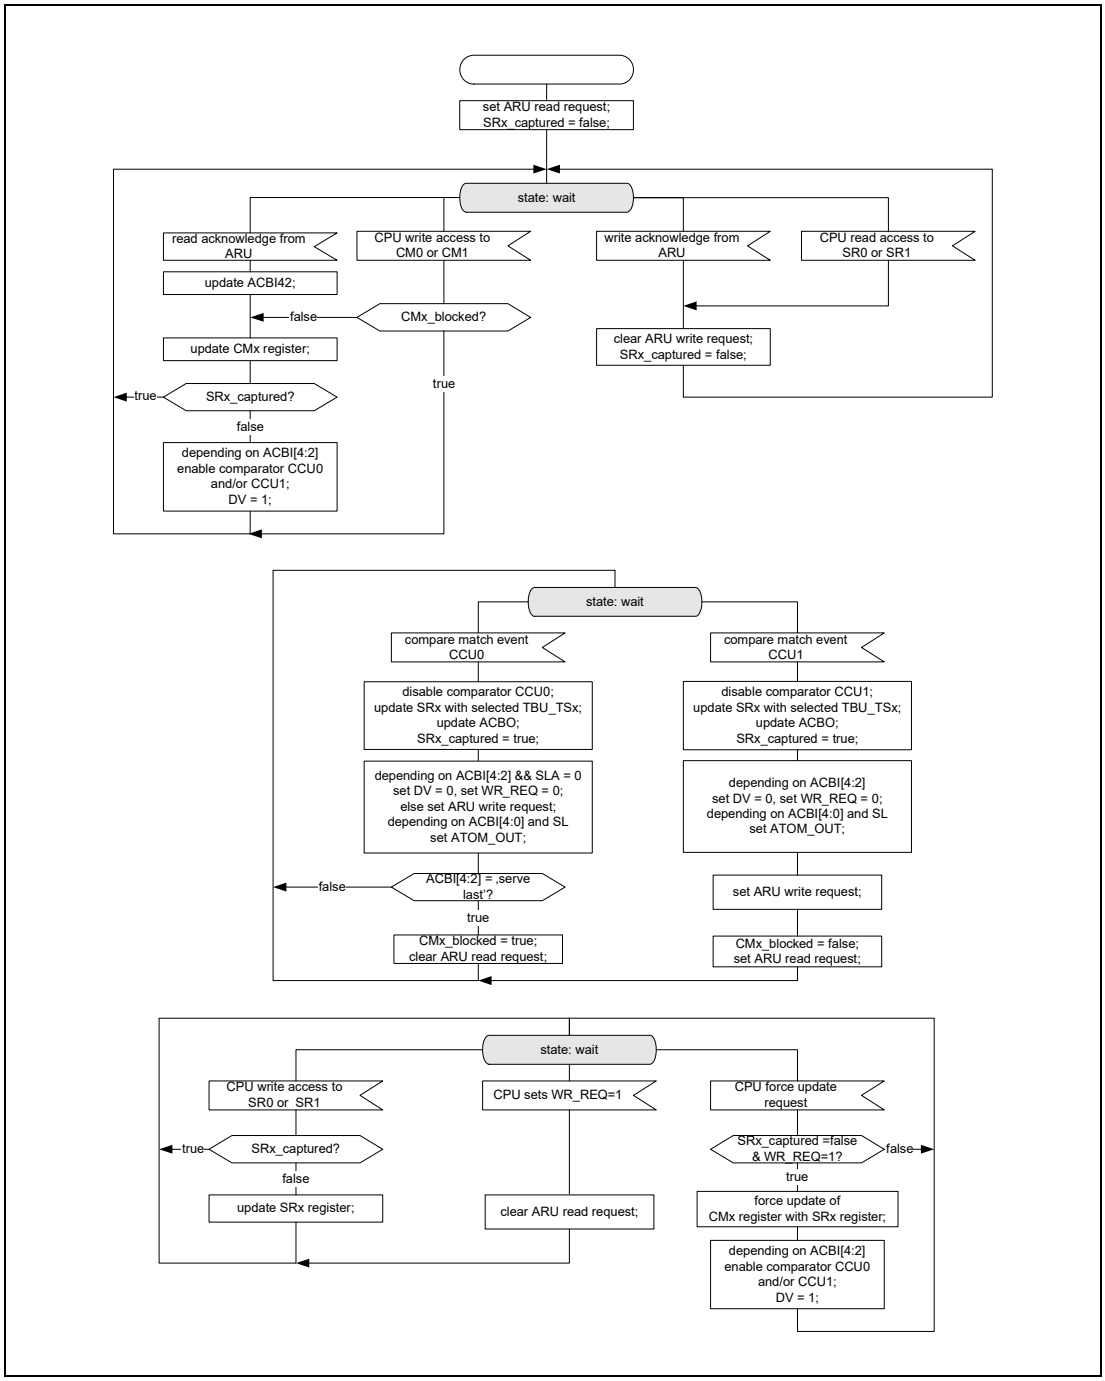

**Figure 25.38 SOMC State diagram for SOMC mode, ARU enabled, ABM disabled**

(b) ARU Blocking mode

When the compare registers are updated by ARU, the ATOM channel can be configured to receive ARU data in a blocking manner. This can be configured by setting the ABM bit in the GTM0ATOMixCTRL register.

If the ABM and ARU_EN bits are set, the (one) two compare values for CM0 and/or CM1 can be provided by ARU or CPU. If the compare registers CM0 and/or CM1 are/is updated, the ATOM channel waits for the compare match event to happen. No further data is requested from the ARU.

When the specified compare match event happens, the shadow registers SR0 and SR1 are updated together with the ACBO bits in the GTM0ATOMixSTAT register. The data in the shadow registers is marked as valid for the ARU and the DV bit is reset inside the GTM0ATOMixCTRL register.

If the register SR0 and SR1 holding the captured TBU time stamp values are read by either the ARU or the CPU, the next write access to or update of the register CM0 or CM1 via ARU or the CPU enables the new compare match check again.

At least one of the registers SR0 or SR1 has to be read, before new data is requested from ARU.

The CPU can check at any time if the ATOM channel has received valid data from the ARU and waits for a compare event to happen. This is signalled by a set DV bit inside the GTM0ATOMixSTAT register.

The behavior of an ATOM channel in SOMC mode, when ARU is enabled and ARU blocking mode is enabled is shown in **Figure 25.39**.

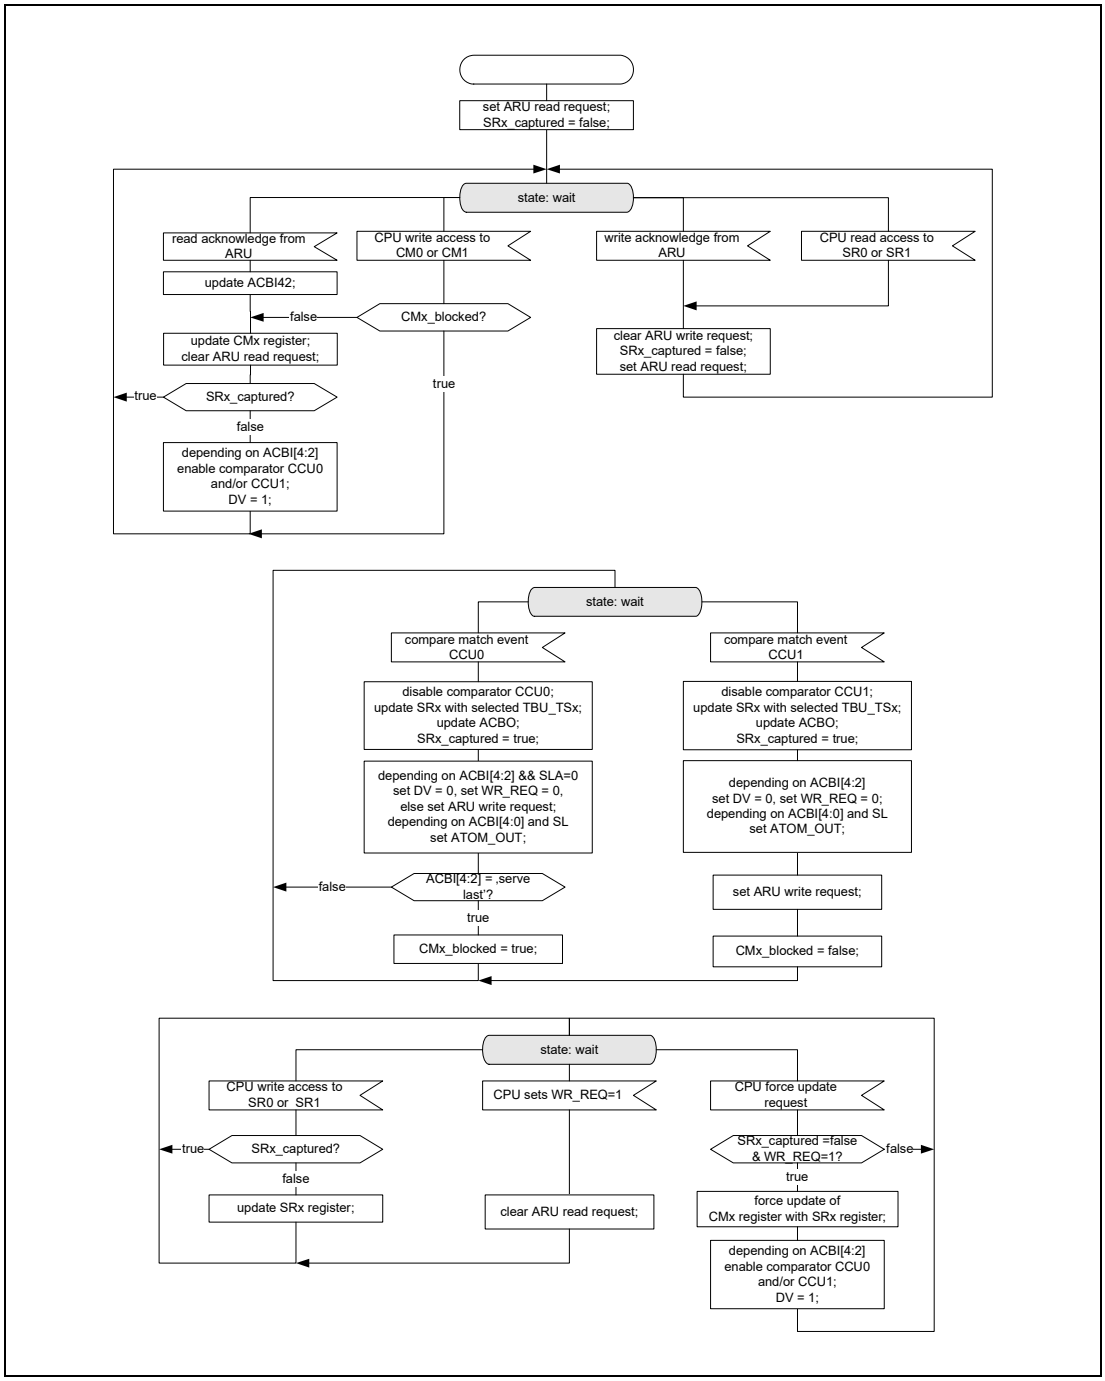

**Figure 25.39 SOMC State diagram for SOMC mode, ARU enabled and ABM enabled**

(c) ATOM SOMC Late update mechanism

Although, the ATOM channel may be controlled by data received via the ARU, the CPU is able to request at any time a late update of the compare register. This can be initiated by setting the WR_REQ bit inside the GTM0ATOMixCTRL register. By doing this, the ATOM will request no further data from ARU (if ARU access was enabled). The channel will in any case continue to compare against the values stored inside the compare registers (if bit DV was set). The CPU can now update the new compare values until the compare event happens by writing to the shadow registers, and force the ATOM channel to update the compare registers by writing to the force update register bits in the AGC register.

If the WR_REQ bit is set and a compare match event happens, any further access to the shadow registers SR0, SR1 is blocked and the force update of this channel is blocked. In addition, the WRF bit is set in the GTM0ATOMixSTAT register. Thus, the CPU can determine that the late update failed by reading the WRF bit.

If a compare match event already happened, the WR_REQ bit could not be set until the channel is unlocked for a new compare match event by reading the shadow registers. In addition, the WRF bit is set if the CPU tries to write the WR_REQ bit in that case.

If between a correct WR_REQ bit set, a correct shadow register write, and before the force update is requested by the AGC a match event occurs on the old compare values, the WRF bit will be set.

The WRF bit will be set in any case if the CPU tries to write to a blocked shadow register.

The WR_REQ bit and the DV bit will be reset on a compare match event.

A blocked force update mechanism will be enabled again after a read access to the register SR0 or SR1 by either the ARU or the CPU.

The ATOM SOMC late update mechanism from CPU is shown in **Figure 25.40**.

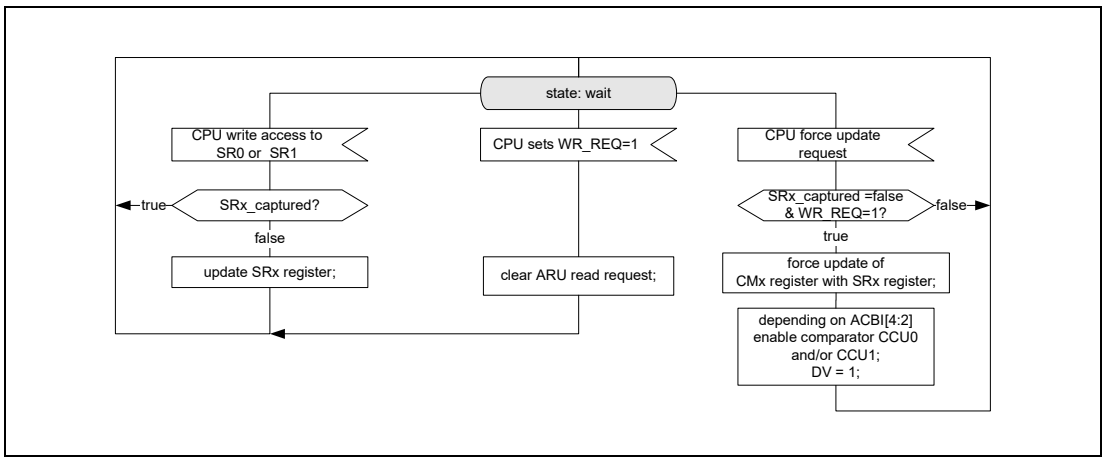

**Figure 25.40 SOMC State diagram for late update requests by CPU**

### (4) Register GTM0ATOMixCTRL in SOMC mode (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:**
GTM0ATM00CTRL: <GTM_base> + $0D004_H$,
GTM0ATM01CTRL: <GTM_base> + $0D084_H$,
GTM0ATM02CTRL: <GTM_base> + $0D104_H$,
GTM0ATM03CTRL: <GTM_base> + $0D184_H$,
GTM0ATM04CTRL: <GTM_base> + $0D204_H$,
GTM0ATM05CTRL: <GTM_base> + $0D284_H$,
GTM0ATM06CTRL: <GTM_base> + $0D304_H$,
GTM0ATM07CTRL: <GTM_base> + $0D384_H$,
GTM0ATM10CTRL: <GTM_base> + $0D804_H$
GTM0ATM11CTRL: <GTM_base> + $0D884_H$
GTM0ATM12CTRL: <GTM_base> + $0D904_H$
GTM0ATM13CTRL: <GTM_base> + $0D984_H$
GTM0ATM14CTRL: <GTM_base> + $0DA04_H$
GTM0ATM15CTRL: <GTM_base> + $0DA84_H$
GTM0ATM16CTRL: <GTM_base> + $0DB04_H$
GTM0ATM17CTRL: <GTM_base> + $0DB84_H$
GTM0ATM20CTRL: <GTM_base> + $0E004_H$
GTM0ATM21CTRL: <GTM_base> + $0E084_H$
GTM0ATM22CTRL: <GTM_base> + $0E104_H$
GTM0ATM23CTRL: <GTM_base> + $0E184_H$
GTM0ATM24CTRL: <GTM_base> + $0E204_H$

**Value after reset:** 0000 $0x00_H$

**Table 25.101 GTM0ATOMixCTRL in SOMC mode Register Contents (1/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 28 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 27 | ABM | ARU blocking mode<br>0: ARU blocking mode disabled: ATOM reads continuously from ARU and updates CM0, CM1 independent of pending compare match event<br>1: ARU blocking mode enabled: after updating CM0,CM1 via ARU, no new data is read from ARU until compare match event occurred and SR0 and/or SR1 are read. |
| 26 | Not used | Not used in this mode. |

**Table 25.101 GTM0ATOMixCTRL in SOMC mode Register Contents (2/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 25 | SLA | Serve last ARU communication strategy.<br>0: Capture SRx time stamps after CCU0 match event not provided to ARU<br>1: Capture SRx time stamps after CCU0 match event provided to ARU<br>**NOTES**<br>1. Please note, that setting of this bit has only effect, when ACBI(4:2) is configured for serve last compare strategy (“100”, “101”, or “110”).<br>2. When this bit is not set, the captured time stamps in the shadow registers SRx are only provided after the CCU1 match occurred. The ACBO(4:3) bits always return “10” in that case.<br>3. By setting this bit, the ATOM channel also provides the captured time stamps after the CCU0 match event to the ARU. The ACBO(4:3) bits are set to “01” in that case. After the CCU1 match event, the time stamps are captured again in the SRx registers and provided to the ARU. The ACBO(4:3) bits are set to “10”. When the data in the shadow registers after the CCU0 match was not consumed by an ARU destination and the CCU1 match occurs, the data in the shadow registers is overwritten by the new captured time stamps. The ATOM channel does not request new data from the ARU when the CCU0 match values are read from an ARU destination. |
| 24 | TRIGOUT | Trigger output selection (output signal TRIG_CHx) of module ATOM_CHx.<br>0: TRIG_[x] is TRIG_[x-1] or TIM_EXT_CAPTURE(x)<br>1: TRIG_[x] is TRIG_CCU0 |

### 25.11.3.3 ATOM Signal Output Mode PWM (SOMP)

In ATOM Signal Output Mode PWM (SOMP) the ATOM submodule channel is able to generate complex PWM signals with different duty cycles and periods. Duty cycles and periods can be changed synchronously and asynchronously. Synchronous change of the duty cycle and/or period means that the duty cycle or period duration changes after the end of the preceding period. An asynchronous change of period and/or duty cycle means that the duration changes during the actual running PWM period.

The signal level of the pulse generated inside the period can be configured inside the channel control register (SL bit of GTM0ATOMixCTRL register). The initial signal output level for the channel is the reverse pulse level defined by the SL bit. **Figure 25.41** clarifies this behavior.

In SOMP mode, depending on configuration bits RST_CCU0 of register GTM0ATOMixCTRL the counter register CN0 can be reset either when the counter value is equal to the compare value CM0 or when signalled by the ATOM[i] trigger signal TRIG_[x-1] of the preceding channel [x-1] (which can also be the last channel of preceding instance TOM[i-1]) or the trigger signal TIM_EXT_CAPTURE(x) of the assigned TIM channel [x].

In this case, if UPEN_CTRL[x]=1, also the working register CM0, CM1 and CLK_SRC are updated.

Note: As an exception, the input TRIG_[0] of instance ATOM0 is triggered by its own last channel cCATO via signal TRIG_[cCATO]. See **Section 25.18, GTM Device 207** and **Section 25.19, GTM Device 208** for value cCATO of ATOM0.

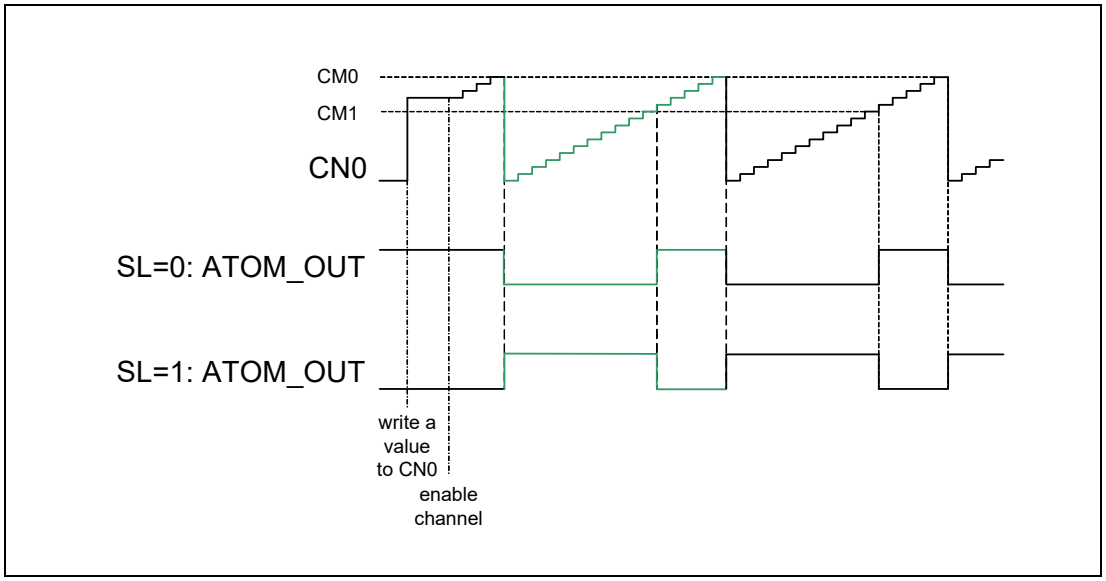

**Figure 25.41 PWM Output behavior with respect to the SL bit in the GTM0ATOMixCTRL register**

On an asynchronous update, it is guaranteed, that no spike occurs at the output port of the channel due to a too late update of the operation registers. The behavior of the output signal due to the different possibilities of an asynchronous update during a PWM period is shown in **Figure 25.42** .

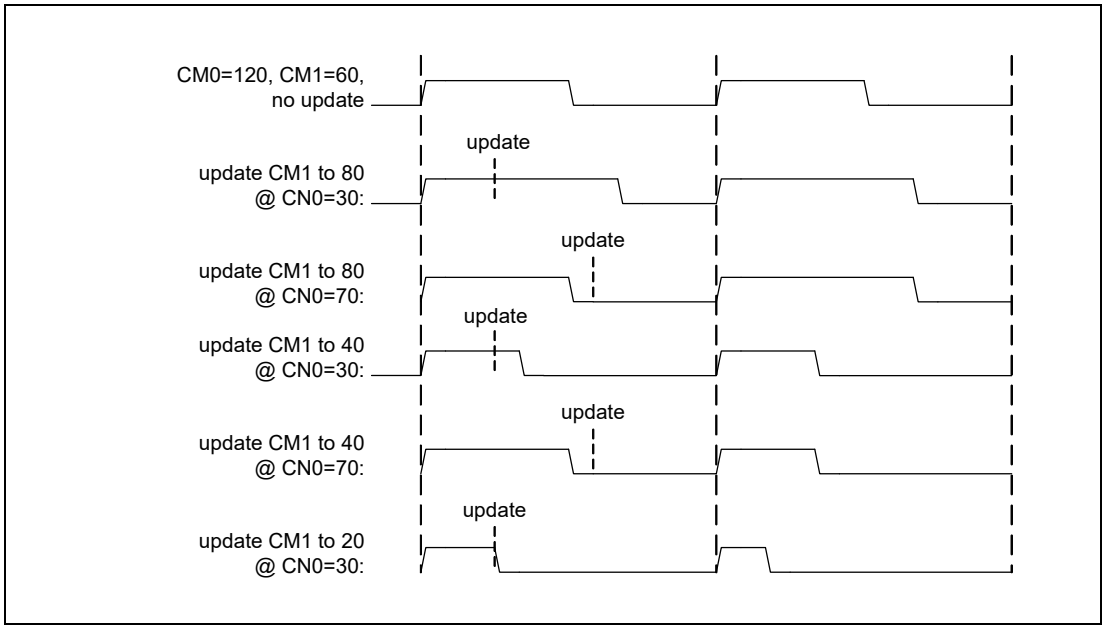

**Figure 25.42 PWM Output behavior in case of an asynchronous update of the duty cycle**

The duration of the pulse high or low time and period is measured with the counter in subunit CCU0. The trigger of the counter is one of the eight CMU clock signals configurable in the channel control register GTM0ATOMixCTRL. The register CM0 holds the duration of the period and the register CM1 holds the duration of the duty cycle in clock ticks of the selected CMU clock.

If counter register CN0 of channel x is reset by its own CCU0 unit (i.e. the compare match of CN0 ≥ CM0 configured by RST_CCU0 = 0), following statements are valid:

- CN0 counts from 0 to CM0-1 and is then reset to 0
- When CN0 is reset from CM0 to 0, an edge to SL is generated.
- When CN0 is incrementing and reaches CN0 > CM1, an edge to !SL is generated.
- if CM0 = 0 or CM0=1, the counter CN0 is constant 0.
- if CM1 = 0, the output is !SL = 0% duty cycle
- if CM1 >= CM0 and CM0>1, the output is SL = 100% duty cycle

If the counter register CN0 of channel x is reset by the trigger signal coming from another channel or the assigned TIM module (configured by RST_CCU0 = 1), following statements are valid:

- CN0 counts from 0 to MAX-1 and is then reset to 0 by trigger signal
- CM0 defines the edge to SL value, CM1 defines the edge to !SL value.
- if CM0 = CM1, the output switches to SL if CN0 = CM0 = CM1 (CM0 has higher priority)
- if CM0 = 0 and CM1= = MAX, the output is SL = 100% duty cycle
- if CM0 > MAX, the output is !SL = 0 % duty cycle, independent of CM1.

In case the counter value CN0 reaches the compare value in register CM0 or the channel receives an external update trigger via the FUPD(x) signal, a synchronous update is performed. A synchronous update means that the registers CM0 and CM1 are updated with the content of the shadow registers SR0 and SR1 and the CLK_SRC register is updated with the value of the CLK_SRC_SR register.

The clock source for the counter can be changed synchronously at the end of a period. If ARU access is disabled, this is done by using the bit field CLK_SRC_SR of register GTM0ATOMixCTRL as shadow registers for the next CMU clock source.

If ARU access is enabled, the bits ACBI(4), ACBI(3) and ACBI(2) received via ARU and stored in register ATOM_[i]_CH[x]_STAT are used as shadow register for the update of the CMU clock source register CLK_SRC.

For the synchronous update mechanism the generation of a complex PWM output waveform is possible without CPU interaction by reloading the shadow registers SR0, SR1 and the ACBI bit field over the ACI subunit from the ARU, while the ATOM channel operates on the CM0 and CM1 registers.

This internal update mechanism is established, when the old PWM period ends. The shadow registers are loaded into the operation registers, the counter register is reset, the new clock source according to the CLK_SRC_SR or ACBI(4), ACBI(3) and ACBI(2) bits is selected and the new PWM generation starts.

In parallel, the ATOM channel issues a read request to the ARU to reload the shadow registers with new values while the ATOM channel operates on the operation registers. To guarantee the reloading, the PWM period must not be smaller than the worst case ARU round trip time and source for the PWM characteristic must provide the new data within this time. Otherwise, the old PWM values are used from the shadow registers.

When updated over the ARU the user has to ensure that the new period duration is located in the lower (bits 23 to 0) and the duty cycle duration is located in the upper (bits 47 to 24) ARU data word and the new clock source is specified in the ARU control bits 52 to 50.

This pipelined data stream character is shown in **Figure 25.43** .

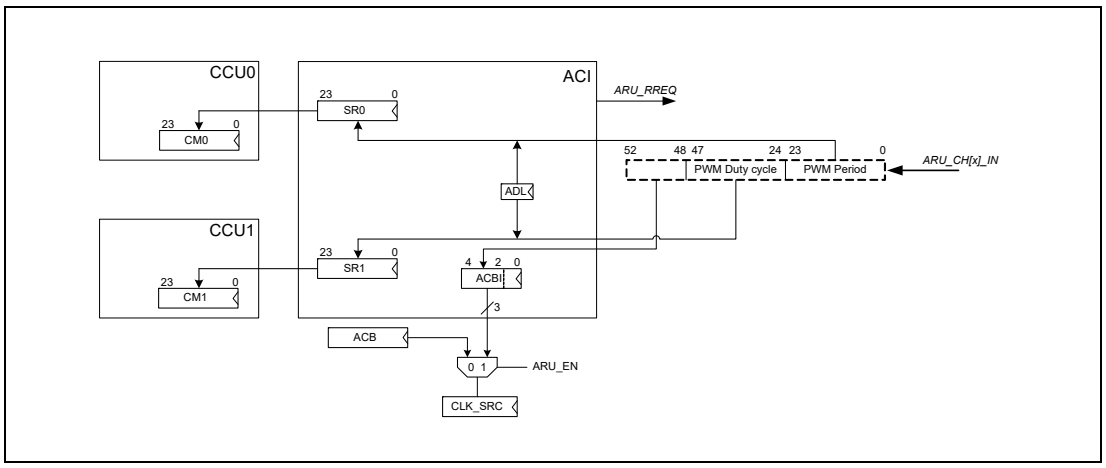

**Figure 25.43 ARU Data input stream pipeline structure for SOMP mode**

When an ARU transfer is in progress which means the ARU_RREQ is served by the ARU, the ACI locks the update mechanism of CM0, CM1 and CLK_SRC until the read request has finished. The CCU0 and CCU1 operate on the old values when the update mechanism is locked.

The shadow registers SR0 and SR1 can also be updated over the AEI bus interface. When updated via the AEI bus the CM0 and CM1 update mechanism has to be locked via the AGC_GLB_CTRL register with the UPENx signal in the AGC subunit. To select the new clock source in this case, the CPU has to write to the CLK_SRC_SR bit field of the GTM0ATOMixCTRL register.

For an asynchronous update of the duty cycle and/or period the new values must be written directly into the compare registers CM0 and/or CM1 while the counter CN0 continues counting. This update can be done only via the AEI bus interface immediately by the CPU or by the FUPD(x) trigger signal triggered from the AGC global trigger logic. Values received through the ARU interface are never loaded asynchronously into the operation registers CM0 and CM1. Therefore, the ATOM channel can generate a PWM signal on the output port pin ATOM[i]_CH[x]_OUT on behalf of the content of the CM0 and CM1 registers, while it receives new PWM values via the ARU interface ACI in its shadow registers.

On a compare match of CN0 and CM0 or CM1 the output signal level of ATOM[i]_CH[x]_OUT is toggled according to the signal level output bit SL in the GTM0ATOMixCTRL register.

Thus, the duty cycle output level can be changed during runtime by writing the new duty cycle level into the SL bit of the channel configuration register. The new signal level becomes active for the next trigger CCU_TRIGx (since bit SL is written).

Since the ATOM[i]_CH[x]_OUT signal level is defined as the reverse duty cycle output level when the ATOM channel is enabled, a PWM period can be shifted earlier by writing an initial offset value to CN0 register. By doing this, the ATOM channel first counts until CN0 reaches CM0 and then it toggles the output signal at ATOM[i]_CH[x]_OUT.

### (1) SOMP One-shot mode

The ATOM channel can operate in One-shot mode when the OSM bit is set in the channel control register. One-shot mode means that a single pulse with the pulse level defined in bit SL is generated on the output line.

First the channel has to be enabled by setting the corresponding ENDIS_STAT value.

In One-shot mode the counter CN0 will not be incremented once the channel is enabled.

A write access to the register CN0 triggers the start of pulse generation (i.e. the increment of the counter register CN0).

If the counter CN0 is reset from CM0 back to zero, the first edge at ATOM[i]_CH[x]_OUT is generated.

To avoid an update of CMx register with content of SRx register at this point in time, the automatic update should be disabled by setting UPEN_CTRL[x] = 00 (in register GTM0ATOMixCTRL)

The second edge is generated if CN0 is greater or equal than CM1 (i.e. CN0 was incremented until it has reached CM1 or CN0 is greater than CM1 after an update of CM1).

If the counter CN0 has reached the value of CM0 a second time, the counter stops.

The new value of CN0 determines the start delay of the first edge. The delay time of the first edge is given by (CM0-CN0) multiplied with period defined by current value of CLK_SRC.

**Figure 25.44** clarifies the pulse generation in SOMP One-shot mode.

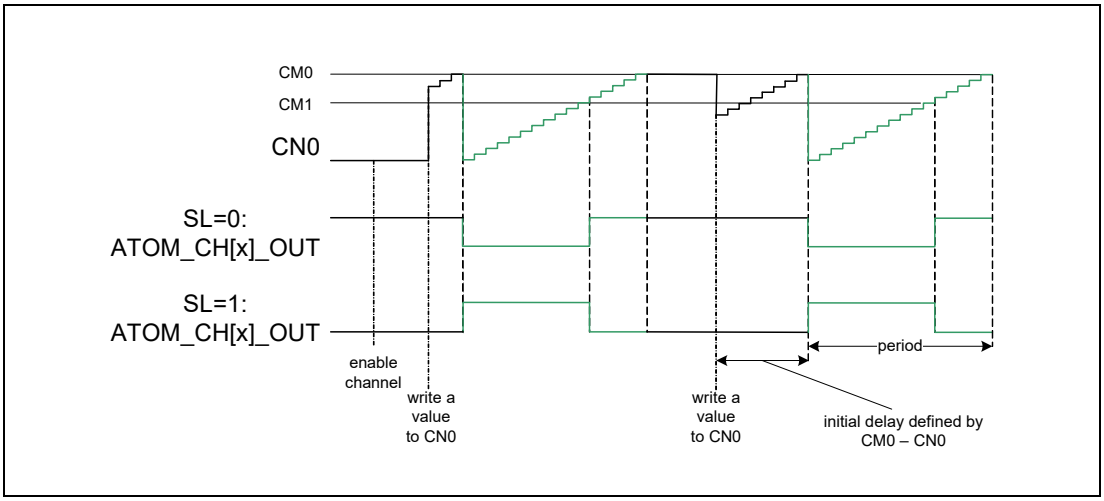

**Figure 25.44 PWM Output with respect to configuration bit SL in One-shot mode: trigger by writing to CN0**

Further output of single pulses can be started by a write access to register CN0.

If CN0 is already incrementing (i.e. started by writing to CN0 a value CN0start < CM0), the affect of a second write access to CN0 depends on the phase of CN0:

phase 1: update of CN0 before CN0 reaches first time CM0

phase 2: update of CN0 after CN0 has reached first time CM0 but is less than CM1

phase 3: update of CN0 after CN0 has reached first time CM0 and CN0 is greater than or equal CM1

In phase 1: writing to counter CN0 a value CN0new < CM0 leads to a shift of first edge (generated if CN0 reaches CM0 first time) by the time CM0-CN0new.

In phase 2: writing to incrementing counter CN0 a value CN0new < CM1 while CN0old is below CM1 leads to a lengthening of the pulse. The counter CN0 stops if it reaches CM0.

In phase 3: Writing to incrementing counter CN0 a value CN0new while CN0old is already greater than or equal CM1 leads to an immediate restart of a single pulse generation inclusive the initial delay defined by CM0 - CN0new.

If a channel is configured to one-shot mode and configuration bit OSM_TRIG is set to 1, the trigger signal OSM_TRIG (i.e. TRIG_[x-1] or TIM_EXT_CAPTURE(x)) triggers start of one pulse generation.

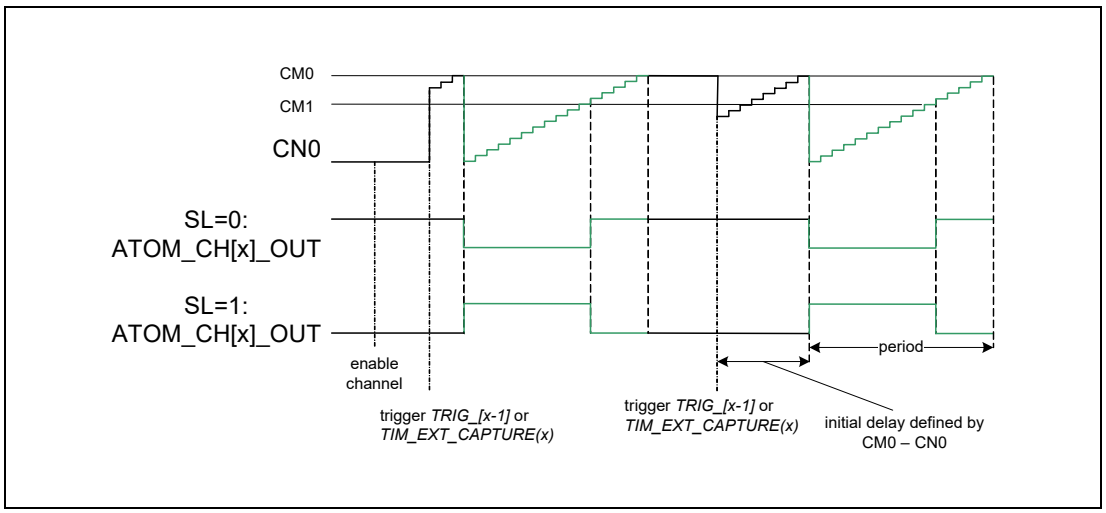

**Figure 25.45 PWM Output with respect to configuration bit SL in one-shot mode: trigger by TRIG_[x-1] orTIM_EXT_CAPTURE(x)**

### (2) PCM mode (pulse count modulation)

At the output ATOM[i]_CH[x]_OUT a pulse count modulated signal can be generated instead of the simple PWM output signal in SOMP mode.

The PCM mode is enabled by setting bit BITREV to 1 (bit 6 in GTM0ATOMixCTRL register).

Please note that it is device specific, in which channel the PCM mode is available. See **Section 25.18, GTM Device 207**and **Section 25.19, GTM Device 208**.

With the configuration bit BITREV = 1 a bit-reversing of the counter output CN0 is configured. In this case the bits LSB and MSB are swapped, the bits LSB+1 and MSB-1 are swapped, the bits LSB+2 and MSB–2 are swapped and so on.

The effect of bit-reversing of the CN0 register value is shown in the following **Figure 25.46**.

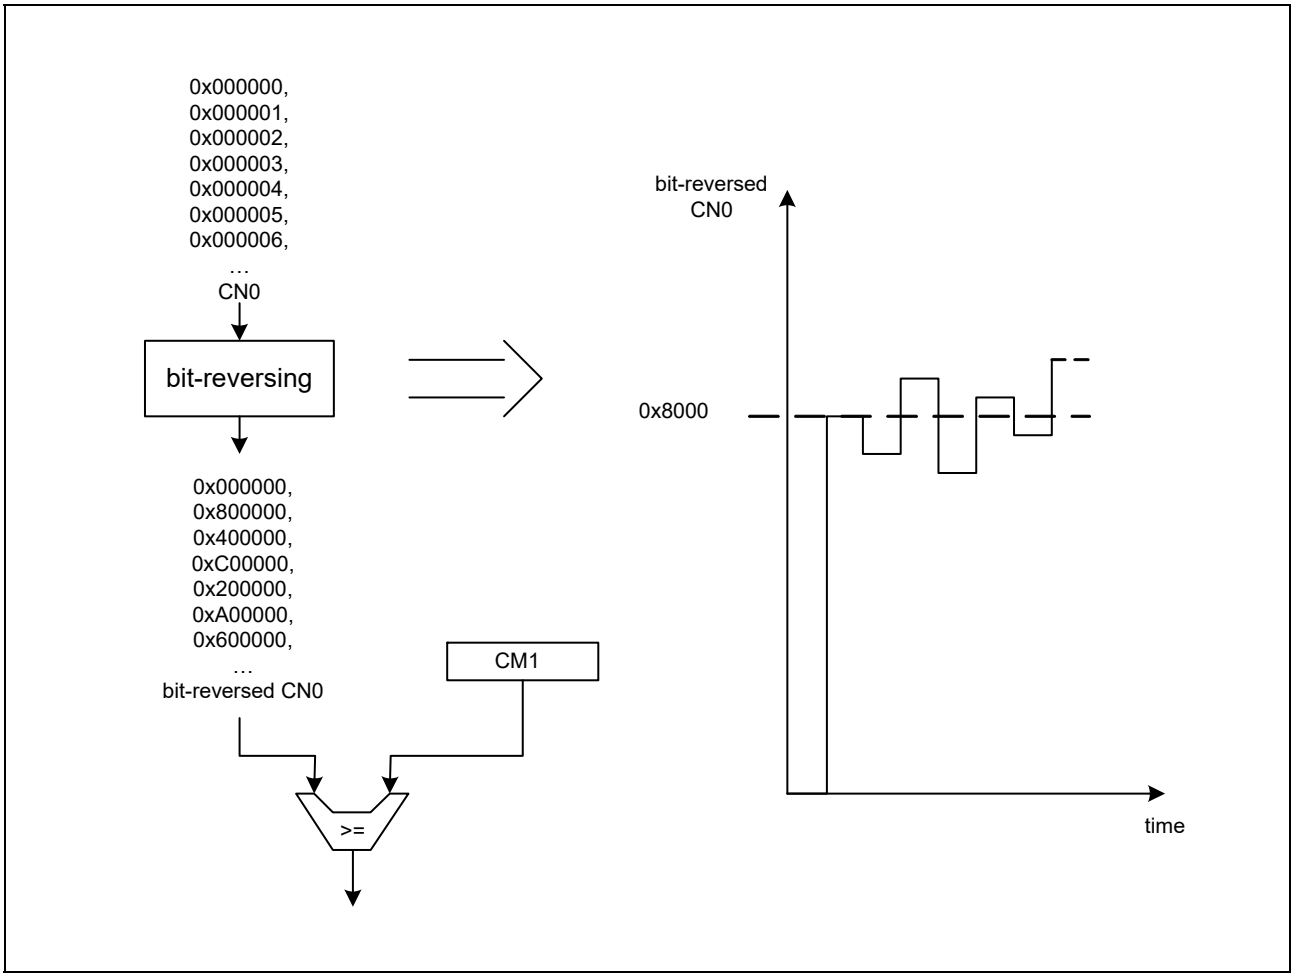

**Figure 25.46 Bit reversing of counter CN0 output**

In the PCM mode the counter register CN0 is incremented by every clock tick depending on configured CMU clock (CMU_CLK).

The output of counter register CN0 is first bit-reversed and then compared with the configured register value CM1.

If the bit-reversed value of register CN0 is greater or equal than CM1, the SR-FlipFlop of submodule SOU is set (i.e. set to inverse value of SL) otherwise the SR-FlipFlop is reset (i.e. to the value of SL). This generates at the output ATOM[i]_CH[x]_OUT a pulse count modulated signal.

In PCM mode the CM0 register - in which the period is defined - normally has to be set to its maximum value $FFFFFF_H$.

To reduce time period of updating duty cycle value in CM1 register, it is additionally possible to setup period value in CM0 register to smaller values than maximum value as described before.

Possible values for CM0 register are each 2 exponentiated with even numbered values e.g. $800000_H$, $400000_H$, $200000_H$ ... .

In this case the duty cycle has to be configured in the following manner.

Depending on how much the period in CM0 register is decreased - means shifted right starting from $1000000_H$ – the duty cycle in CM1 register has to be shifted left (= rotated: shift MSB back into LSB) with same value, e.g. :

period CM0 = $001000_H$ → shifted 8 bits right from $1000000_H$

→ so duty cycle has to be shifted left 8 bit :

e.g.50 % duty cycle = $0008000_H$ → shift 8 bits left → CM1 = $800000_H$

More examples :

| period CM0 | → | duty cycle | → | shift | → | CM1 |
|---|---|---|---|---|---|---|
| $FFFFFF_H$ | → | $800000_H$ | → | no shift | → | $800000_H$ |
| $800000_H$ | → | $400000_H$ | → | shift 1 bit left | → | $800000_H$ |
| $400000_H$ | → | $100000_H$ | → | shift 2 bits left | → | $400000_H$ |
| $200000_H$ | → | $0FFFFF_H$ | → | shift 3 bits left | → | $7FFFF8_H$ |
| $100000_H$ | → | $033333_H$ | → | shift 4 bits left | → | $333330_H$ |
| $080000_H$ | → | $005555_H$ | → | shift 5 bits left | → | $0AAAA0_H$ |
| ... | | | | | | |
| $000020_H$ | → | $000008_H$ | → | shift 19 bits left | → | $400000_H$ |
| $000010_H$ | → | $000005_H$ | → | shift 20 bits left | → | $500000_H$ |
| ... | | | | | | |

**NOTE**

In this mode the interrupt CCU1TC (see register GTM0ATOMixIRQNOTIFY) is set every time if bitreverse value of CN0 is greater or equal than CM1 which may be multiple times during one period. Therefore, from application point of view it is not useful to enable this interrupt.

### (3) GTM0ATOMixCTRL in SOMP mode (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATM00CTRL: <GTM_base> + $0D004_H$, GTM0ATM01CTRL: <GTM_base> + $0D084_H$, GTM0ATM02CTRL: <GTM_base> + $0D104_H$, GTM0ATM03CTRL: <GTM_base> + $0D184_H$, GTM0ATM04CTRL: <GTM_base> + $0D204_H$, GTM0ATM05CTRL: <GTM_base> + $0D284_H$, GTM0ATM06CTRL: <GTM_base> + $0D304_H$, GTM0ATM07CTRL: <GTM_base> + $0D384_H$, GTM0ATM10CTRL: <GTM_base> + $0D804_H$, GTM0ATM11CTRL: <GTM_base> + $0D884_H$, GTM0ATM12CTRL: <GTM_base> + $0D904_H$, GTM0ATM13CTRL: <GTM_base> + $0D984_H$, GTM0ATM14CTRL: <GTM_base> + $0DA04_H$, GTM0ATM15CTRL: <GTM_base> + $0DA84_H$, GTM0ATM16CTRL: <GTM_base> + $0DB04_H$, GTM0ATM17CTRL: <GTM_base> + $0DB84_H$, GTM0ATM20CTRL: <GTM_base> + $0E004_H$, GTM0ATM21CTRL: <GTM_base> + $0E084_H$, GTM0ATM22CTRL: <GTM_base> + $0E104_H$, GTM0ATM23CTRL: <GTM_base> + $0E184_H$, GTM0ATM24CTRL: <GTM_base> + $0E204_H$

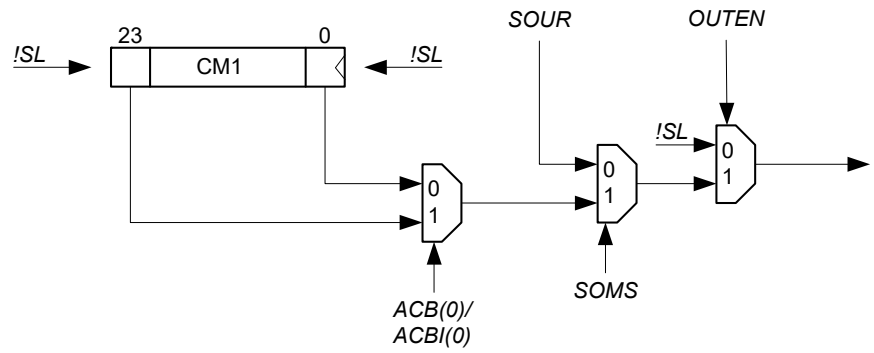
### 25.11.3.4 ATOM Signal Output Mode Serial (SOMS)

In ATOM Signal Output Mode Serial (SOMS) the ATOM channel acts as a serial output shift register where the content of the CM1 register in the CCU1 unit is shifted out whenever the unit is triggered by the selected CMU_CLK input clock signal. The shift direction is configurable with the ACB(0) bit inside the GTM0ATOMixCTRL register when ARU is disabled and the ACBI(0) bit inside the GTM0ATOMixSTAT register when ARU is enabled.

The data inside the CM1 register has to be aligned according to the selected shift direction in the ACB(0)/ACBI(0) bit. This means that when a right shift is selected, that the data word has to be aligned to bit 0 of the CM1 register and when a left shift is selected, that the data has to be aligned to bit 23 of the CM1 register.



**Note:** The !SL means inverse value of SL.

**Figure 25.47 SOMS Mode output generation**

**Figure 25.47** shows the output generation in case of SOMS mode is selected.

In SOMS mode CCU0 runs in counter/compare mode and counts the number of bits shifted out so far. The total number of bits that should be shifted is defined as CM0. The total number of bits that are visible at ATOM_OUT is CM0+1.

When the output is disabled the ATOM_OUT is set to the inverse SL bit definition.

When the content of the CM1 register is shifted out, the inverse signal level is shifted into the CM1 register.

When the output is enabled while UPEN_CTRL[x] is disabled, the ATOM_OUT signal level is defined by CM1 bit 0 or 23, dependent on the shift direction defined by ACB(0) or ACBI(0) register setting. **Figure 25.48** should clarify the ATOM channel start-up behavior in this case for right shift. For left shift the CM1 bit 0 in **Figure 25.48** has to be replaced by CM1 bit 23.

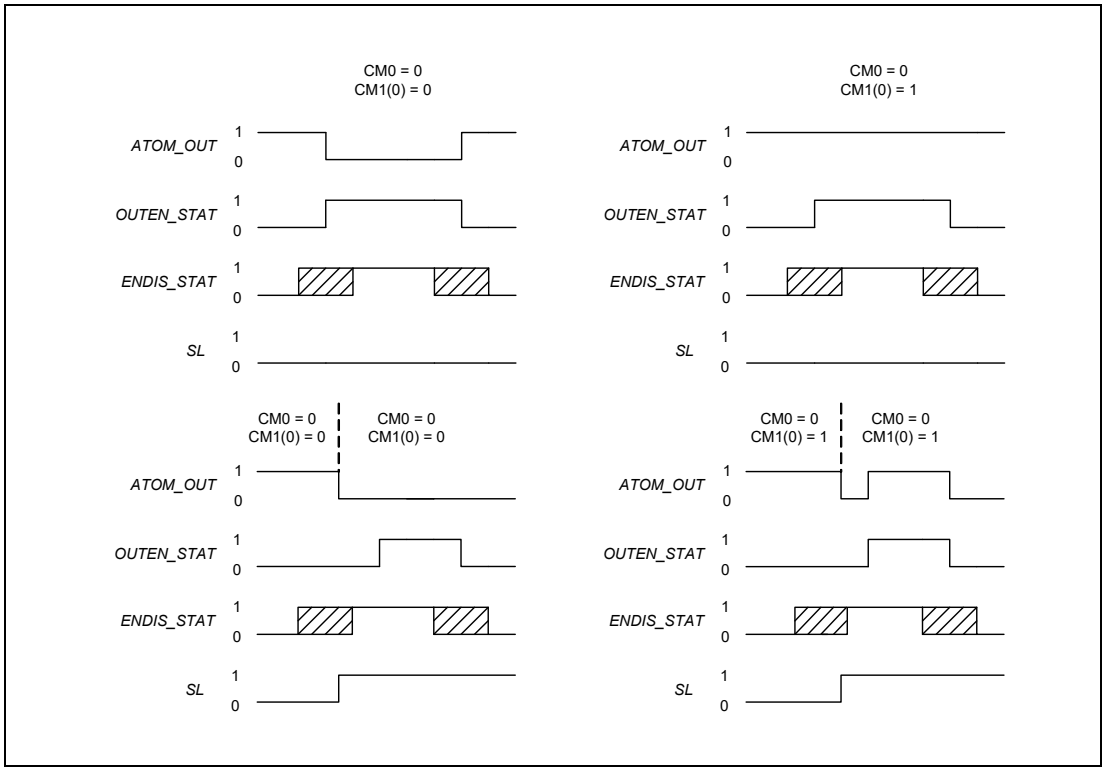


**Figure 25.48 SOMS Output signal level at start-up, UPEN_CTRL[x] disabled**

If UPEN_CTRL[x] is set and the channel is enabled, the output level is defined by bit 0 or 23 of CM1 register dependent on the shift direction. **Figure 25.49** shows the output behavior in that case.

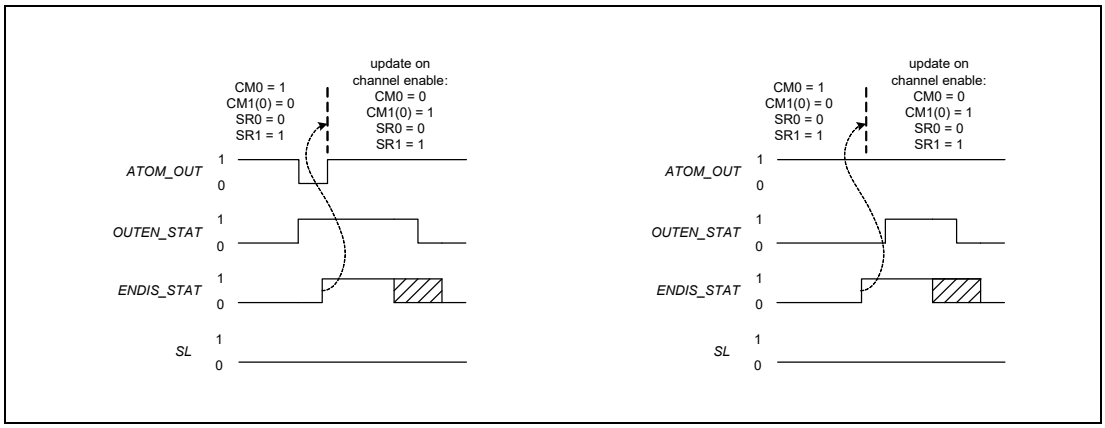

**Figure 25.49 SOMS Output signal level at start-up, UPEN_CTRL[x] enabled**

When the serial data to be shifted is provided via ARU the number of bits that should be shifted has to be defined in the lower 24 bits of the ARU word (23 to 0) and the data that is to be shifted has to be defined in the ARU bits 47 to 24 aligned according to the shift direction. This shift direction has to be defined in the ARU word bit 48 (SL0 bit).

If bit UPEN_CTRL[x] of a channel x is set, after update of CM0/CM1 register with the content of the SR0/SR1 register, a new ARU read request is set up.

If bit UPEN_CTRL[x] of a channel x is not set, no (further) ARU read request is set up (because the SR0/SR1 register are never used for update) and the ATOM may stop shifting after CN0 has reached CM0. Note, that in this case also no automatic restart of shifting is possible.

If a channel is enabled with the settings SOMS mode and ARU_EN = 1, the first received values from ARU are stored in register SR0 and SR1. If CN0 and CM0 are 0 (i.e. CN0 is not counting) and the update of channel x is enabled (UPEN_CTRL[x] = 1), an immediate update of the register CM0 and CM1 is also done. This update of CM0 and CM1 triggers the start of shifting.

It is recommended to configure the ATOM channel in One-shot mode when the ARU_EN bit is not set, since the ATOM channel would reload new values from the shadow registers when CN0 reaches CM0.

**(1) SOMS mode with ARU_EN = 1 and OSM = 0, UPEN_CTRL[x] = 1:**

In case of bit ARU_EN is set and bit OSM is not set, the channel is running in the SOMS continuous mode. Then, if the content of the CM0 register equals the counter CN0, the CM0 and CM1 registers are reloaded with the SR0 and SR1 content and new values are requested from the ARU. If the update of the shadow registers does not happen before CN0 reaches CM0 the old values of SR0 and SR1 are used to reload the operation registers.

In contrast to controlling the channel via AEI, the shift direction defined by ARU word bit 48 has only effect after the update of CMx operation registers from the SRx registers.

**(2) SOMS mode with ARU_EN = 1 and OSM = 1, UPEN_CTRL[x] = 1:**

In case of bit ARU_EN is set and bit OSM is set, the channel is running in the SOMS one-shot mode. Then, if the content of the CM0 register equals the counter CN0 and if new values are available in SR0 and SR1 (bit DV set), the CM0 and CM1 registers are reloaded with the SR0 and SR1 content and new values are requested from the ARU. If no new values are available in SR0 and SR1, the register CM0 and CM1 will not be updated, the counter CN0 stops and the ATOM channel continues to request new data from ARU. A later reception of new ARU data in SR0 and SR1 will immediately force the update of the register CM0 and CM1 and restart the counter CN0.

**(3) SOMS mode with ARU_EN = 0 and OSM = 0, UPEN_CTRL[x] = 1:**

In case of bit ARU_EN is not set and bit OSM is not set, the ATOM channel updates its CM0/CM1 register with the content of the SR0/SR1 register and restarts shifting immediately. The first bit of new CM1 register value will be applied at the output without any gap to the last bit of the previous CM1 register value.

**(4) SOMS mode with ARU_EN = 0 and OSM = 1, UPEN_CTRL[x] = 1:**

In case of bit ARU_EN is not set and bit OSM is set, the ATOM channel stops shifting when CN0 reaches CM0 and no update of CM0 and CM1 is performed.

Then, the shifting of the channel can be restarted again by writing a zero (0) to the CN0 register again. Please note, that the CN0 register should be written with a zero since the CN0 register counts the number of bits shifted out by the ATOM channel.

The writing of a zero to CN0 causes also an immediate update of CM0/CM1 register with the content of SR0/SR1 register.

**(5) Interrupts in SOMS mode**

In ATOM Signal Output Mode Serial only the interrupt CCU0TC (GTM0ATOMixIRQNOTIFY) in case of CN0 ≥ CM0 is generated. The interrupt CCU1TC has no meaning and is not generated.

### (6) GTM0ATOMixCTRL in SOMS mode (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:**
GTM0ATM00CTRL: <GTM_base> + $0D004_H$,
GTM0ATM01CTRL: <GTM_base> + $0D084_H$,

| 2 | Not used | Not used in this mode. |
| 1, 0 | MODE | ATOM channel mode select.<br>11: ATOM Signal Output Mode Serial (SOMS) |

### 25.11.3.5 ATOM Signal Output Mode Buffered Compare(SOMB)

#### (1) Overview

In ATOM Signal Output Mode buffered Compare (SOMB) the output action is performed according to the comparison result of the input values located in CM0 and/or CM1 registers and the two (three) time base values TBU_TS0 or TBU_TS1 (or TBU_TS2) provided by the TBU. For a description of the time base generation see the TBU specification in **Section 25.9, Time Base Unit (TBU)**. It is configurable, which of the two (three) time bases is to be compared with one or both values in CM0 and CM1.

The compare strategy of the two compare units CCU0 and CCU1 is controlled by the value of bit field ACBI of register GTM0ATOMixSTAT. This bit field is only readable by CPU. If ARU is disabled, the bit field ACBI can only be updated with the value of bit field ACB of register GTM0ATOMixCTRL. If ARU is enabled, the ACBI bit field can be updated with the value of shadow register ACB_SR which contains a value received via ARU or the value of bit field ACB of register GTM0ATOMixCTRL.

The table below lists all valid control configurations for bit field ACBI of register GTM0ATOMixSTAT.

**Table 25.104 ATOM SOMB compare strategies**

| ACBI(4) | ACBI(3) | ACBI(2) | CCUx control |
|---|---|---|---|
| 0 | 0 | 0 | Reserved. Has no effect. |
| 0 | 0 | 1 | Reserved. Has no effect. |
| 0 | 1 | 0 | Compare in CCU0 only, use time base TBU_TS0. Output signal level is defined by combination of SL, ACB10/ACBI(1..0) bits. |
| 0 | 1 | 1 | Compare in CCU1 only, use time base TBU_TS1 or TBU_TS2. Output signal level is defined by combination of SL, ACBI[1:0] bits. |
| 1 | 0 | 0 | Serve Last: Compare in CCU0 and then in CCU1 using *TBU_TS0*. Output signal level when CCU0 matches is defined by combination of SL, ACBI[1:0] . On the CCU1 match the output level is toggled. |
| 1 | 0 | 1 | Serve Last: Compare in CCU0 and then in CCU1 using TBU_TS1 or TBU_TS2. Output signal level when CCU0 matches is defined by combination of SL, ACBI[1:0] . On the CCU1 match the output level is toggled. |
| 1 | 1 | 0 | Serve Last: Compare in CCU0 using TBU_TS0 and then in CCU1 using TBU_TS1 or TBU_TS2. Output signal level when CCU1 matches is defined by combination of SL, ACBI[1:0] |
| 1 | 1 | 1 | Cancels pending comparison. |

The CCUx trigger signals TRIG_CCU0 and TRIG_CCU1 creates edges depending on the combination of the predefined signal level in SL bit and the two control bits ACBI[1:0].

In SOMB mode, if ARU access is enabled, the new compare values received via ARU are always stored in the shadow register SR0 and SR1 and the ACB bits are stores in an internal register ACB_SR.

If the scheduled compare matches in CCU0 and/or CCU1 are occurred and the SRx register contain new valid values, the register CM0 and CM1 are updated automatically with the content of the corresponding SRx register, the ACBI bit field is updated with the content of internal ACB_SR register and the DV bit of register GTM0ATOMixSTAT is set. If the SRx register and the CMx register contain no valid value, the compare units are waiting in an idle state.

On a compare match of one of the compare units CCUx units the output ATOM_OUT is set according to combination of ACBI bit 1 down to 0 (in register GTM0ATOMixSTAT) and the SL bit of register GTM0ATOMixCTRL.

**Table 25.105 ATOM SOMB output control by ACBI[1:0] and SL**

| SL | ACBI(1) | ACBI(0) | Output Behavior |
|---|---|---|---|
| 0 | 0 | 0 | No signal level change at output. |
| 0 | 0 | 1 | Set output signal level to 1. |
| 0 | 1 | 0 | Set output signal level to 0. |
| 0 | 1 | 1 | Toggle output signal level. |
| 1 | 0 | 0 | No signal level change at output. |
| 1 | 0 | 1 | Set output signal level to 0. |
| 1 | 1 | 0 | Set output signal level to 1. |
| 1 | 1 | 1 | Toggle output signal level. |

In opposite to SOMC mode no time stamp value of TBU is captured in SRx register.

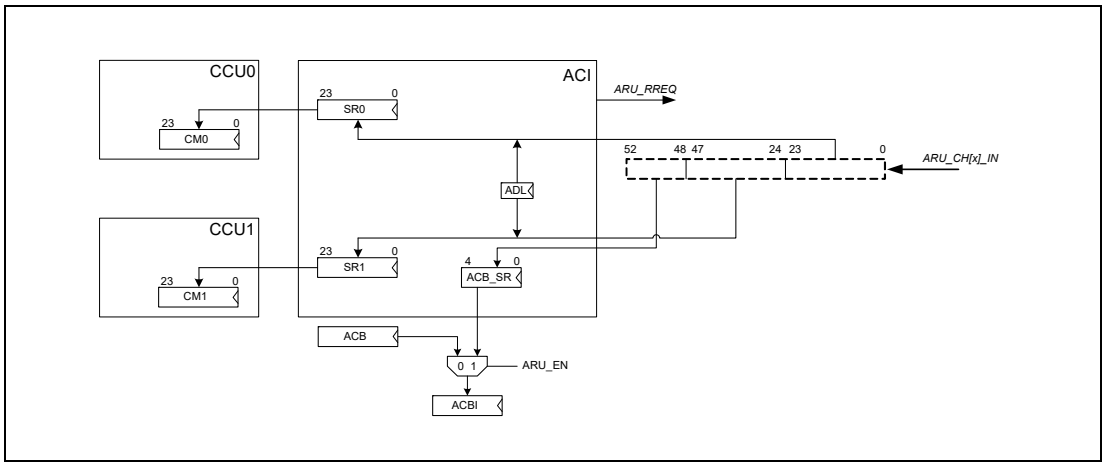

**Figure 25.50 ARU interface behavior in SOMB mode**

The flag DV of register GTM0ATOMixSTAT indicates that at least one of the CMx register contains valid data and a compare event may be pending (if channel is enabled).

The DV flag is reset if none of the CMx register contains valid data.

### (2) SOMB under CPU control

If bit ARU_EN of register GTM0ATOMixCTRL is not set, the ATOM channel can only be controlled via CPU.

Writing to one of the CMx register sets automatically the DV bit to validate the new compare value. A comparison depending on value ACBI of register GTM0ATOMixSTAT is started immediately.

Because only the ACB bit of register GTM0ATOMixCTRL can be written and this bit field serves as a shadow register for the work register ACBI (bit field of register GTM0ATOMixSTAT), it is recommended to first update the ACB bit field before updating CMx/SRx register.

The compare strategy is controlled by the value stored in bit field ACBI of register GTM0ATOMixSTAT. If ARU is disabled, this bit field can only be updated with the value of bit field ACB of register GTM0ATOMixCTRL.

The update of bit field ACBI can be triggered by a forced update or the normal update mechanism controlled by bit UPEN_CTRL[x] in register GTM0ATOMiAGCGLBCTRL.

Writing to one of the SRx register and triggering a forced update, updates the CMx register with the value of SRx register and the ACBI bit field with the content of ACB bit field of register GTM0ATOMiAGCGLBCTRL. A new comparison is started.

Writing to one of the SRx register while update of CMx register is disabled (UPEN_CTRL[x] = 0 in GTM0ATOMiAGCGLBCTRL) and enabling update afterwards, triggers the update of CMx register and the ACBI bit field and starts comparison if previous comparison is finished (DV bit was reset).

If ARU access is disabled (ARU_EN = 0), a force update updates the CMx register with the content of SRx register and the ACBI bit field with the content of ACB bit field of register GTM0ATOMixCTRL.

### (3) SOMB under ARU control

If both compare units CCU0/CCU1 are finished with previous job (depending on compare strategy) and the SRx register contain no new value, they are waiting until new data was received via ARU and stored in SRx register. Then, an immediately update takes place.

If both compare units are finished with previous job (depending on compare strategy) and there are new data available in SRx register, the update the CMx register with the value of the SRx register and the ACBI bit field with the value of internal ACB_SR register takes place and a new compare job is started immediately.

After an update of the CMx register, a new ARU read request is set.

New compare values received via the ARU are stored in shadow register SRx. The ACB bits received via ARU are stored in the internal register ACB_SR.

If ARU access is enabled (ARU_EN = 1), a force update updates the CMx register with the content of SRx register and the ACBI bit field with the content of internal ACB_SR register.

For compare strategy ‘serve last’ the CCU0 and CCU1 compare match may occur sequentially. During different phases of compare match the CPU access rights to register CM0 and CM1 as well as to WR_REQ bit is different. These access rights by CPU to register CM0 and CM1 and the WR_REQ are depicted in the following figure.

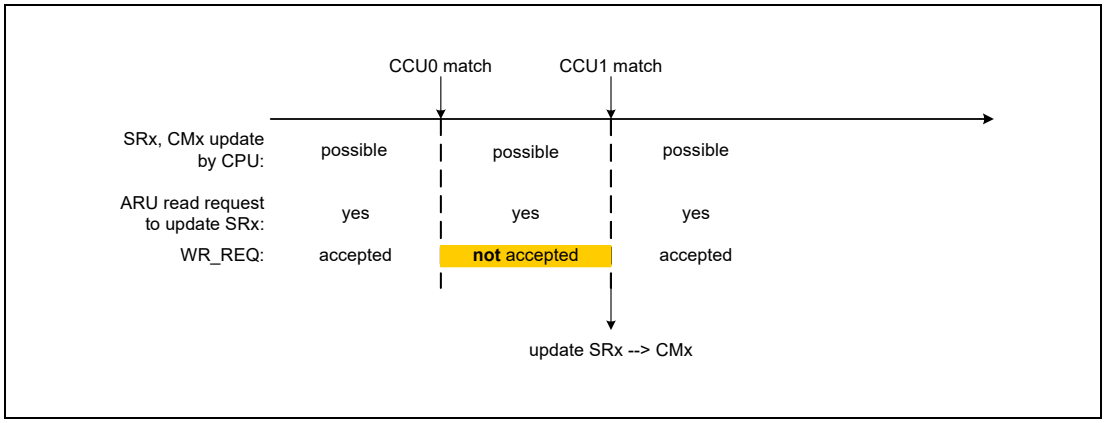

**Figure 25.51 CPU access rights in case of compare strategy ‘serve last’**

(a) ARU Non-blocking mode

If bit ABM in register GTM0ATOMixCTRL is not set, the ARU blocking mode is disabled. In this case the ATOM channel is continuously reading via ARU and storing new values in the SRx register and the ACB shadow register ACB_SR.

If ARU_EN is not set, the bit ABM has no meaning.

(b) ARU Blocking mode

If bit ABM in register GTM0ATOMixCTRL is set, the ARU blocking mode is enabled. In this case the ATOM channel stops requesting new SRx values via ARU after reception of a new SRx value and restarts requesting a new value via ARU after compare match on both compare units (depending on compare strategy) followed by the immediate update of the CMx register with content of SRx register and an update of ACBI with the content of ACB_SR.

If ARU_EN is not set, the bit ABM has no meaning.

(c) Late Update by CPU

Although, the ATOM channel may be controlled by data received via the ARU, the CPU is able to request at any time a late update of the compare register. This can be initiated by setting the WR_REQ bit inside the GTM0ATOMixCTRL register.

If none of the two compare match event happened, the ATOM channel accepts the setting of WR_REQ bit. In this case, the ATOM will request no further data from ARU (if ARU access was enabled) and will disable the update of CMx register with the content of SRx register on a compare match event.

If at least one of the requested compare match events happened (depending on strategy) the WR_REQ bit is not set and the WRF flag in register GTM0ATOMixSTAT is set to indicate that the late update was not successful.

The channel will in any case continue to compare against the values stored inside the compare registers (if bit DV was set). The CPU can now update the compare values by writing to the shadow registers and force the ATOM channel to update the compare registers by writing to the force update register bits in the AGC register.

With a force update the WR_REQ bit is reset automatically and the ARU read request is set up again (if ARU access was enabled).

### (4) GTM0ATOMixCTRL in SOMB mode (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATM00CTRL: <GTM_base> + $0D004_H$, GTM0ATM01CTRL: <GTM_base> + $0D084_H$, GTM0ATM02CTRL: <GTM_base> + $0D104_H$, GTM0ATM03CTRL: <GTM_base> + $0D184_H$, GTM0ATM04CTRL: <GTM_base> + $0D204_H$, GTM0ATM05CTRL: <GTM_base> + $0D284_H$, GTM0ATM06CTRL: <GTM_base> + $0D304_H$, GTM0ATM07CTRL: <GTM_base> + $0D384_H$, GTM0ATM10CTRL: <GTM_base> + $0D804_H$, GTM0ATM11CTRL: <GTM_base> + $0D884_H$, GTM0ATM12CTRL: <GTM_base> + $0D904_H$, GTM0ATM13CTRL: <GTM_base> + $0D984_H$, GTM0ATM14CTRL: <GTM_base> + $0DA04_H$, GTM0ATM15CTRL: <GTM_base> + $0DA84_H$, GTM0ATM16CTRL: <GTM_base> + $0DB04_H$, GTM0ATM17CTRL: <GTM_base> + $0DB84_H$, GTM0ATM20CTRL: <GTM_base> + $0E004_H$, GTM0ATM21CTRL: <GTM_base> + $0E084_H$, GTM0ATM22CTRL: <GTM_base> + $0E104_H$, GTM0ATM23CTRL: <GTM_base> + $0E184_H$, GTM0ATM24CTRL: <GTM_base> + $0E204_H$

### 25.11.4 ATOM Interrupt signals

The following table describes ATOM interrupt signals:

**Table 25.107 ATOM interrupt signals**

| Signal | Description |
|---|---|
| CCU0TCx_IRQ | CCU0 Trigger condition interrupt for channel x |
| CCU1TCx_IRQ | CCU1 Trigger condition interrupt for channel x |

### 25.11.5 ATOM Register overview

The following table shows a conclusion of ATOM register address offset and initial values.

**Table 25.108 Register list**

| Symbol | Register Name | Details in Section |
|---|---|---|
| GTM0ATOMiAGCGLBCTRL | AGC Global control register | **25.11.6.1** |
| GTM0ATOMiAGCENDISCTRL | AGC0 Enable/disable control register | **25.11.6.2** |
| GTM0ATOMiAGCENDISSTAT | AGC Enable/disable status register (represents status of ATOM channels) | **25.11.6.3** |
| GTM0ATOMiAGCACTTB | AGC Action time base register | **25.11.6.4** |
| GTM0ATOMiAGCOUTENCTRL | AGC Output enable control register | **25.11.6.5** |
| GTM0ATOMiAGCOUTENSTAT | AGC Output enable status register | **25.11.6.6** |
| GTM0ATOMiAGCFUPDCTRL | AGC Force update control register | **25.11.6.7** |
| GTM0ATOMiAGCINTTRIG | AGC Internal trigger control register | **25.11.6.8** |
| GTM0ATOMixCTRL | ATOM Channel x control register | **(1)** |
| GTM0ATOMixSTAT | ATOM Channel x status register | **(2)** |
| GTM0ATOMixRDADDR | ATOM Channel x ARU read address register | **25.11.6.9** |
| GTM0ATOMixCN0 | ATOM Channel x CCU0 counter register | **25.11.6.10** |
| GTM0ATOMixCM0 | ATOM Channel x CCU0 compare register | **25.11.6.11** |
| GTM0ATOMixSR0 | ATOM Channel x CCU0 compare shadow register | **25.11.6.12** |
| GTM0ATOMixCM1 | ATOM Channel x CCU1 compare register | **25.11.6.13** |
| GTM0ATOMixSR1 | ATOM Channel x CCU1 compare shadow register | **25.11.6.14** |
| GTM0ATOMixIRQNOTIFY | ATOM channel x interrupt notification register | **25.11.6.15** |
| GTM0ATOMixIRQEN | ATOM channel x interrupt enable register | **25.11.6.16** |
| GTM0ATOMixIRQFORCINT | ATOM channel x software interrupt generation | **25.11.6.17** |
| GTM0ATOM00IRQMOD | IRQ mode configuration register | **25.11.6.18** |

## 25.11.6 ATOM Register description

### 25.11.6.1 GTM0ATOMiAGCGLBCTRL (i = 0 to 2)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATOM0AGCGLBCTRL: <GTM_base> + $0D040_H$
GTM0ATOM1AGCGLBCTRL: <GTM_base> + $0D840_H$
GTM0ATOM2AGCGLBCTRL: <GTM_base> + $0E040_H$

**Value after reset:** $0000\ 0000_H$

**Table 25.112 GTM0ATOMiAGCACTTB Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 27 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 26, 25 | TBU_SEL | Selection of time base used for comparison<br>00: TBU_TS0 selected<br>01: TBU_TS1 selected<br>10: TBU_TS2 selected<br>11: Same as 00<br>**NOTE**<br>The bit combination “10” is only applicable if the TBU of the device contains three time base channels. Otherwise, this bit combination is also reserved. See GTM Architecture block diagram on page 3 to determine the number of channels for TBU of this device. |
| 24 | TB_TRIG | Set trigger request<br>0: No trigger request<br>1: Set trigger request<br>**NOTE**<br>This flag is reset automatically if the selected time base unit (TBU_TS0 or TBU_TS1 or TBU_TS2 if present) has reached the value ACT_TB and the update of the register were triggered. |
| 23 to 0 | ACT_TB | specifies the signed compare value with selected signal TBU_TS[x], x = 0 to 2. If selected TBU_TS[x] value is in the interval [ACT_TB-007FFFFFh, ACT_TB] the event is in the past and the trigger is generated immediately. Otherwise the event is in the future and the trigger is generated if selected TBU_TS[x] is equal to ACT_TB. |

### 25.11.6.5 GTM0ATOMiAGCOUTENCTRL (i = 0 to 2)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATOM0AGCOUTENCTRL: <GTM_base> + $0D050_H$
GTM0ATOM1AGCOUTENCTRL: <GTM_base> + $0D850_H$
GTM0ATOM2AGCOUTENCTRL: <GTM_base> + $0E050_H$

**Value after reset:** $0000\ 0000_H$

**Table 25.116 GTM0ATOMiAGCINTTRIG Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 16 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 15, 14 | INT_TRIG7 | Select input signal TRIG_7 as a trigger source<br>See bits 1, 0 |
| 13, 12 | INT_TRIG6 | Select input signal TRIG_6 as a trigger source<br>See bits 1, 0 |
| 11, 10 | INT_TRIG5 | Select input signal TRIG_5 as a trigger source<br>See bits 1, 0 |
| 9, 8 | INT_TRIG4 | Select input signal TRIG_4 as a trigger source<br>See bits 1, 0 |
| 7, 6 | INT_TRIG3 | Select input signal TRIG_3 as a trigger source<br>See bits 1, 0 |
| 5, 4 | INT_TRIG2 | Select input signal TRIG_2 as a trigger source<br>See bits 1, 0 |
| 3, 2 | INT_TRIG1 | Select input signal TRIG_1 as a trigger source<br>See bits 1, 0 |
| 1, 0 | INT_TRIG0 | Select input signal TRIG_0 as a trigger source<br>Write of following double bit values is possible:<br>00: Don't care, bits 1, 0 will not be changed<br>01: Internal trigger from channel 0 (TRIG_0) not used: is read as 00 (see below)<br>10: Internal trigger from channel 0 (TRIG_0) used: is read as 11 (see below)<br>11: Don't care, bits 1, 0 will not be changed<br>Read of following double values means:<br>00: Internal trigger from channel 0 (TRIG_0) not used<br>11: Internal trigger from channel 0 (TRIG_0) used |

### (1) GTM0ATOMixCTRL (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATOM00CTRL: <GTM_base> + $0D004_H$, GTM0ATOM01CTRL: <GTM_base> + $0D084_H$, GTM0ATOM02CTRL: <GTM_base> + $0D104_H$, GTM0ATOM03CTRL: <GTM_base> + $0D184_H$, GTM0ATOM04CTRL: <GTM_base> + $0D204_H$, GTM0ATOM05CTRL: <GTM_base> + $0D284_H$, GTM0ATOM06CTRL: <GTM_base> + $0D304_H$, GTM0ATOM07CTRL: <GTM_base> + $0D384_H$, GTM0ATOM10CTRL: <GTM_base> + $0D804_H$, GTM0ATOM11CTRL: <GTM_base> + $0D884_H$, GTM0ATOM12CTRL: <GTM_base> + $0D904_H$, GTM0ATOM13CTRL: <GTM_base> + $0D984_H$, GTM0ATOM14CTRL: <GTM_base> + $0DA04_H$, GTM0ATOM15CTRL: <GTM_base> + $0DA84_H$, GTM0ATOM16CTRL: <GTM_base> + $0DB04_H$, GTM0ATOM17CTRL: <GTM_base> + $0DB84_H$, GTM0ATOM20CTRL: <GTM_base> + $0E004_H$, GTM0ATOM21CTRL: <GTM_base> + $0E084_H$, GTM0ATOM22CTRL: <GTM_base> + $0E104_H$, GTM0ATOM23CTRL: <GTM_base> + $0E184_H$, GTM0ATOM24CTRL: <GTM_base> + $0E204_H$

**Value after reset:** 0000 $0X00_H$

**Table 25.117 GTM0ATOMixCTRL Register Contents (1/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 30 | SOMB | SOMB mode<br>0: ATOM channel mode defined by bit field MODE<br>1: ATOM SOMB mode enabled |
| 29, 28 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 27 | ABM | ARU blocking mode<br>0: ARU blocking mode disabled: ATOM reads continuously from ARU and updates CM0, CM1 independent of pending compare match event<br>1: ARU blocking mode enabled: after updating CM0,CM1 via ARU, no new data is read from ARU until compare match event is occurred.<br>**NOTE**<br>This bit is only applicable in SOMC mode. |
| 26 | OSM | One-shot mode<br>0: Continuous PWM generation after channel enable<br>1: A single pulse is generated<br>**NOTE**<br>This bit is only applicable in SOMP and SOMS modes. |

**Table 25.117 GTM0ATOMixCTRL Register Contents (2/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 25 | SLA | Serve last ARU communication strategy<br>0: Capture SRx time stamps after CCU0 match event not provided to ARU<br>1: Capture SRx time stamps after CCU0 match event provided to ARU<br>**NOTES**<br>1. This bit is only applicable in SOMC mode.<br>2. Please note, that setting of this bit has only effect, when ACBI(4:2) is configured for serve last compare strategy (“100”, “101”, or “110”).<br>3. When this bit is not set, the captured time stamps in the shadow registers SRx are only provided after the CCU1 match occurred. The ACBO(4:3) bits always return "10" in that case.<br>4. By setting this bit, the ATOM channel also provides the captured time stamps after the CCU0 match event to the ARU. The ACBO(4:3) bits are set to “01” in that case. After the CCU1 match event, the time stamps are captured again in the SRx registers and provided to the ARU. The ACBO(4:3) bits are set to “10”. When the data in the shadow registers after the CCU0 match was not consumed by an ARU destination and the CCU1 match occurs, the data in the shadow registers is overwritten by the new captured time stamps. The ATOM channel does not request new data from the ARU when the CCU0 match values are read from an ARU destination. |
| 24 | TRIGOUT | Trigger output selection (output signal TRIG_CHx) of module ATOM_CHx.<br>0: TRIG_[x] is TRIG_[x-1] orTIM_EXT_CAPTURE(x).<br>1: TRIG_[x] is TRIG_CCU0 |
| 23 | EXTTRIGOUT | Select TIM_EXT_CAPTURE(x) as potential output signal TRIG_[x]<br>0: Signal TRIG_[x-1] is selected as output on TRIG_[x] (if TRIGOUT = 1)<br>1: Signal TIM_EXT_CAPTURE(x) is selected as output on TRIG_[x] (if TRIGOUT = 1) |
| 22 | EXT_TRIG | Select TIM_EXT_CAPTURE(x) as trigger signal<br>0: Signal TIM_[x-1] is selected as trigger to reset CN0 or to start single pulse generation.<br>1: Signal TIM_EXT_CAPTURE(x) is selected |
| 21 | OSM_TRIG | Enable trigger of one-shot pulse by trigger signal *OSM_TRIG*<br>0: Signal OSM_TRIG can not trigger start of single pulse generation<br>1: Signal OSM_TRIG can trigger start of single pulse generation (only if bit OSM = 1)<br>**NOTE**<br>This bit should only be set if bit OSM=1 and bit RST_CCU0 = 0. |
| 20 | RST_CCU0 | Reset source of CCU0<br>0: Reset counter register CN0 to 0 on matching comparison with CM0<br>1: Reset counter register CN0 to 0 on trigger TRIG_[x-1] orTIM_EXT_CAPTURE(x).<br>**NOTES**<br>1. If RST_CCU0=1 and UPEN_CTRLx=1 are set, TRIG_[x-1] or TIM_EXT_CAPTURE(x) triggers also the update of work register (CM0, CM1 and CLK_SRC).<br>2. This bit is only applicable in SOMP mode.<br>3. This bit should only be set if bit OSM=0 (i.e. in continuous mode) |
| 19 to 17 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 16 | WR_REQ | CPU Write request bit for late compare register update.<br>**NOTE**<br>This bit is only applicable in SOMC and SOMB mode. |
| 15 | Reserved | These bits are always read as 0. When written, write the initial value. |

**Table 25.117 GTM0ATOMixCTRL Register Contents (3/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 14 to 12 | CLK_SRC_SR | Actual CMU clock source (SOMS)/ shadow register for CMU clock source (SOMP).<br>000: CMU_CLK0 selected<br>001: CMU_CLK1 selected<br>010: CMU_CLK2 selected<br>011: CMU_CLK3 selected<br>100: CMU_CLK4 selected<br>101: CMU_CLK5 selected<br>110: CMU_CLK6 selected<br>111: CMU_CLK7 selected<br>**NOTES**<br>1. After (channel) reset the selected CLK_SRC value is the SYS_CLK (input of Global Clock Divider). To use in SOMP mode one of the CMU_CLKx, it is required to perform a forced update of CLK_SRC with the value of CLK_SRC_SR value before/with enabling the channel.<br>2. This register is a shadow register for the CMU_CLKx select. Thus, if the CMU_CLK source for PWM generation should be changed during operation, the old CMU_CLK has to operate until the update of the ATOM channels internal CLK_SRC register by the CLK_SRC_SR content is done either by an end of a period or a FORCE_UPDATE. |
| 11 | SL | Initial signal level.<br>0: Low signal level<br>1: High signal level<br>**NOTES**<br>1. Reset value depends on the hardware configuration chosen by silicon vendor.<br>2. If the output is disabled, the output ATOM_OUT[x] is set to inverse SL independent of the ATOM channel mode.<br>3. In SOMP, SOMI, SOMS mode, if the channel is disabled, the internal register SOUR inside ATOM sub unit SOU is set to inverse value of SL. By enabling the channel the register SOUR is not changed. Thus, if the output is enabled afterwards, the output ATOM_OUT[x] is the inverse value of SL.<br>4. In SOMC mode, if the channel is disabled, the internal register SOUR inside ATOM sub unit SOU is set to value of SL. By enabling the channel the register SOUR is not changed. Thus, if the output is enabled and the channel is disabled, the output ATOM_OUT[x] is the value of SL.<br>5. In SOMS mode, this bit is only applicable when the channel and its output are disabled. |
| 10 | Reserved | This bit is always read as 0. When written, write the initial value. |
| 9 | CMP_CTRL | CCUx compare strategy select.<br>0: Greater/equal compare against TBU time base values (TBU_TSx ≥ CMx)<br>1: Less/equal compare against TBU time base values (TBU_TSx ≤ CMx)<br>**NOTE**<br>This bit is only applicable in SOMC mode. |
| 8 to 4 | ACB | ATOM Mode control bits.<br>**NOTES**<br>1. These bits have different meaning in the different ATOM channel modes. See the mode description **Section 25.11.3, ATOM Channel modes** . |
| 3 | ARU_EN | ARU Input stream enable.<br>0: ARU Input stream disabled<br>1: ARU Input stream enabled |

**Table 25.117 GTM0ATOMixCTRL Register Contents (4/4)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 2 | TB12_SEL | Select time base value TBU_TS1 or TBU_TS2.<br>0: TBU_TS1 selected for comparison<br>1: TBU_TS2 selected for comparison<br>**NOTE**<br>This bit is only applicable in SOMC mode. |
| 1, 0 | MODE | ATOM channel mode select.<br>00: ATOM Signal Output Mode Immediate (SOMI)<br>01: ATOM Signal Output Mode Compare (SOMC)<br>10: ATOM Signal Output Mode PWM (SOMP)<br>11: ATOM Signal Output Mode Serial (SOMS) |

### (2) GTM0ATOMixSTAT (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:**
GTM0ATOM00STAT: <GTM_base> + $0D01C_H$,
GTM0ATOM01STAT: <GTM_base> + $0D09C_H$,
GTM0ATOM02STAT: <GTM_base> + $0D11C_H$,
GTM0ATOM03STAT: <GTM_base> + $0D19C_H$,

**Table 25.118 GTM0ATOMixSTAT Register Contents (1/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 29 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 28 to 24 | ACBO | ATOM Internal status bits.<br>ACBO[3] = 1: CCU0 Compare match occurred<br>ACBO[4] = 1: CCU1 Compare match occurred<br>**NOTES**<br>1. These bits are only set in SOMC mode.<br>2. ACBO is reset to 0b00000 on an update of register CM0 or CM1 (via ARU or CPU)<br>3. In SOMC mode these bits are sent as ARU control bits 52 to 48. |
| 23 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 22 | WRF | Write request of CPU failed for late update.<br>0: Late update was successful, CCUx units wait for comparison.<br>1: Late update failed.<br>The bit WRF can be reset by writing a 1 to it.<br>**NOTE**<br>This bit is only applicable in SOMC and SOMB mode. |

**Table 25.118 GTM0ATOMixSTAT Register Contents (2/2)**

| Bit Position | Bit Name | Function |
|---|---|---|
| 21 | DV | Valid ARU Data stored in compare registers.<br>0: No valid data stored in register CM0 and/or CM1, no comparison is activated.<br>1: Valid data stored in CM0 and/or CM1, comparison activated.<br>**NOTE**<br>This bit is only applicable in SOMC and SOMB mode. The CPU can determine the status of the ARU transfers with this bit. After the compare event occurred, the bit is reset by hardware. |
| 20 to 16 | ACBI | ATOM Mode control bits.<br>**NOTES**<br>1. For ATOM SOMI, SOMC, SOMP and SOMS mode this register serves as a mirror for the five ARU control bits received through the ARU interface. The bits are valid, when the DV bit is set.<br>2. For SOMB mode this bit field serves as the work register of the compare strategy. It can be updated with the value of bit field ACB of register GTM0ATOMixCTRL or the value of internal shadow register ACB_SR. |
| 15 to 1 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 0 | OL | Actual output signal level of ATOM_CHx_OUT.<br>0: Actual output signal level is low<br>1: Actual output signal level is high<br>**NOTE**<br>Reset value is the inverted value of bit SL which depends on the hardware configuration chosen by silicon vendor. |

### 25.11.6.9 GTM0ATOMixRDADDR (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0ATOM00RDADDR: <GTM_base> + $0D000_H$, GTM0ATOM10RDADDR: <GTM_base> + $0D800_H$
GTM0ATOM01RDADDR: <GTM_base> + $0D080_H$, GTM0ATOM11RDADDR: <GTM_base> + $0D880_H$
GTM0ATOM02RDADDR: <GTM_base> + $0D100_H$, GTM0ATOM12RDADDR: <GTM_base> + $0D900_H$
GTM0ATOM03RDADDR: <GTM_base> + $0D180_H$, GTM0ATOM13RDADDR: <GTM_base> + $0D980_H$

**Table 25.119 GTM0ATOMixRDADDR Register Contents**

| Bit Position | Bit Name | Function |
|---|---|---|
| 31 to 25 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 24 to 16 | RDADDR1 | ARU Read address 1.<br>**NOTES**<br>1. The ATOM channel switches to this read address, when requested in the ARU control bits 52 to 48 with the pattern “111--”. The channel switches back to the RDADDR0 after one ARU data package was received on RDADDR1.<br>2. This read address is only applicable in SOMC mode.<br>3. This bit field is only writeable if channel is disabled. |
| 15 to 9 | Reserved | These bits are always read as 0. When written, write the initial value. |
| 8 to 0 | RDADDR0 | ARU Read address 0.<br>**NOTES**<br>1. This read address is used by the ATOM channel to receive data from ARU immediately after the channel and ARU access is enabled (see **Section (1), GTM0ATOMixCTRL (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)** for details).<br>2. This bit field is only writeable if channel is disabled. |

### 25.11.6.10 GTM0ATOMixCN0 (i = 0, x = 0 to 7, i = 1, x = 0 to 7, i = 2, x = 0 to 4)

**Access:** This register can be read/written in 32-bit units.

**Address:**
GTM0ATOM00CN0: <GTM_base> + $0D018_H$,
GTM0ATOM01CN0: <GTM_base> + $0D098_H$,
GTM0ATOM02CN0: <GTM_base> + $0D118_H$,
GTM0ATOM03CN0: <GTM_base> + $0D198_H$,

# 25.12 Dead Time Module (DTM)

## 25.12.1 Overview

The following figure gives an overview of the structure of the Dead Time Module (DTM).

### 25.12.1.1 DTM overview

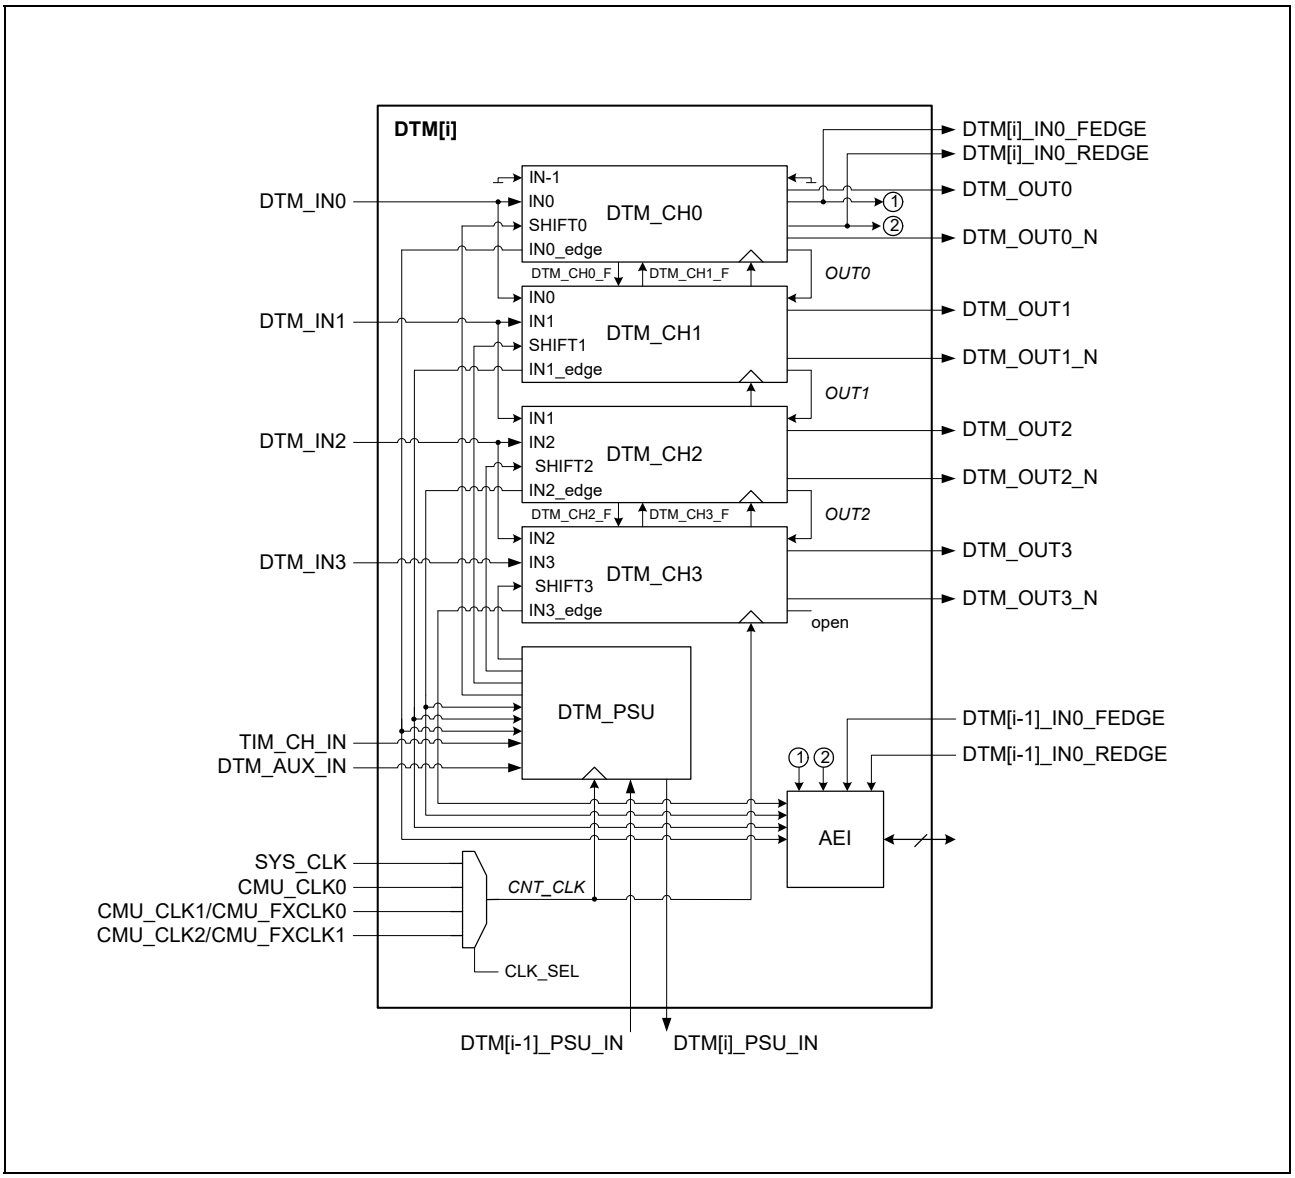

**Figure 25.52 DTM block diagram**

The main function of the DTM is to derive for each input DTM_IN0 to DTM_IN3 the individual inverse signal (DTM[i]_OUT[x]_N) and to apply an edge specific delay between the edge of the original signal and the edge of the derived inverted signal (i.e., the dead time). This function is mainly used for controlling of half bridges.

A second function provided by DTM is to set the outputs of one channel to the value of the preceding channel if requested by a trigger on input TIM_CH_IN or DTM_AUX_IN. This feature allows a phase shift on one PWM signal to the phase of the preceding PWM signal up to the next edge on this channel.

The third function provided by DTM is to (N)AND/(N)OR/X(N)OR combine the input DTM_IN[x] signal of one DTM channel with the signal on input TIM_CH_IN or DTM_AUX_IN (selected inside DTM_PSU and assigned to one of the signals SHIFT[x]) or with the output 1 (signal OUT[x]) of preceding channel.

As a result OUT2 may be the combined signal of DTM_IN0 and TIM_CH_IN or DTM_AUX_IN and the signal DTM_IN1. For OUT3 this chain can be combined again with signal DTM_IN3.

The outputs of each channel may be swapped individually to provide the function of combining signals on each output of a channel.

In general, the DTM instances are placed behind the TOM and the ATOM instances, i.e., the outputs TOM_OUT[x] and ATOM_OUT[x] are each routed to a DTM instance.

Additionally, some TIM instances are also connected to the DTM instances.

These connections between DTM and the modules TIM, TOM and ATOM are depicted in **25.12.1.2**.

Note, for unavailable DTM[i] instances the signal DTM[i-1]_PSU_IN is passed through to DTM[i]_PSU_IN, DTM[i-1]_IN0_FEDGE and DTM[i-1]_IN0_REDGE are passed through to DTM[i]_IN0_FEDGE and DTM[i]_IN0_REDGE.

Note, depending on device configuration, not every DTM instance is available. E.g. a device may only have one DTM connected to the first four channels of ATOM. In this case, the other four channels (4 to 7) are connected directly to GTM outputs.

For detailed information, which DTM instance is available, see corresponding device specific **Table 25.2, Sub-Units and Channels** of this specification [1].

### 25.12.1.2 Connections of TIM, TOM and ATOM to DTM

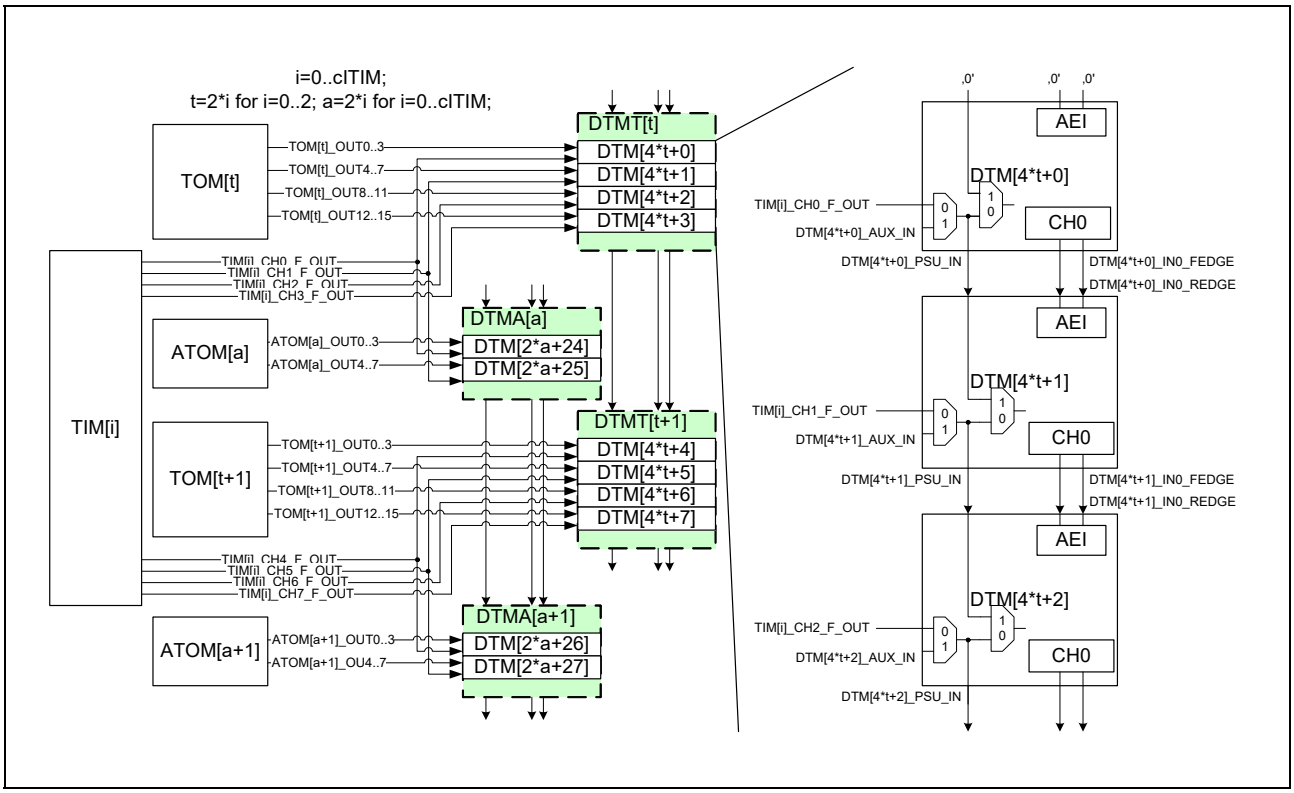

**Figure 25.53 Connections of TIM, TOM and ATOM to DTM**

For each TIM instance index i it can be calculates which instance of DTM and thus also which DTM channel is connected to which TIM channel, TOM channel or ATOM channel.

Four DTM instances behind a TOM instance x are grouped together in a hierarchy called DTMT[x].

Two DTM instances behind an ATOM instance x are grouped together in a hierarchy called DTMA[x].

A DTM instance is only available if there exist at least one TOM or ATOM instance and one TIM instance that can be connected to it.

## 25.12.2 DTM Channel

The following figure depicts the functions of a DTM channel.

### 25.12.2.1 DTM channel 0 overview

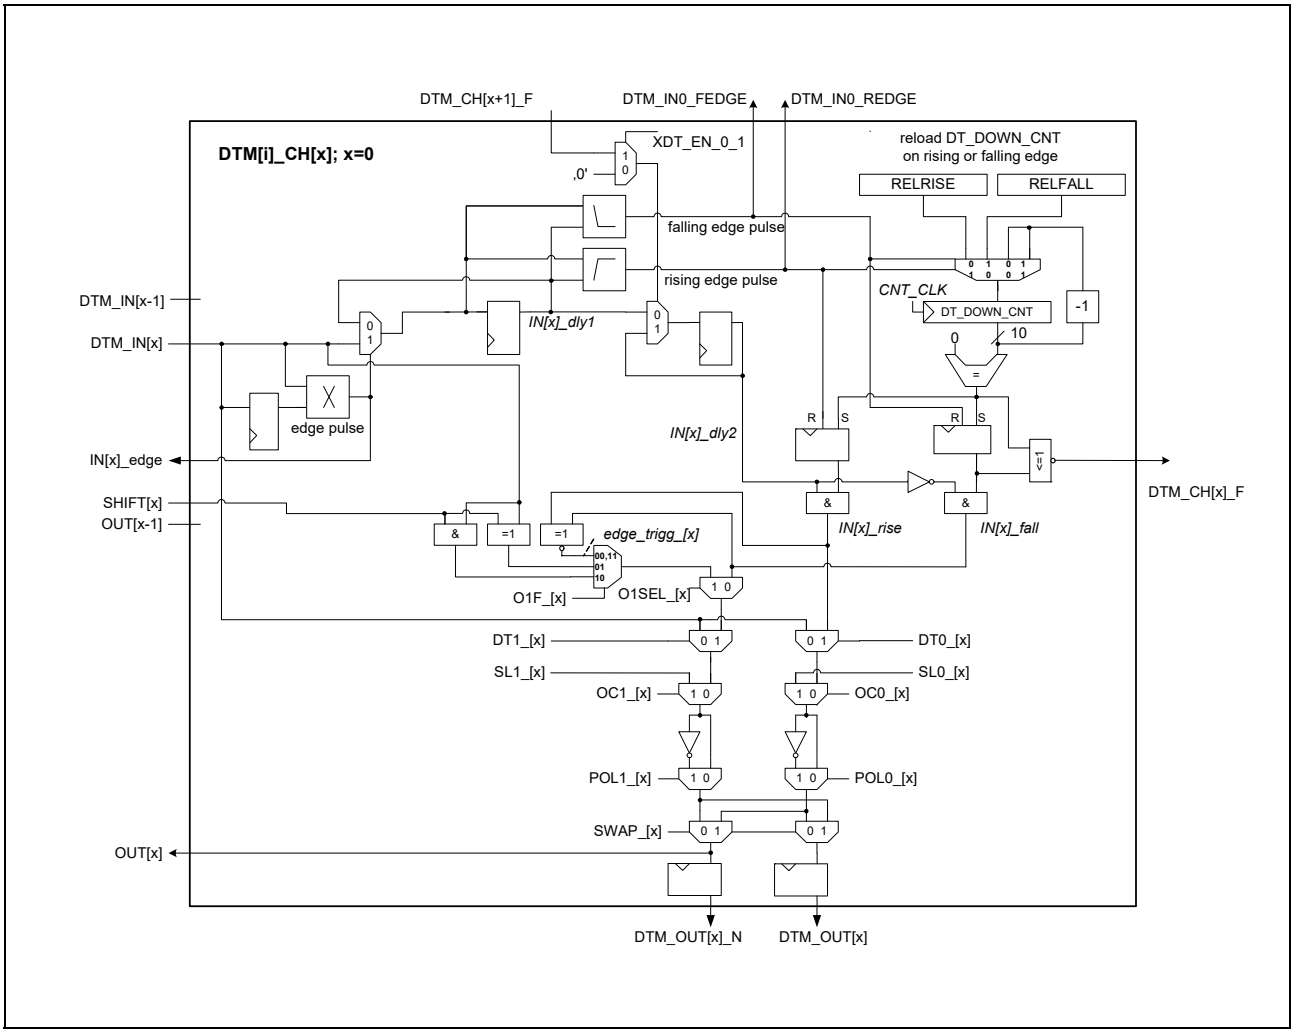

**Figure 25.54 DTM channel 0 block diagram**

### 25.12.2.2 DTM channel 1 to 3 overview

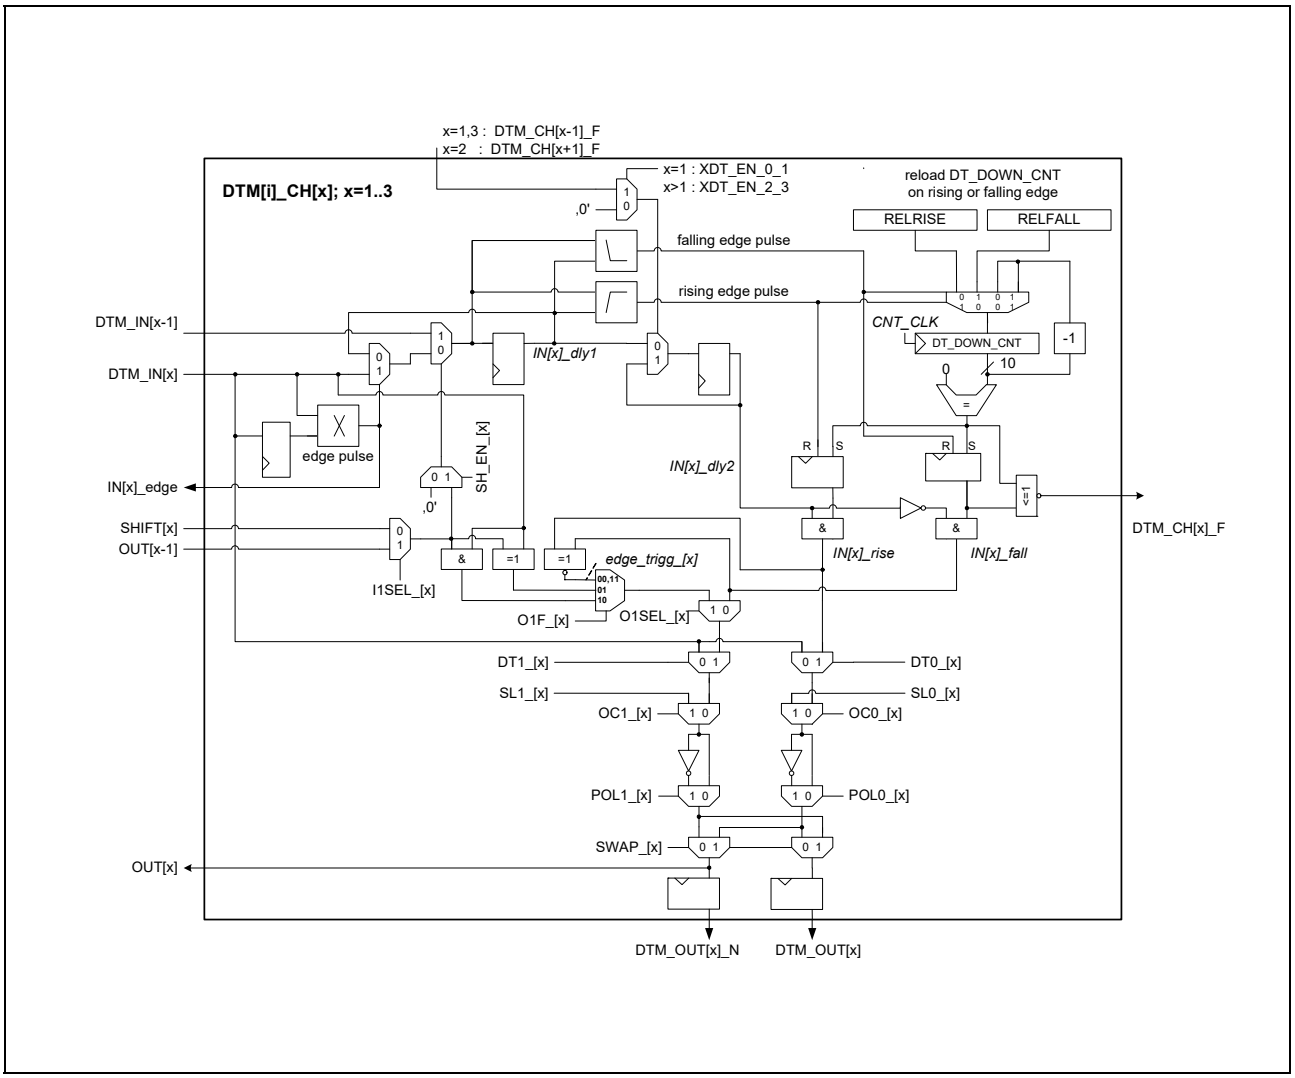

**Figure 25.55 DTM channel 1 to 3 block diagram**

The main feature of each channel is to derive the inverse signal out of the input signal DTM_IN[x], apply an edge dependent delay on the two resulting signal paths and provide these signals at the outputs DTM[i]_OUT[x] and DTM[i]_OUT[x]_N.

There are two possibilities to apply dead time on GTM output signals.

One is to use one DTM channel per TOM/ATOM channel and generate inside the DTM the second inverse signal. This is called the standard dead time generation.

The second way is to generate two signals out of two TOM/ATOM channel and to apply inside the DTM only the dead time by using two cross linked DTM channel. This is called the cross dead time generation.

### 25.12.2.3 Standard dead time generation

Standard dead time generation means that per DTM channel out of one input signal the inverse output signal is generated additionally and on both output signals the dead time between their edges is applied.

The dead time can be configured for each edge individually. The bit field RELRISE in register GTM0DTMixDTV contains the reload value for the counter and defines the delay for rising edges in multiples of selected clock ticks.

The bit field RELFALL in register GTM0DTMixDTV contains the reload value for the counter and defines the delay for falling edges in multiples of selected clock ticks.

The counter is reloaded with the value of RELRISE on a rising edge and reloaded with the value of RELFALL on a falling edge on input DTM_IN[x] (or DTM_IN[x-1] in case of shift enable SH_EN_[x]).

On a reload of the counter the FlipFlop following the counter output comparator is reset and stays reset until the counter has reached 0.

After reload, the counter DT_DOWN_CNT counts down until it reaches 0 and stops at 0.

The signal flow for function of standard dead time signal generation is depicted in following figure

### 25.12.2.4 Wave signals for function of dead time generation

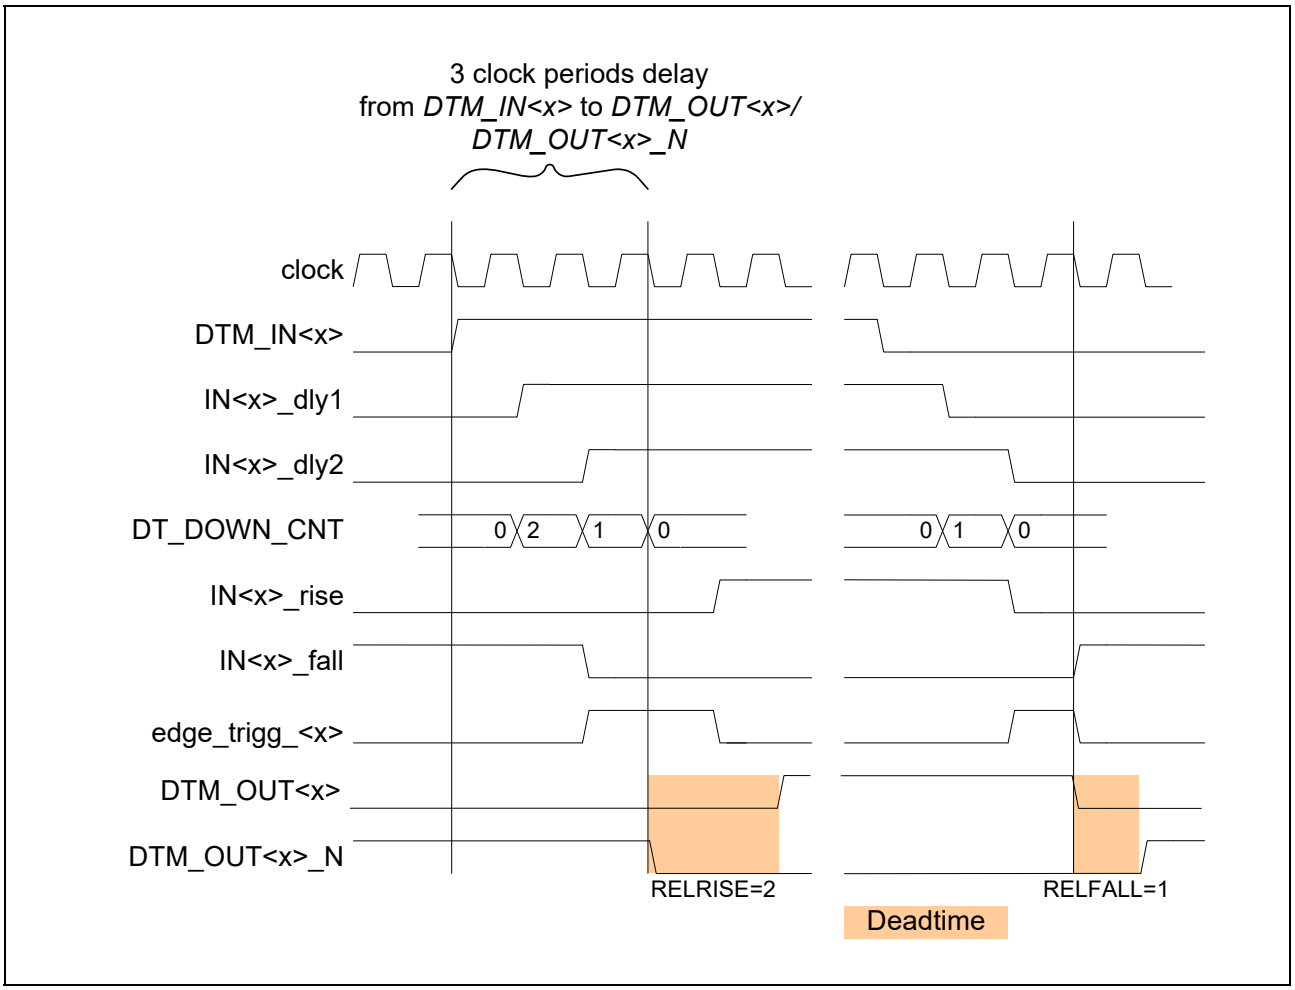

Figure 25.56 Wave signals for function of dead time generation

**NOTES**

1. The delay from the input signal DTM_IN[x] to the output signals DTM[i]_OUT[x] and DTM[i]_OUT[x]_N is three system clock periods by disabled feed through (see DT0/1_[x] in GTM0DTMiCHCTRL2).
2. The delay from the input signal DTM_IN[x] to the output signals DTM[i]_OUT[x] and DTM[i]_OUT[x]_N is one system clock periods by enabled feed through (see DT0/1_[x] in GTM0DTMiCHCTRL2).
3. The reset level of the output signals DTM[i]_OUT[x] connected from ATOM module depends on the hardware configuration value atom_out_reset_level_c chosen by silicon vendor.
4. The reset level of the output signals DTM[i]_OUT[x]_N connected from ATOM module depends on the inverted hardware configuration value atom_out_reset_level_c chosen by silicon vendor.

#### 25.12.2.5 Cross channel dead time

A second way to apply a dead time value on two output signals is the cross channel dead time.

In opposite to the dead time described in **25.12.2.3** the cross channel dead time mode does not generate out of one signal the corresponding inverse signal but tries to apply the dead time on the input signals of two neighbored DTM channel.

To do this, two neighbored DTM input signals (on DTM channel 0 and 1 or on DTM channel 2 and 3) are cross linked together in the way that a falling edge on one channel leads to a hold phase of current signal value on the cross linked channel.

This behavior is reached by the following:

A falling edge on e.g. channel 0 reloads the DT_DOWN_CNT with the value of RELFALL. While this counter is counting down, the output signal of the cross linked channel 1 keeps its value. If the counter DT_DOWN_CNT has reached 0 again, the channel 1 output is released and can follow the value on its input.

The timing of the cross channel dead time is depicted in the following figure:

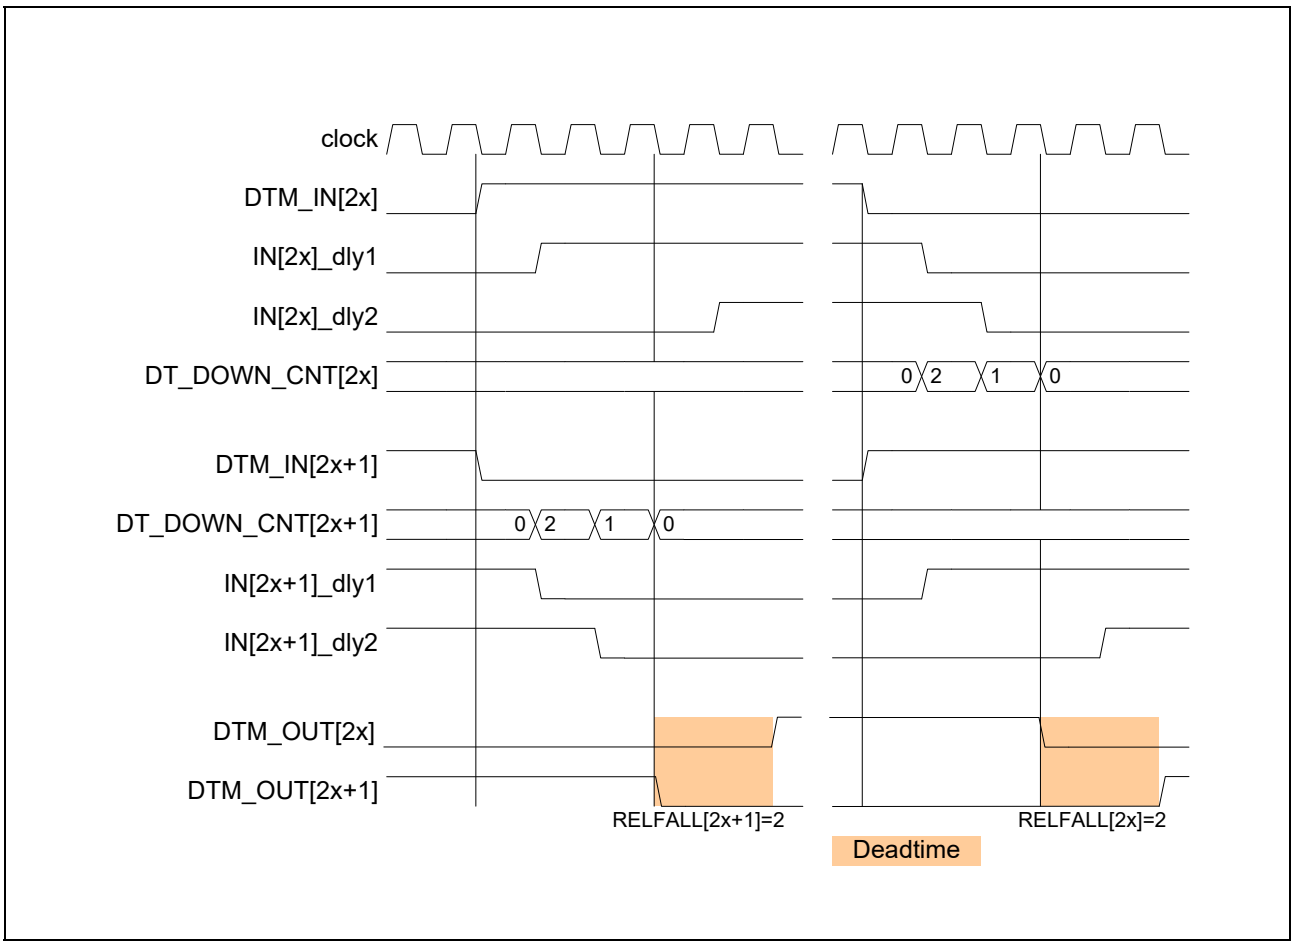

**Figure 25.57 Cross channel dead time timing diagram**

## 25.12.3 Phase Shift Control Unit

The phase shift unit (DTM_PSU) is depicted in the following figure. It supports the second major function of the DTM module to allow phase shifting of PWM signal on one of the channels.

### 25.12.3.1 Phase Shift Unit overview

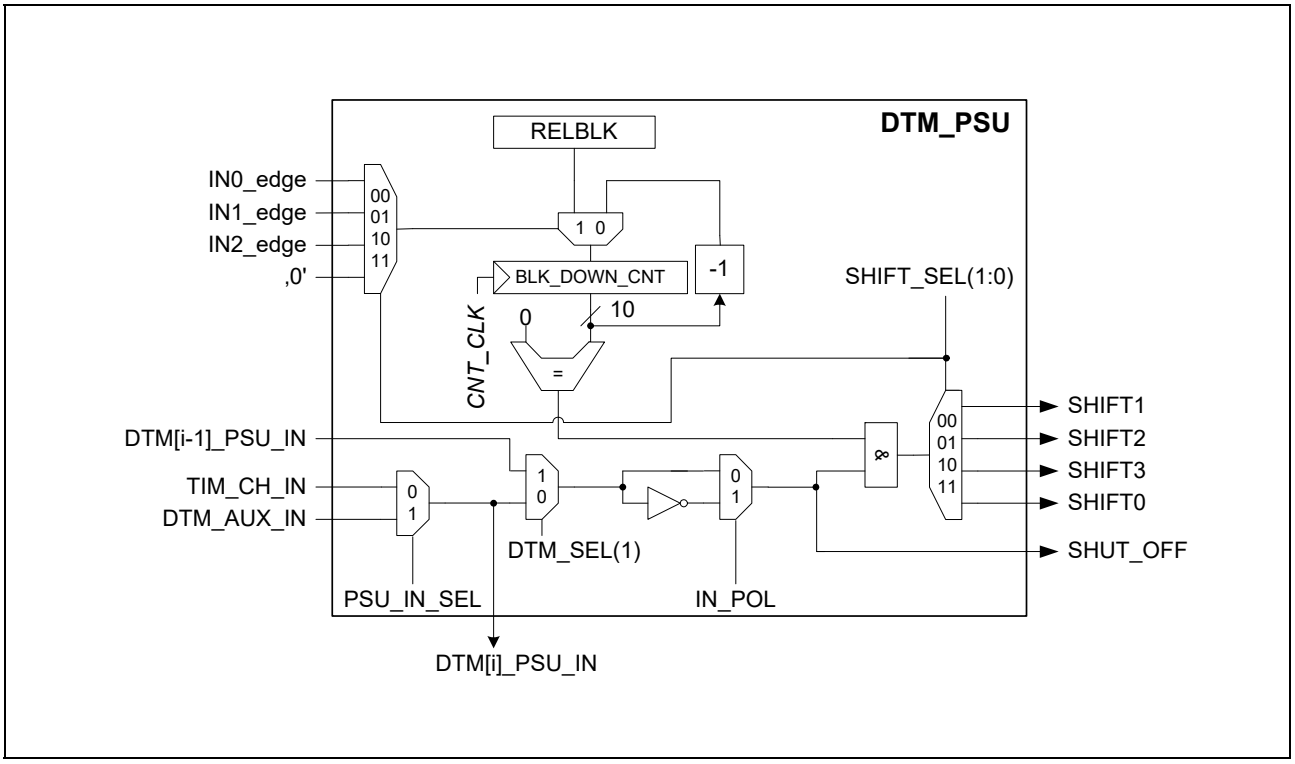

**Figure 25.58 Phase Shift Unit overview**

This submodule provides an additional counter BLK_DOWN_CNT and reload register RELBLK (bit field of register GTM0DTMiPSCTRL). The counter is reloaded on an edge detected on one of the selected signals IN0_edge to IN2_edge (selected by bit field SHIFT_SEL in register GTM0DTMiPSCTRL). Then, the counter counts down until it reaches 0. While the counter is counting down, it blocks the trigger (i.e. the selected one of the signals SHIFT[x]) of one of the channels by one of the input signals TIM_CH_IN or DTM_AUX_IN.

If the counter BLK_DOWN_CNT is not counting, a pulse on the input TIM_CH_IN or DTM_AUX_IN is forwarded to one of the selected DTM_PSU outputs SHIFT[x]. This signal triggers in the selected channel (if SH_EN_x=1) the update of the first Flip-Flop on channel x (i.e. representing IN[x]_DLY ) to the input value DTM_IN[x-1] of the preceding channel. If this update leads to an edge, the succeeding part of DTM channel derives the inverse signal and applies the corresponding dead time (i.e. the edge delay) to the output signals of the channel.

**NOTE**

For channel x=0 input signals DTM_IN[x-1] and OUT[x-1] are unused and I1SEL_[x] and SH_EN_[x] are defined as 0.

The following figure shows an example of phase shifting on channel 1.

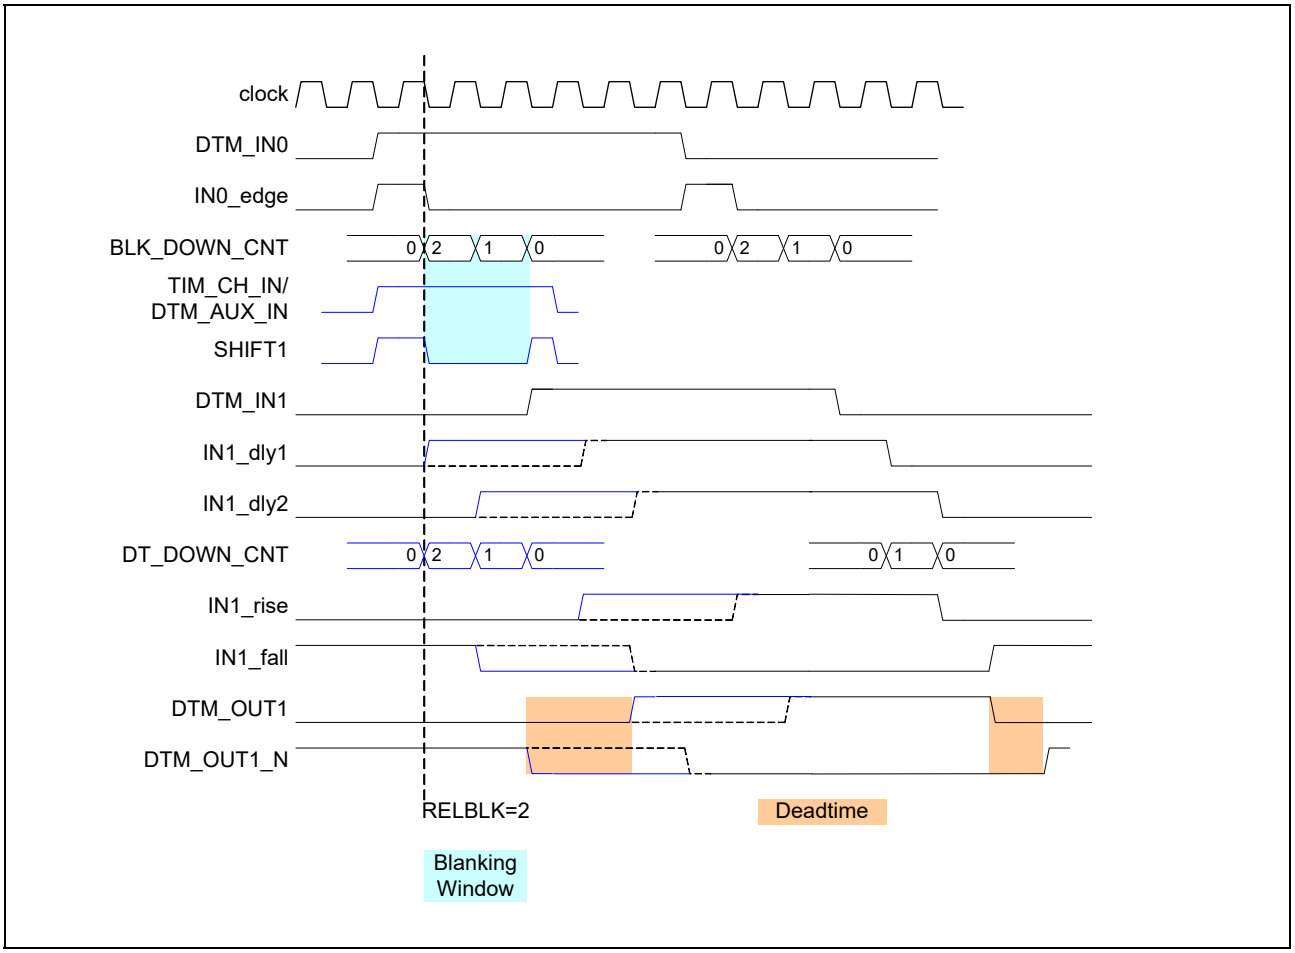

**Figure 25.59 Example wave of phase shift on channel 1**

### 25.12.4 Multiple output signal combination

Each channel provides additionally the possibility to combine the channel inputs DTM_IN[x] and SHIFT[x] or OUT[x-1] (selected by I1SEL_[x]) by an AND or an XOR gate (selected by O1F_[x]).

It is recommended to use the combination of signals only if bit field RELBLK of register GTM0DTMiPSCTRL is 0. Otherwise, the signals TIM_CH_IN/DTM_AUX_IN may be disturbed by the blanking window counter.

Together with the inverter inside submodule DTM_PSU (selected by IN_POL), the inverter on each output of a channel (selected by POL0_[x]/POL1_[x]) and the possibility to change polarity of DTM_IN[x] inside connected TOM/ATOM channel, a (N)AND, (N)OR or X(N)OR combination of the signals is possible.

#### 25.12.4.1 Combination of input signal TIM_CH_IN/AUX_IN with TOM/ATOM signal

If the input selection I1SEL_[x] of a channel x is set to 0, the output selection O1SEL_[x] is set to 1 and SWAP_[x] is set to 0, depending on PSU_IN_SEL either TIM_CH_IN or DTM_AUX_IN can be combined with signal DTM_IN[x].

The function of combination on DTM output DTM[i]_OUT[x]_N (and also OUT[x]) is defined by O1F_[x] in the following way:

**Table 25.129 The function of combination on DTM output DTM[i]_OUT[x]_N**

| | O1F_x | POL1_x | IN_POL | (A)TOM output inverted |
|---|---|---|---|---|
| XOR | 01 | 0 | 0 | no |
| AND | 10 | 0 | 0 | no |
| XNOR | 01 | 1 | 0 | no |
| NAND | 10 | 1 | 0 | no |
| XNOR | 01 | 1 | 1 | yes |
| OR | 10 | 1 | 1 | yes |
| XOR | 01 | 0 | 1 | yes |
| NOR | 10 | 0 | 1 | yes |

**Note:** The inversion of the (A)TOM output can be reached by switching the **SL** bit (for TOM and ATOM SOMP/SOMC mode).

### 25.12.4.2 Combination of multiple TOM/ATOM output signals

If the input selection I1SEL_[x] of a channel x (with x = 1 to 3) is set to 1, the output selection O1SEL_[x] is set to 1 and SWAP_[x] is set to 0, the output of the preceding DTM channel OUT[x-1] can be combined with signal DTM_IN[x].

The function of combination on DTM output DTM[i]_OUT[x]_N (and also OUT[x]) is defined by O1F_[x] in the following way:

**Table 25.130 The function of combination on DTM output DTM[i]_OUT[x]_N**

| | O1F_x | POL1_x | POL1_x-1 | (A)TOM output inverted |
|---|---|---|---|---|
| XOR | 01 | 0 | 0 | no |
| AND | 10 | 0 | 0 | no |
| XNOR | 01 | 1 | 0 | no |
| NAND | 10 | 1 | 0 | no |
| XNOR | 01 | 1 | 1 | yes |
| OR | 10 | 1 | 1 | yes |
| XOR | 01 | 0 | 1 | yes |
| NOR | 10 | 0 | 1 | yes |

By setting I1SEL_[x] to 1 on all four channel, a combination of all four signals DTM_IN0 to DTM_IN3 can be achieved (combinatorial chain).

To allow also combination of signals generated for output DTM[i]_OUT[x], the outputs 0 and 1 can be swapped by setting bit SWAP_ [x] for channel x.

### 25.12.4.3 Pulse generation on edge

Another feature of the DTM is to generate on the second output DTM[i]_OUT[x]_N a pulse on every edge of corresponding input signal DTM[i]_IN[x].

This can be reached by configuring O1SEL_[x] to ‘1’, i.e. selecting signal edge_trigg_[x] as the output signal (O1F_[x] has to be '00'). The signal edge_trigg_[x] is depicted in **Figure 25.56, Wave signals for function of dead time generation**.

The pulse length can be adjusted individually for each edge type by the configuration value REL_RISE and REL_FALL of register DTM[i]_CH[x]_DV.

The parameter REL_RISE defines the pulse length in case of a rising edge on input DTM[i]_IN[x], the parameter REL_FALL define the pulse length in case of a falling edge on input DTM[i]_IN[x].

### 25.12.5 Synchronous update of channel control register 2

It is possible to use the shadow register GTM0DTMiCHCTRL2SR and a selected edge of one of the channel 0 to 3 to update the work register GTM0DTMiCHCTRL2.

The update mechanism and it's configuration is depicted in the following figure.

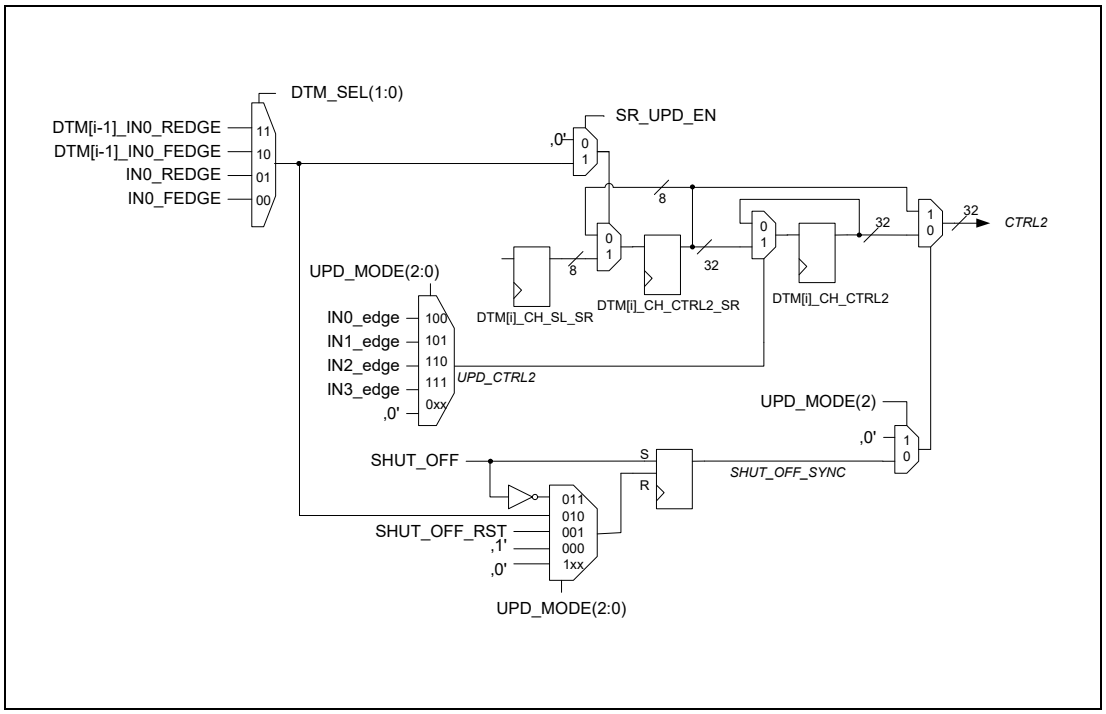

**Figure 25.60 Synchronous update mechanism of register GTM0DTMiCHCTRL2**

If enabled by the bit field UPD_MODE of register GTM0DTMiCTRL (i.e. UPD_MODE = 1xx), the register GTM0DTMiCHCTRL2SR serves as a shadow register of register GTM0DTMiCHCTRL2. The update is then triggered by an edge on one of the selected inputs DTM_IN0 to DTM_IN3.

The synchronous update allows the user to change output polarity, the selection of constant signal level, the constant signal level itself and the switch to/from feed through path on all four channels in parallel synchronized to one of the input edges on DTM_IN0 to DTM_IN3.

### 25.12.6 DTM output shut off

A fast shut off for the eight outputs of DTM instance i can be triggered by one of the two assigned inputs TIM[n]_CH_IN or DTM[i]_AUX_IN or the two inputs TIM[m]_CH_IN or DTM[i-1]_AUX_IN of the previous DTM instance i-1. (DTM_AUX_IN inputs are clamped to low (no function) for the P1x-C devices). The selection of the trigger signal source is done by the bits PSU_IN_SEL and DTM_SEL(1) (see **Figure 25.58** ). The selected trigger signal is named SHUT_OFF.

Enabling of the shut off feature is done by setting UPD_MODE(2:0) to one of the values “001”, “010” or “011”.

The shut off behavior of the DTM outputs is defined by the value of register GTM0DTMiCHCTRL2SR.

If the shut off feature is enabled by UPD_MODE, as long as the signal SHUT_OFF_SYNC is ‘0’, the register GTM0DTMiCHCTRL2 defines the output signal behavior.

If the signal SHUT_OFF_SYNC is ‘1’, the register GTM0DTMiCHCTRL2SR defines the output signal behavior.

The signal SHUT_OFF_SYNC is set to ‘1’ if signal SHUT_OFF switches to ‘1’ and is reset depending on value of UPD_MODE(2:0). The reset is higher prioritized than set

There are three different ways to reset the signal SHUT_OFF_SYNC to ‘0’:

- The CPU writes a ‘1’ to bit SHUT_OFF_RST of register DTM_CH_CTRL1
- Synchronous to an edge on DTM channel 0 input of this DTM instance i or on an edge on DTM channel 0 input of preceding DTM instance i-1.
- Asynchronous if signal SHUT_OFF switches back to '0'

**Figure 25.60** depicts the shut off feature and the different shut off release possibilities.

Note: The reset of SHUT_OFF_SYNC has higher priority then the set of this signal.

For the eight SL bits (SLx_y_SR) of the shadow register GTM0DTMiCHCTRL2SR exist a second shadow register DTM[i]_CH_SR.

If enabled by configuration bit SR_UPD_EN of register GTM0DTMiCTRL, the update of SL bits of register GTM0DTMiCHCTRL2SR can be triggered by one of the signals selected by bit field DTM_SEL of register GTM0DTMiCTRL. This trigger signal is either the rising or the falling edge detected on DTM[i]_IN0 of instance i or the rising or the falling edge on DTM[i-1]_IN0 of preceding instance i-1.

As depicted in **Figure 25.54** the DTM input signal TIM_CH_IN/DTM_AUX_IN can be forwarded to the succeeding instance. Thus, it can be used to trigger shut off in two consecutive DTM instances.

### 25.12.7 Configuration Register Overview

The following table gives an overview of the DTM configuration register.

**Table 25.131 Register list**

| Symbol | Register Name | Details in Section |
|---|---|---|
| GTM0DTMiCTRL | Global Configuration and Control Register | **25.12.8.1** |
| GTM0DTMiCHCTRL1 | Channel Control Register 1 | **25.12.8.2** |
| GTM0DTMiCHCTRL2 | Channel Control Register 2 | **25.12.8.3** |
| GTM0DTMiCHCTRL2SR | Channel Control Register 2 Shadow | **25.12.8.4** |
| GTM0DTMiPSCTRL | Phase Shift Unit Configuration and Control Register | **25.12.8.5** |
| GTM0DTMixDTV | Dead Time Reload Values; x = 0 to 3 | **25.12.8.6** |
| DTM[i]_CH_SR | Channel Shadow Register | **25.12.8.7** |

## 25.12.8 Configuration Register Description

### 25.12.8.1 GTM0DTMiCTRL (i = 24, 26, 28)

**Access:** This register can be read/written in 32-bit units.

**Address:** GTM0DTM24CTRL: <GTM_base> + $13600_H$
GTM0DTM26CTRL: <GTM_base> + $13680_H$
GTM0DTM28CTRL: <GTM_base> + $13700_H$

| 0 | SL0_0_SR_SR | Shadow register for bit SL0_0_SR of register GTM0DTMiCHCTRL2SR |

# 25.13 Multi Channel Sequencer (MCS)

## 25.13.1 Overview

The Multi Channel Sequencer (MCS) sub module is a generic data processing module that is connected to the ARU. One of its major applications is to calculate complex output sequences that may depend on the time base values of the TBU and are processed in combination with the ATOM sub module. Other applications can use the MCS sub module to perform extended data processing of input data resulting from the TIM sub module. Moreover, some applications may process data provided by the CPU within the MCS sub module, and the calculated results are sent to the outputs using the ATOM sub modules.

The following parameters are design variables for the MCS hardware structure that can vary in its range for different module instances:

W - Word width of the data path

T - Number of available MCS channels

RDW - RAM data width of connected RAM

RAW - RAM address width used by the MCS for addressing memory

NPS - Number of pipeline stages

USR - Use second RAM (0 - one RAM available, 1 – two RAMs available)

All MCS instances in the GTM use the values W = 24, RDW = 32, and NPS = 5. The values for T and RAW are device specific and vary between the following values:

T = 3, 6, or 9

RAW = 9

USR = 0 or 1.

## 25.13.2 Architecture

### 25.13.2.1 MCS Architecture

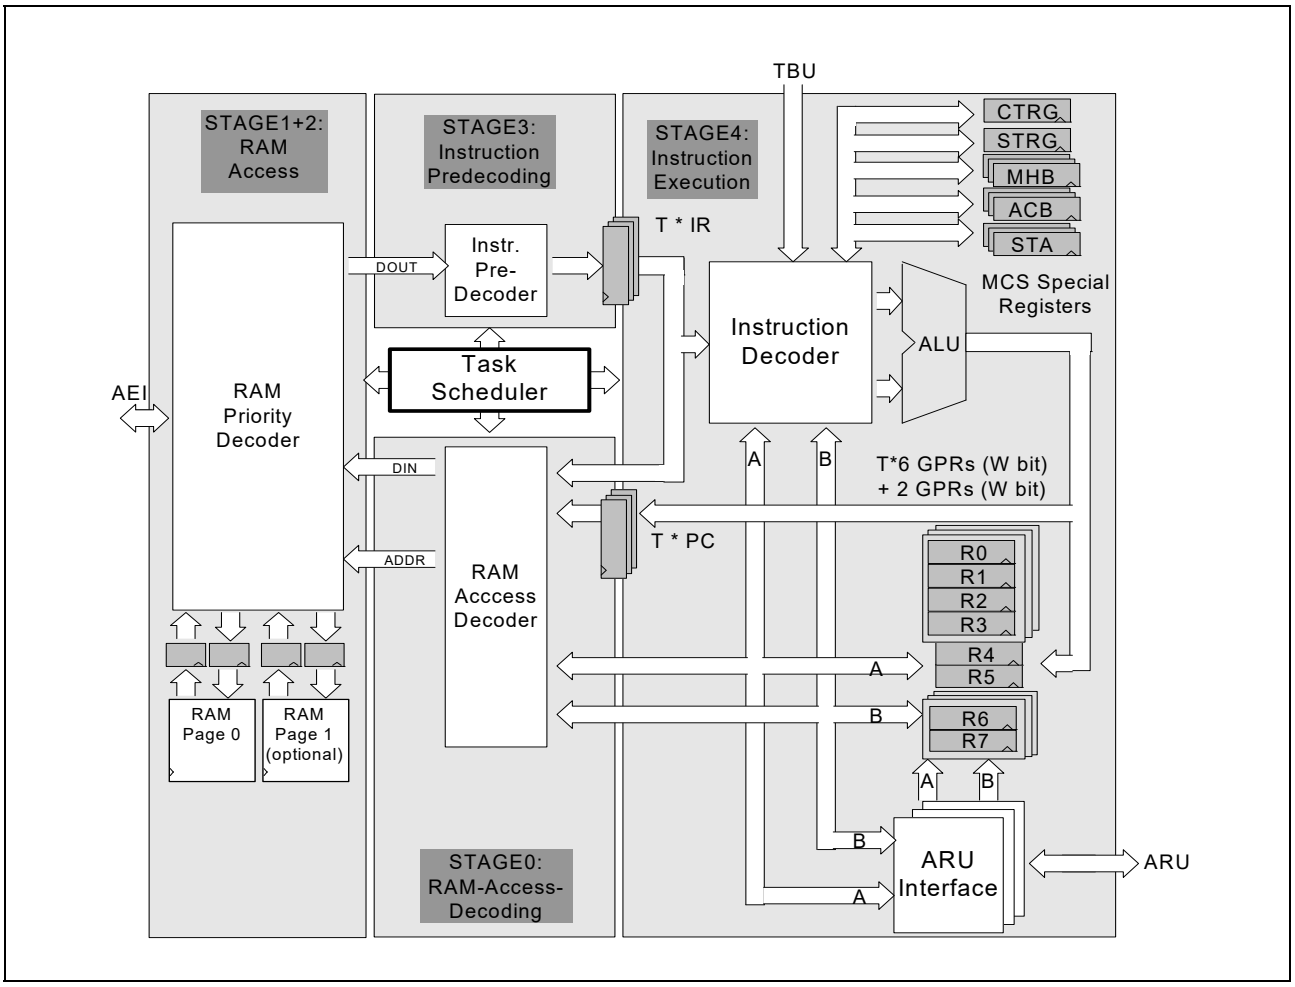

Figure 25.61 MCS Architecture block diagram

**Figure 25.61** gives an overview of the MCS architecture.

The MCS module mainly embeds a single data path with five pipeline stages, consisting of a W-bit wide Arithmetic Logic Unit (ALU), several decoders, and a connection to one or two RAM modules (depending on parameter USR) located outside of the MCS sub module.

The data path of the MCS is shared by T so called MCS-channels, whereas each MCS-channel executes a dedicated micro-program that is stored inside the RAM connected to the MCS module.

The connected RAM may contain arbitrary sized code and data sections that are accessible by all MCS-channels and the CPU via AEI bus interface. More details about the RAM can be found in **Section 25.13.4, Memory Organization**

An MCS-channel can also be considered as an individual task of a processor that is scheduled to the commonly used data path at a specific point in time. The execution of the different MCS-channels on the different pipeline stages is controlled by a central hardware related task scheduler, which enables fast task switches within a single clock cycle. Details about the task scheduler and the available scheduling algorithms can be found in **Section 25.13.3, Scheduling**.

Typically, if data has to be exchanged between different MCS-channels and/or the CPU, the connected RAM, which is accessible by all MCS-channels and the CPU, can be used.

Besides the commonly used data path, each MCS-channel has a dedicated ARU interface for communication with other ARU connected modules, an Instruction Register (IR), a Program Counter Register (PC), a Status Register (STA), an ARU Control Bit Register (ACB), a Memory High Byte Register (MHB) and a Register Bank with eight W bit general purpose registers (R0, R1, ....R7). With exception to the registers R4 and R5, all of these registers are only visible within its dedicated MCS-channel and thus the MCS-channels cannot exchange data using registers. The registers R4 and R5 are common to all MCS-channels and thus they can also be used for sharing data between MCS-channels. Moreover, the general purpose registers (R0, R1, ... R7) are also writable by the CPU, an thus an MCS channel may also consume data from the CPU using its general purpose registers.

The MCS also provides a common 16 bit wide trigger register that can be accessed by all MCS channels in order to trigger other MCS-channels located in the same module. Writing to STRG sets bits and writing to CTRG clears bits in the common trigger register. To enable triggering of MCS-channels by CPU, the CPU can set bits in the common trigger register by writing to GTM0MCSiSTRG and clear bits by writing to GTM0MCSiCTRG.

Considering the architecture in the figure above, the main actions of the different pipeline stages are as follows:

Pipeline stage 0 performs a setup of address, input data, and control signals for the next RAM access of a specific MCS-channel.

The actual RAM access of a specific MCS-channel is executed in pipeline stage 1 and 2, assuming an external connection of a synchronous RAM with a latency of one clock cycle.

Pipeline stage 3 performs pre-decoding and dispatching of instructions and data resulting from the RAM.

Finally, in pipeline stage 4 the current instruction is executed.

Since the internal registers of the MCS can be updated by different sources (MCS write access, CPU write access, ARU read access) a write conflict occurs if more than one source wants to write to the same register. In this case the result of the register is unpredictable. However, the software should setup its application in a way that such conflicts do not occur.

One exception is the common trigger register, which may be written by multiple sources (different MCS channels and CPU) in order to enable triggering of different MCS channels. Typically, the software should setup its application in a manner that different sources should not write the same bits in the trigger register.

### 25.13.3 Scheduling

The MCS provides a hardware related task scheduler, which globally controls the execution of the tasks in the different pipeline stages. The task scheduler implements four different scheduling modes, that can be selected by the SCD_MODE bit field in the GTM0MCSiCTRLSTAT register. Depending on the selected scheduling mode, the task scheduler is selecting a dedicated MCS channel that will be executed in pipeline stage 0 in the next clock cycle. Additionally, MCS channels that are already present in the pipeline are shifted to its successor pipeline stage, with each clock cycle. This means, that the execution time of an MCS-channel in a specific pipeline stage is always one clock cycle.

The MCS task scheduler may also schedule an empty cycle to pipeline stage 0, in order to grant a time slice to the CPU for accessing the connected RAM.

It should be noted, if the task scheduler assigns an MCS-task to pipeline stage 0, but this task does not access the RAM, the CPU can access the corresponding RAM, even if the scheduler did not reserve an empty clock cycle.

In the following, the available scheduling modes are described.

#### 25.13.3.1 Round Robin Scheduling

The Round Robin Scheduling Mode implements the simplest scheduling algorithm. This algorithm schedules a predefined set of MCS channels in the range [0; SCD_CH] in ascending order. After the last channel SCD_CH has been assigned to the pipeline, an empty cycle is scheduled in order to enable RAM access for the CPU. The parameter SCD_CH can be controlled by the register GTM0MCSiCTRLSTAT. If the value of SCD_CH is greater than T-1, the scheduler assumes a value of T-1 for bit field SCD_CH.

**Figure 25.62** shows a timing example of the Round Robin Scheduling with T = 8 MCS-channels (marked as $C_0$ to $C_7$) that are scheduled together with a CPU access to a pipeline with and NPS = 5 stages. It is assumed that bit field SCD_CH is set to 8.

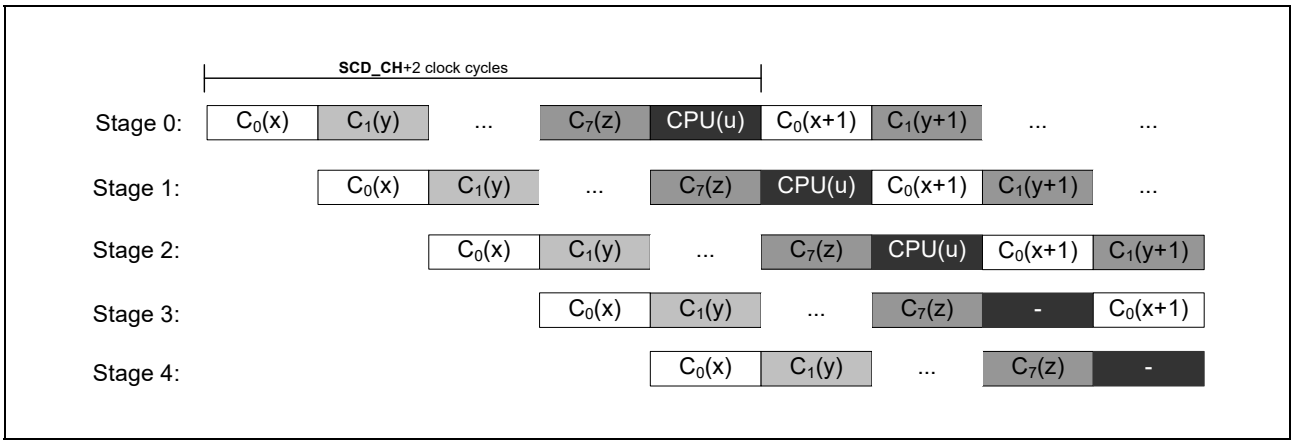

Figure 25.62 Timing of Round Robin Scheduling

The identifier Ci(x) denotes that MCS-channel i is currently executing the instruction or data located in the memory at position x in the corresponding pipeline stage. The figure shows, which MCS-channel is activated in specific pipeline stage at a specific point in time.

Moreover, the figure shows, that the Round Robin scheduling is always repeated after SCD_CH+2 clock cycles, which means that the time duration of an instruction cycle is SCD_CH+2 clock cycles. However, if the value SCD_CH + 2 is less than NPS, the duration of an instruction cycle is limited by

the depth of the pipeline to NPS clock cycles. Thus the effective execution time of a single cycle instruction is always MIN(SCD_CH+2, NPS) clock cycles, ignoring the latency of the pipeline.

The Round Robin scheduling algorithm has the characteristic that it fairly distributes all time slices to all MCS-channels and the CPU. This means, that the program execution time of a specific task is independent from the activity of any neighboring task or the CPU RAM access, and thus a correct estimation of the actual program execution time is very easy. However, the round-robin scheduling may waste clock cycles by scheduling MCS-channels that are not ready to execute an instruction (e.g. MCS-channel is disabled by CPU). The following scheduling modes overcome this issue.

#### 25.13.3.2 Accelerated Scheduling

In order to improve the computational performance, the accelerated scheduling mode provides two key features. Firstly, the scheduler only selects MCS-channels that are not suspended and thus can actually execute an instruction. Secondly, the scheduler applies instruction prefetching to minimize empty cycles in the pipeline. An MCS-channel is marked as suspended due to one of the reasons:

- An MCS-channel is executing a read or write request to an ARU connected sub module (instruction ARD, AWR, ARDI, AWRI, NARD, NARDI).
- An MCS-channel waits on a register match event (e.g. instruction WURM), in order to wait on a desired register value (e.g. trigger event from another MCS channel).
- An MCS-channel is disabled.

In the case of instruction prefetching, the scheduler will assign an MCS-channel $C_p$ to pipeline stage 0, which is already present in another pipeline stage. This means, that the execution of the last instruction of $C_p$ located in the memory MEM(PC/4) is not yet finished completely, whereas PC is the current value of the program counter of MCS-channel $C_p$. Thus, the newly scheduled MCS-channel $C_p$ will prefetch a successor instruction MEM(PC/4+PFO) under the assumption that there will be no branch and no memory access in the program between the instructions MEM(PC/4) and MEM(PC/4+PFO). The prefetch offset value PFO is determined by counting the number of already scheduled MCS channels $C_p$ in the pipeline. However, if the assumption fails, the pipeline will be flushed by replacing all MCS-channel $C_p$ of the pipeline with an empty cycle, as soon as the instruction decoder detects a branch or a memory access. In general, each MCS-channel can accept instruction prefetching. However, there are some cases in which an upcoming flushing of the pipeline can be easily detected by the MCS hardware due to evaluation of internal states. Therefore, it is defined that an MCS-channel accepts instruction prefetching only under the following conditions:

- An MCS-channel is currently not in the second cycle of a two-cycle control flow instruction (instruction CALL, RET).
- An MCS-channel is currently not in the second cycle of a three-cycle memory access instruction (instruction MWRL, MWRIL).

The accelerated scheduling mode guarantees, that the time duration of an instruction cycle varies between 1 and T+1 cycles. Hence, a single cycle instructions has an effective execution time between 1 to T+1 clock cycles, depending on the number of suspended MCS-channels and the actual instruction sequence. The worst case execution time occurs if all channels are active and the CPU also accesses the RAM. The best case occurs e.g. if only one MCS-channel is enabled and the executed program sequence has only linear code without branches and memory access.

The algorithm of the accelerated scheduling mode first, evaluates the state of all available MCS-channels as well as a CPU request to the RAMs and then it decides if a specific MCS-channel or an empty cycle is assigned to pipeline stage 0 in the next clock cycle. It should be noted that the accelerated scheduling mode treats RAM access requests from the CPU in a similar manner as MCS-

channels, which means that empty cycles for RAM requests are only inserted into the pipeline if there is an active RAM request from the CPU or no other task can be scheduled.

In order to fairly trade all available MCS-channels as well as CPU RAM requests and to guarantee a worst case execution time of T+1 clock cycles, an additional task prioritization scheme is applied used that dynamically prioritizes all MCS-channels and a CPU memory access depending on the history of the scheduler's decisions. The algorithm of the accelerated scheduler mode is executed every clock cycle and it works in the following manner:

1. Try to find an MCS-channel $C_r$ with highest priority that is not suspended and not already scheduled to the pipeline stages 0 to NPS-2. If $C_r$ is found assign $C_r$ to pipeline stage 0 and finish scheduling for current clock cycle.
2. Otherwise, try to find an MCS-channel $C_p$ with highest priority that is not suspended and accepts instruction prefetching. If $C_p$ is found assign $C_p$ to pipeline stage 0 and finish scheduling for current clock cycle.
3. Otherwise, try to find an MCS-channel $C_s$ with highest priority that is suspended and accepts instruction prefetching. If $C_s$ is found assign $C_s$ to pipeline stage 0 and finish scheduling for current clock cycle.
4. Otherwise, assign an empty cycle to pipeline stage 0 and finish scheduling for current clock cycle.

The underlying task prioritization scheme tracks the history of the scheduled MCS-channels in a list consisting of T+1 items. The list is initialized with all MCS-channels followed by a reserved time slot for the CPU RAM access. The position of an MCS-channel within this list implicitly defines the priority, while the back of this list holds the MCS-channel with highest priority. Whenever the scheduling algorithm described above has found an MCS-channel $C_r$ or $C_p$ it to be scheduled in the next clock cycle, it removes this item from the list and put it to the front of the list. In order to fairly prioritize all MCS-channels, the algorithm also removes the item at the back of the list to the second position in the list, after the inserted scheduled front item. Since the list always contains all possible MCS-channels and with each clock cycles each non-scheduled item is moved at least one position towards the end of list, it is obvious that each MCS-channel will have the highest priority not later than T+1 clock cycles.

**Figure 25.63** shows a timing example of the accelerated scheduling with NPS=5 pipeline stages.

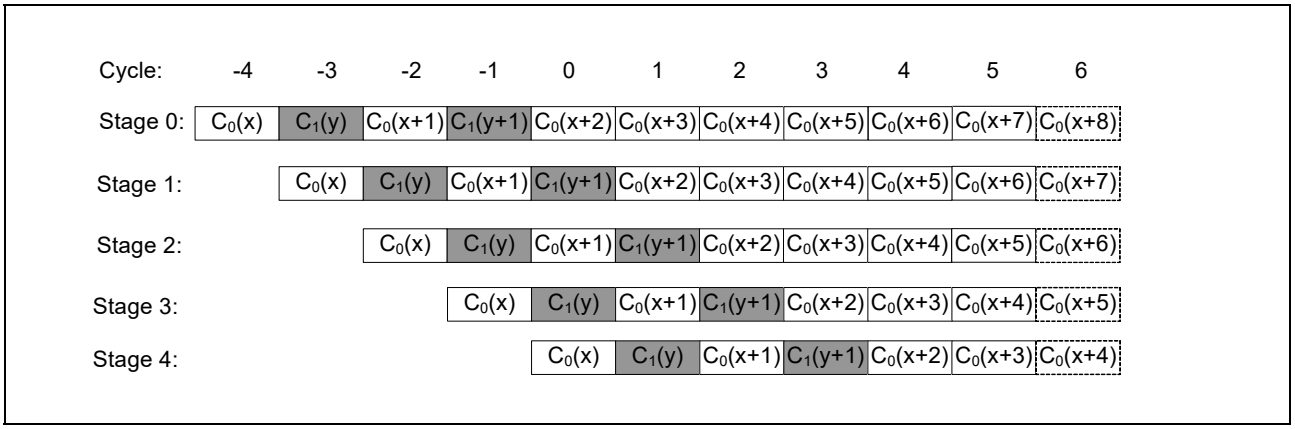

**Figure 25.63 Timing of Accelerated Scheduling**

The example assumes that initially MCS-channels 0 and 1 are enabled and the program for each MCS-channel is located in the RAM as follows:

**MCS-Channel 0**

| Memory Location | Instruction |
|---|---|
| x+0 | ADDL R0, 7 |
| x+1 | XOR R0, R1 |
| x+2 | SHR R0, 7 |
| x+3 | JBC STA, Z, 4*(x+9) |
| x+4 | MOVL R2, 5 |

**MCS-Channel 1**

| Memory Location | Instruction |
|---|---|
| y+0 | MOVL STA, 0 |

**Figure 25.64 The example assumes that initially MCS-channels 0 and 1**

Since both channels are ready to run, the scheduler fairly selects the channels in an alternating order, as it can be obtained in stage 0 at the clock cycles before cycle 1. Since MCS-channel 1 is disabling itself at cycle 1 with the instruction of memory location y, the scheduler will only select MCS-channel 0 in the following by applying instruction prefetching. But it should be noted, the scheduler applies instruction prefetching during the whole sequence, due to the fact that the number of enabled channels is always less than the available number of pipeline stages NPS. The actual state of pipeline in cycle 6 depends on conditional branch instruction of memory location x + 3. If the branch is not taken, the linear code execution of MCS-channel 0 is continued as shown in the Figure. However, if the branch to memory location x+9 is taken, in cycle 6 the scheduler will fetch the instruction $C_0$(x+9) in stage 0 and flush the stages 1 to NPS-1. Note, the flushing of the pipeline only concerns the prefetched instructions of the MCS-channel that is currently executed in the last stage. If pipeline stage 1 of cycle 5 would belong to another channel than 0, only the stages greater than 2 would be flushed.

#### 25.13.3.3 Single Prioritization Scheduling

The Single Prioritization Scheduling mode is an extended variant of the Accelerated Scheduling mode, which additionally applies a task prioritization of a single MCS-channel. In this mode, the bit field SCD_CH of register GTM0MCSiCTRLSTAT is used to identify a dedicated MCS-channel that is always preferred during scheduling. This means, that the scheduler will assign preferred MCS-channel SCD_CH to pipeline stage 0, as long as this channel is not suspended. If the preferred MCS-channel is entering its suspended state, the scheduling algorithm switches to the accelerated scheduling as previously described in **Section 25.13.3.2, Accelerated Scheduling**. Whenever the MCS-channel SCD_CH is resuming from its suspended state, the scheduler switches back and assign the channel SCD_CH to pipeline stage 0 until the next suspension event occurs. If the bifield SCD_CH contains the value T or higher, the task scheduler will always prioritize CPU access to the RAM. This means, whenever the task scheduler detects that the CPU wants to access an MCS-RAM, the scheduler will assign an empty cycle into pipeline stage 0. If the CPU does not access the RAM any more, it switches back to the accelerated mode, as described previously in **Section 25.13.3.2, Accelerated Scheduling**.

In consequence, the Single Prioritization Scheduling mode cannot guarantee a maximum time duration of an instruction cycle for the overall execution of all MCS-channels, since it strongly depends on the activity of the prioritized MCS-channel SCD_CH. However, the Single Prioritization Scheduling mode provides the fastest possible execution for MCS-channel SCD_CH. Moreover, during the time spawn, in which the prioritized MCS-channel SCD_CH is suspended, this mode guarantees a duration of 1 to T+1 clock cycles of an instruction cycle for all non-prioritized channels.

#### 25.13.3.4 Multiple Prioritization Scheduling

The Multiple Prioritization Scheduling mode is an extended variant of the Accelerated Scheduling mode, which additionally applies a task prioritization for multiple MCS-channels. In this mode, the bit field SCD_CH of register GTM0MCSiCTRLSTAT is used to identify a set of dedicated MCS-channels, which are always preferred during scheduling. The identifiers of the prioritized MCS-channels are in the range [0; SCD_CH] and the non-prioritized channels are in the range [SCD_CH+1; T-1]. The individual priority for the set of prioritized MCS-channels is applied in descending order, which means that MCS-channel 0 has the highest priority, followed MCS-channel 1, which has the second highest priority, and so on. The non-prioritized MCS-channels do not have any priority. A value of T-1 or higher for the bifield SCD_CH means that all T MCS-channels are prioritized MCS-channels.
