CASE 419BL

General Description

These dual N & P Channel logic level enhancement mode field effect transistors are produced using **onsemi**'s proprietary, high cell density, DMOS technology. This very high density process is especially tailored to minimize on−state resistance. This device has been designed especially for low voltage applications as a replacement for digital transistors in load switching applications. Since bias resistors are not required this dual digital FET can replace several digital transistors with different bias resistors.

Features

- N−Channel 0.68 A, 25 V
  $R_{DS(ON)}$ = 0.45 Ω @ V_{GS} = 4.5 V
- P−Channel −0.46 A, −25 V
  $R_{DS(ON)}$ = 1.1 Ω @ V_{GS} = −4.5 V
- Very Low Level Gate Drive Requirements Allowing Direct Operation in 3 V Circuits. $V_{GS(th)}$ < 1.0 V.
- Gate−Source Zener for ESD Ruggedness. >6 kV Human Body Model
- Replace Multiple Dual NPN & PNP Digital Transistors
- This is a Pb−Free Device

Product parametric performance is indicated in the Electrical Characteristics for the listed test conditions, unless otherwise noted. Product performance may not be indicated by the Electrical Characteristics if operated under different conditions.

1. $R_{\theta JA}$ is the sum of the junction−to−case and case−to−ambient thermal resistance where thecase thermal reference is defined as the solder mounting surface of the drain pins. $R_{\theta JC}$ is guaranteed by design while $R_{\theta CA}$ is determined by the user's board design.
